It is objected to this machine, however, that it requires a considerable wind to make it work. Leumannus has contrived another, wherein the sails are horizontal, and are more easily driven about, and will turn what way soever the wind blows.

Mr. d'Ouvers liray invented a new *anemometer*, which of itself expresses on paper, not only the several winds that have blown during the space of twenty-four hours, and at what hour each began and ended, but also the different strength and velocities of each. Vide Mem. Acad. Scienc. an. 1734. p. 169. See WIND *Machines*.

ANEMONE, in *Botany*, *wind-flower*, a genus of the *polyandria polygynia* class. Its characters are, that the flower is naked, having no empalement, and consists of two or three orders of leaves, or petals, which are oblong, and disposed in three series over each other; it hath many germens collected into a head, which afterwards become so many seeds inclosed with a down, which adhere to the foot-stalk, and form an obtuse cone.

Mr. Tournefort enumerates 168 species; Linnæus 23; Mr. Miller, however, mentions no more than 6.

The proper soil and culture of many varieties of this beautiful flower are these: for the soil take a quantity of fresh light sandy loam, or hazel-earth, from a common, or dry pasture, not dug above eight or ten inches deep; mix this with a third part its quantity of rotten cow-dung, and lay it up in a heap; turn this over at least once a month, and every time pick out the stones and break the clods. After this mixture has been twelve months made, it will be fit for use.

The beds of this earth must be prepared in September, and should be made eight inches deep, if it be in a wet soil; but if in a dry one, three or four inches will be sufficient; three weeks after this has been laid in, stir it for six inches deep with a spade, and then with a stick draw lines each way of the bed, at four inches distance, so that the whole may be in squares; then make a hole three inches deep in the centre of each square, and plant a root in each; and when all are planted, rake the earth of the whole bed smooth, so as to cover the roots two inches thick. The season of planting these roots for forward flowers, is the middle of September, and for the later in October: this is best done at a time when there are gentle rains. Some roots should also be saved to be planted after Christmas, for fear of accidents to the former from very hard weather.

These usually flower three weeks after those planted in autumn. In the beginning of April the early planted roots will begin to flower, and they will keep in flower near a month, if the weather prove favourable, and they are properly shaded with mats, laid over hoops in the greatest heat of the day; the second, and last planted ones, will follow these; and, in the whole, there will be at least two months fine flowering.

Toward the latter end of May the first planted roots will lose all their leaves, and they must be then taken up and washed clean, and laid to dry on mats in the shade; after which they are to be put up in paper bags, and hung up till the time of planting them comes on again. The later planted ones are to be taken up also as soon as their leaves are decayed, and not suffered to remain to make new shoots; for then it is too late to remove them.

They are propagated two ways, either by dividing the roots, or by sowing. The roots are to be divided as soon as they are taken up out of the ground: they will succeed if broken into as many parts as there are eyes or buds in them; but they flower most strongly, if not parted too small.

The way, by sowing, is this: choose first some good kinds of *anemones*, plant these early, and they will produce ripe seed three weeks after the flower first blows. This must be carefully gathered, and in August it should be sowed in pots or pans, or a very well prepared bed of light earth, rubbing it between the hands with a little dry sand, to prevent several of the seeds from clinging together, and spreading them as even as possible all over the bed; after this a light hair-brush should be drawn many times over the surface of the bed, to pull asunder any lumps of seed that may yet have fallen together; observing not to brush off the seed, and as much as possible not to brush it into heaps. When this is done, some light earth, about a quarter of an inch deep, should be sifted over the bed. If the weather be hot, the bed must be at times covered with mats laid hollow, and gently watered.

In about two months after sowing, the plants will appear, if the season has been favourable, and they are to be carefully defended from the hard frosts by proper covering, and from the heat of the sun afterwards by a moveable reed-fence. As the spring advances, if the weather be dry, they must be gently watered, and when their green leaves decay, there must be a quarter of an inch more earth sifted over them, and the like again at Michaelmas; and the bed must be kept clear from weeds, and the following spring they will flower.

The *anemones* are good for pains of the head, and for inflammations; help diseases of the uterus, and procure milk into the breasts. Taken in ptisan, or applied to the part in wool, they provoke the menses. The root, chewed in the mouth, draws out phlegm, and makes the teeth sound; and the decoction thereof cures inflammations in the eyes.

All the *anemones* are acrimonious and detersive, drawers, and endued with the faculty of opening the mouths of the veins.

ANEMONES, *sea*, a species of the ACTINIA, the history of which has been lately elucidated by the abbé Dicquemarre. He has already discovered four or five different species of them. They vary in their size, shape, and colour; but are generally found to resemble a truncated cone, and many of them are of an uniform colour, whilst others are spotted either in regular stripes, or in a more irregular manner. They are found adhering to rocks or stones in the sand, or in oyster-beds: and they are observed to stretch out their limbs and mouth, in order to lay hold of any thing that touches the surface of the sand, &c. where they lie. This accurate observer could easily distinguish these animals from plants by their progressive motion, by the means they make use of to seize their prey, and to defend themselves, by their deglutition, digestion, and evacuations, and also by the propagation of their species. He accordingly classes them among spontaneous animals.

The *anemones* have a wonderful faculty of reproduction; for, by many experiments, M. Dicquemarre ascertained this property, and he conjectures that it is owing to their gelatinous texture. Their limbs budded out successively after several amputations. Nay, some of them were dissected through the body; and the basis, together with that part of the stump which was left, survived, projected new limbs, and the animal moved and eat bits of muscles, which are its usual nourishment. They appeared to bear a considerable degree of heat, and to live in a vacuum, at least in a very rare air; and they require, for a very considerable time, no other food than what they find disseminated in sea water.

Anemones are irritable to such a degree, that light very much affects them, though to appearance they have no eyes; and by means of this property, the abbé has made use of them for indicating the different changes of temperature in the atmosphere; and he gives the following account of this new kind of *barometers*. The sea-water, in which the *anemones* are placed, must be renewed every day, and this must be their only nourishment; and the observation should be made at intervals equally distant from the renewals of the water. If the *anemones* be shut and contracted, there is reason to apprehend an approaching storm; that is, high winds, and a rough, agitated sea. When they are all shut, but not remarkably contracted, they foretoken a weather somewhat less boisterous, but still attended with gales, and a rough sea. If they appear in the least open, or alternately and frequently opening and closing, they indicate a mean state both of winds and waves. When they are quite open, tolerably fine weather, and a smooth sea, may be expected. And lastly, when their bodies are considerably extended, and their limbs divergent, they surely prognosticate fixed, fair weather, and a very calm sea. The glass in which they are deposited may be swung at sea, in the same manner as the compass, so that the rolling of the ship may agitate the water as little as possible. These animals are viviparous; for several of them brought forth eight, ten, and twelve young ones, in the hand. They feed upon wandering nettles, or sea-jellies; and they are all fit for food. Upon being removed in fresh water, they acquired a pale colour, their coat becomes flabby, and they soon die. Phil. Trans. vol. lxiii. part ii. vol. lxv. part ii. and vol. lxvii. part i. See ACTINIA, ANIMAL *flower*, URTICA *Marina*, &c.

ANEMOSPERMOS, in *Botany*. See ANEMONE.

ANEMOSCOPE is sometimes used for a machine invented to foretel the changes of the wind.

The word is derived from ἄνεμος, *wind*, and σκοπέω, *I consider*.

It has been observed, that HYGROSCOPES made of cat's-gut, &c. prove very good *anemoscopes*; for from falling, by the turning of the cord a-thort, to foretel the shifting of the wind. See an account of two different *anemoscopes*; one by Mr. Pickering, Phil. Trans. vol. xlii. part ii. p. 9. the other by Mr. Martin, in his Philos. Brit. vol. ii. p. 211. See ANEMOMETER, and WIND *machine*.

The *anemoscope* used by the ancients seems, by Vitruvius's description of it, to have been intended rather to shew which way the wind actually blew, than to foretel into which quarter it would change.

Otto de Guericke also gave the title *anemoscope* to a machine invented by him, to foretel the change of the weather, as to fair and rain.

It consisted of a wooden little man, who rose and fell in a glass tube, as the atmosphere was more or less heavy. —Accordingly, M. Conners has shewn, that this *anemoscope* was only an application of the common BAROMETER. See WIND.

The *anemoscope* of Vitruvius is famous. It is made of the bird *lunck*, whose feathers are picked, the skin stripped off, *viscera* taken out, and the skin in this state drawn anew over the bones; this being hung up in the chimney, is said always to direct its bill to the point from whence the wind is like to blow. Ephem. Acad. N. C. Dec. 3. An. 9. App. p. 245.

ANETHUM, in *Botany*. See DILL.

ANETHUM, *oleum vel, simis anethi*, are procured by mere coagulation. They are commended by Galen in humid ulcers, especially about the *pudenda*.

ANETHUM, *water of*, *aqua anethi*, is procured from the leaves, while in flower, by distillation in *balneo Mariæ*. It is accounted stomachic, carminative, and anodyne.

ANETHUM, *oil of*, is either procured by infusion, or distillation. The former kind is prescribed by Dioscorides, as a proper emollient for disorders of the privities; also a warm discutient, digestive, &c. The latter is held to be aromatic, stomachic, &c.

ANEURYSM, ANEURYSMA, in *Surgery*, a soft, throbbing, ruddy tumor, occasioned by a dilatation, or by a wound of an artery.

The word comes from ἀνευρύνω, *dilato*, *I dilate*.

Surgeons distinguish two kinds of *aneurism*, which they call the true and the spurious. The true *aneurism* is formed by a dilatation only of the artery, either all round, or only one side, much in the manner of the *varices*, or tumors of the veins; this has always a pulsation.

This kind of *aneurism* is seldom fatal; though reckoned, when large, incurable; the chief inconveniencies are, the magnitude of the tumor, and the pulsation.

Mr. Littre gives us the history of an *aneurysma* of this kind, in the *aorta*; the cause whereof he attributes to an extraordinary diminution of the cavity of the axillary and subclavian arteries. Hist. de l'Acad. Roy. an. 1712.

Another history of an *aneurysma* of the same part we have, by Mr. Lafage, in the Philosophical Transactions. It was occasioned by some violent shocks the patient received on the breast, which threw him into spitting of blood, and soon after formed the tumor, whereof he died. Upon dissection, the *aneurysma* was found so big, that it filled the whole cavity of the thorax on the right side.

There is another remarkable history of an *aneurism*, in the London Medical Observations. There is also a remarkable case of the same kind, with an account of the uncertainty of discovering the symptoms of the disease, by Jos. Warner, F. R. S. Phil. Trans. vol. l. part i. N° 44. an. 1757.

The spurious *aneurism* is, when the artery having been opened, by puncture or incision, or other accident, the blood is extravasated between the muscles and integuments, and the limb appears swelled and livid, and there is little or no pulsation. The most common seat of an *aneurism* is in the brachial artery, and its most common occasion a puncture of that artery in bleeding; but the same accident may happen to any artery, and from various causes, and is often the case in the internal arteries, from falls, blows, and violent strains; in the arm is often happens from the outer coat only of the artery having been cut in bleeding, and the inner one giving way by degrees, as not of strength to bear the impulse of the blood. These are at first very small, and disregarded by the patient, but they grow at length to the size of an egg, and sometimes even to that of a man's head.

The *aneurisms* of the great internal arteries are the most fatal of all; those of their external branches are often remedied, but those in the arm frequently after the operation are attended with a wasting of the arm, and an amputation becomes necessary. The natural bursting of an *aneurism* is very dangerous, as the patient may be lost in a minute's time, if the artery be not compressed above; sometimes surgeons have also opened the larger *aneurisms*, mistaking them for abscesses.

The method of curing a slight *aneurism* in the arm, or elsewhere, is either by deligation and compression, or by incision; the first ought always to be first tried, and is done either by strait bandages with compresses, or by an engine invented for that purpose. Small *aneurisms* are often thus cured; but when large and dangerous, the operation by the knife must be used. In this the first care is to stop the course of the blood by the tourniquet; the second to denude the artery, and free it from the adjacent integuments, and the last to contract or contrunge it either by medicine or ligature.

The spurious *aneurism* is often produced by the bursting of the true kind, under the integuments; and in this case it is to be treated as the true, and cured by the operation with the knife, and by ligature, or caustics; but in all these cases, the ligature seems the best method.

When any part of an artery has lost its spring, it is less capable than before to resist the impulse of the blood. This part of a canal, which is continually pushed by the blood, must therefore become gradually more and more dilated; until by degrees there becomes formed in the part that sort of tumor which surgeons and anatomists call an *aneurism* by dilatation, or the true *aneurism*, and this dilated part of the vessel is, properly speaking, a kind of bag through which the blood that first formed it is continually passing.

When an artery has been by any means wounded, the blood which escapes through the orifice causes another sort of tumor; and this is called an *aneurism by wounding*, or a spurious *aneurism*. Heister.

The most common *aneurisms* by wound happen from bleeding in the arm; in these, if the artery be but slightly wounded, and the bandage and compress properly applied, the cure is often performed, so that no farther mischief ensues; but if the wound is larger or the compression less regular, bad symptoms come on sooner or later, and there often is a necessity at last of submitting to the operation of opening the skin, dispersing the blood, and closing the vessel. Mem. Acad. Scienc. Par. 1736.

Dr. Hunter, who has treated largely on this subject, divides *aneurisms* into four kinds, the *true*, the *false*, the *mixed*, and the *varicose*. The *true aneurism* is formed by a dilatation of the artery, and may happen in any part of the body. The *false aneurism* is formed by a rupture, or wound, in the coats of the artery, and may be either *diffused* or *circumscribed*. The *mixed aneurism* is formed partly by wound, or rupture, in the artery, and partly by dilatation.

The *varicose aneurism* is owing to the wound of an artery through a vein, so that the blood passes from the trunk of the artery into the trunk of the vein, and so back to the heart. See Lond. Med. Obf. and Inq. vol. i. art. 26. vol. ii. art. 30 and 36. vol. iii. art. 37. 12.

If an artery happens to be cut, the blood gushes out impetuously by ſtarts, and is not eaſily ſtopped; and an inflammation and diſcoloration of the part ſucceed, with a tumor, and inability to move the part. The ſymptoms are nearly the ſame in caſe of a corroſion of the coats of the artery; only in this caſe they are leſs violent.

If the blood ceaſe to flow from the wounded artery, and pour itſelf between the interſtices of the muſcles, recourſe is had to manual operation; which being neglected, the extirpation of the limb frequently becomes unavoidable. See caſes of *aneuriſms*, with remarks, by Dr. Donald Monro, in the third volume of Eſſ. Phyſ. and Liter. Edinb. 1771. art. 12. p. 178.

ANFELDTYHDE, or ANFEALTHILF, in *Law*, a ſimple accuſation; for the Saxons had two ſorts of accuſation, viz. *ſimples* and *triples*. That was called ſingle, when the oath of the criminal, and of two more, were ſufficient to diſcharge him: but his own oath, and the oaths of five more, were required to free him *a triplici accuſatione*.

ANGARI, or ANGARII, in *Antiquity*, denote public couriers, appointed for the carrying of meſſages.

The ancient Perſians, Budæus obſerves, had their *ἀγγαρήιον δρόμον*, which was a ſet of couriers on horſeback, poſted at certain ſtages or diſtances, always in readineſs to receive the diſpatches from one, and forward them to another, with wonderful celerity, anſwering to what the moderns call poſts, q. d. *poſiti*, as being poſted at certain places or ſtages. Herod. lib. viii.

The *angari* were alſo called by the Perſians *oſandæ*; by the Greeks *ἐπισπέμπτοι*, on account of the long journies they made in one day, which, according to Suidas, amounted not to leſs than 1500 ſtadia.

ANGARI is alſo applied figuratively to porters, and others employed in laborious offices, as bearing burdens.

ANGARIA is uſed, in a general ſenſe, for any burden, or incumbrance, forcibly impoſed on perſons.

Some define *angariæ*, by perſonal ſervices, which a party is compelled to diſcharge in his own perſon, or to ſerve at his own expence.—Or, ſuch ſervices impoſed on lands, whereby a perſon is obliged to work for another, either with his horſe, tea ats, or the like.

ANGARIA, in the *Civil Law*, denotes a duty required of the ſubjects to furniſh out horſes and carriages for conveying of corn for the ſoldiers, and ſuch things as belonged to the *fiſcus*.

This duty goes by the name of *curſus publicus*, *angaria*, *parangaria*, *tranſlatio*, and *veitio*. The horſes uſed in this ſervice are particularly called *paraveredi*, and *equi curſuales*.

Angariæ are generally underſtood as excluſive of ſhips; though, on ſome occaſions, theſe were preſſed into the ſervice for tranſporting proviſions and the like.

Angariæ differ from *parangariæ*, in that the former are confined to public or main roads, the latter to oblique or croſs roads.

In the Book of Feuds, the performance of *angariæ* and *parangariæ* is ranked in the number of royal ſervices. Lib. ii. tit. 56.

The clergy were exempted from this ſervice by two laws of Conſtantius; but he revoked this privilege in 360. The privilege was reſtored in 382, and confirmed by Honorius in 412, but was taken away again in 440. Bingh. Orig. Eccleſiaſt. lib. v. cap. 3. § 10.

ANGARIA, is alſo uſed, in *Ancient Military Writers*, for a guard of ſoldiers poſted in any place for the ſecurity of it. Veget. lib. i. cap. 3. lib. ii. cap. 19. lib. iii. cap. 8.

ANGEIOGRAPHIA, the knowledge, or deſcription, of all kinds of ancient inſtruments, veſſels, and utenſils, both domeſtic, military, and nautical.

The word is compounded of *ἀγγεῖον*, an, *veſſel*, and *γράφω*, *ſcribo*, *I deſcribe*.

Angeiography alſo includes the conſideration of the WEIGHTS, MEASURES, &c. uſed by the ſeveral nations.

ANGEIOLOGY, ANGEIOLOGIA, in *Anatomy*, the hiſtory or deſcription, of the veſſels in a human body; i. e. gr. the nerves, veins, and lymphatics.—See *Tab. Anat.* part ii.

The word is derived from *ἀγγεῖον*, a *veſſel*, and *λόγος*, *diſcourſe*.

Angeiology is a branch of SARCOLOGY.

ANGEIOTOMY, in *Surgery*, is uſed by ſome to denote an artificial ſection of the veſſels, as in bleeding.

The word is formed of *ἀγγεῖον*, *veſſel*, and *τέμνω*, *ſeco*, *I cut*.

In this ſenſe *angeiotomy* may be divided into PHLEBOTOMY and ARTERIOTOMY.

ANGEL, a ſpiritual intelligent ſubſtance; the firſt in rank and dignity among created beings.

The word *angel*, *ἄγγελος*, is not properly a denomination of nature but of office; denoting as much as *nuncius*, *meſſenger*, a perſon employed to carry one's orders, or declare his will.—Thus it is St. Paul repreſents *angels*, Heb. i. 14. where he calls them *miniſtring ſpirits*; and yet cuſtom has prevailed ſo much, that *angel* is now commonly taken for the denomination of a particular nature.

The exiſtence of *angels* is ſuppoſed in all religions, though it is incapable of being proved *a priori*.—Indeed, the ancient Sadducees are repreſented as denying all ſpirits; and yet the Samaritans and Caraites, who are reputed Sadducees, openly allow them: witneſs Abuſaid, the author of an Arabic verſion of the Pentateuch; and Aaron, a Caraite Jew, in his comment on the Pentateuch; both extant in manuſcript in the king of France's library.

In the Alcoran, we find frequent mention of *angels*.—The Muſſulmen believe them of different orders or degrees, and to be deſtined for different employments both in heaven and on earth. They attribute exceeding great power to the angel Gabriel; as to be able to defcend in the ſpace of an hour from heaven to earth; to overturn a mountain with a ſingle feather of his wing; &c. The *angel* Aſrael, they ſuppoſe, is appointed to take the ſouls of ſuch as die; and another *angel*, named Eſraphil, they ſay, ſtands with a trumpet ready in his mouth to proclaim the day of judgment.

The heathen philoſophers and poets were alſo agreed as to the exiſtence of intelligent beings, ſuperior to man; as is ſhewn by St. Cyprian, in his treatiſe of the vanity of idols, from the teſtimonies of Plato, Socrates, Trimegiſtus, &c.

Authors are not ſo unanimous about the nature as about the exiſtence of *angels*.—Clemens Alexandrinus believed they had bodies; which was alſo the opinion of Origen, Cæſarius, Tertullian, and ſeveral others. Athanaſius, St. Baſil, St. Gregory Nicene, St. Cyril, St. Chryſoſtom, &c. hold them to be mere ſpirits.

Eccleſiaſtical writers make an HIERARCHY of nine orders of *angels*.

By the ancient councils, men are forbid to frame or give particular names to *angels*; the only names owned by the church are Michael, Gabriel, and Raphael, to which is ſometimes added Uriel. Du-Cange.

Before the Babylonish captivity the Jews did not know the name of any *angel*; at least we find none mentioned in the books written before this event. Calmet. Dict. Bib.

Authors are divided as to the time of the creation of *angels*; some will have it to have been before the creation of our world, or even before all ages, that is, from eternity; this was Origen's opinion, who, according to Leontius, held that all spirits, *angels*, devils, and even human souls, were from eternity.

Others hold *angels* to have been created before the world, yet not from eternity; of which opinion are Nazianzen, and others. Others again maintain that they were created at the same time with our world, but on what day is disputed. Theodoret and Epiphanius fix their date first on the first day.

Good *angels* are called *angels of light*, and *guardian angels*; and those on the contrary, who are the *devil's* ministers, *angels of darkness*, and *fallen angels*.

ANGEL is more particularly understood of a spirit of the ninth and lowest class, or order of the HIERARCHY, or heavenly choir.

There was an officer of the Synagogue, among the Jews, who had the name of *angel*; and he was called INT, or *episcopus*, because he overlooked the reader of the law.

In the Apocalypse, the denomination *angel* is also given to the pastors of several churches: who are called, the *angel* of the church of Ephesus, the *angel* of the church of Smyrna, &c. Du-Cange adds, that the same name was anciently given to certain popes, and bishops; by reason of their singular sanctity, &c.

ANGEL is also used, in *Commerce*, for an ancient gold coin struck in England; so called from the figure of an *angel* impressed upon it.

Its value in 1 Hen. VI. was 6*s.* 8*d.* in 1 Hen. VIII. 7*s.* 6*d.* in 34 Hen. VIII. 8*s.* in 6 Edw. VI. it was 10*s.* in 2 Eliz. it was 10*s.* and in 23 Eliz. the same.—And the *half angel*, or, as it was sometimes called, the *angelet*, was the moiety of this; and the *quarter angelet*, proportionable.

The *angel* now subsists no otherwise than as a money of account; denoting 10*s.*

The French have also had their *angels*, *demi-angels*, and *angelots*; but they are now disused.

ANGEL-*fish*, in *Ichthyology*, the English name of the fish called by the generality of authors the SQUATINA, and by some the SQUATUS and RHINA. It is also called the MONK-*fish*, and is, according to the Artedian system, a species of the *squalus*, distinguished from the others of that genus by the name of the *squalus* with no *pinna ani*, and with the mouth placed in the top of the head.

ANGELIC, or ANGELICAL, something belonging to, or that partakes of the nature of *angels*.

We lay an *angelical* life, &c.—St. Thomas is styled the *angelical doctor*.—The *angelical* salutation is called by the Romanists *Ave Maria*; sometimes simply *angelus*.

ANGELIC *garment*, ANGELICA *vestis*, among our *Anabaptists*, was a monkish garment, which laymen put on a little before their death, that they might have the benefit of the prayers of the monks.

It was from them called *angelical*, because they were called *angeli*, who by their prayers *animæ salutis procurrebant*.—Hence, where we read the plural *monachos ad succurrendum* in our old books, it must be understood of one who had put on the habit when he was at the point of death.

ANGELICA, in *Botany*, a genus of the *pentandria digynia* class, a medicinal plant, of which the characters are, that it is umbelliferous, the greater umbel being composed of many small ones; the empalement of the flowers is indented into five parts; the flowers of the whole umbel are uniform. The germen is situated below the flower, which afterward becomes a roundish fruit, splitting into two, and composed of two seeds, which are plane on one side, convex on the other, and are bordered.

Mr. Miller enumerates *five* species.

It grows in gardens, and flowers and seeds in June and July: the root perishing after the ripening of the seed, which is in the second year of its growth. It is of a sweet smell, of an aromatic taste, and is loaded with a highly exalted oil, and volatile salt.

The roots of the garden *angelica* are of considerable use in medicine: the leaves also are sometimes used, and the seeds. It is a stomachic, a cordial, a sudorific; it is good in flatulencies, and is by many ranked among the vulnerary herbs. It is prescribed in malignant diseases of all kinds, against the effects of poison, and in the plague.

It has been a custom with some physicians, in the times of contagion of this kind, to make a paste of the fresh roots beaten with vinegar, and to carry this in a box about them, readily to be applied to the nose occasionally; others prefer the holding a piece of the dry root in the mouth, and others the drinking a glass of strong vinegar, in which it has been infused, fasting.

It has also been a custom to sprinkle the powder of the root over the cloaths of persons who go among the infected, through an opinion that it preserves them from imbibing the effluvia, which otherwise they might carry elsewhere.

A dram of the powder of the root alone, or half that quantity with a dram of Venice treacle are recommended to be given as a remedy in the plague, to be repeated every six hours, and a gentle sweat to be kept up all the time.

The root is used in many of our shop compositions, as in the plague-water, &c. and the dried leaves are a principal ingredient in the ladies red-powders famous in England for the cure of fevers.

The Laplanders are extremely fond of *angelica*, and use it in great abundance, both in meat and medicine. They use only the fibres, never meddling with the roots or seed, in which we find the highest flavour, and greatest virtue. They gather the large stalks before the plant is run to seed, and roast them or bake them till they are thoroughly tender, and then eat them as a delicate dish.

When they are sick, they boil either these fibres or the roots of the roots, which they call *jerth*, in water, and in worse cases in whey made of rein-deer milk, and give large draughts of this decoction to keep up a breathing sweat.

ANGELICA, *berry-bearing*. See ARALIA.

ANGELICA, *wild*. See ARCHANGEL.

ANGELICA *water* is one of the compound waters of the shops: thus called from the *angelica* root, which is the chief ingredient in the composition, and the most active part of that plant. Neumann.

ANGELICA *grass*, a technical name given to Anderson's Scots pills.

ANGELICA was also a celebrated dance among the ancient Greeks, performed at their feasts.

It was thus called, from ἄγγελος, *nuncius*, *messenger*; because, as Pollux assures us, the dancers were dressed in the habit of messengers.

ANGELICI, an ancient order of knights, instituted in 1190, by Isaacus Angelus Flavius Comnenus, emperor of Constantinople.

They were divided into three classes; but all under direction of one grand-master.—The *first* were called *turquois*, from a collar which they wore, and these were fifty in number.—The *second* were called the *knights of justice*, and were ecclesiastics.—And the *third* were called *knights servitors*.

Justinani will have this order to have been instituted in the year 313, by Constantine; and supposes the occasion thereof to have been the appearance of an angel to that emperor, with the sign of a cross, and these words, *In hoc signo vinces*; but that there was such a thing as any military order in those days, is a mere fable.

ANGELICI were also a sect of ancient Christians.—St. Augustine supposes them thus called from their yielding an extravagant worship to angels, and such as tended to IDOLATRY; though Epiphanius derives the name from their holding that the world was created by angels.

ANGELINA *manna arabica*, in *Botany*. This is a tree of vast size, sometimes above fifteen feet thick, growing on rocky and sandy places in Malabar, in the East Indies. It bears ripe fruit in December, and continues bearing for a whole century.

The dried leaves heated, alleviate pains and stiffness in the joints, and discuss an intumescence of the *testes* occasioned by a contusion, or any external violence; as also an *hydrocele*, or *pneumatocele*. It is effectual likewise in some venereal complaints, and incommodious fluxes.

ANGELICÆ, *Angelitæ*, in *Ecclesiastical History*, certain Christians, thus denominated from *Angelion*, the name of a place in Alexandria, where their first assemblies were held.

The *Angelitæ* appear to have been the same with what are otherwise called *Severitæ*, sometimes *Theodosiani* and *Domitiani*, from the names of their leaders: sometimes also *Tabennisiotæ*.

They made their first appearance in the time of the emperor Anastasius, and pope Symmachus, about the year of Christ 492.

The distinguishing tenets of the *Angelitæ* were, that the several persons of the Trinity had no distinct essence, substance, or deity; but only a subsistence or deity in common, or indivisible among them.

ANGELOLATRIA, from ἄγγελος, *angel*, and λατρεία, *I worship*, the superstitious worship, or adoration of angels.

ANGELOLOGIA, from ἄγγελος and λόγος, *discourse*, the doctrine or science of angels, their nature, office, &c. Gerhard has published a sacred *Angeiologia*. Mulinus an apocryphal *Angeiologia*.

Some use the term *Angelosophia* in a sense much the same.

A. Varenius has given an *Angelosophia*.

ANGELOGRAPHIA, from ἄγγελος and γράφω, *I describe*, a description of angels, their orders, names, discipline, &c.

This amounts to much the same with what others call *angeiologia*.

Cassianus and Manilius have published *Angeiographies*.

ANGELOT, an ancient English gold coin, struck at Paris while under subjection to the English.

It was thus called from the figure of an angel supporting the escutcheon of the arms of England and France.

There was another coin of the same denomination struck under Philip de Valois.

ANGELOT is also used in commerce to denote a small, fat, rich sort of cheese, brought from Normandy.

Skinner supposes it to have been thus called from the name of the person who first made it up in that form, and perhaps stamped it with his own name. Menage takes it to have been denominated from the resemblance it bears to the English coin called *angelus*.

It is made chiefly in the Pays de Bray, whence it is also denominated *angelot de Bray*.

It is commonly made in vats, either square or shaped like a heart.

ANGELUS, in the *Church History* of France, denotes a prayer to the Holy Virgin, established by Louis XI. to be repeated three times a day, at the sound of a bell rung for that purpose.

The *angelus* is the same with what is otherwise called *Ave Maria*, or the angelic salutation.

ANGER.—Hutcheson defines *anger*, a propensity to occasion evil to another, arising upon an apprehension of an injury done by him.

Anger is either deliberative or instinctive; and the latter kind is rash and ungovernable, because it operates blindly, without affording time for deliberation or foresight. Bishop Butler very justly observes, that *anger* is far from being a selfish passion, since it is naturally excited by injuries offered to others, as well as to ourselves; and was designed by the Author of nature not only to excite us to act vigorously in defending ourselves from evil, but to interest us in the defence or relief of the injured and helpless, and to raise us above the fear of the proud and mighty oppressor. Butler's Sermons, Serm. viii.

Anger is of such a nature, that it quickly throws the whole nervous system into preternatural commotions, by a violent structure of the nervous and muscular parts; and surprisingly augments not only the *systole* of the heart, and of all contiguous vessels, but also the tone of the fibrous parts in the whole body. It is also certain, that this passion, by the spasmodic structure it produces in the parts, exerts its power principally on the stomach and intestines, which are highly nervous and membranous parts; whence the symptoms are more dangerous, in proportion to the greater consent of the stomach and intestines with the other nervous parts, and almost with the whole body.

The unhappy influence of *anger* likewise, on the biliary and hepatic ducts, is very surprising; since by an intense constriction of these, the liver is not only rendered schirrhous, but stones also are often generated in the gall-bladder, and biliary ducts; these accidents have scarcely any other origin than an obstruction of the free motion and efflux of the bile, by means of this violent structure. From such a structure of these ducts likewise proceeds the jaundice, which in process of time lays a foundation for calculous concretions in the gall-bladder. Lastly, by increasing the motion of the fluid, or the spasms of the fibrous parts, by means of *anger*, a larger quantity of blood is propelled with an *impetus*, to certain parts; whence it happens, that they are too much distended, and the orifices of the veins distributed there, opened. It is evident from experience that *anger* has a great tendency to excite enormous haemorrhages, either from the nose, the aperture of the pulmonary artery, the veins of the arms; or in women, from the uterus; especially in those previously accustomed and disposed to such evacuations.

For the influence of this passion on the perspiration and urine of human bodies, see PERSPIRATION, &c.

ANGERONALIA, in *Antiquity*, solemn feasts held by the Romans, the 21st of December, in honour of Angerona, or Angeronia, the goddess of patience and silence.

Festus and Julius Modestus, quoted by Macrobius, Saturn. lib. i. cap. 10. derive the name from *angina*, *squinancy*; and suppose the goddess to have been thus denominated, because she presided over that disease.—Others suppose it formed from *angor*, *grief*, *pain*; to intimate that she gave relief to those afflicted therewith. Others deduce it from *angeo*, *I press*, *I chafe*; as being required the goddess of silence, &c.

ANGETENAR, in the *Arabian Astronomy*, denotes a fixed star of the fourth magnitude, in the body of CETUS, or the WHALE.

ANGIGLOSSII, from ἀγγεῖον, *conferva*, and γλῶσσα, *lingua*, denotes those who speak with difficulty, hesitation, or even stammering.

ANGILDUM, in our *Old Writers*, denotes a simple gild, that is, the simple value of the man, or other thing.

The word is compounded of the Saxon, *an*, *one*, and *gild*, *payment*, *price*, or *compensation*.

In this sense, *angildum* stands contradistinguished from *twigildum*, a *double compensation*; *trigildum*, a *triple compensation*.

ANGINA, in *Medicine*, an inflammation about the muscles of the *larynx* or *pharynx*, attended with an acute fever, difficulty of swallowing, and danger of suffocation.

The word is derived immediately from the Latin *ango*, *I vex*, formed of ἄγχω, *suffoco*, *strangle*.

The *angina* is the same with what we popularly call QUINZY, or *squinancy*. It is an inflammation in the parts of the throat subservient to respiration, speech, and deglutition. When the disorder is epidemic, it is usually between spring and Summer, after a long continuance of cold and rainy weather. The true *quinzy* is an acute inflammatory disorder; the ballard *quinzy* is a symphatic, catarrhal disorder; and the fever that accompanies it is not acute, but rather chronical. See QUINZY.

ANGINA *gangrena*, or *aphtha*, the ulcerated, malignant, putrid, *sore* THROAT; on which there are various treatises by Fothergill, Huxham, Northcote, &c.

ANGINA *hirci*, in *Botany*, a name used by some of the later Greek writers to express what the more ancient writers of this nation called *linaceftis*, and the Latins *ephimum*; this was the *cuscuta* or *dodder* growing on the flax, as that on the thyme was called *epithymum*. It was called *angina lini*, the quinzy of flax, from its choaking that plant.

ANGINA *pectoris*, in *Medicine*, a name given to a disease, dangerous, and not extremely rare, first described by Dr. W. Heberden, and so called from the seat of the disorder, and the sense of strangling and anxiety with which it is attended. The doctor's account of it is in the second volume of the London Medic. Transf. p. 59. &c. See also Medic. and Phil. Comment. vol. ii. p. 65. The patient while walking, especially if soon after eating, is affected with a painful sensation in his breast; at first, it is removed by his standing still, but afterwards it does not go off so suddenly; it comes on in bed, obliges the patient to get up, and continues for an hour or more; sometimes, though rarely, it attacks the patient standing or sitting still. It is brought on by trivial accidents, coughing, &c. or any slight disturbance. In some it is worst in winter, in others in summer. The pulse, sometimes at least, is not disturbed, consequently the heart is not affected by the pain. People affected with it often die suddenly, but some continue subject to it for twenty and odd years. The seat of it seems to be in or about the *os sternum*, towards the left side, and a pain in the middle of the left arm sometimes accompanies it. The cause is probably a spasm, or cramp, or an ulcer, or both. Wine, or other *cordials*, taken at bed-time, prevent or weaken night-fits, but opium is the most effectual relief; ten, fifteen, or twenty drops of the thebaic tincture, taken at bed-time, may be safely continued as long as requisite.

This disease has been since accurately described, and suitable preventives or remedies proposed, by Dr. Fothergill. Med. Obs. and Inq. vol. v. p. 233. 252.

ANGIOSPERMIA, in *Botany*, a term used by Linnæus, to express a certain series of the DIDYNAMIA or plants of the verticillate kind, which have their seeds not lodged naked within the cup. They are by this distinguished from the *gymnospermia*, which have them so; whereas the *angiospermia* have them inclosed in a capsule, and adhering to a *placenta* placed in the middle of that capsule. The class of DIDYNAMIA contains the labiated and perforated plants. The *angiospermia* are the perforated, the others the labiated kind. This order, or series, contains sixty-three genera, comprehending those that have a simple stigma, and perforate cuspule; those with a double stigma, and such as have many petals.

ANGLE, ANGULUS, in *Geometry*, the aperture or mutual inclination of two lines, which meet, and form an *angle* at their point of intersection.

Such is the *angle* BAC (*Tab.* IV. *Geometry*, *fig.* 91.) formed by the lines AB and AC, meeting in the point A.—The lines AB and AC, are called the *legs* of the *angle*; and the point of the intersection, the VERTEX.

Angles are sometimes denoted by a single letter affixed to the *vertex*, or angular point, as A; and sometimes by three letters, that of the vertex being in the middle, as BAC.

The measure of an *angle*, whereby its quantity is expressed, is an ARCH, DE, described from its vertex A, with any radius at pleasure, between its legs, AC and AB. See MEASURE.

Hence

Hence *angles* are diſtinguiſhed by the ratio of the arches which they thus ſubtend, to the CIRCUMFERENCE of the whole CIRCLE.—And thus an *angle* is ſaid to be of ſo many degrees, as are the degrees of the arch DE.

Hence alſo, ſince ſimilar arches, AB and DE, *fig.* 87, have the ſame ratio to their reſpective circumferences; and the circumferences contain each the ſame number of degrees; the arches AB and DF, which are the meaſures of the two *angles* ACB, and DCE, are equal; and therefore the *angles* themſelves muſt be ſo too.—Hence, again, as the quantity of an *angle* is eſtimated by the ratio of the arch, ſubtended by it, to the periphery, it does not matter what radius that arch is deſcribed with: but the meaſures of equal *angles* are always either equal arches, or ſimilar ones; and contrarily.

It follows, therefore, that the quantity of the *angles* remains ſtill the ſame, though the legs be either produced or diminiſhed.—And thus in ſimilar triangles, and in ſimilar figures, the homologous or correſponding *angles* are alſo equal.

The *taking of angles* is an operation of great uſe and extent in ſurveying, navigation, geography, aſtronomy, &c. The inſtruments chiefly uſed for this purpoſe are quadrants, theodolites, circumferentors, &c.

Mr. Hadley has invented a new and excellent inſtrument for taking *angles*, uſeful where the motion of the object, or any circumſtance cauſing the unſteadineſs in the common inſtruments, renders the making obſervations difficult or uncertain. Phil. Tranſ. N° 420, and N° 425.

Mr. Dolland has likewiſe contrived an inſtrument for meaſuring ſmall *angles*. Phil. Tranſ. vol. xlviii. N° 74. See MICROMETER.

In the practice of ſurveying, no *angles* of leſs than thirty degrees ſhould be taken: nor ſhould any be aſſumed but ſuch as are actually meaſured. See Hiſt. Acad. Scienc. 1740.

ANGLE, *to meaſure the quantity of an.*—1. On paper. Apply the centre of a protractor on the vertex of the *angle* O, (*Tab.* III. *Surveying*, *fig.* 49) ſo that the radius OB lie on one of the legs: the degree ſhown in the arch, by the other leg of the *angle*, will give the *angle* required.—To do the ſame with a line of chords, ſee SECTOR.

2. On the ground.—Place a ſurveying inſtrument, e. g. a ſemicircle (*fig.* 50) in ſuch a manner as that a radius thereof CG may lie over one leg of the *angle*, and the centre C over the vertex.—The firſt is obtained by looking through the ſights F and G, towards a mark fixed at the end of the leg; and the latter, by letting fall a plumbet from the centre of the inſtrument.—Then, the moveable index HI being turned this way and that, till through its ſights you diſcover a mark placed at the extreme of the other leg of the *angle*; the degree it cuts in the limb of the inſtrument ſhews the quantity of the *angle*.

To take the angle with a QUADRANT, THEODOLITE, PLAIN TABLE, CIRCUMFERENTOR, COMPASS, &c. ſee the ſeveral articles.

To plot or lay down any given *angle*, i. e. the quantity of the *angle* being given, to deſcribe it on paper. See PLOTTING and PROTRACTOR.

To biſect a given *angle*, as HIK, (*Tab.* IV. *Geometry*, *fig.* 92.) from the centre I, with any radius at pleaſure, deſcribe an arch LM. From L and M, with an aperture greater than half LM, ſtrike two arches, mutually interſecting each other in N. Then drawing the right line IN, we have HIN=NIK.

To trifect an *angle*, ſee TRISECTION.

ANGLES are of various kinds and denominations.

With regard to the form of their legs, they are divided into *rectilinear*, *curvilinear*, and *mixed*.

ANGLE, *rectilinear*, or *right lined*, is that whoſe legs are both right lines: as BAC. (*Tab.* IV. *Geometry*, *fig.* 91.)

ANGLE *curvilinear*, is that whoſe legs are both of them curves.

ANGLE *mixt*, or *interlinear*, is that, one of whoſe ſides is a right line, and the other a curve.

With regard to their quantity, *angles* are again divided into *right*, *acute*, *obtuſe*, and *oblique*.

ANGLE, *right*, is that formed by a line falling perpendicularly on another; or that which ſubtends an arch of 90 degrees.—Such is the *angle* KLM (*fig.* 93.)

The meaſure of a right *angle*, therefore, is a quadrant of a circle; and conſequently all right *angles* are equal to each other.

ANGLE, *acute*, is that which is leſs than a right *angle*, or than 90°.—as AEC (*fig.* 86.)

ANGLE, *obtuſe*, is that greater than a right *angle*, or whoſe meaſure exceeds 90°.—as AED.

ANGLE, *oblique*, is a common name both for acute and obtuſe *angles*.

With regard to their ſituation in reſpect of each other, *angles* are divided into *contiguous*, *adjacent*, *vertical*, *alternate*, and *oppoſite*.

ANGLES *contiguous*, are ſuch as have the ſame vertex, and one leg common to both.—Such are FGH and HGI (*fig.* 94.)

ANGLE *adjacent*, is that made by producing one of the legs of another *angle*. Such is the *angle* AEC (*fig.* 86.) made by producing a leg, ED, of the *angle* AED, to C. Two *adjacent angles*, *x* and *y*, or any other number of *angles* made on the ſame point E, over the ſame right line CD, are together equal to two right ones; and conſequently to 180°. And hence, one of two adjacent *angles* being given, the other is likewiſe given; as being the complement of the former to 180°.

Hence alſo, to meaſure an inacceſſible *angle* in a field, taking an adjacent acceſſible *angle*, and ſubtracting the quantity thereof from 180°, the remainder is the *angle* required.

Again, all the *angles*, *x*, *y*, *o*, E, &c. made round a given point E, are equal to four right ones; and therefore all make 360°.

ANGLES, *vertical*, or *oppoſite*, are thoſe whoſe legs are continuations of each other. Such are the *angles* *x* and *x*, (*fig.* 86.)

If a right line AB, cut another, CD, in E, the vertical *angles* *x* and *o*, as alſo *y* and E, are equal. And hence, if it be required to meaſure, in a field, or any other place, an inacceſſible *angle*, *x*; and the other vertical *angle*, *o*, be acceſſible; this latter may be taken in lieu of the former.

ANGLE, *alternate*. See ALTERNATE. Such are the *angles* *x* and *y*, (*fig.* 36)

The alternate *angles* *y* and *x* are equal.

ANGLES, *external*, are the *angles* of any right-lined figure made without it, by producing all the ſides ſeverally.

All the external *angles* of any figure, taken together, are equal to four right *angles*; and the external *angle* of a triangle is equal to both the internal and oppoſite ones, as is demonſtrated by Euclid, lib. i. prop. 32.

ANGLES, *internal*, are the *angles* made by the ſides of any right-lined figure within.

The ſum of all the internal *angles* of any right-lined figure is equal to twice as many right *angles* as the figure hath ſides, excepting four. This is eaſily demonſtrated from Euclid, prop. 32. lib. i.

The external *angle* is demonſtrated to be equal to the internal oppoſite one; and the two internal oppoſite ones are equal to two right ones.

ANGLES, *homologous*, are ſuch *angles* in two figures, as retain the ſame order from the firſt, in both figures.

ANGLE *at the periphery* is an *angle* whoſe vertex and legs do all terminate in the periphery of a circle. Such is the *angle* EFG (*Tab.* IV. *Geom. fig.* 95.)

ANGLE *in the* SEGMENT, is the ſame with that at the periphery.

It is demonſtrated by Euclid, that all the *angles* in the ſame ſegment are equal to one another; that is, any *angle* EFG, is equal to any *angle* E F G in the ſame ſegment EFG.

The *angle* at the periphery, or in the ſegment, is comprehended between two chords EF and FD, and ſtands on the arch ED. See CHORD, &c.

The meaſure of an *angle* without the periphery X (*fig.* 96.) is the difference between half the concave arch LM, whereon it ſtands, and half the convex arch NO intercepted between its legs.

ANGLE *in a ſemicircle*, is an *angle* in a ſegment of a circle, whoſe baſe is a diameter thereof.

It is demonſtrated by Euclid, that the *angle* in a ſemicircle is a right one; in a ſegment greater than a ſemicircle, it is leſs than a right one; and in a ſegment leſs than a ſemicircle, is greater than a right one.

Since an *angle* in a ſemicircle ſtands on a ſemicircle, its meaſure is a quadrant of a circle; and therefore is a right *angle*.

ANGLE *of a ſemicircle*, in *Geometry*, the *angle* which the diameter of a circle makes with the circumference. The chief property of this *angle* is, that it is leſs than a right *angle*, and greater than an acute right-lined *angle*.

ANGLE *at the centre* is an *angle* whoſe vertex is in the centre of a circle, and its legs terminated in the periphery thereof. Such is the *angle* CAB (*fig.* 95.)

The *angle* at the centre is comprehended between two radii, and its meaſure is the arch BC.

Euclid demonſtrates, that the *angle* at the centre BAC is double of the *angle* BDC, ſtanding on the ſame arch BC. And hence, half of the arch BC is the meaſure of the *angle* at the periphery.

Hence, alſo, two or more *angles* HLI, and HMI (*fig.* 97.) ſtanding on the ſame, or equal arches, are always equal.

ANGLE *without the centre*, HKI, is that whoſe vertex K is

not in the centre, but its legs HK and IK are terminated in the periphery.

The measure of an *angle* without the centre is half of the arches HI and LM, wherein it and its vertical O do stand.

ANGLE *of contact* is that made by the arch of a circle and a tangent in the point of CONTACT.—Such is the *angle* HAD, (*fig.* 10.)

The *angle* of contact, in a circle, is proved by Euclid to be less than any right-lined *angle*; but from hence it does not follow, that the *angle* of contact is of no quantity, as Peletarius, Wallis, and some others, have imagined. V. Wall. Algeb. p. 70, &c. Sir Isaac Newton shews, that if the curve HAE (*fig.* 97.) be a cubic parabola, where the ordinate DF is in the subtriple ratio of the abscisse AD, the *angle* BAF, contained under the tangent AB in its vertex, and the curve, is infinitely greater than the circular *angle* of contact BAC; and that, if other parabolas of higher kinds be described to the same axis and vertex, whose abscisses AD are as the ordinates DF², DF³, DF⁴, &c. you will have a series of *angles* of contact going on infinitely, of which any one is infinitely greater than that next before it.

ANGLE *of a segment* is that made by a chord with a tangent, in the point of contact. Such is the *angle* MLH (*fig.* 10.)

It is demonstrated by Euclid, that the *angle* MLH is equal to any angle M *a* L in the alternate segment M *a* L.

ANGLES, *for the effects, properties, relations, &c. of, when combined into triangles, quadrangles, and polygonous figures*, see TRIANGLE, QUADRANGLE, SQUARE, PARALLELOGRAM, POLYGON, FIGURE, &c.

ANGLES are again divided into PLANE, SPHERICAL, and SOLID.

ANGLES, *plane*, are those we have hitherto been speaking of; which are defined by the inclination of two lines in a plane, meeting in a point.

ANGLE, *spherical*, is the inclination of the planes of two great circles of the sphere.

For the properties of spherical *angles*, see SPHERICAL *Angle*.

ANGLE, *solid*, is the mutual inclination of more than two planes, or plane *angles*, meeting in a point, and not contained in the same plane. For the measure, properties, &c. of solid *angles*, see SOLID *Angle*.

We also meet with other less usual sorts of *angles* among some geometricians; as,

ANGLE, *horned*, *angulus cornutus*, that made by a right line, whether a tangent or secant, with the periphery of a circle.

ANGLE, *lunular*, *angulus lunularis*, is that formed by the intersection of two curve lines; the one concave, and the other convex.

ANGLE, *cissoid*, *angulus cissoides*, is the inner *angle* made by two spherical convex lines intersecting each other. See CISSOID.

ANGLE, *sistroid*, *angulus sistroides*, is that in figure of a SISTRUM.

ANGLE, *peleoid*, *angulus* PELECOIDES, is that in figure of a hatchet.

ANGLE, in *Trigonometry*. See TRIANGLE and TRIGONOMETRY.

For the sines, tangents, and secants of *angles*, see SINE, TANGENT and SECANT.

ANGLE, in *Mechanics*. *Angle of* DIRECTION, is that comprehended between the lines of direction of two conspiring forces.

ANGLE *of* ELEVATION is that comprehended between the line of direction of a projectile, and a horizontal line. Such is the *angle* RAB (*Tab.* IV. *Mechanics*, *fig.* 47.) which is comprehended between the line of direction of the projectile AR, and the horizontal line AB.

ANGLE *of incidence* is that made by the line of direction of an impinging body, in the point of contact. Such is the angle DCA (*fig.* 66.)

ANGLE *of reflection*, is that made by the line of direction of the reflected body, in the point of contact from which it rebounds. Such is the *angle* ECF.

ANGLE, in *Optics*. *Visual*, or *optic angle*, is the *angle* included between the two rays drawn from the two extreme points of an object to the centre of the pupil.—Such is the *angle* ABC (*Tab.* IV. *Optics*, *fig.* 69.) comprehended between the rays AB and BC.

Objects seen under the same, or an equal *angle*, must always appear equal.

The least *visible angle*, according to Dr. Hook, is one minute; though Dr. Jurin shews, that at the time of his debate with Hevelius on this subject, the latter could probably discover a single flat under so small an *angle* as 20″. Dr. Jurin states the grounds of this controversy, and discusses the question at large in his Essay upon distinct and indistinct vision, published in Smith's *Optics*, p. 148, &c.

ANGLE *of the interval*, of two places, is the *angle* subtended by two lines directed from the eye to those places.

ANGLE *of incidence*, in *Catoptrics*, is the lesser *angle*, made by an incident ray of light, with the plane of a speculum; or, if the speculum be concave or convex, with a tangent to the point of incidence. Such is the *angle* ABD (*fig.* 26.) Or, as some define it, it is the *angle* which a ray of light makes with a perpendicular to that point of the surface of any *medium* on which it falls.

Every incident ray, AB, makes two *angles*, the one acute, ABD, the other obtuse, ABE, though sometimes both right. The lesser of such *angles* is the *angle* of incidence. See INCIDENCE.

ANGLE *of incidence*, in *Dioptrics*, is the *angle* ABI (*fig.* 56.) made by an incident ray, AB, with a lens, or other refracting surface, HI.

ANGLE *of inclination* is the *angle* ABD, contained between an incident ray, AB, and the axis of incidence, DB. See AXIS, &c.

ANGLE *of reflexion*, ANGLE, *reflected*, } in *Catoptrics*. See REFLECTION.

ANGLE, *of refraction*, ANGLE, *refracted*, } in *Dioptrics*. See REFRACTION.

ANGLE, in *Astronomy*. ANGLE *of commutation*. See COMMUTATION.

ANGLE *of elongation*, or ANGLE *at the earth*. See ELONGATION.

ANGLE, *parallactic*. See PARALLACTIC *angle*.

ANGLE *at the Sun*, is the *angle* RSP (*Tab. Astronomy*, *fig.* 25.) under which the distance of a planet P, from the ecliptic PC, is seen from the sun.

ANGLE *of the East*. See NONAGESIMAL.

ANGLE *of obliquity*, of the ecliptic, or the *angle* of inclination of the *axis* of the earth, to the *axis* of the ecliptic, is 23° 28′, and remains the same in all points of the earth's annual orbit. By means of this inclination, such inhabitants of the earth as live beyond 45° of latitude have more of the sun's heat, taking all the year round; and those who live within 45° have less of his heat, than if the earth always moved in the equinoctial. See OBLIQUITY and ECLIPTIC.

ANGLE *of longitude* is the *angle* which the circle of a star's longitude makes with the meridian, at the pole of the ecliptic.

ANGLE *of right ascension*, is the *angle* which the circle of a star's right ascension makes with a meridian at the pole of the world. See *Right* ASCENSION.

ANGLE, *in Navigation*.—ANGLE *of the thumb*, or *lunidromic* ANGLE. See RHUMB, and LOXODROMY.

ANGLES, in *Fortification*, are understood of those formed by the several lines used in fortifying, or making a place defensible.

These are of two sorts; *real* and *imaginary*.—*Real angles* are those which actually subsist and appear in the works. Such are the *flanked angle*, *angle of the epaule*, *angle of the flank*, and the *re-entering angle of the counterscarp*. *Imaginary*, or *vacuit angles*, are those which are only subservient to the construction, and which subsist no more after the fortification is drawn. Such are the *angle of the centre*, *angle of the polygon*, *flanking angle*, *salliant angle of the counterscarp*, &c.

ANGLE *of*, or *at*, *the centre*, is the *angle* formed at the centre of the polygon, by two semidiameters drawn thither from the two nearest extremities of the polygon. Such is the *angle* CKF (*Tab. Fortification*, *fig.* 1.)

ANGLE *of the circumference* is the next *angle* made by the arch drawn from one gorge to the other.

ANGLE *of the counterscarp* is that made by the two sides of the counterscarp, meeting before the middle of the CURTIN.

ANGLE *of the curtin*, or *of the flank*, is that made by, or contained between, the curtin and the flank; such is the *angle* BAE.

ANGLE *of the complement of the line of defence*, is the *angle* arising from the intersection of the two complements one with another.

ANGLE, *diminished*, is the *angle* which is made by the meeting of the exterior side of the polygon with the face of the BASTION. Such is the *angle* BCF.

ANGLE *of the polygon* is the *angle* GHM, intercepted either between the two internal sides GH and HM, or the two external sides.

ANGLE *of the epaule*, or *shoulder*, is that formed by the flank and the face of the bastion. Such is the *angle* ABC.

ANGLE *of the interior figure* is the *angle* GHM, made in H, by the centre of the bastion, by the meeting in the innermost sides of the figure GH, and HM.

ANGLE *of the tenaille*, or *flanking* ANGLE *inwards*, is that made by the two rasant lines of defence, i. e. the two faces of the bastion when prolonged.

ANGLE *flanking inward*, is the *angle* CIH, made by the flanking line with the curtin.

ANGLE, *flanked*, by some called the ANGLE *of the bastion*, is the *angle* BCS, made by the two faces of the bastion, BC, CS; being the outermost part of the bastion, and that most exposed to the enemy's batteries, and therefore by some called the *point of the bastion*.

ANGLE *of the flank* is that formed by the *flank* and the *curtin*.

ANGLE *forming the flank* is that consisting of one flank, and one DEMI-*gorge*.

ANGLE *forming the face*, is that composed of one flank and one face.

ANGLE *of the triangle*, in *Fortification*, is half the *angle* of the *polygon*.

ANGLE *of the moat* is that made before the *curtin*, where it is intersected.

ANGLE, *re-entering*, or *re-entrant*, is that whose vertex is turned inwards, towards the place.

ANGLE, *salient*, is that which advances its point towards the field.

ANGLE *of the tenaille*, or *the outward flanking angle*, called also *the angle of the moat*, or *the dead angle*, is made by the two lines *flotant* in the faces of the two bastions, extended till they meet in an *angle* towards the *curtin*.—This always turns its point in towards the work.

ANGLE *of a wall*, in *Architecture*, is the point or corner where the two sides or faces of a wall meet.

ANGLES *of a battalion*, in the *Military Art*, are those soldiers placed where the ranks and files terminate. See BATTALION.

The *angles* of a battalion are said to be *blunted*, when the soldiers at the four corners are removed, so that the square battalion becomes octagonal; this was an evolution very common among the ancients, though now disused.

ANGLES, in *Anatomy*, are understood of the *canthi* or corners of the eye, where the upper eye-lid meets with the under.

That next the nose is called the *great* or *internal* and that towards the temples, the *less*, or *external angle*, or CANTHUS.

ANGLES, in *Astrology*, denote certain houses of a figure, or scheme of the heavens. Thus the *horoscope* of the first house is termed the *angle of the east*.

ANGLER, a fisherman, or other person, who practises ANGLING.

Anglers are to be distinguished from poachers. Some make the same difference between them that is between the fair trader and smuggler. Accordingly the legislature has made the latter penal, but laid no restraint on the former. *Angling* can do no prejudice to the fish of a river. *Anglers* fish for their recreation, not for lucre; whereas poachers make it their livelihood.

The tackle necessary for an *angler* is various, according to the branch of the art he applies himself to. He must be equipt with variety of books, and a competent quantity of every sort; he must not be without wax, silk, a pair of scissars or pen-knife, a basket or bag, and landing-net, plummets, shot, and floats of every kind, needles and thread, lines, hair, Indian-grass, variety of feathers, more particularly those taken from the neck of a mallard, the wing of a partridge, a capon's neck, the top of a plover, or the hackle of a red cock. He must likewise be furnished with twist, and bedding for dubbing his artificial flies; he must have a landing hook, reels for his silk lines, a pouch or book for his hair-lines, a convenient place wherein to repoſit his small craft, viz. flies, hooks, wax, shot, silk, &c. a bag for his worms, a tin-box for his gentles.

When he takes his stand, he is to shelter himself under some bush, or tree, or stand so far from the brink of the river that he can only discern his float; because fish are timorous, and easily frighted. The best way of *angling* with the fly is down the river, and not up; neither need the *angler* ever make above half a dozen of trials in one place, either with fly or ground-bait, when he angles for trout; by that time the fish will either offer to take, or refuse the bait and not stir at all.

ANGLICANÆ *guttæ*. See GUTTÆ.

ANGLICANUS *sudor*. See SWEATING *sickneſs*.

ANGLICISM, a word, or phrase, in the English IDIOM; or manner of speech peculiar to the English tongue.

ANGLING, the art of catching fish, by means of a rod, with a line, hook, and bait, fitted thereto.

There are several prudential rules observed by thorough anglers; such as, not to wear any white or shining apparel, but be cloathed in a dark ſky colour: to invite the fish to the place intended for *angling*, by casting in, from time to time, proper foods, as boiled corn, worms, and garbage: to keep them together in the time of *angling* by throwing in grains of ground malt: or sinking a box of worms with small holes for them to creep slowly out at, &c. To draw salmon or trout together, *anglers* use a composition of fine clay incorporated with blood, and ground malt.

To learn what bait is best for any fish at any time; after having caught one, they slit his gills, and take out the stomach; and thus find what he last fed on.

The several methods of *angling* for salmon, trout, carp, tench, perch, pike, dace, gudgeons, roach, flounder, &c. see under *Salmon*-FISHING, *Trout*-FISHING, &c.

The angler's first business is to prepare for catching the fish by inviting them about him; the method of doing this in standing waters, by throwing in grains, chopped worms and the like, is well known; but the chief difficulty is in running rivers and brooks. The method in this case is to prepare a tin-box capable of holding some hundred of worms, bored on all sides, and full of holes of such a size as they may be just able to crawl out at: there must be a plummet fastened to this box to sink it, and a line to draw it back at pleasure; in this case it is to be thrown into the water at a proper place, above which the angler may stand under cover. The worms will slowly and gradually crawl out of this box, and the fish will be gathered about to feed on them; the baited hook is to be thrown in higher up, and carried down by the stream. If this method does not bring the fish about the place in a little time, there is reason to suspect that some pike lies lurking thereabout, and deters them; in this case, it is proper to throw out a baited hook, and he will generally be taken: after this the attempt will succeed.

The *angling* rod must be kept in a moderate state neither too dry nor too moist: in the first case it will be brittle, in the other rotten. When pastes are used, it is proper to mix a little tow with them, and rub them over with honey; finally, a small anointing them with butter is of great use to keep them from being washed off the hook. The eyes of any fish that is taken are an excellent bait, for almost any other kind of fish.

In a pond, the best place for the *angler* to take his stand is usually that where the cattle go into the water; in rivers, if breams are fished for, it should be in the deepest and most quiet places; if eels, under the banks of rivers that hang over; pearch are to be expected in clean places, where the stream is swift; and chub in deep-shaded holes: roach are mostly found where the pearch are, and trout only in swift and clear streams. Places where there are many weeds, or old stumps of trees, harbour fish in great numbers, and they usually bite freely there, but there is danger of entangling the line, or fastening the hook to the weeds.

In case of this accident, recourse is to be had to a ring of lead, of about six inches round, fastened to a small pack-thread; this ring is to be thrust over the rod, and let to fall into the water. It will descend to the place where the hook is entangled, and then by pulling the pack-thread gently, the hook will be soon disengaged, or at the worst it can only be broke off near the end of the line; whereas when this is not employed, the rod itself is sometimes broken, or the line nearer its upper end.

Deep waters are best for *angling* in, for the fish do not love to be disturbed by wind and weather.

The best season is from April to October, for in very cold stormy weather the fish will not bite; the best times of the day are from three till nine in the morning, and from three in the afternoon till sun-set.

In an easterly wind there is never much sport for the angler; the southerly winds are the best for his purpose, and a warm but louring day is most of all to be chosen: a gentle wind after a sudden shower to disturb the water makes a very good opportunity for the angler; the cooler the weather in the hottest months, the better, but in winter on the contrary the warmer the day the better. A cloudy day after a bright moon-light night is always a good day for sport, for the fish do not care to go after prey in the bright moon-shine, and are therefore hungry the next morning.

The openings of sluices and mill-dams always bring fish up the current to seek for the food which is brought with the stream, and *angling* in these places is usually successful.

Those who are fond of *angling* might save themselves some fruitless trouble, by observing when small fish in a jar take or refuse food.

It is very good *angling* a little before the fish spawn, for then their bellies being full, they frequent sandy fords, to rub and loosen their bellies; at which time they will bite freely. In waters which ebb and flow, it is best *angling* at the ebb; but if the tide be not strong, the flood is to be preferred.

ANGLING, *ground*, the art of catching fish under water without a float, only with a plumb of lead, or a bullet.

This

This method is moſt expedient in cold weather, when the fiſh ſwim low. The bullet is to be placed nine inches from the baited hook; the top of the rod is to be very gentle, that the fiſh may more eaſily run away with the bait, and not be ſcared with the ſtiffneſs of it. The angler in this way is not to ſtrike as ſoon as he feels the fiſh bite, but ſlacken his line a little, to give the fiſh an opportunity to ſwallow the hook.

The tackle here is to be fine and ſlender, ſtrong and big lines being apt to fright the fiſh. Morning and evening are the chief ſeaſons for the *grounding* line for trout, but in a cloudy day, or a muddy water, you may fiſh at *ground* from morn to night.

ANGLING, *night*, a method of catching large and ſhy fiſh in the night. Trout, and many other of the beſt ſorts of fiſh, are naturally ſhy and fearful; they therefore prey in the night, as the ſecureſt time.

The method of taking them on this plan is thus: the tackle muſt be ſtrong, and need not be ſo fine as for day-fiſhing, when every thing is ſeen; the hook muſt be baited with a large earthworm, or a black ſnail, and thrown out into the river; there muſt be no lead to the line, ſo that the bait may not ſink, but be kept drawling along, upon, or near, the ſurface.

Whatever trout is near the place will be brought hither by the noiſe, and motion of the water, and will ſeize the worm or ſnail. The angler will be alarmed by the noiſe which the fiſh makes in riſing, and is to give him line, and time to ſwallow the hook; when a ſlight twitch ſecures him. The beſt and largeſt trouts are found to bite thus in the night, and they riſe moſtly in the ſtill and clear deeps, not in the ſhallow ſwift currents. Sometimes, though there are fiſh about the place, they will not riſe at the bait; in this caſe, the angler muſt put on ſome lead to his line, and ſink it to the bottom.

ANGLING *fly*. See FISHING *fly*.

ANGLING *hook*. See FISHING *hook*.

ANGLING *line* is either made of hair twiſted, or of ſilk, or of the Indian weed. The beſt colours are the ſorrel, white, and grey; the two laſt for clear waters, the firſt for muddy ones. Nor is the pale watery green deſpiſable: this colour is given artificially, by ſteeping the hair in a liquor made of allum, ſoot, and the juice of wallnut-leaves boiled together. See *angling* LINE.

ANGLING *rod*. See FISHING *rod*.

In *angling*, they obſerve, after having ſtruck a large fiſh, to keep the rod bent; which will hinder him from running to the utmoſt length of the rod-line, by which he would be enabled to break his hold, or the hook.

ANGLO-CALVINISTS, a name given by ſome *Eccleſiaſtical Hiſtorians* to the members of the church of England, becauſe their doctrinal articles are built on the ſyſtem of Calvin; though ſome modern writers, without ſufficient reaſon, pretend that the doctrinal ſyſtem of the Engliſh church is Arminian.

The *Anglo-Calviniſts* make one of the four branches or diviſions of Calviniſts: and as ſuch ſtand diſtinguiſhed from the pure CALVINISTS, the PISCATORIANS, and the ARMINIANS.

ANGLO-SAXON *language*, that ſpoke by the ancient Angli or Saxons, who ſettled in England.

It was thus called from the people, who were partly Angli, partly Saxon.

It is otherwiſe denominated ſimply *Saxon*.

The *Anglo-Saxon*, or Engliſh-Saxon, is properly the original Engliſh; being the language which our Saxon anceſtors firſt eſtabliſhed in this iſland.—It is now called *Anglo-Saxon*, to diſtinguiſh it from the modern or preſent Engliſh.

ANGON, in the *Ancient Writers on Mechanics*, denotes a military engine of the bow-kind. Others again ſpeak of it as a kind of javelin uſed by the French, the iron head of which reſembled a *fleur de lys*. It is the opinion of ſome writers, that the arms of France are not *fleurs de lys*, but the iron points of the *angon*, or *javelin* of the ancient French.

ANGON.ÆUS, in *Anatomy*, a name given by Riolanus, and others, to a muſcle called by the generality of other writers *anconæus*, and *cubitalis minor*.

ANGOR is uſed by ſome phyſicians to denote a ſhrinking inwards of the native heat of the body, or its retiring to the centre; upon which enſues a pain, and palpitation of the heart, attended with faintneſs and melancholy.

In this ſenſe, *angor* amounts to much the ſame with what the Greeks call *anguoin*.

The *angor* is reputed a bad ſymptom, when it happens in the beginning of an acute fever.

ANGSANA, or ANGSAVA, in *Botany*, names by which ſome authors have deſcribed the DRACO *arbor*, or *dragon-tree*; one of the trees ſaid to afford the *ſanguis draconis*, or *dragon's blood* of the ſhops.

It is eſteemed an aſtringent, and an excellent remedy in the *epiphor*.

ANGUELLA, in *Ichthyology*, a name given by ſome authors to the fiſh more uſually called HEIRETUS, and ATHERINA, a ſmall fiſh caught about the ſhores of the Mediterranean, and ſome other places, and eſteemed a delicate taſted one.

ANGUILLA, in *Ichthyology*. See EEL.

ANGUILLIFORM, *anguilliformis*, in *Ichthyology*, the term for a very large claſs of fiſhes, which are luſt and lubricous like the eel, and have no ſcales.

The word is derived from *anguilla*, an *eel*, and *forma*, *ſhape*, or *appearance*. Moſt of the fiſh comprized in this claſs are long-bodied alſo like the eel. Some of them have neither fins at their gills nor belly, as the *muræ* and *lampreys*; others have fins at their gills, but none on their bellies, as the *ſea-ſerpents*, *eel*, *conger*, *ophidion*, and *unimaculus*. And others have both, as the *tænia*, *muſtela*, *anguis*, and the like.

ANGUILLIFORM is ſometimes alſo applied to land animals, which bear a reſemblance to eels, but do not properly belong to that claſs.

In this ſenſe, we read of *anguilliform* worms. C. Elſtrus maintains that eels are viviparous; having found in ſome of them certain membranes full of *anguilliform* worms.

ANGUINA, in *Botany*, the name of a genus of plants deſcribed by Michell, and mentioned by Plumier, and in the Malabar Garden. It is the ſame genus with the TRICHOSANTHES of Linnæus, deſcribed in his *Genera Plantarum*, p. 466.

ANGUINEAL *hyperbola*. See HYPERBOLA and CURVE.

ANGUINEI *verſus*, in *Poetry*, thoſe which may be read backwards.

Theſe are otherwiſe called recurrent verſes. Such, e. g. are,

Optimum jus, lex amica, vox diſerta.
Diſerta vox, amica lex, jus optimum.

ANGUINUM *ovum*, among *Ancient Writers*, denotes an extraordinary ſort of an egg, ſaid to be produced by the joint *ſaliva* of a cluſter of ſnakes; being toſſed up on high by the hiſs, and thus caught in the air by the druids. It was endued, they ſaid, with many marvellous virtues.

ANGUIS, the SNAKE, in the Linnæan ſyſtem of *Zoology*, makes a diſtinct and large genus of the order of ſerpents, and claſs of amphibious animals; the character of which is, their having no feet, and a ſcaly body of a cylindric figure. See SNAKE.

ANGUIS *Æſculapii*. See COLUBER.

ANGUIUM *lapis*, a name given to a ſuppoſed ſtone in Germany, which is of a cylindric figure, and has a cavity capable of admitting a finger, and of a yellow colour, with a great many variegations. The vulgar call it *duchaneck*, and have an idle opinion of its having its origin in ſome manner from a ſerpent-nut. Dr Boot, who had ſeen many of them, declares them to be fictitious, and made of glaſs tinged with two or three colours.

ANGULAR, ſomething that relates to, or hath, *angles*.

Angular objects or a diſtance appear round; the little inequalities diſappearing at a much leſs diſtance than the bulk of the body.

ANGULAR *motion* is a compound kind of motion, wherein the moveable both glides and revolves at the ſame time. Such is the motion of the wheel of a coach, or other vehicle.

The phenomena, &c. of ſuch motion, ſee accounted for under the article ROTA *Ariſtotelica*.

ANGULAR, *acute*, *ſcalene*, ſee ACUTE.

ANGULAR, *capital*, ſee CAPITAL.

ANGULAR *column*, ſee COLUMN.

ANGULAR *niche*, ſee NICHE.

ANGULAR *motion*, in *Aſtronomy*, is the meaſure of the diſtance between any two planets, revolving round any body as the common centre of their motion.

The quantity of this motion is expreſſed by two right lines, drawn from the ſaid centre to the revolving bodies; which will open wider, and conſequently the angle will grow greater, as the revolving bodies part farther and farther from one another.

ANGULARIS *ſcapulæ*, in *Anatomy*, a name given by Winſlow, and ſome others, to the muſcle of the ſhoulder generally called the LEVATOR *ſcapulæ*.

ANGURIA, in *Botany*, ſee *Water*-MELON.

ANGUSTICLAVIA, or ANGUSTUS CLAVUS, in *Antiquity*, a *tunica*, embroidered with little purple ſtuds, worn by the knights.

The word is compounded of *anguſtus*, *ſmall*, and *clavus*, *ſtud*; becauſe thoſe ornaments were ſmaller in this garment than in the *laticlavia*, which was worn by the ſenators.

ANHALDIN, *anhaldinum*, an epithet given to various medicines, formerly kept as ſecrets in the family of Anhalt. Three of the moſt celebrated medicines under this denomination are a corroſive, a water, and a ſpirit.

The corrosive, as described by Burggrave, is compounded of calcined antimony, sublimate mercury, sal ammoniac, and calcined tartar, distilled and rectified.

The description of the *Anhaltin* water is given in the common dispensatories, and that of the spirit may be found in De Spina.

ANHELITUS signifies a shortness and thickness of breath; as in an ASTHMA. See RESPIRATION.

The word is Latin, formed of the verb *anhelo*, *I breathe with difficulty*.

ANHIMA, in *Ornithology*, the name of a Brasilian bird, somewhat resembling the crane-family, but not regularly of it. It is distinguished in a very singular manner from all other birds, having a long single horn on its head, inserted a little above the origin of the beak, and standing forwards, and a little bent downwards. This is of two or three fingers breadth long, and is slender and round, as if nicely turned, and is of a bony substance, and fine white colour; and on the front of each wing it has two other such horns growing from the substance of the bone. It is found about waters, and is a very voracious bird, but feeds only on vegetables. It is longer than a swan; and is of a mixed colour of black, grey, and white, with a very little yellow in some places. It is always seen male and female together; and the male is twice as large as the female, which is here described, and is larger than our swan. It makes a very loud noise, often repeating the notes, *vyha*, *vyha*. Marcgrave's Hist. Brasil. This, in the Linnæan system, is a species of *palamedea*. See SCREAMER.

ANHINGA, in *Ornithology*, the name of a very elegant Brasilian water fowl. It is about the size of our common duck; its beak is straight, very sharp, not thick, and about three fingers breadth long, and has all along the middle, as well above as below, long series of hooked prickles all bending backwards; its head is small, and its neck slender and long, not less than a foot in length; its legs are short, and its toes connected by a membrane, as in the cormorant and duck-kind; its tail is ten fingers breadth long; its wings, when folded, reach not more than half the length of the tail; its head and neck are yellowish, and covered with extremely soft velvet-like feathers; its breast, belly, and thighs, are of a silvery white; the upper part of its back is brown spotted with yellow, and the rest all black; it is common on the Brasilian shores, and feeds on fish. Marcgrave's Hist. Brasil.

ANHLOTE, in *Law*, a single tribute or tax. The words *anhlote*, and *onlot*, are mentioned in the laws of William the Conqueror; and their sense is, that every one should pay, according to the custom of the country, his part and share, as scot and lot, &c. Leg. W. I. *cap.* 64.

ANHUIBA, in *Botany*, a name by which some authors call the SASSAFRAS tree, the wood of which is so much used in medicine.

ANHYDROS, in *Botany*, a name given by the ancient Greeks, and from them copied by the Romans in the time of Pliny, to express one of those kinds of the STRYCHNA, or night-shades, which, when taken internally, caused madness.

ANIL, in *Ornithology*, the name of a Brasilian bird, somewhat allied to the PARROQUET kind. It is about the size of a thrush, and is all over black. It is very common in the woods, but is not eaten. Marcgrave's Hist. Brasil.

ANIL, in *Natural History*, the shrub from whose leaves and stalks INDIGO is prepared. It is also called NIL. For the method of preparing *indigo* from it, see INDIGO.

ANIMA, a SOUL; whether rational, sensitive, or vegetative.

The word is pure Latin, formed of *anima*, *breath*.

ANIMA is sometimes used by physicians to denote the principle of life in the body.

In which sense Willis calls the blood *anima brutalis*.

ANIMA is also figuratively used by chemists for the volatile principles in bodies, whereby they are capable of being raised by the fire.

In which sense we meet with *anima jaspidis*, the soul of JASPER, &c. Phil. Trans. N° 74. p. 2233.

ANIMA is more particularly applied to simple medicines, carefully exalted by solution and extraction to a high degree of power.

In which sense, we meet with *anima aloes*, *anima rhabarbari*, *anima tartari*, &c.

Sometimes also it denotes *medicines* which are peculiarly salutary to particular parts of the body. Thus we meet with

ANIMA *articulorum*, which is a denomination sometimes given to HERMODACTYLI; on account of their efficacy in disorders of the joints.

ANIMA *hepatis*, *soul of the liver*; a term applied by the chemists to the *sal martis*, salt of iron or steel; on account of its use in distempers of that part.

It is most usually prescribed under the name of *vitriolum martis*.

ANIMA *pulmonum*, used for *crocus*, or saffron; by reason of its supposed great use in diseases of the lungs.

ANIMA *mundi*, *q. d. soul of the world*, or *of the universe*, denotes a certain pure ethereal substance or spirit diffused, according to many of the ancient philosophers, through the mass of the world, informing, actuating, and uniting the divers parts thereof into one great, perfect, organical, and vital body or animal.

Plato treats at large of the *anima mundi*, in his Timæus; and is even supposed to be the author of the *dogma*; yet are interpreters much at a loss about his meaning. Aristotle, however, taking it in the common and obvious sense, strenuously opposes it.

The modern Platonists explain their master's *anima mundi* by a certain universal ethereal spirit, which in the heavens exists perfectly pure, as retaining its proper nature; but on earth, pervading elementary bodies, and intimately mixing with all the minute atoms thereof, it assumes somewhat of their nature, and becomes of a peculiar kind. So the poet:

Spiritus intus alit, totaque infusa per artus
Mens agitat molem, & magno se corpore miscet.

They add, that this *anima mundi*, which more immediately resides in the celestial regions as its proper seat, moves and governs the heavens in such manner, as that the heavens themselves first received their existence from the fecundity of the same spirit: for that this *anima*, being the primary source of life, every where breathed a spirit like itself, by virtue whereof various kinds of things were framed conformable to the divine ideas.

The notion of an *anima mundi* is rejected by most of the modern philosophers; though M. du Hamel thinks, without any great reason, since the generality of them admit something very much like it. Thus the Peripatetics have recourse to celestial influxes, in order to account for the origin of forms, and the secret powers of bodies.

The Cartesians have their subtile matter, which answers to most of the uses and intentions of Plato's *anima mundi*; being supposed to flow from the sun, and the other heavenly bodies, and to be diffused through all the parts of the world, to be the source or principle of all motion, &c. Some later philosophers in the place of these substitute fire; and others a subtile elastic spirit, or *medium*, diffused through all parts of space.

The principal thing objected, on the Christian scheme, against Plato's doctrine of the *anima mundi*, is, that it mingles the Deity too much with the creatures; confounds, in some measure, the workman with his work, making this, as it were, a part of that, and the several portions of the universe so many parts of the godhead. Yet is the same principle asserted by Seneca, Epist. 92. *Totum hoc quo continemur, & unum est, & Deus. Et socii sumus, & membra.*

ANIMA *gemmarum*, a term used by Becher, and some others, to express that principle, to which the gems, and other beautiful stones, owe their colours.

This *anima lapidum* is no more than the metalline sulphur to which these stones and gems, naturally colourless, owe their tinges; and, like other metalline sulphurs, it may be raised and evaporated by fire. Becher, Phys. Sect.

ANIMA *saturni*, *the soul of lead*, a preparation of lead, serving to many purposes in the enamel work. The method of making it is this; put litharge, powdered fine, into a glazed earthen vessel, and pour distilled vinegar upon it to the height of four fingers; let it stand till the vinegar is of a white or milky hue: pour off this coloured vinegar, and put on fresh, and so do till the vinegar will no longer be coloured by the litharge; then set these liquors together in open glazed earthen vessels, that the white powder may subside, and the vinegar be poured off clear. This white substance is the *anima saturni*. Sometimes this white matter will not precipitate without the addition of water; and sometimes it is necessary to evaporate the liquors; but by that means, it is always prepared. Neri's Art of Glass, p. 184.

ANIMADVERSION sometimes signifies *correction*; and sometimes remarks or observations made on a book, &c. and sometimes, a serious consideration and reflection on any subject, by the rules of criticism.

The word is formed of *animus*, the *mind*; and *adverto*, *I turn to*.

ANIMAL, a being, which, besides the power of growing, increasing, and producing its like, which vegetables likewise have, is farther endowed with sentation, and spontaneous loco-motion.

The word is derived from *anima*, *soul*; and literally denotes something endued with a soul.

An *animal*, respect being only had to the body not the soul, may be defined, with Boerhaave, to be an organical body,

body consisting of vessels and juices, and taking in the matter of its nutriment by a part called the *mouth*; whence it is conveyed into another called the *stomach*, into which it has roots implanted, whereby it draws in its nourishment, after the manner of plants.

Some have defined *animals* from their loco-motion, as being capable of shifting from place to place; and plants, from their sticking fast to the same subject: but on this principle, oysters, muscles, cockles, &c. would be almost excluded from the class of *animals*, inasmuch as they usually adhere, or grow to rocks, &c. yet it is certain that those creatures are real *animals*, as they have mouths and stomachs to take in their food, and lacteals and mesenteric veins to receive it, and sometimes can even move from place to place on occasion. Indeed, muscles seem an exception from the former definition; if, as it is said, that anomalous creature breathes, and receives its nourishment, not at the mouth, but by the *anus*: the part which we account its head, though without either eyes, ears, or tongue, or any other *apparatus*, save a hole, which we may call its mouth, is an immoveable part; being fastened to one of the shells, so that it cannot seek for food, but the food must come to seek it. This food is water, which, as the shell opens, enters in at the *anus* of the muscle, which opens at the same time; and passing thence into certain canals, between the inner surface of the shell, and the outer surface of the *animal*, is said to be conveyed thence into its mouth, by a certain motion, which the *animal* can produce at pleasure.

We may, therefore, with Dr. Tyson, fix the *criterion* of an *animal* in a *ductus alimentalis*, i. e. a *gula*, stomach, and intestines; all which make but one continued canal.

All *animals*, according to the most probable and received opinion, come from eggs; and are there inclosed, as it were, in *epitome*, till the seed of the male penetrate their covering, and stretch them so that they become ready for hatching.

There then enters, into their vessels, a chylous juice; which being pushed forwards by the spirits, circulates through the whole habit of the little body, nourishes and dilates it by little and little, and thus produces what we call *growth*.

This circulation repeated several times, refines and attenuates the juices, till at length they become of a red colour, and are converted into what we call *blood*. This natural operation bears a great resemblance to several chemical processes, by which, in attenuating and dissolving oily or sulphureous substances, they assume a red colour.

The philosophers comprehend man under the species of *animals*: and define him a reasonable *animal*; though among naturalists, &c. the term *animal* is usually restrained to irrationals.

Man, says Litter, is as very an *animal* as any quadruped of them all; and most of his actions are resolvable into instinct, notwithstanding the principles which custom and education have superinduced.

ANIMALS are ordinarily divided into *terrestrial*, *aquatic*, *volatile*, *amphibious*, *insects*, *&c.*

Terrestrial animals are either *quadrupeds* or *reptiles*.—Quadrupeds have either the feet cloven, as the bullock; or entire, as the horse; or divided into several toes or claws, as the dog, lion, &c. The other divisions will be found under the words FISH, BIRD, &c.

For a general account of the various kinds of *animals*, we shall here subjoin Mr. Ray's scheme.

Animals are either,

Sanguineous, that is, such as have blood, which breathe either by
- Lungs, have either
  - Two ventricles in the heart, and those either
    - Viviparous.
      - Aquatic, as the whale kind. See WHALE.
      - Terrestrial, as quadrupeds.
    - Oviparous, as birds.
  - But one ventricle in the heart, as frogs, tortoises, and serpents.
- Gills, as all sanguineous fishes, except the whale-kind.

Exsanguineous, or without blood, which may be divided into
- Greater; and those either
  - Naked,
    - Terrestrial, as naked snails.
    - Aquatic, as the poulp, cuttle-fish, &c.
  - Covered with a tegument, either
    - Crustaceous, as lobsters, and cray-fish.
    - Testaceous, either
      - Univalve, as limpets.
      - Bivalve, as oysters, muscles, cockles, &c.
      - Turbinate, as periwinkles, snails, &c.
- Lesser as insects of all sorts.

Terrestrial hairy *animals*, or quadrupeds, are either
- Hoofed, which are either
  - Whole-footed, or hooved, as the horse and ass:
  - Cloven-footed, having the hoof divided into
    - Two principal parts, called *digits*, either
      - Such as chew not the cud, as swine.
      - Ruminant, or such as chew the cud, divided into
        - Such as have perpetual and hollow horns:
          - Beef-kind,
          - Sheep-kind,
          - Goat-kind.
        - Such as have solid, branched, and deciduous horns, as the deer kind.
    - Four parts, or *quadrifidum*, as the rhinoceros and hippopotamus.
- Clawed or digitate, having the foot divided into
  - Two parts or toes, having no nails, as the camel kind.
  - Many toes or claws, either
    - Undivided, as the elephant.
    - Divided, which have either
      - Broad nails, and an human shape, as apes.
      - Narrower and more pointed nails, which, in respect of their teeth, are divided into such as have
        - Many fore-teeth or cutters in each jaw:
          - The greater, which have
            - A shorter snout, and rounder head, as the cat-kind.
            - A longer snout and beard, as the dog-kind.
          - The lesser, the vermin or weazel kind.
        - Only two large and remarkable fore-teeth; all which are phytivorous, and are called the hare kind.

Some have objected to Ray's division of *animals*, that all *animals are* sanguineous, since all have a vital fluid circulating through veins and arteries, though it be not of a red colour in all, the essential character of the blood lying not in its crimson colour, but in its office: in which view every fluid, by whose motion through vessels the life of an *animal* is sustained, may be denominated blood.

But this is rather a dispute about words than things.

The celebrated Linnæus has distributed *animals* into six classes, viz. *mammalia*, *aves*, *amphibia*, *pisces*, *insecta*, *vermes*. Each class is divided into a certain number of orders, and each order is again subdivided into *genera*, or kinds, each of which contains a variety of species. The system of this ingenious naturalist includes 354 kinds, and near 6000 known species. *Systema Naturæ.*

For particulars relating to *animals*, their numbers, analogous structure, sagacity, instinct, &c. see CREATION, ARK, HEAD, NECK, TAIL, FOOT, HORN, HOOF, STORGE, INSTINCT, &c.

ANIMALS consist of *solids*, or firm parts, as flesh, bones, membranes, &c. and *fluids*, as blood, &c. Of an intermediate kind may perhaps be reckoned fat, &c.

The solids are mere earth, bound together by some oily humour; and accordingly they are reducible by fire into such earth again.

Thus a bone, being perfectly purged of all its moisture by calcination, is found a mere earth, which the least force will crumble into dust, for want of the natural gluten: yet the same bone, by immerging it in water or oil, becomes firm and strong again; and more so in oil than in water. And thus cupels are made of animal earth, which will sustain the utmost effect of fire.

The fluid parts of *animals* are the cruder as they are less distant from the lacteals, and absorbent vessels. Thus chyle is little else but a vegetable juice; but in its farther progress, it gradually lays aside its vegetable characters; till after a number of circulations it becomes a perfect animal juice under the denomination of blood, from whence the humours are all derived.

Animal substances have been distinguished from those of vegetables by two circumstances: the first, that when burnt they are found perfectly insipid; all animal salts being volatile, and flying off with heat: the contrary of which is found in vegetables, which constantly retain some fixed salt in all their ashes.

The second, that no pure acid is contained in any animal juice; nor can any acid salt be extracted from the same: the contrary of which is found in all vegetables. See ACID.

Yet are *animals* converted into their vegetable nature, by putrefaction.

ANIMALS, *oviparous*. See OVIPAROUS.

ANIMALS, *rapacious*. See RAPACIOUS.

ANIMALS, *generation of*. See GENERATION.

ANIMALS make the subject of that branch of natural history called *Zoology*.

The structure of *animals*, with their disorders, remedies, &c. make the subject of anatomy, medicine, &c.

ANIMALS make the principal figures in heraldry; both as bearings, and as supporters, &c.

ANIMAL is also used adjectively, to denote something that belongs to, or partakes of, the nature of an *animal* body. Thus we say *animal* food, *animal* œconomy, &c.
Moralists frequently oppose the *animal* part, which is the sensible, fleshy part of a man, to the rational part, which is the understanding.

ANIMAL *actions* are those peculiar to *animals*; or which belong to *animals*, as such.
Such are SENSATION, and *muscular* MOTION.

ANIMAL *flower*, in *Zoology*, a name given by Mr. Griffith Hughes, to an *animal*, or *zoophyte*, somewhat resembling the flower of the marygold, but of a paler yellow.
This name seems well adapted to the *animal*; for its *claws*, or *tentacles*, being disposed in regular circles, and tinged with a variety of bright lively colours, very nearly represent the beautiful petals of some of our most elegantly fringed and radiated flowers: such as the carnation, marygold, and anemone. Phil. Transf. abr. vol. ix. p. 110.

ANIMAL *functions*, among *Physicians*. See FUNCTION.

ANIMAL *glue*, see GLUE.

ANIMAL *gods*, *ibid animalia*, in *Mythology*, those into which human souls are converted by means of certain religious ceremonies.
Labeo has written expressly on the *animal gods*.

ANIMAL *heat*. See HEAT.

ANIMAL *hunger*. See HUNGER.

ANIMAL *liquors*.—The common opinion is, that all the *animal liquors*, excepting chyle and milk, are of an alcalescent nature; but M. Quefnay, in his book Sur l'Oeconomie Animale, affirms, that our gelatinous liquors contain a very acefcent falt, capable of refilling a heat of two hundred degrees. The proof of which, fays he, offers itfelf daily to every one. Who is it that has not remarked, that broth made with flefh well freed from fat, when corrupted, becomes as four as verjuice? The foundation on which M. Quefnay builds his doctrine concerning *animal liquors*, is the feparation of milk into its oily, cheefy, and watery fubftances. Med. Eff. Edinb.

ANIMAL *motion* is the fame with what we call *mufcular motion*.
It is divided into two branches; natural or involuntary, and fpontaneous.

ANIMAL *œconomy*, see OECONOMY.

ANIMAL *oil*, see OIL.

ANIMAL *fecretion* is the act whereby the divers juices of the body are fecreted or feparated from the common maſs of blood, by means of the glands. See SECRETION.

ANIMAL *fpirits* are a fine fubtile juice or humour in animal bodies; fuppofed by many to be the great inſtrument of muſcular motion, fenſation, &c.
The ancients diſtinguiſhed fpirits into three kinds, viz. *animal*, *vital*, and *vegetative*: but the moderns have reduced them to one ſort, viz. *animal*: about the nature of which, and the matter whence they are formed, great diſputes have ariſen among anatomiſts, though their very exiſtence has never been fatisfy proved.
In the Hiſtory of the Royal Academy of Sciences at Paris, an. 1750, there is an ingenious memoir on this ſubject by M. Bertin. He undertakes to prove that the nervous fluid, or *animal ſpirits*, circulate; that if they depart from the brain they return to it by the nerves. In ſhort, he propoſes to form the courſe of this fluid into a ſyſtem of circulation, leſs demonſtrable, indeed, to the ſenſes than that of the circulation of the blood, but in other reſpects, grounded on equally ſolid reaſons.
As it is hard to define what could never yet be brought under the judgment of our *ſenſes*, all that we ſhall here offer concerning them, is, that they muſt needs be extremely ſubtile bodies, which eſcape all manner of examination by the ſenſes, though ever ſo well aſſiſted; and pervade the tracts of the nerves, which yet have no diſcovery of cavity or perforation; nor could ever by any experiment be collected; yet are conſtantly moving in vaſt quantities, as they muſt of neceſſity be, to perform all thoſe mighty operations which are aſcribed to them. However, the antiquity of the opinion claims ſome reverence.
By the help of theſe ſpirits we are furniſhed with a vaſt number of ſpontaneous motions of great *promptneſs*; and without them we muſt leave a great chaſm in the philoſophical hiſtory of *animal* bodies; but after all, the *phænomena* that would in this caſe be unexplained, are, it may be, to us inexplicable.
They are ſuppoſed to be ſeparated in the brain, from the ſubtileſt parts of the blood, and thence carried, by the nerves, to all the parts of the body, for the performance of all *animal* and vital functions.

ANIMAL *ſubſtances* comprehend all the component parts of *animals*, of what uſe or intention ſoever they may be.

ANIMAL *foſſile ſubſtances*, thoſe found buried in the earth at various depths, and embodied among various *ſtrata*.
Theſe are principally of four kinds: 1. Sea-ſhells. 2. The teeth, bony palate, and bones of fiſhes. 3. The bones of land *animals*. And, 4. Complete fiſh. See *Foſſile* BONES, *Foſſile* SHELLS, MARINE *remains*, and *Foſſile* IVORY.

ANIMAL *ſubſtances*, *fermentative quality of*. See FERMENT, and FERMENTATION.

ANIMAL *ſyſtem* imports the whole claſs of beings endowed with *animal* life.
In which ſenſe *animal ſyſtem* amounts to the ſame with what chemiſts and others call the *animal kingdom*.

ANIMAL is alſo ſometimes applied, in a figurative ſenſe, to artificial or moral things.
Hobbes conſiders government as a huge complex *animal*, under the denomination of *Leviathan*.
The reaſon of the appellation is founded on the analogy between an *animal* and a political body. The ſovereign or legiſlative power anſwers to the *head*; the magiſtrates to the limbs or members; rewards and puniſhments are the nerves; riches, the ſtrength; counſellors, the faculty of memory; equity, reaſon; ſedition, ſickneſs; civil war, death.

ANIMALCULE, ANIMALCULUM, a diminutive of animal, ſignifying ſuch a minute creature as is either ſcarce, or not at all diſcernible by the naked eye.
Such are thoſe numerous inſects which crowd the water in the ſummer months; changing it ſometimes of a deep or paleneſs colour; ſometimes of a yellow, &c. Theſe often ſeem to be of the ſhrimp-kind, and the moſt common one is called by Swammerdam, *pulex aquaticus arborefcens*. The cauſes of their concourſe, at this time, Dr. Derham obſerves, is to perform their *coat*. He adds, that they afford a comfortable food to many water animals. The green ſcum, on the top of ſtagnant waters, is often nothing elſe but prodigious numbers of another ſmaller order of *animalcules*; which, in all probability, ſerve for food to the *pulices aquatici*.
The MICROSCOPE diſcovers legions of *animalcules* in moſt liquors, as water, wine, vinegar, beer, dew, &c. In the Philoſophical Tranſactions, we have obſervations of the *animalcules* in rain water, in ſeveral chalybeat waters, infuſions of pepper, bay berries, oats, barley, wheat, &c. The human ſeed has been obſerved by divers authors to contain great numbers of *animalcules*.
Thoſe who have made the moſt minute reſearches, and the moſt accurate inquiries, into the natures of the ſeveral objects ſubjected to their ſenſes, have found that the ſubſtances upon which they employed their curioſity, were often quite different from what at firſt view they appeared to be. Thus for inſtance, the whole earth has been found replenished with an inexhauſtible ſtore of what we ſhould leaſt of all ſuſpect: that is, an infinite number of *animalcules* floating in the air we breathe, ſporting in the fluids we drink, or adhering to the ſeveral objects we ſee and handle. The conjectures and hypotheſes relating to the production, generation, ſtructure and uſes of theſe *animalcules*, have been as various as were ever contrived by caprice, or embraced by credulity. Not to bewilder ourſelves, however, in theſe labyrinths, but to confine our aſſertions to actual diſcoveries; by the aſſiſtance of the MICROSCOPE we not only perceive that ſuch *animalcules* exiſt, but are alſo enabled, in ſome degree, to determine their ſhapes, and the various peculiarities of their motion.
The contemplation of *animalcules*, has made the ideas of infinitely ſmall bodies extremely familiar to us. A mite was anciently thought the limit of littleneſs; but we are not now ſurpriſed to be told of animals twenty-ſeven millions of times ſmaller than a mite.
Minute animals are found proportionably much ſtronger, more active and vivacious than large ones. The ſpring of a flea in its leap, how vaſtly does it out-ſtrip any thing greater animals are capable of? A mite, how vaſtly faſter does it run than a race horſe? M. de l'Iſle has given the computation of the velocity of a little creature ſcarce viſible by its ſmallneſs, which he found to run three inches in half a ſecond; ſuppoſing now its feet to be the fifteenth part of a line, it muſt make 500 ſteps in the ſpace of three inches; that is, it muſt ſhift its legs 500 times in a ſecond, or in the ordinary pulſation of an artery. Hiſt. Acad. Scienc. 1711. p. 23.
Dr. Hill, in his Hiſtory of Animals, has arranged *animalcules* under three claſſes: 1. Such as have no tails, nor any viſible limbs. 2. Thoſe which have tails, but no viſible limbs. And, 3. Thoſe which have viſible limbs: and each claſs is ſubdivided into ſeveral diſtinct *genera*. Hiſt. Anim. p. 1, &c.

ANIMALCULES, *viſible*, thoſe which may be diſcerned by the naked eye.
Such, e. gr. are mites, divers ſpecies of inſects, reptiles, and other vermin.

ANIMALCULES, *invisible*. Naturalists suppose another species or order of invisible *animalcules*, viz. such as escape the cognizance even of the best microscopes, and give many probable conjectures in relation to them. Reason and analogy give some support to the existence of infinite imperceptible *animalcules*.

The naked eye, some say, takes in from the elephant to the mite; but there commences a new order reserved only for the microscope, which comprehends all these from the mite, to those twenty-seven millions of times smaller; and this order cannot be yet said to be exhausted, if the microscope be not arrived at its last perfection.

ANIMALCULES, *microscopical*, those only discoverable by the help of a large magnifier. These, according to some, come under the denomination of *invisible animalcules*.

The excessive minuteness of these *animalcules* conceals them from the human eye unarmed. One of the wonders of the modern philosophy is, to have invented means for bringing creatures, to us so imperceptible, under our cognizance and inspection. An object a thousand times too little to be able to affect our sense, should seem to have been very safe. Yet we have extended our views over animals, to whom these would be mountains. In reality, most of our microscopical *animalcules* are of so small a magnitude, that through a lens, whose focal distance is the tenth part of an inch, they only appear as so many points; that is, their parts cannot be distinguished, so that they appear from the vertex of that lens under an angle not exceeding a minute. If we investigate the magnitude of such an object, it will be found nearly equal to $\frac{1}{1000}$ of an inch long. Supposing therefore these *animalcules* of a cubic figure, that is, of the same length, breadth, and thickness, their magnitude would be expressed by the cube of the fraction $\frac{1}{1000}$, that is, by the number $\frac{1}{1000000000}$, that is, so many parts of a square inch is each *animalcule* equal to. It is strictly true of these *animalcules*, that many thousands of them may dance on the point of a small needle.

These are in some liquors *animalcules* so small, that upon calculation the whole magnitude of the earth is not found large enough to be a third proportional to these minute floating animals, and the whales in the ocean.

With regard to their structure and economy, *animalcules* are found of divers sorts; some formed like fish, others reptile, others hexapedal, some horned, &c. In several kinds however small, it is easy to discover the form of their mouths, their proboscides, horns, &c. the motions of their hearts, lungs, and other parts.

Every *animalcule* being an organized body, how delicate and subtile soever the parts be, that are necessary to constitute it, and to preserve its vital actions? It is hard to conceive, how, in so narrow a compass, there should be contained a heart to be the fountain of life, muscles necessary to its motions, glands for the secretion of its fluids, stomach and bowels to digest its food, and other innumerable members, without which an *animalcule* cannot subsist. But since every one of these members is also an organical body, they must likewise have parts necessary to their actions. For they consist of fibres, membranes, coats, veins, arteries, nerves, and an almost infinite number of fine tubes like those, whose smallness seems to exceed all efforts of imagination. But there are some parts that ought always to be infinitely less than these, as the fluids that flow along these fine tubes, the blood, lymph, and animal spirits, whose subtilty, even in large animals, is incredible.

Leewenhoeck calculates that a thousand millions of *animalcula*, which are discovered in common water, are not altogether so large as a common grain of sand. This author, upon examining the male sperm of various animals, discovered in many infinite numbers of *animalcula*, not larger than those above mentioned. In the milt of a single cod-fish, there are more animals than there are men upon the whole earth; and yet a grain of sand is bigger than four millions of them. The white matter also, which sticks to the teeth, abounds with *animalcula* of various figures, to which vinegar is fatal; and it is known that vinegar consists *animalcules* in the shape of eels. In short, according to this author, there is scarce any thing which corrupts, without producing *animalcules*. *Animalcula* are said to be the cause of various disorders. The itch, from several experiments, is affirmed to be a disorder arising from the irritation of a species of *animalcula* found in the pustules of that ailment; whence the communication of it by contact from one to another is easily conceived, as also the reason of the cure being effected by cutaneous applications. On this foundation some have attributed the small-pox and measles, and infectious diseases; others the epilepsy, &c. to *animalcules*. Langius goes farther, and pretends to reduce all diseases in general to the same principle. A late writer at Paris, who assumed the title of an English physician, has done more. He not only accounts for all diseases, but for the operations of all medicines, from the hypothesis of *animalcules*. He has peculiar animals for every disease: scorbutic *animalcules*, podagrical *animalcules*, variolous *animalcules*, &c. all at his service. Journ. des Sçav. tom. lxxiii. p. 535. &c.

But as most discoveries in natural philosophy, have laid a foundation for the warm imaginations of some men to form visionary theories, to the great prejudice of real knowledge: so those relating to *animalcula* have been drawn in, however improperly, to support the most whimsical and chimerical systems.

See a variety of microscopical objects, *animal*, *vegetable*, and *mineral*, delineated in table, *Microscopical Objects and Discoveries*.

ANIMATE, ANIMATED, something endued with life, or a living soul.

In mechanics, *animate power* is used to denote a man, or brute; in contradistinction to *inanimate power*, as springs, weights, &c.

Naturalists and philosophers vary extremely in assigning the characters, subjects, and species of *animate* bodies. Some include flocks and stones in this rank; others exclude brutes themselves.

Some of the philosophers have held all nature to be *animated*; that the sun, the earth, the plants, rivers, trees, stones, &c. are so many animals; others, that the whole system is only one huge animal, informed with a soul, or *anima mundi*. Plato, in Timæo. Motholf. Polyh. Phil. lib. ii. p. 1. cap. 11.

ANIMATED *horse hairs*. See HAIR *hairs*.

ANIMATED is also used to denote a thing impregnated with vermin or ANIMALCULES.

In this sense the whole earth may seem to be *animated*; since in every part of it we meet with an infinite number of animals, either visible or invisible; they are found in air, water, earth, plants, and even in the hardest stones; and there is perhaps no animal known, which does not breed numbers of others in the different parts of its body.

ANIMATED *mercury*, among *Chemists*, signifies quicksilver, impregnated with some subtile and spirituous particles, so as to render it capable of growing hot when mingled with gold.

ANIMATED *needle*, a needle touched with the load-stone, or MAGNET.

ANIMATION, signifies the informing of an animal body with a soul.

Thus the *fœtus* of the womb is said to come to its *animation*, when it begins to act as a true animal: or after the female that bears it is *quick*, as the common way of expression is.

The learned are not agreed about the time when the female becomes quick; some compute it at forty days after conception; others fix it about the middle of the term of GESTATION.

T. Fienus Gardinius, Verde, Fort. Licetus, F. de Bonnonia, have written expressly on the *animation* of the FŒTUS; Fr. Zamellia on the *animation* of the SEED.

ANIMATION is also used by some *mechanical philosophers*, for the act of soliciting the descent of a body so as to give it continually new degrees of ACCELERATION.

ANIMATION is also used by *Alchemists* for the operation of fermenting a white foliated earth, with a kind of philosophical or celestial water or sulphur.

ANIMATION is also used in a moral or figurative sense, for the act of giving life and force to a discourse, or the like.

ANIMATION is also used by *hermetic philosophers*, to denote a certain state of perfection to which a body is brought by some appropriate process, in virtue whereof it becomes capable of producing some extraordinary phænomena.

ANIME, ANIME *& cancamum*, in *Pharmacy*, a kind of resin, wherof there are two kinds, the *western*, and *eastern*. This resin is the produce of an American tree, of which we have no certain account.

The *western* flows from an incision of a tree in New Spain, called *courbaril*; it is transparent, and of a colour like that of frankincense; its smell is very agreeable, and it easily consumes in the fire.

The eastern gum *anime* is distinguished into three kinds: the first is white; the second blackish, in smell like myrrh; the third pale, resinous, and dry.

Anime, according to Neumann, is a resin totally soluble in spirit of wine. It is called improperly *gum anime*. Other authors mention two substances, to which this name is given, one of which is brought from India, and is resinous; the other is brought from Brasil, and is similar in appearance and insolubility in spirit of wine, or in water, to the substance called *gum copal*. All the *anime* which is to be found in shops of druggists is of this latter kind; and if it does not proceed from the same tree as *gum copal*, is scarcely distinguishable from it.

The small tears are the purest; it has little taste, but an agreeable smell; it easily breaks between the teeth; but if chewed for some time it softens, and becomes adhesive. Laid on red-hot iron, it melts immediately, catches flame, and burns quickly away, leaving a little white ashes. In our shops, we have only the American sorts of this resin.

The best *gum anime* ought to be white, dry, friable, clean, of a good smell, that soon consumes when thrown into the fire; and that contains a great deal of oil and essential salt.

It is proper to discuss, to soften and dissipate cold humours, and is therefore good for the head-ach; to strengthen the brain they apply it to the top of the head, and perfume night-caps with it: it is also used for cleansing and cicatrising wounds.

Its principal use in medicine is external; in cold, painful, rheumatic, flatulent affections of the head, nerves, and joints: palsies, contractions, relaxations, contusions, &c. It is an ingredient in plasters and cerates, for these purposes.

ANIME, in *Heraldry*, is where the eyes, &c. of a rapacious creature are borne of a different colour from the rest of the creature.

The French say *animé*, the English *incensed*, the Latins *insensus*, of such or such a colour.

ANIMELLÆ, the glands under the ears, &c. called also *tonsillæ*.

ANIMETTA, in *Ecclesiastical Writers*, denotes the pall or cloth wherewith the cup is covered in the eucharist.

ANIMI *obliquium*. See LIPOTHYMIA and SWOONING.

ANINGA, in *Commerce*, a root growing in the Caribbee islands, of use in the refinement of sugar.

The decoction of this root is found a more certain, as well as more innocent means of clarifying sugar, than the sublimate and arsenic used for this purpose, before the discovery of the *aninga*.

ANISATUM, a name given to ANISE-SEED water.

ANJOU *cabbage*, in *Botany*. See CABBAGE.

ANISCALPTOR, in *Anatomy*, a muscle, otherwise called LATISSIMUS *dorsi*.

ANISE-SEED, a medicinal seed, produced by an umbelliferous plant of the same name, common in some gardens, of the *pentandria digynia* class.

The outer thin skin of the seeds of this plant contains an essential oil; and the kernel itself contains an inodorous expressible oil. It can only operate as a mere resinous substance, and may therefore be, not improperly, supplied by cheaper resins. Neumann, p. 397.

The plant which produces it, is a species of *pimpinella*, or *Burnet* SAXIFRAGE. It is a small tender plant, producing one stalk, seldom rising above two feet high. It flowers and seeds in July, the root dying every year after it has yielded seed. It is cultivated in Germany; but the best seed, which is a smaller sort, comes from Spain. The seed only is used, being one of the four greater hot seeds.

Anise-seed is carminative, expelling wind out of the stomach and bowels, both given at the mouth, and in clysters.

It is frequently put into children's victuals for the gripes and wind. It is very useful against cold affections of the lungs, difficulty of breathing, and asthma. Some commend it much to be taken frequently by nurses to increase their milk. It is often used as a corrector of the stronger purgative medicines. The oil distilled from the seed is used for the same purposes; and is often applied outwardly in carminative and anodyne liniments: particularly for the pleurisy, and other pains in the side.

ANISE-SEED, *star*, *anisum stellatum*, is a seed brought chiefly from Tartary; thus called from the affinity it bears in smell to the common *anise-seed*, and the star-like figure of its *capsula seminalis*.

It was first brought into Europe from the Philippine islands by an English mariner, named Thomas Candy. In his return from a voyage round the world in the year 1603.—The natives call it *aimor* and *ginge*; the Europeans sometimes FORNICULUM *Sinense*, or Chinese FENNEL; botanists, ANISUM *indicum*, ANISUM *peregrinum*, ANISUM *asiaticum Philippinarum insularum*, CARDAMOMUM *silvestre*, BADIANUM, &c.

Its virtues are of the same kind with those of the common *anise-seed*, only that it is sweeter, more grateful, penetrating, and aromatic. It is reputed a general cordial and strengthener.

The Chinese use it in the preparation of their tea; and after their example the Dutch also use it in this liquor, pretending it makes it more pleasant.

The wood is also imported into Europe, where it is employed in works of marquetry and mosaic. It is also called ANIL.

In distilling the anise-seed for the oil, there is procured a limpid water, called *anise-seed* water; which has much the same virtues with the oil.

See Neumann's chemical history of these plants, and his account of their chemical differences from each other, and of the peculiarities of the essential oil of *anise-seed*, in his Works, p. 393, & seq.

ANKER, ANCHOR, a liquid measure chiefly used at Amsterdam, &c.

The *anker* is the fourth part of the *aum*, and contains two *stekan*; each *stekan* consists of sixteen *mengles*; the *mengle* being equal to two Paris pints.

ANNALE, in some *Middle Age writers*, denotes a day held every year in commemoration of the dead.

In which sense *annale* amounts to the same with what is otherwise called *anniversarium*.

ANNALE is more particularly applied to the masses celebrated during the space of a year for the dead.

ANNALIS *actio*, in the *Civil Law*, denotes an action which may be put in practice any time within the year. In the like sense we meet with *annalis declaratio*, or *negotium*, *annalis officium*, &c.

ANNALIS *cursus*, in *Roman Antiquity*, the nail which the prætor, consul, or dictator, fixed every year in the wall of Jupiter's temple, on the ides of September, to shew the æra or number of years from the building of Rome. This custom was afterwards changed, and the years were reckoned by the CONSULS.

ANNALIS *exceptio*, a kind of privilege anciently granted the people of Italy, that whoever had made a contract could not be compelled to the performance, or payment of what had been agreed on within the year. Some extend this privilege so as to render it still more grievous, by computing the year exclusive of all holidays.

ANNALES *libri*, in the *Civil Law*, denote books wherein the acts, and proceedings of a whole year, were contained.

In which sense *annales* stand opposed to *semestres libri*, wherein the acts and constitutions of six months were contained.

ANNALES *laicæ*, denote a kind of woollen almanacs used among our ancestors, called also *runstocks* or *clogs*.

ANNALES, in *Middle Age Writers*, denote yearlings, or young cattle of a year old, or under two.

ANNALES also denote a kind of rent, or annual revenue.

ANNALS, an historical account of the affairs of a state, digested in the order of years.

The difference between *annals* and *history* is variously assigned by various authors. Some say that *history* is properly a recital of things which the author has seen, or been a by-stander to. What they build upon is, the etymology of the word; *history*, in the Greek, signifying the knowledge of things present, and, in effect, *seeing* properly signifies *to see*. On the contrary, *annals*, say they, relate to the transactions of others, and such as the writer never saw.

Of this opinion the great *annalist*, Tacitus himself, seems to have been; because the first part of his work, which treats of former times, he calls *annals*; but when he comes down to his own times, he changes his title, and calls it *history*.

According to Sempronius Asellio, *annals* are a bare relation of what passes each year; whereas *history* relates not only to the transactions themselves, but also the causes, motives, and springs of them. The *annalist* merely states his facts, but the historian reasons and descants on them.

Of this last opinion seems Cicero to be, when speaking of *annalists*, he says, *Usam diurnis tandem putant esse brevitatem, non exornatores rerum, sed earum narratores*. He adds, that *history*, in its original, was the composition of *annals*.

Cicero relates the origin of *annals*: to preserve the memory of transactions, the *pontifex maximus*, says he, wrote what passed each year; and exposed it on a table, in his own house, where every one was at liberty to read it.—This they called *annales maximi*; and this custom was kept up till the year of Rome 620.

Annales maximi consisted of eighty books. They were most of them destroyed in the burning of the city by the Gauls.

The like *annals* were kept from the earliest times by the Egyptians, Babylonians, Persians, Chaldeans, &c. Several other writers, in imitation of these, adopted this simple and naked way of relating facts; and were hence denominated *annalists*.—Such were Cato, Pictor, Fabius Antipater, &c.

The *Annals* of Grotius is a book finely written, and contains excellent materials. He is not so particular as Strada, but more profound, and comes much nearer to Tacitus.

ANNATES, ANNATA, in *Ecclesiastical Writers*, denotes a year's income, due anciently to the pope upon the death

of

of any bishop, abbot, or parish-priest; and to be paid by his successor.

Annates are also called from the Latin *annus*, *year*, because their rate is after the value of one year's purchase. *Annates* are the same with what of later days are called *primitiæ*, or *first-fruits*; with this only difference, that first fruits with us are paid to the king.

The invention of *annates* is ascribed, by a late writer, to Anthonin, bishop of Ephesus, who exacted from all bishops consecrated by him, a sum proportionate to the annual revenues of their sees. The council of Ephesus, held in 400, condemned this exaction, but not till Anthonin was dead. It was long after that *annates* got footing in the western church. The time when they were first introduced is very obscure; some refer it to the pontificate of Alexander IV. others to that of John XXII. who, in the first year of his papacy, obtained a year's revenue of all the cathedral benefices. Clement V. is said to have been the first pope who imposed *annates* on England. In 1309, during the schism of the antipopes, Benedict IX. exacted a year's revenue of all the archbishoprics, bishoprics, and abbies. But in the time of these popes, the *annates* were not fixed; and the clergy often refused to pay them. There were even popes who condemned *annates*; and the secular princes frequently objected to the payment of them, forbidding any money to be carried out of their dominions on this account.

Nic. de Clemangis, A. Massa, Gallesius, Campegius, and Fernandus Conchensis, have written expressly concerning *annates*.

Matthew Paris, in his History of England, for the year 740, relates, that the archbishop of Canterbury, in virtue of a grant or concession of the pope, received *annates* of all the benefices that became vacant in England. Before this time, among the laws of king Ina, who began his reign in the year 712, there is an order for the payment of them. But, in after-times, the holy see thought fit to take these away from the bishops and archbishops, and appropriate them to themselves. And from the popes the parliament under Henry VIII. took them, and gave them to the crown. 25 H. VIII. cap. 20. Finally queen Anne restored them to the church, by appropriating them to the augmentation of poor livings.

ANNEALING, or, as it is popularly called, *nealing*, see NEALING.

ANNEXATION, in a legal sense, the act of joining or uniting some less considerable thing to a greater.

ANNEXED, something joined to, or dependent on another. —Thus we say, such a farm, such an advowson, is *annexed* to such a see, such a manor, &c. Charles VIII. in the year 1486, *annexed* Provence to the crown of France.

ANNIENTED, or rather ANIENTED, a term sometimes used in law-books, in the sense of frustrated, or annulled.

It is formed of the verb *annentir*, *to bring to nothing*, or *to annihilate*.

ANNIHILATION, the act of reducing a substance into nothing; or of totally destroying and taking away its existence.

The word is compounded of *ad*, *to*, and *nihil*, *nothing*.

Annihilation stands opposed to creation: the one supposes something made out of nothing, the other something reduced to nothing.

All *annihilation* must be metaphysical or supernatural: bodies naturally admit of changes and alterations in their forms, but not of *annihilation*.

The ancient philosophers in effect denied all *annihilation* as well as creation, resolving all the changes in the world into new modifications, without supposing the production of any thing new, or destruction of the old.

By daily experience they saw compounds dissolved, and in their dissolution nothing perished, but their union or connection of parts; when in death the body and soul were separated, the man they held was gone, but the spirit remained in its original, the great soul of the world, and the body in its earth from whence it came; these were again wrought by nature into new compositions; and entered new states of being, which had no relation to the former.

According to some, nothing is so difficult as *annihilation*; it requires the infinite power of the Creator to effect it; some go farther, and seem to put it out of the power of God himself. According to others, nothing is so easy: existence is a state of violence; all things are continually endeavouring to return to their primitive nothing; it requires no power at all, say they, what is more, it requires an infinite power to prevent it.

The Talapoins hold it the supreme degree of happiness to have the soul totally *annihilated*, and freed from the burden and slavery of transmigration.

Some Christians maintain, that God will *annihilate* the souls of the damned, after a certain time of punishment; and this *annihilation*, they say, is the second death. Irenæus, according to M. du Pin, was of this opinion.

ANNIHILATION is also used, in *Political Arithmetic*: thus, when the capital stock of any public fund is reduced, so much is is reduced is said to be *annihilated*.

ANNI *nubiles*, among *Law Writers*, the legal age at which a maid becomes fit for marriage; which is at twelve years.

ANNIS *communibus*. See COMMUNIBUS.

ANNISEED. See ANISE-SEED.

ANNIVERSARY, is properly the yearly return of any remarkable day; anciently also called a *year-day*, or *mind-day*, that is, a memorial day.

The word is formed from *annus* and *verto*, on account of its returning every year.

ANNIVERSARY *days*, *dies anniversarii*, among our ancestors, more particularly denote those days wherein the martyrdoms of the saints were yearly celebrated in the church: as also days whereon, at every year's end, men were wont to provide for the souls of their deceased friends.—*Anniversaria dies vota repetitur defunctis, quantum minimus qualibet eorum causa habeatur in ambito*.—This was the reason given by Alcuinus in his divine offices.

ANNIVERSARY *winds*, are those which blow constantly at certain seasons of the year.

These are otherwise called Etesian winds: such are the TRADE *winds* and MONSOONS.

ANNIVERSARY is more particularly used for the *anniels*, or mass, rehearsed daily for the space of a year after a person's death.

ANNO *Domini*, q. d. in the *year of our Lord*; the computation of time from the EPOCHA of the incarnation of Jesus Christ.

ANNOISANCE, in *Law*. See NUISANCE.

ANNOMINATION, *annominatio*, in *Rhetoric*, the same with what is otherwise called PARONOMASIA.

ANNONA, in *History*. See *Cura d'Apia*.

ANNONA, in *Ancient Writers*, denotes victuals or provisions of corn for a year.

ANNONA *civilis*, the corn with which the granaries of cities were filled every year, for the subsistence of the citizens.

ANNONA *militaris*, the corn and other provision laid up in the magazines for the subsistence of an army during the campaign.

In ancient writers, we also meet with the phrases *singulæ annonæ*, *binæ annonæ*, *ternæ annonæ*; with regard to which Salmasius lays down this rule, that when *annona* occurs in the singular number, it includes not only corn, but flesh, wine, oil, and other necessaries; whereas, when it is used in the plural number, it imports bread alone. Aquinus is not contented with this rule, but instead of it advances another, viz. that *annona* in the singular number includes all kinds of provision; and, in the plural, imports so many rations or pittances of bread, flesh, and the like, distributed to so many men.

In this sense, soldiers are sometimes said to have risen to the benefit of five or more *annonæ*, that is, were entitled to so many rations. The emperors Arcadius and Honorius took great pains to reduce this profusion. Hence we read of *annonæ præfectus*, or *curator*, who superintended the sale of corn; *annonæ Augustæ*, who managed the military provisions; *annonarius*, an officer appointed to distribute provisions to the soldiers; and *annonarii*, denoting monopolists.

ANNONAGE, *annonagium*, a tax on corn.

ANNONAGE is much the same with *frumentage*.

ANNOTATION, a succinct commentary, or remark on a book, or writing; in order to clear up some passages, or to draw some induction, or consequence from it.

The word is formed of *ad*, and *nota*, *note*.

ANNOTATION, in *Medicine*, denotes the very beginning of a febrile paroxysm, when the patient grows chill, shudders, yawns, is drowsy, and the like.

It is also used for a symptom peculiar to hectic fevers, when the patient, an hour or two after eating, finds himself hot, his pulse quickened, &c. without any inducement.

ANNOTATION, in the *Civil Law*, denotes a kind of rescript or grant of the emperor, signed with his own hand. But this *annotation* differed from a mere rescript, and a pragmatic sanction.

It took its name from the note or subscription at the bottom, which was in red letters.

ANNOTTO, in *Commerce*, a kind of red dye, brought from the West Indies. This is otherwise denominated *anotta* and *arlate*.

It is procured from a red flower, produced by a shrub, which grows seven or eight feet high. This flower being thrown into tubs and cisterns, for the purpose, is treated much after the manner of INDIGO; and the red matter extracted by this infusion and fermentation from the pellicles of the seed.

The *annotto*, is now only prepared by the Spaniards. The English had formerly a manufacture at St. Angelo, now ruined. The drug is preferred by the dyers to indigo, and sold one fourth dearer. The double Gloucester cheese is coloured with this dye, not with marygolds.

To water it gives only a pale brownish yellow colour, and is very little soluble in that liquid. It readily dissolves in spirit of wine, and gives a bright orange colour; hence it is useful as an ingredient in varnishes and lacquers. Wool and silk boiled in a solution of it, by alkaline salts in water, acquire a deep, but not a durable orange dye; for though it is not changed by alum or acids, it is discharged by soaps, and destroyed by exposure to the air. It is said to be an antidote to the poisonous juice of *aconitum*, or *cocculus*.

See more of this artificial preparation, and the manner of making it, in Dr. Lewis's Commercium Phil. Tech. p. 224, &c. or Neumann's Works, p. 433, &c.

ANNUAL, something which returns every year, or closes at the end of the year.

Thus we say, an *annual*, or yearly feast, office, commission, rent, revenue, income, &c.

The *annual* motion of the earth, see proved under EARTH.

ANNUAL is sometimes used for the yearly rent, or income of a prebendary, &c.

In which sense *annuals* amounts to the same with what we otherwise call *annates*.

ANNUAL is also used, in *Ecclesiastical Writers*, to denote a yearly office, said for the soul of a person deceased on the day of his obit, or anniversary.

ANNUAL, in the Scottish *Law*, denotes any yearly revenue, or due, paid at certain times, either legal, as Martinmas and Whitsuntide, or conventional, as the parties agree.

In the acts of parliament, made by queen Mary, mention is made of *ground-annuels*, *fee-annuel*, and *top-annuel*, the meaning whereof is somewhat uncertain.

ANNUEL, *ground*, according to Skene, it, when the property of any land, whether built or unbuilt, is let or sold for a yearly rent, to be paid either to the proprietor, or to some chaplain, or priest.

ANNUEL, *fee*, is either when the mail or due is disposed of as a yeadly revenue; or, when the land or tenement is let in fee-farm hereditary, for a certain yearly sum to be paid under the denomination of *feuda firma*.

ANNUEL, *top*, is a due given or assigned out of houses or buildings, where the property remains with the former owner, only with the condition of his paying the said *annuel*.

ANNUEL *of Norway*, of which mention is made in the acts of parliament of king James the Third, was an *annuel* payment of a hundred marks sterling, which the kings of Scotland were obliged to pay to the kings of Norway, in satisfaction for some pretensions which the latter had to the Scottish kingdom, by virtue of a conveyance made thereof by Malcolm Canmore, who usurped the crown after his brother's decease.

This *annuel* was first established in 1266; in consideration whereof the Norwegians renounced all title to the succession of the isles of Scotland. It was paid till the year 1468, when the *annuel*, with all its arrears, was renounced in the contract of marriage between king James the Third, and Margaret daughter of Christian the First, king of Norway, Denmark, and Sweden. See Skene de Verb. Signif.

ANNUAL *argument of longitude*. See ARGUMENT.

ANNUAL *epacts*. See EPACTS.

ANNUAL *equation* of the mean motion of the sun and moon, and of the moon's apogee and nodes. See EQUATION.

ANNUAL *leaves*, are such leaves of plants, as come up afresh in the spring, and perish in winter. These stand opposed to *ever-greens*.

ANNUAL *plants*, called also simply *annuals*, are such as only live their year, i. e. come up in the spring, and die again in autumn; and accordingly are to be recruited every year.

ANNUAL *meadow-grass*, called in some parts of England Suffolk grass, is a species of grass, which makes the finest turf, and seems well adapted to dairy-farms.

ANNUALIA, yearly oblations anciently made by the relations of deceased persons on the day of their death.

This day they called *year-day*, &c. and on it masses were celebrated with great solemnity.

ANNUENTES *muscles*, in *Anatomy*, a pair of transverse muscles, at the root of the *vertebræ* of the back, called also by Sir. Cowper RECTI *interni minores*, because they lie under the RECTI *majores*.

They are called *annuentes*, from *annuere*, *to nod* or *to assent*, because they help to nod the head, or draw it directly downwards and forwards.

ANNUITIES, signify any interest of money, rents, or pensions, payable from time to time, at particular periods.

The most general division of *annuities* is into *annuities certain*, and *annuities*, the payment of which depends on a *contingency*; such, in particular, as the continuance of a life.

Annuities have been also divided into *annuities in possession* and *annuities in reversion*; the former meaning such as either have commenced, or are to commence *immediately*: and the latter such as will not commence till some particular future event has happened, or till some given period of time has expired.

Annuities may be farther considered, as *payable yearly*, *half-yearly*, or *quarterly*.

The present value of an *annuity* is that sum which, being improved at interest, will be sufficient to pay the *annuity*.

The present value of an *annuity certain*, payable yearly, and the first payment of which is to be made at the end of a year, is calculated in the following manner.

Let the *annuity* be supposed to be 100*l.* the present value of the first payment of it, or of a hundred pounds to be received a year hence, is that sum in hand, which being put out to interest, will increase to 100*l.* in a year. In like manner, the present value of the second payment, or of 100*l.* to be received two years hence, is that sum in hand, which being put out to interest, will increase to 100*l.* in two years. The like is true of the value of the 3d, 4th, 5th, &c. payments; and the sum of the values of all the payments is the value of the *annuity*.

Let the interest be supposed to be 4 *per cent.* The sum which improved at 4 *per cent.* interest for a year will produce 100*l.* at the end of the year, is the sum which bears the same proportion to 100*l.* that 100*l.* bears to 100*l.* with 4 added to it, that is, to 104*l.* Say then as 104*l.* is to 100*l.* so is 100*l.* to a fourth proportional, which will be 96*l.* 15*s.* or 96*l.* 3*l.* which is the value of the first payment.

Again, the sum which improved at 4 *per cent.* for two years will produce 100*l.* at the end of two years, is the sum which being now put out to interest, will produce in a year that sum which in one year more will produce 100*l.* that is, it is the sum that will produce in a year 96*l.* 3*l.* for it has been just shewn, that 96*l.* 3*l.* will in a year produce 100*l.* Say then as 104*l.* is to 100*l.* so is 96*l.* 3*l.* or 96*l.* 15*s.* to a fourth proportional, which will be 92*l.* 4*s.* or 92*l.* 9*s.* The value therefore of the second payment is 92*l.* 9*s.*

By proceeding in this method it will be found, that the values of the 3d, 4th, 5th, &c. payments, are £88. 8*s.* £85. 4*s.* £82. 19*s.* &c. The sum of 10, 20, or 100 of these values, is £811, £1359. £2450, respectively, or the present value of an *annuity* of 100*l.* payable for 10, 20, or 100 years. The sum of an infinite number of these values is 2500*l.* or the value of a perpetual *annuity* of 100*l.* at 4 *per cent.*

In general: suppose r to denote 1*l.* increased by its interest for a year, or the amount of 1*l.* in a year. Then $\frac{1}{r}$ will be the present value of 1*l.* to be received a year hence: for r is to 1 as 1 is to $\frac{1}{r}$. Also $\frac{1}{r^2}$ will be the value of 1*l.* to be received at the end of two years: for r is to 1, as $\frac{1}{r}$ is to $\frac{1}{r^2}$. In like manner, $\frac{1}{r^3}$, $\frac{1}{r^4}$, $\frac{1}{r^5}$, &c. will be the values of 1*l.* to be received at the end of 3, 4, 5, &c. years respectively; and $\frac{1}{r^n}$ will be the value of 1*l.* to be received at the end of n years. The value, therefore, of an *annuity* of 1*l.* for n year is $\frac{1}{r} + \frac{1}{r^2} + \frac{1}{r^3} + \frac{1}{r^4}$, &c. continued to n terms.

And the value of the perpetuity is the series continued *in infinitum*.

In order to find the sum of n terms of this series, put S equal to it, or $S = \frac{1}{r} + \frac{1}{r^2} + \frac{1}{r^3}$, &c. $+ \frac{1}{r^n}$.

Then,

$Sr = 1 + \frac{1}{r} + \frac{1}{r^2}$, &c. $+ \frac{1}{r^{n-1}}$. And

$Sr - 1 = \frac{1}{r} + \frac{1}{r^2}$, &c. $+ \frac{1}{r^{n-1}} = S - \frac{1}{r^n}$. Therefore

$Sr - 1 = S - \frac{1}{r^n}$. And consequently

$Sr - S = 1 - \frac{1}{r^n}$, and $S = \frac{1}{r-1} - \frac{1}{r^n} \times \frac{1}{r-1}$.

This is the general theorem for finding the sum of any given number of the first terms of the series $\frac{1}{r} + \frac{1}{r^2} + \frac{1}{r^3}$, &c. that is, for finding from the rate of interest given, the value of an *annuity certain*, payable yearly for any number of years. If the *annuity* is a perpetuity, it

is plain, that $\frac{1}{r^n}$, or the laſt term vaniſhing, $\frac{1}{r^n} \times \frac{1}{r-1}$, alſo vaniſhes; and, conſequently, that the expreſſion becomes $S = \frac{1}{r-1}$: from whence it reſults that the value of a perpetuity is always unity divided by the intereſt of 1*l.* for a year, or 100*l.* divided by the rate of intereſt.

The value of the *reverſion* of a perpetual *annuity*, to be entered upon after a particular term, is "the value of the *annuity* for the given term ſubtracted from the perpetuity." For example: the value of an *annuity* to be entered upon ten years hence is (reckoning intereſt at 4 *per cent.*) 8.111, i. e. the value of an *annuity* certain for ten years, ſubtracted from 25 the perpetuity, or 16.893 that is, 16 $\frac{7}{8}$ years purchaſe nearly. If the *annuity* is to be entered upon at the end of 18 years, the value will be 12.34.

If the reverſion is not a perpetuity, but an *annuity* certain for a given term, to be entered upon after another given term, the value will be the value of the perpetuity after both terms ſubtracted from the value of the perpetuity after the firſt term; that is, ſuppoſing the reverſion an *annuity* for 8 years, to be entered upon after 10 years, the value is (reckoning intereſt at 4 *per cent.*) the difference between 16.89, and 12.34, or 4.551, that is, 4 $\frac{1}{2}$ years purchaſe nearly.

Annuities certain differ in value, as they are made payable *yearly*, *half-yearly*, or *quarterly*. The following theorems, founded on the general theorem juſt given, will ſufficiently explain this ſubject. Let r denote, as before, 1*l.* increaſed by its intereſt for a year, and n the term or number of years during which any *annuity* is to be paid. Let P denote the perpetuity, or $\frac{1}{r-1}$: let y denote the value of an *annuity* for n years, ſuppoſing it paid *yearly*, or $\frac{1}{r-1} - \frac{1}{r-1} \times \frac{1}{r^n}$; b its value payable *half-yearly*; and q its value payable *quarterly*.

THEOREM I.

$$y = P - P \times \frac{1}{r^n}.$$

THEOREM II.

$$b = P - P \times \frac{1}{1 + \frac{r-1}{4}\Big|^{2n}}$$

THEOREM III.

$$q = P - P \times \frac{1}{1 + \frac{r-1}{4}\Big|^{4n}}$$

Example I.

Let the rate of intereſt be 4 *per cent.* and the term five years; and conſequently $r = 1.04$, $n = 5$, $P = 25$ and $\frac{1}{r^n}$, or the value of 1*l.* payable at the end of five years, .8219.

Then, $y = 25 - 25 \times .8219 = 4.4518$
$b = 25 - 25 \times .82034 = 4.4913$
$q = 25 - 25 \times .8196 = 4.5120$

Example II.

Let the rate of intereſt be the ſame, and the term for which the *annuity* is payable 25 years.

Then, $y = 15.6220$.
$b = 15.7818$.
$q = 15.7694$

Example III.

Intereſt being the ſame, let the term be 50 years.

Then, $y = 21.4822$
$b = 21.5491$
$q = 21.5820$

Example IV.

Intereſt being the ſame, let the term be 100 years.

Then, $y = 24.505$
$b = 24.523$
$q = 24.532$

TABLES for finding the values and amounts of ſums and *annuities* for any number of years not exceeding a hundred, at any rates of compound intereſt from 3 to 6 *per cent.*

TABLE I.

Shewing the amount of 1*l.* principal.

Years	At 3 per Cent.	3½ per Cent.	4 per Cent.	4½ per Cent.	5 per Cent.	6 per Cent.
1	1.030000	1.035000	1.040000	1.045000	1.050000	1.060000
2	1.060900	1.071225	1.081600	1.092025	1.102500	1.123600
3	1.092727	1.108718	1.124864	1.141166	1.157625	1.191016
4	1.125509	1.147523	1.169859	1.192519	1.215506	1.262477
5	1.159274	1.187686	1.216653	1.246182	1.276282	1.338226

Conſtruction of Table I.

The numbers in this table are the powers of 1*l.* increaſed by its intereſt for a year: that is, they are the powers of the *amount* of 1*l.* in a year, at the ſeveral rates of intereſt: ſuppoſing r to be that amount, they are r, r^2, r^3, r^4, &c.

Use. *To find the amount of any sum in any number of years, not exceeding* 100. Anſ. Oppoſite to the given number of years, and under the rate of intereſt, is the amount of 1*l.* in that time, which, multiplied by the given ſum, produces the required amount.

Examples.

1. What will 18*l.* amount to in 100 years at 4 *per cent. per ann.* compound intereſt? *Anſ.* 50.504948, multiplied by 10, is 505*l.* 1*s.*

2. What will 250*l.* amount to in 50 years, at 5 *per cent. per ann.* compound intereſt? *Anſ.* 11.467400, multiplied by 250, is 2886*l.* 17*s.*

TABLE II.

Shewing the principal that will amount to 1*l.* in any number of years not exceeding 100; or the preſent value of 1*l.* to be received at the end of any number of years not exceeding 100; diſcounting at any rate of compound intereſt from 3 to 6 *per cent.*

Years	At 3 per Cent.	3½ per Cent.	4 per Cent.	4½ per Cent.	5 per Cent.	6 per Cent.

Conſtruction of Table II.

The numbers in this table are the reciprocals of the correſponding numbers in the laſt, or the quotients of unity divided by thoſe numbers; that is $\frac{1}{r}$, $\frac{1}{r^2}$, $\frac{1}{r^3}$, $\frac{1}{r^4}$, &c. Suppoſing r to denote 1*l.* with its intereſt for a year.

Uſe. *To find what the preſent value is of any ſum payable in any future time: and alſo what principal will amount to a given ſum in any number of years.* Anſ. Oppoſite to the given number of years, and under the rate of intereſt, is the preſent value of 1*l.* to be received at the end of the given time, or the ſum that will amount to 1*l.* in that time, which, multiplied by the given ſum, produces the required value or principal.

1. What is the preſent value of 1000*l.* to be received 10 years hence, reckoning compound intereſt at 5 *per cent.*? *Anſ.* 613913, multiplied by 1000, is 613*l.* 18*s.* 6*d.* nearly.

2. What principal will amount to 1000*l.* in 10 years at 5 *per cent. per ann.* compound intereſt? *Anſ.* 613913, multiplied by 1000*l.* is 613*l.* 18*s.* 3*d.*

3. What ſum put out for 25 years at 4½ *per cent.* intereſt, will clear a debt of 4000*l.*? *Anſ.* 332731, multiplied by 4000, is 1330*l.* 18*s.* 6*d.*

TABLE III.

The preſent value of an *annuity* of 1*l.* for any number of years not exceeding 100, at any rate of compound intereſt from 3 to 6 *per cent.*

Years	At 3 per Cent.	3½ per Cent.	4 per Cent.	4½ per Cent.	5 per Cent.	6 per Cent.

Construction of Table III.

The 2d, 3d, 4th, &c. numbers in this table are the sums of the first 2, 3, 4, &c. numbers in the second; that is, the sums of $\frac{1}{r}+\frac{1}{r^2}$, of $\frac{1}{r}+\frac{1}{r^2}+\frac{1}{r^3}$, of $\frac{1}{r}+\frac{1}{r^2}+\frac{1}{r^3}+\frac{1}{r^4}$, &c.

Use. *To find the present worth of any annuity.* Multiply the present value opposite to the given number of years, and under the rate of interest, by the given annuity, and the product will be the answer. If the annuity is in reversion, multiply the number opposite to the time of reversion in the 2d table, the number opposite to the time of continuance in this table, and the annuity together: or, when the sum of both these times does not exceed 100, from the number in this table opposite to that sum take the number opposite to the reversionary time, and multiply the remainder by the annuity.

Examples.

1. What is the present value of an annuity of 50*l.* to continue 20 years at 4 *per cent.*? *Ans.* 13.590326, multiplied by 40, is 543*l.* 12*s.* nearly.

2. What is the present value of an annuity of 40*l.* to continue 20 years, but not to commence till the end of 5 years, at 4 *per cent.*? *Ans.* 18.21957, multiplied by 13.590326, multiplied by 40, is 494*l.* 15*s.* Or 4.631822, subtracted from 13.590326, and the remainder multiplied by 40, is 494*l.* 16*s.* as before.

TABLE IV.

The amount of an annuity of 1*l.* at compound interest.

Years	At 3 per Cent.	3½ per Cent.	4 per Cent.	4½ per Cent.	5 per Cent.	6 per Cent.

Construction of Table IV.

The first number of each column in this table, is unity. The second is the first number in this table added to the first number in the first table. The third number is the second in this table added to the second in the first table, and so on; that is, the numbers in this table are 1, $1+r$, $1+r+r^2$, $1+r+r^2+r^3$, &c.

Use. *To find the amount of an annuity forborn any number of years at compound interest.* Multiply the amount in the table opposite to the given number of years, and under the rate of interest, by the given annuity. The product is the answer.

Examples.

1. What will an annuity of 50*l.* amount to in 15 years, at 3 *per cent.* compound interest? *Ans.* 17.293780, multiplied by 50*l.* is 864*l.* 13*s.* 9*d.*

2. What is the amount of an annuity of 40*l.* in 28 years at 4 *per cent.*? *Ans.* 49.967675, multiplied by 40, is 1998*l.* nearly.

3. A person is possessed of a 1000*l.* principal, bearing 4 *per cent.* interest, and in order to increase his income, resolves to take out of his principal 20*l.* the first year, and afterwards as much more as will be necessary to make a constant income of 80*l. per ann.* In what time will he reduce his principal to nothing? *Ans.* In the same time that an *annuity* of 20*l.* would increase at 4 *per cent.* compound interest to 1000*l.* that is, in 28 years, by the preceding question.

The preceding observations, rules, and tables, contain all that is most important in the doctrine of *annuities certain*. He that would gain further information should consult Malcolm's Arithmetic, from page 395 to the end; Simpson's Algebra, fect. 18; Mr. Dodson's Mathematical Repository, p. 298, &c. Jones's Synopsis, chap. 1. Phil. Trans. vol. lvii. p. 109, &c.

For an explanation of the doctrine of *annuities on lives*, see ASSURANCE, COMPLEMENT, EXPECTATION, LIFE *Annuities*, REVERSIONS.

ANNULAR, ANNULARIS, something that relates to, or resembles a ring, by the Latins called *annulus*.

ANNULAR *cartilage*, or ANNULARIS, is the second cartilage of the *larynx*, being round, and investing the whole *larynx*; called also *cricoides*.

ANNULAR *ligament*, *ligamentum* ANNULARE, is a strong ligament, encompassing the CARPUS OF WAIST; after the manner of a bracelet.

Its use is to connect or bind the two bones of the arm together; and also to restrain the tendons of the several muscles of the hand and fingers, and prevent their flying out of their places, when in action.

The ligament of the TARSUS is also denominated *annular* ligament.

Add, that the sphincter muscle of the *anus* is also called *annularis*, or *annular* muscle, from its figure.

ANNULAR *process*, or *protuberance*, is a process of the MEDULLA *oblongata*: thus called by Dr. Willis, because it surrounds the same, much like a ring.

ANNULAR is also an epithet given the fourth finger, popularly called the *ring* FINGER.

ANNULATA, in *Zoology*. See COLUBER.

ANNULET, *little ring*, in *Heraldry*, is a DIFFERENCE or mark of distinction, which the fifth brother of any family ought to bear in his coat of arms.

Annulets are also part of the coat armour of several families. They were anciently reputed a mark of nobility and jurisdiction; it being the custom of prelates to receive their investiture *per baculum & annulum*.

ANNULETS, in *Architecture*, are small square members, in the Doric capital, placed under the quarter round. See *The Architect*, pl. 25. n. 17. They are also called *fillets*, *listels*, &c.

ANNULET is also used for a narrow flat moulding, common to other parts of a column; viz. the base, &c. as well as the capital; so called, because it encompasses the column around. In which sense *annulet* is frequently used for *taenia*, or list of a column.

ANNULUS, a species of the VOLUTA.

ANNULLING, the abolishing of an act, procedure, sentence, or the like.

The word is compounded of *ad* and *nullus*, *none*; q. d. *making none*.

ANNUNTIATE, ANNUNTIADA, or ANNUNTIATA, a denomination common to several orders, both religious and military; instituted with a view to the Annunciation.

The first religious order of this kind was instituted in 1232, by seven Florentine merchants. These are also called *Servites*, q. d. *Servantes*.

The second was a nunnery at Bourges, founded by Joan, queen of France, after her divorce from Lewis XII.

The third was also a nunnery, founded by a Genoese lady in 1600. The fourth was a friery, founded by cardinal Torrecremata, at Rome, in 1460; which last are grown so very rich, that they give fortunes of forty Roman crowns to above four hundred girls, on the anniversary of the Annunciation.

ANNUNCIATA, *or knights of the* ANNUNTIADA, was a military order, instituted in 1362, by Amadeus VI. duke of Savoy; in memory of Amadeus I. who defended the isle of Rhodes against the Turks.

It was at first called the order of the True Lovers Knots; in memory of a bracelet of hair presented to the founder by a lady; but upon the election of Amadeus VIII. to the pontificate, it changed its name for that of the *Annunciata*, in 1434. The great collar of the order, which the knights wear on public occasions, weighs 250 crowns of gold, and the following letters are engraven on it: *F. E. R. T.* signifying *Fortitudo ejus Rhodum tenuit*.

ANNUNCIATION, the tidings which the angel Gabriel brought to the Holy Virgin, of the mystery of the incarnation.

The word is compounded of *ad* and *nuntio*, *I declare*. The Greeks call it ευαγγελισμος, *glad tidings*; and ταξεις, *salutation*.

ANNUNCIATION is also the name of a feast, celebrated annually on the 25th of March, popularly called *Lady-day*, in commemoration of that wonderful event.

Some authors are of opinion, that the feast was originally solemnized in honour of our Saviour; and that the holding it in the name and honour of the Virgin is of a much later standing.

Several of the eastern churches celebrate the *Annunciation* at a different season from those of the West. The Syrians call it *Basserah*, q. d. *search*, *inquiry*: and mark it in the calendar for the first day of December. The Armenians hold it on the fifth of January: thus anticipating the time, to prevent its falling in Lent; but the Greeks make no scruple of celebrating the festival even in Lent.

The Jews also give the title *Annunciation* to part of the ceremony of their passover; viz. that, wherein they explain the origin and occasion of that solemnity. This explanation they call הגדה, *Haggada*, q. d. the *Annunciation*.

ANNUNCIATOR, in the *Greek Church*, an officer whose business is to give notice of the feasts, and holy days to be observed.

ANOCHUS, an imaginary name of a *medicine*, concerning which many fruitless conjectures have been made. The word occurs only in Gaza's translation of the account which Theophrastus has left us of the RUDNYNUS of those times. The author says, that the goats which eat the leaves and fruits of the *rudnynus* were killed by it, and that they died of a stoppage of the bowels, which he has expressed by the word ανοχος, derived from the verb ανεχω, which signifies a retention of the stools.

It is to be observed by the way, that the *rudnynus* of the Greeks could not be the same plant known at this time by that name, since the cattle eat our *rudnynus* or FUSANUS whenever they can get it, and that without any danger; but the descriptions of these plants in the ancient and modern authors shew also that they were very different.

ANOCTORON, in *Ecclesiastical Antiquity*, a name used by some writers for a church.

Anactora properly import Roman halls, divers of which were converted into churches.

In which sense *anactora* amount to much the same with BASILICÆ.

ANOCYSTI, in *Natural History*, the name of a class of the ECHINI *marini*, which have an aperture of the *anus* at the top of the shell.

Some of these approach to a hemispheric or spheroidal figure, others flatter, and in shape somewhat resembling a shield.

ANODUS is used by some *Chemical Writers* to denote a nutritious matter separated by the kidneys.

In this sense *anodus* stands contradistinguished from the superfluous part, that is the urine.

ANODYNE, in *Physic*, is understood of such remedies, as calm and assuage pain.

The word is derived from the privative α, and οδυνη, *dolor*, *to be in pain*.

Anodynes are of two kinds; the first proper, called also *paregorics*.

The second *spurious*, or improper, which rather stupefy than alleviate; acting only by inducing a stupor, drowsiness, or sleep.

These are more properly called *narcotics*, *hypnotics*, or *opiates*.

The true *anodynes* are applied externally to the part affected. Such, among the class of simples, are, the onion, lily, root of mallows, leaves of violets, elder, &c. Camphor is the best *anodyne* in nervous cases, and at the decline of fevers.

Anodynes should not be given without great caution, nor on a full stomach, nor in droppies. Hemlock procures ease and sleep, without causing that head-ach next morning, usually complained of after taking opium. If the pulse be strong a larger dose is safe; if weak, a less dose must be given.

We have also certain compound medicines in the shops, prepared with this intention, and called by this name. Such is the *anodyne balsam*, made of Castile soap, camphor, saffron, and spirit of wine, digested in a gentle heat. It is recommended not only for procuring ease in the most racking extremities of pain, but also for assisting in discharging the peccant matters that occasioned it.

This balsam is much the same with the modern *opodeldoc*.

A ready way of preparing an useful, safe, and efficacious *anodyne*, is as follows: take half an ounce of opium, dissolve it in a gentle heat in three ounces of water, strain the solution, and evaporate it to a dry substance. Grind this to powder in a glass mortar with twice the quantity of

of lead-sugar, and you have an excellent preparation of opium, to be given three or four grains for a dose. Shaw's Lect. p. 133.

The dissolving the opium thus in water, we see will not only of its gross and foul parts, but also of its virulous, which are found much more pernicious than the rest; and by dividing its parts afterwards with sugar, the medicine is rendered more uniform, resoluble, and miscible with animal fluids.

But however opium is prepared, it still must be acknowledged that it retains qualities that make it little less than a poison in a very large dose; whence it were much to be wished something could be found that would be more innocent, and yet answer the same purpose. Add this camphire and nitre will do on many, though not on all occasions.

ANOINTED. See CHRIST and MESSIAH.

ANOINTERS, a religious sect in some parts of England, so called from the ceremony they used in anointing all persons before they admitted them into their church. They founded their opinion of anointing upon the fifth of James, verses 14 and 15. See Plott's Oxfordsh. 268.

ANOLE, in *Zoology*, the name of a species of lizard common in the West Indies, about houses and plantations. It is the size of the common lizard of Europe, but its head is longer, its skin of a yellowish colour, and its back variegated with green, blue, and grey lines running from the neck to the tail. They creep into holes for the night, and there make a continual and very disagreeable noise, in the day time they are always in motion.

ANOLYMPIADES, in *Antiquity*, a name given by the Eleans to those Olympic games, which had been celebrated under the direction of the Pisæans and Arcadians. The Eleans claimed the sole right of managing the Olympic games, in which they sometimes met with competitors. The hundred and fourth Olympiad was celebrated by order of the Arcadians, by whom the Eleans were at that time reduced very low; this, as well as those managed by the inhabitants of Pisa, they called unlawful Olympiads, and left them out of their annals, wherein the names of the victors, and other occurrences, were registered. Potter, Arch. Græc.

ANOMALISTICAL *year*, in *Astronomy*, called also *periodical year*, is the space of time wherein the earth passes through her orbit.

The *anomalistical*, or common year, is somewhat greater than the tropical year; by reason of the PRECESSION of the equinox.

ANOMALOUS, *irregular*, something that deviates from the ordinary rule and method of other things of the same kind.

The word is not compounded of the privative a and νομος, *lex*, as is usually imagined: for whence, on such supposition, should the last syllable *al*, arise? But it comes from the Greek ανωμαλος, *aureos, rugis, irregular*, formed of the privative a and ομαλος, *planus, æquus*.

ANOMALOUS *verbs*, in *Grammar*, are such as are irregular in their conjugations; deviating from the rules or formulas observed by others.

There are *anomalous* verbs, or irregular inflexions of verbs, in all languages. In the English, all the irregularity in our *anomalous* verbs lies in the formation of the preter tense, and passive participle; though this only holds of the native Teutonic or Saxon words, and not of the foreign words, borrowed from the Latin, French, &c.

The principal irregularity arises from the quickness of our pronunciation, whereby we change the consonant *d* into *t*, putting off the regular ending *ed*.

Thus for *mend*, we write *ment* or *mend*; for *dwelled*, *dwelt*, or *dwell'd*; for *snatched*, *snatch'd*, &c. But this properly is rather of the nature of a contraction than an irregularity; and is complained of by some of our polite writers as an abuse, to the disadvantage of our language, tending to disfigure it, and turn a tenth part of our smoothest words into clusters of consonants; which is the more intolerable, because our want of vowels has been the general complaint of the best writers.

Another irregularity relates to the preter tense, and passive participle. Thus *grow*, if it were regular, or formed according to the rule, would make *growed*, in the preter tense, and the passive participle; whereas it makes *grew* in the preter tense, and *grown* in the passive participle.

ANOMALY, in *Grammar*, denotes an irregularity in the accidents of a word, whereby it deviates from the common rules of paradigm whereby other words of the like kind are governed.

ANOMALY, in *Astronomy*, is the distance of a planet from the APHELION or APOGEE; or it is an irregularity in the motion of a planet, whereby it deviates from the aphelion or apogee.

Kepler distinguishes three kinds of these *anomalies*; *mean*, *eccentric*, and *true*.

ANOMALY, *mean* or *simple*, in the *Ancient Astronomy*, is the distance of a planet's mean place from the apogee.

In the modern astronomy, it is the time wherein the planet moves from its aphelion A, to the mean place or point of its orbit I. (*Tab. Astronomy, fig.* 1.)

Hence, as the area, or the angle, of the elliptic area ASI, is proportional to the time wherein the planet describes the arch AI; that area may represent the mean *anomaly*. Or thus, the area SKA, found by drawing a line LK, through the planet's place, perpendicular to the line of the aphsides PA, till it cuts the circle DA, and drawing the line SK, may represent the mean *anomaly*; for this area is every where proportional to the former area SIA, as is demonstrated by Dr. Gregory. Phil. Trans. N° 247.

ANOMALY *of the excentre*, or *of the centre*, in the *New Astronomy*, is an arch of the excentric circle AK (*fig.* 2.) included between the aphelium A, and a right line KI, drawn through the centre of the planet I, perpendicularly to the line of the apsides AP. See ECCENTRIC.

In the ancient *Astronomy*, it is an arch of the zodiac, terminated by the line of the apsides, and the line of the mean motion of the centre. See the methods of finding the *anomaly of the excentric*, in Phil. Trans. N° 247.

ANOMALY, *true* or *equated*, is the angle at the sun ASI, which a planet's distance from the aphelium AI, appears under; or it is the angle or area, taken proportional to the time in which the planet moves from the mean place I, to its aphelion A.

And hence, in the sun's motion, it will be the distance of his true place from the apogee.

The true *anomaly* being given, the mean one is easily found; but less difficult to find the true *anomaly* from the mean one given.

The geometrical methods of Wallis and Newton, by the protracted cycloid, are not fit for calculation; nor yet the method of series, as being too laborious. Hence astronomers are forced to have recourse to approximations. Ward, in his Astronomia Geometrica, takes the angle ABI, at the focus where the sun is not, for the mean *anomaly*; which will nearly represent it, if the orbit of the planet be not very excentric: and thus easily solves the problem. But this method does not hold of the orbit of Mars, as being more excentric than those of the other planets.

Sir Isaac Newton shews how to effect even this; and when his correction is made, and the problem solved according to Ward's hypothesis, he thence affirms, that, even in the orbit of Mars, there will scarce ever be an error of above a second.

ANOMOEANS, ANOMOEI, in *Church History*, a sect of Christians who denied any similitude between the essence of the Father and that of the Son. See TRINITY.

The word is composed of the privative a and ομοιος, *similar, resembling*; q. d. *different, dissimilar*.

Anomœans was the name whereby the pure Arians were distinguished in the fourth century, because they not only denied the consubstantiality of the Word, but even asserted, that he was of a nature different from that of the Father; in contradistinction to the Semi-Arians, who indeed denied the consubstantiality of the Word, but who owned, at the same time, that he was like the Father.

ANOMIA, a genus of worms, ranged by Linnæus under the order of *testacea*; including twenty-seven species.

ANOMORHOMBOIDIA, in *Natural History*, the name of a genus of spars.

The word is derived from ανωμαλος, *irregular*, and ρομβος, a *rhomboidal figure*.

The bodies of this genus are pellucid crystalline spars of no determinate regular external form, but always breaking into regularly rhomboidal masses; easily fissile, and composed of plates running both horizontally and perpendicularly through the masses, but cleaving more readily and evenly in an horizontal than in a perpendicular direction; the plates being ever composed of irregular arrangements of rhomboidal concretions.

Of this genus there are five known species, which have all, in some degree, the double refraction of the Iceland crystal.

ANONIS, in *Botany*, See REST-HARROW.

ANONYMOS, See GNEOMON.

ANONYMOUS, something that is nameless, or to which no name is affixed.

It is formed of the privative a, and ονυμα, *name*.

The term is chiefly applied to books which do not express their author's name, and to authors whose names are unknown. Decker, advocate of the imperial chamber at Spires, and Placcius of Hamburgh, have given catalogues of *anonymous* books. Bate, Gotth. Struvius and others of learned men who have endeavoured to investigate the authors of *anonymous* books.

ANONYMOUS, in *Anatomy*, a name sometimes given to parts newly discovered, or first taken notice of.

ANONYMOUS is also an appellation anciently given to the second

second cartilage of the throat, by later writers called *cricoides*, or *annulariformis*.

ANONYMOUS, in *Commerce*. Partnerships in trade in France are styled *anonymous*, when they are not carried on under any particular name, but wherein each of the partners trades visibly on his own account, and in his own name; after which all the partners give one another an account of their profit or loss in trade. These sorts of partnerships are concealed, and known only to the parties themselves.

ANONYMOUS *partnerships in trade*, are also in France such, wherein persons of fortune and quality deposit sums of money, in order to share of the profits and loss. To this end those who furnish the capital have no trouble in carrying on the trade, but do their names appear to be any way interested therein.

ANONYMOUS, in *Law*, the sending *anonymous* letters demanding money, &c. is felony by the Black Act, 9 Geo. I. cap. 22.

ANOREXY, ANOREXIA, in *Medicine*, an inappetency, or loss of appetite.

The word is compounded of the privative *a*, and *orexis*, *appetite*, *I desire*.

Anorexia is properly a longer continuance than is natural without a desire to eat.

If the thought, or the sight, of proper food create a sickness in the stomach, or a tendency to vomit, the case is more properly called a *nausea*.

Anorexia is chiefly considered as a symptom of some other disorder, from which the curative indications are to be taken, and afterwards themselves used.

ANOTTA, in *Botany*. See BIXA.

ANPITS, in the *Saxon Laws*, or some *Middle Age Writers*, denotes a breast-work, answering to what is otherwise called *herlarum*.

ANSÆ, ANSES, in *Astronomy*, those apparently prominent parts of the planet Saturn's ring, discovered in its opening, and appearing like handles to the body of that planet. The Latin word literally signifies *handles*, or *ears*, of divers utensils.

ANSARIUM, in the *Civil Law*, a duty imposed on all provisions carried in vessels with *ansæ*. This was otherwise called *anfarium*, and the collectors of it *anfarii*.

ANSATUM *ferrum*, according to some, denotes a dart or javelin, with an *ansa* fastened to it.

Others rather take the *ansa* of a javelin to be those two eminences about the middle of the *cuspis*, or point, which hinders the weapon from passing through the whole body.

ANSCOTE, in our *Ancient Law-Books*, the same with *ambitus*. See SCOT.

ANSEL *weight*. See AUMEL *Weight*.

ANSELM's *art*. See ART.

ANSER, in *Astronomy*, a small star, of the fifth or sixth magnitude, in the Milky Way, between the Swan and Eagle; first brought into order by Hevelius.

ANSER *Americanus*. See TOUCAN.

ANSERES comprehends one of the six orders of birds in the Linnæan system, distinguished by a smooth beak, covered with a skin, globose at the tale, and enlarged towards the apex; the jaw is denticulated, and the tongue fleshy; the feet are formed for swimming, having three toes connected by a membrane; the legs are thick and shorty the body is bulky, and covered with a thin skin and feathers. This order of birds is analogous to the *bellua*, in the class of *mammalia*. See GOOSE.

ANSES. See ANSÆ.

ANSPESSADES, or LANSPESSADES, a kind of inferior officers in the foot, below the corporals, and yet above the common centinels.

The word is formed of the Italian *lanciè spezzate*, q. d. *broken lances*; which was occasioned hence, that they were originally disbanded *gendarmes*, who, for want of other subsistence, fell for a place of some distinction in the infantry.

There are usually four or five in each company.

ANSWER, in a law-sense, *&c.* See REJOINDER.

ANT, *formica*, a genus of insects belonging to the order of *hymenoptera*, famous in *Natural History*. It is distinguished from the other genera of this order, by having an erect *squama*, or scaly body, placed between the thorax and abdomen. The male and female *ants* have wings, but the neutral have none. The sting of the female and neutral is concealed. There are five species common in England. 1. The hill *ant*, called also the great *hymenopterous*, or horse *ant*. 2. The jet *ant*. 3. The red *ant*. 4. The common yellow *ant*. 5. The small black *ant*. These several species possess, in common, a double jaw, a mouth, a pair of articulated antennæ, or horns, two eyes, and a neck, which connects the head with the breast. They are visibly distinguished with respect to both their colour and size. The hill *ant* take their name from their usual habitations, which are the sunny banks of hills, for the advantage of bringing their young to maturity. They are also fond of the decayed roots of trees, where they may with greater ease form their apartments. These are considerably larger than any of the rest; their head and body are fine brown, and their breast a faint red. The jet and red *ants* are of equal size, and they derive their name from their respective colours. The former usually nest at the bottom of old trees, and the latter under broad stones, and other rubbish. The common yellow and small black *ants* are about half as big as the jet or red *ants*; and most frequently chuse their habitation in those eminences cast up by moles, which, on account of the size they make of them, are called *ant-hills*. Nevertheless, *ants* of different species may take up their residence in any of the situations above mentioned, but they never associate with each other. *Ants* of a particular species never go into any nest but their own; the consequence of an attempt of this kind would be his Bane-death; even when pursued, they will never fly into another hole for shelter, except in the last extremity, and will sometimes rather suffer themselves to be taken. They do not seem to know what hospitality is. Sir Edmund King affures us, that if a red *ant* be put into a black *ant's* bank, war immediately enfues; the black seize their prey, and never leave pinching him on the head with their forceps, or claws, till they have destroyed him; after which they drag the dead body out of the verge of the bank. If a black *ant* be put into a red *ant's* bank, he immediately feels his fafety by flight. Phil. Transf. N° 23. or Abr. vol. ii. p. 189.

Ants of each species form feparate colonies; and they adapt the fituation and ftructure of their cells to the feasons of the year. In winter they dig deep, and in fummer rife nearer to the furface of the ground. Their fubterraneous habitation is divided into a number of different cells of an oval figure, all communicating with one another by circular and fmooth paffages, for the convenience of draining off the water, and furnifhing entries into their different apartments. The hill and jet *ants*, being protected by the trees under which they lodge, are not at the trouble of digging thefe channels for carrying off the water. They take great care in keeping their apartments clean, and remove any of their colony that dies out of their fettlement. Pliny relates, that the *ants* of his country buried their dead; but that circumftance has not been obferved among us.

Each colony is ufually compofed of a large female, which Mr. Gould, for diftinction fake, calls the queen, and various companies of workers. Befide thefe, they are joined by a number of winged *ants*, which are commonly known by the name of *ant-flies*. The common *ants* are of neither fex, but feem entirely deftined to take care of the young which are committed by the queen to their protection. The queen is the mother of the whole brood, and is diftinguifhed from them by her fuperior fize and particular colour, as well as by the refpect that is fhewn her by her fubjects. The colour of the queen is different in the feveral colonies. Her head is furnifhed like thofe of the common *ants*. She has likewife three bald fpecks on her front, placed in a triangular form, which ferve to her eyes of the fame ftructure with thofe of the fpider. The queen of the red colony is provided with a fting, in which fhe differs from thofe of the other fpecies. The queen, as foon as fhe has depofited a parcel of her eggs, leaves them to the affection and care of the workers, and withdraws to a feparate apartment. Two or three yellow queens have been fometimes found in the fame colony; and in the red colony there are feldom fewer than two; and in this refpect they differ from the hill and fmall black *ant*, which have only one.

Mr. Gould made a great number of experiments and obfervations in order to evince this fact, that the queen alone fupplies every particular colony with its inhabitants; and he adds, that the firft three different forts of eggs, the male, female, and neuter. The two firft are depofited in the fpring, and the laft in July and Auguft. When the queen has furnifhed an apartment with eggs, the common *ants* difcover the greateft tendernefs and care in breeding over them, and preferving them from moifture. After the eggs have continued for fome time in this ftate, cherifhed and protected by the workers, they begin to lofe their tranfparency; they are covered over with a number of fmall hairs; they are extended with feveral rings, and appear in the fhape of vermicles, or little worms. In procefs of time a black fpeck is obfervable in them, which Mr. Lewenhoeck, and Mr. Gould, take to be their digefted food. Thefe *ant-vermicles* grow very ſlowly in the firſt ſummer; and in the fucceeding winter they ſeem not to increaſe at all: but from April to June in the ſecond year they grow very faſt,

fall, and are prepared for another change into the nymph, or aurelia state. They are previously transferred by the workers to a proper situation near the surface of the colony, where they weave in the manner of silk-worms, and infold themselves in a kind of silken tissue; and in this state they are vulgarly denominated *ant-eggs*. The process from this state to that of *ants* is gradual and slow, and not usually completed in less than a month. But the manner of their transformation cannot be accurately observed, because they will not arrive, like most other aurelias, to maturity under glasses. The female sorelles are generally the first which transform, and are those that make their appearance in the shape of large flies. These give birth to new colonies, and intitle themselves to the dignity of queens. The male, or small *ant-flies*, appear next, and early enough to be contemporary with the others. Last of all, the neutral aurelia change into common *ants*, or workers, without wings, but not till moult, or all the flies, have forsook the settlement. The male *ants* are furnished with two or more small hooks near their extremities, like those of other insects of the fly-kind, which are the external parts of generation, whereby they fasten to the females; they have likewise a triangle of eyes in the same position with those of the large flies. These *ant-flies*, both large and small, are of very short duration; they seldom continue above three weeks. Those of the female kind, which are not necessary for the propagation of new colonies, together with the male, are destroyed either by a worm, which is generated in their bodies, or by furnishing a repast for other creatures.

The labouring *ants* are incessantly employed by night as well as by day, in preparing and carrying materials for their respective cells. The house *ants* make their nests of large quantities of sticks, straws, and fragments of leaves, which they place together in heaps, for the convenience of suddenly sheltering themselves on the approach of an enemy, as well as for promoting the maturity of the young nymphs. The common *ants* build only with small pieces of dry earth, which, after it is cut by their double saw, they intrull with blades of grass, and form into conical mounts about half a foot high, for the purpose of favouring the growth of the vermicles, and the transformation of the nymphs. Another part of the employment of the labouring *ants* respects the young; in every stage of their progression from eggs to perfect *ants*, the workers remove them every day into different parts of the colony, in the morning they transfer them to cells nearer the surface, for the benefit of the sun's influence, and in the evening to such as are more remote and guarded. They are likewise employed in collecting the juices of various fruits and insects for the nutriment of the vermicles; which they convey full into their own alvus, and then into the bodies of the vermicles, or maggots. Another part of their employment is that of dismantling the nymphs at the time of their transformation.

It has been mentioned by many naturalists, ancient and modern, from the time of Solomon to our own, that *ants* provide for winter; that accordingly they lay up magazines or granaries of corn, and other provisions; and that to prevent the sprouting of corn, they cut off all the buds before they lay it up; and in order to preserve it from rotting, it has been said, that they bring it out of their hoards in the middle of the day, and spread it on dry earth at the entrance of their nests, for the benefit of the air and sun. But this theory has been contradicted by later experiments and observations. Leewenhoeck is of opinion, that they do not eat at all in the winter, but spend that season like dormice, and many other sorts of animals, in a state of sleep; and that the provision they collect together seems intended for present use; and not so much for themselves as for their young. Mr. Gould confirms this opinion by a great variety of observations. He never could discover any reservoirs of corn, or of other aliment; and for farther satisfaction, he placed in several flower-pots, and other convenient receptacles, different colonies of yellow, small black, red, and hill *ants*, with their respective queens, attendants, and vermicles. They continued in this situation through the whole summer, autumn, and winter; they carried on the operations as in other settlements; formed their apartments, nourished their young, and brought them to perfection. Had it been their usual custom, he presumes that they should have laid up their provisions; but upon gradually removing the earth, and searching the lodgments, there was no appearance of magazines, corn, or any sort of collected food; and he concludes from a number of trials, that English *ants* have no storehouse for their corn, nor require any other food in the winter than water. In excess of cold, he says, they are half benumbed; and at other times they are contented to regale themselves with the common moisture of the earth. However, he intimates, that the customs of foreign *ants* may, in this and various instances, deviate from ours: though the contrary opinion has never been clearly and demonstratively ascertained.

In 1749, M. Carre published a Dissertation on the Policy of *Ants*, the result of above thirty years observation; in which he concurs with Mr. Gould in rejecting the whole theory of their forecast and storehouses as fabulous; and M. Soriniere likewise, after having paid particular attention to the oeconomy of *ants* for twenty years, adopts the same opinion.

It has been a vulgar notion, that *ants* bite; but they have not strength enough in their jaws and teeth to penetrate the cuticula. However the red *ants* have a sting in the posterior part of their bodies, which they thrust out, and plunge into any thing that offends them, by a kind of vibratory motion, which injects an acrid, corrosive sort of liquor, that occasions a smart but momentary pain, and raises an inflammation. The other *ants* have no sting.

Ants furnish sustenance for many species of animals; and particularly for young pheasants and partridges; if the latter be bred under a hen, and supplied with *ant*-hills and fresh water, and at proper intervals a mixture of millepedes and ear-wigs, they will not fail to come to maturity. *Ants* also supply a resin, an oil, and an acid, which have been deemed of considerable service in the art of physic.

These small animals are very injurious to gardens and pasture lands; as well by feeding on the fruit as by making hills for their habitation. In the hotter countries, as Italy, Spain, and the West Indies, *ants* are the great pest of the fields and plantations; and no method has yet been discovered for effectually destroying them. Trees may be preserved from them by incompassing the stem for four fingers breadth, with a roll of wool, newly pulled from the sheep's belly; or by laying saw-dust all around the stump of in. Some smear the tree with tar, which has the same effect, but then tar is prejudicial to the tree. In Dr. Hawkesworth's Account of the Voyages for making Discoveries in the Southern Hemisphere, mention is frequently made of black, white, and green *ants*; their stings were sharper than those of the common biting *ant*. The white *ants* resembled those of the East Indies, which are the most pernicious of all animals; and their nests were of a pyramidal form, from a few inches to six feet high. See TERMES. Professor Kalm, in his North-American Travels, speaks of a small *ant* in Pensylvania, whose length is one geometrical line, and colour either black, or dark-red. These live in swarms under ground, and in walls: and as Mr. Franklin apprehends, have a peculiar method of communicating their thoughts and desires to one another. Neumann observes, that *ants* may be made use of for obtaining skeletons of small animals, such as mice, frogs, &c. exquisitely beautiful and perfect; far surpassing any thing that can be executed by artificial anatomy. The subject is for this purpose to be inclosed in a wooden box, and properly distended, to prevent the parts from collapsing, or being crushed together by the earth. The box is to be penetrated with a number of holes, through which the *ants* will presently find their way.

See more on this subject in Swammerdam's Bib. Nat. vol. i. Ray's Hist. of Insects, p. 70. Bibl. Univ. t. ix. Melange's D'Hist. Nat. t. i. Gould's Account of English *Ants*, 12mo. 1747, *passim*.

ANT-*bear*. See ANT-*eaters*.

ANT-*eater*, *Myrmecophaga*, the name given by Linnæus to the creature called by others, the *tamandua-guira*, or ant-bear.

The name is derived from the Greek μυρμηξ, an *ant*, and φαγω, *to eat*. The creature is so called, because his food is *ants*, which he eats by thrusting his long tongue into nests, and drawing it back into his mouth, when covered with them.

This, in the Linnæan system of Zoology, is a distinct genus of animals, the characters of which are, that they have no teeth; have feet formed, not for climbing, but walking, and have eight abdominal paps, six on the belly, and two on the breast.

There are two species, one of them covered with hair, the other with scales. The first is called by Linnæus *myrmecophaga*, and the other *manis*; of this latter species there are two sorts; the first, having five toes on both hind and fore feet, is called *manis pentadactyla*; the other with four toes, is called *manis tetradactyla*.

ANT-*eggs* is a name popularly given to a kind of little white balls, found in the banks or nests of *ants*, ordinarily supposed to be the ova of this insect.

Sir Ed. King opened several of those vulgarly reputed eggs, in some of which he found only a maggot in the circumstances as above described; while in another the maggot had begun to put on the shape of an *ant* about

the head, having two little yellow specks, where the eyes were to be. And in others, a farther progress was observed, the included maggot being furnished with every thing to complete the shape of an *ant*, but wholly transparent, the eyes only excepted, which were as black as bugles. Lastly, in others, he took out every way perfect and complete ants, which immediately crept about among the rest.

The true *antcreps* are the white substance which upon opening their hillocks appears to the eye like the scatterings of fine white sugar, or salt, but very soft, and tender. Examined by a microscope, it is found to consist of several pure white appearances in distinct membranes, all figured like the lesser sort of bird eggs, and as clear as a fish's bladder.

The same substance is found in the bodies of the ants themselves.—This spawn, when emitted, they lie in multitudes on, to brood; till in some time it is turned into little vermicles, as small as mites, commonly called *ant-eggs*.

ANT-*hills* are little hillocks of earth, which the *ants* throw up for their habitation and the breeding of their young. They are a very great mischief to dry pastures, not only by wasting so much land as they cover, but by hindering the scythe in mowing the grass, and yielding a poor hungry food, pernicious to cattle.

The manner of destroying them is to cut them into four parts from the top, and then dig into them so deep as to take out the nest below, so deep that when the turf is laid down again it may lie somewhat lower than the level of the rest of the land; by this means it will be wetter than the rest of the land; and this will prevent the *ants* from returning to the same place, which otherwise they would certainly do. The earth that is taken out must be scattered to as great a distance every way as may be, otherwise they will collect it together, and make another hill just by. Some collect the hills together in heaps, and burn them for manure.

The proper time for doing this is winter: and if the places be left open, the frost and rains of that time of the year will destroy the nest; but in this case care must be taken, that they are covered up early enough in the spring, otherwise they will be less fertile in grass than the other places. Human dung has been found a more effectual remedy than any other.

Ants are likewise destroyed by scattering a good quantity of unslacked lime about their hills. Some make use of quicksilver, as a general poison to insects.

ANT-*lion*. See FORMICA-*leo*.

ANT, *mash*, the name given, by Linné and Ray, to a particular species of *ant*, which is of the number of the perfumed insects. It is found on dry banks, and is so much smaller than the common *ant*, that it needs no other distinction. Those of this species which are without wings are of a yellowish colour, and when bruised or crushed emit a sharp and acid smell, as the common *ant* does; but those which have wings are coal-black, and these, instead of the sour smell of the others, emit a perfume not to be endured for its strength. The smell of all the perfumed insects goes off in burning; and these little creatures, after they have been dead one day some time, are found to smell less strongly, but much more agreeably. Phil. Trans. N° 77. or Abr. vol. ii. p. 792.

ANT, *wolving*. At Paramaribo, a Dutch colony in the province of Surinam, there are *ants*, which the Portuguese call *visiting-ants*; they march in troops; and as they appear, all the cupboards and chests of drawers we have open, which they clear of rats, mice, and a peculiar sort of insect in that country called *cacarelas*, and of other noxious animals. If any one chance to molest them, they fall upon him, and tear in pieces his stockings and shoes. These visits are rare: and they do not sometimes appear for three years. Tempelman's Obs. vol. i. p. 30.

ANTA, in the *Ancient Architecture*, a square column, or pilaster, placed at the corners of the walls of temples, and other edifices.

These took their name, according to M. Perrault, from the preposition *ante*, *before*; because placed before the walls and coins of buildings, to secure or strengthen them.

The *ante* stood out of the wall, with a projecture equal to one eighth of their face, provided there were no ornament that had a greater projecture; but it was a rule, that the projecture of the *ante* should always equal that of the cornishment.

There are also *ante* at doors and gates. Pedius confines these use to this last place.

Vitruvius calls those that have but two faces out of the wall angular *ante*, to distinguish them from others which have three faces discouged, and which are placed at the ends of the walls of porticos.

ANTÆ. See ANTIQUÆ.

ANTÆUS, in *Mythology*, a name first given by the Greek writers Ælian and Strabo to the *ichthyocolla piscis*, the fish-glass-fish, or HUSO: and afterwards, by Jonston and others, not only to this fish, but to the common STURGEON.

ANTACHATES is used by some naturalists, for a kind of bituminous stone, of the nature of amber, though of a different colour, which in burning yields a smell like myrrh.

ANTACIDS, is used by some writers to denote medicines proper to quality and resist acid humours.

Antacids are chiefly of the absorbent kind.

Under the class of *antacids* come, 1. *Absorbents*, as chalk, coral, *testa*-shells, hammites and fossil-stones. 2. *Obtunders*, as oils, and fats. 3. *Innutants*, as nitrous salts and soaps.

ANTAGONIST, ANTAGONISTA, among the *Ancients*, denotes an adversary in battle.

The word is formed from ἀντι, *contra*, *against*; and ἀγωνιζομαι, *I contend*.

In this sense the word is rather used in speaking of sportive combats, or games, than of serious fighting.

ANTAGONIST also denotes one of the parties in literary disputes.

ANTAGONIST *muscles*, in *Anatomy*, are those which have opposite functions.

Such are the *flexor* and *extensor* of any limb, the one of which contracts it, and the other stretches it out.

Solitary muscles are those without any *antagonists*, as the heart, &c.

ANTALGIC, from ἀντι, and ἀλγος, *pain*, an epithet given by some writers to medicines proper to abate pain.

In this sense *anodyne*, *antalgic*, *antalgia*, amount to the same with EMPHYTI.

ANTALIUM, in *Natural History*, a small sea-shell of a tubular form, whence it is also denominated TUBULUS *marinus*.

The *antalium*, otherwise written *entalis*, and *entalus*, is about an inch and half long; the thickness of a large quill at one end, and of a small one at the other; fluted from end to end, of a white or greenish-white colour, and is found on rocks, and at the bottom of the sea. Du-Cange.

It is an *alkali*, and said to be of some medicinal use as a resolvent and diuret, at least by the ancients.

The *antalium* bears a near affinity both in origin, structure, and use, with the DENTALIUM.

ANTANACLASIS, a figure in *Rhetoric*; whereby the same word is repeated but in a different, and sometimes double signification.—As, *Let the dead bury the dead.*

The word comes from ἀντι, *rursus*, and ἀνακλασις *repercussio*, *I strike again*.

ANTANAGOGE, from ἀντι, and ἀναγωγη, *retortion*, a figure in *Rhetoric*; when, not being able to answer the accusation of the adversary, we return the charge, by loading him with the same or other crimes: which is usually called RECRIMINATION.

ANTANISOPHYLLUM, in *Botany*. See HOG-WEED.

ANTAPHRODISIAC, from ἀντι, and ἀφροδισια, *Venus*, an epithet given to medicines, which diminish the lewd, and extinguish the stimula or incitements to venery.

ANTAPOCHA, in the *Civil Law*, denotes one's acknowledgment in writing of money paid, in the way of rent, pension, interest, and the like incumbrances. Such instrument or *antapocha*, the debtor gives upon making payment to the creditor, to serve as a proof of the charge or incumbrance for futurity, and exclude any claim of prescription against the payment of it. The *antapocha* differs from the *apocha*, in that this latter is given by the creditor to the debtor, the former *vice versâ*.

ANTARCTIC *pole*, denotes the southern POLE, or end of the earth's axis.

The word is compounded of ἀντι, *contra*; and αρκτος, *ursa*, *bear*; as being opposite to the arctic pole.

The stars near the *antarctic* pole never appear above our horizon.

ANTARCTIC *circle* is one of the lesser circles of the sphere, parallel to the equator, at the distance of 23 deg. 30 min. from the south pole.

It takes its name from its being opposite to another circle, parallel likewise to the equator, and at the same distance from the north pole, called the ARCTIC *circle*.

ANTARES, in *Astronomy*, the scorpion's heart; a fixed star of the first magnitude, in the constellation SCORPIO.

ANTASTROPHE, from ἀντι, and στρεφω, *I turn*, in *Rhetoric*, a species of ANTAPODOSIS.

ANTEAMBULONES, from ante, *before*, and ambulo, *I walk*, in *Antiquity*, a kind of state-servants, who walked before their masters to clear the way, and keep off the crowd.

The *formula* used by these was *Date locum domino meo*.

ANTECANIS is used by some *Astronomers*, to denote the constellation otherwise called CANIS *minor*, or the star PROCYON. It is thus denominated as preceding, or be-

ing the forerunner of the CANIS *major*, and rising a little before it.

ANTECEDENT, in the schools, something that precedes, or goes before, another, in respect of time.

The word is compounded of *ante*, *before*, and *cedere*, *to go*. In which sense it stands opposed to *subsequent*.

ANTECEDENT, in *Grammar*, the word which a relative refers to.

ANTECEDENT, in *Logic*, denotes the first proposition of an *enthymeme*, or of an argument which only consists of two members.

In opposition to this, the latter is called the *consequens*.

Thus, in the argument, *cogito, ergo sum, I think, and therefore I exist*; *cogito* is the *antecedent*: being thus called because it precedes the *ergo*, or the *copula* of the argument.

ANTECEDENT *of a* RATIO, in *Mathematics*, denotes the first TERM, or that which is compared with the other.

Thus, if the *ratio* be *a* : *b*, or of *a* to *b*; *a* is said to be the *antecedent*.

ANTECEDENT *signs*, in *Medicine*, are such symptoms of disorder as appear before a distemper is so formed as to be reducible to any particular class, or proper denomination.

ANTECEDENTS, in *Rhetoric*, are such things as being once allowed, others necessarily or very probably follow. This is one of the fifteen topics or common places enumerated by Cicero and Quintilian.

ANTECEDENT *decree*, in *Theology*, is a decree preceding some other decree or some action of the Creator, or the provision of action. It is a point much controverted, whether predestination be a decree *antecedent* to faith, or subsequent to it.

ANTECEDENT *will*, or *desire*, is that which precedes some other will or desire, or some knowledge or prevision. Thus some divines say, God by a sincere, but *antecedent* desire, wills all men to be saved; that is, this sincere desire of God precedes, and does not suppose, the knowledge of their faith and repentance.

ANTECEDENT *necessity*. See NECESSITY.

ANTECENCY, ANTECEDENCE. See ANTECEDENT, and ANTECEDENTIA.

ANTECEDENTIA, among *Astronomers*. When a planet appears to move westward, contrary to the order of the signs; as from Taurus towards Aries; *it is* said to move *in antecedentia*.

On the contrary, when it goes eastward, or forward, from Aries towards Taurus; *it* is said to move *in consequentia*.

ANTECESSOR, one that goes before, or that leads another. See PRECURSOR, PREDECESSOR, &c.

The term is particularly used in some universities for a public professor, who teaches or lectures the civil law.

ANTECESSORS, in the ancient art of *War*, is an appellation given to a party of horse, dispatched before the *agmen* or body of an army, partly by way of intelligence, and partly to choose out a proper place for encamping on, as well as the most convenient roads for the soldiery to travel in.

These are also denominated *antecursores*.

They amount to the same with what the Greeks call *prodromi*.

ANTECHAMBER, or ANTICHAMBER, an outer chamber, before the principal chamber of an apartment; where the servants wait, and where strangers stay, till the person to be spoken with is at leisure, &c.

The word is formed of *ante*, *before*, and *camera*, a CHAMBER.

ANTECHRIST. See ANTICHRIST.

ANTECURSORES. See ANTECESSORS.

ANTEDATE, in *business affairs*, prior to the true date of a writing, instrument, act, deed, or the like.

Antedates, in *Commerce*, are of very dangerous consequence in matters of trade. To *antedate* is to set down a false date; to date from a day prior to that on which the business is transacted, the note or bill drawn, or letters written, &c.

In France it was formerly the ill custom to have blank orders on the backs of bills of exchange, that is, to indorse them merely with a name, so that they could easily be antedated; which in case of failures was liable to cause very great abuses. But by the regulations for commerce of 1673, it is ordered that the signatures on the backs of bills of exchange shall not serve for orders, unless dated: and *antedates* are punished as forgery.

ANTEDILUVIAN, or ANTIDILUVIAN, something that existed or happened before the DELUGE.

In this sense, those generations from Adam till Noah's flood, are called *Antediluvians*; and those since descended from Noah to the present time, are called *Postdiluvians*.

Dr. Burnet and Dr. Woodward differ very widely about the *Antediluvian* world; the former imagines its face and appearance to have been smooth, equable, and in all respects different from what we now find it to be. The latter, on the contrary, endeavours to prove, that the face of the terraqueous globe before the deluge was the same as it is now, viz. unequal, distinguished into mountains, and dales, and having likewise seas, lakes, and rivers; that the sea was salt, as ours is; was subject to tides; and possessed nearly the same space and extent that it now does; and that the *Antediluvian* world was stocked with animals, vegetables, minerals, &c. that it had the same position, in respect of the sun, which now now has, its axis not being perpendicular, but inclined, as at present, to the plane of the ecliptic; consequently, that there were then the same succession of weather, and the same vicissitudes of seasons as now.

ANTEJURAMENTUM, from *ante*, *before*, and *juramentum*, *oath*, or PRÆJURAMENTUM, by our ancestors also called *juramentum communia*; an oath which both the accuser and accused were anciently obliged to make before any trial or purgation.

The accuser was to swear, that he would prosecute the criminal; and the accused was to make oath on the very day that he was to undergo the ordeal, &c. that he was innocent of the fact with which he was charged.

If the accuser failed, the criminal was discharged; if the accused, he was understood to be guilty, and was not to be admitted to purge himself by the ordeal.

ANTEJUSTINIANEAN, an appellation sometimes given to the ancient Roman law, as it stood before the time of the emperor Justinian.

Tribonian has been often condemned for perverting the writings of the *Antejustinianean* lawyers. Schulting, a celebrated professor at Leyden, has a dissertation on the equity of this censure. Fabricius gives a catalogue of the ancient *Antejustinianean* lawyers. Schulting has published a collection of the *Antejustinianean* writers.

ANTELIUS, or ANTHELIUS, in *Ancient Writers*, denotes an idol placed over the doors of houses, supposed to have the guardianship or protection of them.

The word is originally *anthelios*, q. d. *against the sun*, as being exposed thereto.

ANTELOPE, *gazella*, in *Zoology*, the name of an animal of the goat kind, of which there are three known species.

1. The *gazella Africana præstantior Bibiæ*. This is the species we usually see under the name of the *antelope*; it is called the *addax* in Africa, and in the *decas leptica* of Ælian. Its horns are slender and erect, black, transversely radiated, and twisted into the appearance of spiral lines; though these are in reality so many annular circles, they are toward the middle bent a little outwards, and thence they turn in again, so that they in some measure represent the ancient lyre.

2. The *gazella Indica*, or *Indian antelope*, with very long straight horns, which are annulated only in that part near the head. The horns of this creature are sometimes three feet long, and are perfectly smooth and glossy, except near the head, and black. The creature is the size of our common deer, and is of a greyish colour; its tail is a foot long, and has longer hairs on it than those on the rest of the body. The horns of this species are very common in the museums of the curious. This creature seems to be the animal which produces the bezoar stone so much valued in medicine.

3. The African kind, which has flat horns annulated to the very top, and crooked near the middle; these has been seen alive sometimes in England. It was much smaller than our deer, and of a sandy colour; its belly is white, and its sides where the white and sandy colour met, of a dusky appearance. Its tail is blacker and longer than that of the deer, is covered with a smaller number of hairs than those of our deer, and is white on their part next the body. Its horns grow out of the middle of the forehead near the eyes, and are very long; sharpening at the ends, and all the way marked with *semicircular ridges* or furrows, and a little bent upwards. Its ears are large, and its legs very slender.

The hoofs and horns are used in medicine, being esteemed good against the epilepsy and hysterics.

ANTELUCAN, from *ante*, and *lux*, *light*, in *Ecclesiastical Writers*, is applied to things done in the night or before day.

We find frequent mention of the *antelucan* assemblies, *cœtus antelucani*, of the ancient Christians in times of persecution for religious worship.

ANTELUDIA, from *ante*, and *ludus*, *game*, in *Antiquity*, a day of show or parade preceding the exercises, wherein the preparations made for those solemnities were exposed in great form and pomp.

ANTEMURALE, from *ante*, and *murus*, *wall*, in *Middle Age Writers*, denotes a kind of outer wall environing the other walls and works of a place, and preventing the too near access of the enemy to them.

This is also called by Isidore, *aremurale*, as being *pro munitione muri*, *for the defence of the wall*.

In some writers we find it denominated *antepectoralis mus*, in others *anconæus*.

ANTEMURALE is also used to denote any work without side the rampart or wall of the place.

In this sense, *antemurale* amounts to the same with what we otherwise call OUTWORK.

ANTEMURALE is also used in *Ecclesiastical Writers* for the vestibule or entrance of the *presbyterium*, or BEMA.

ANTENATUS is used in some *Latin Writers* for the first-born, or eldest son, answering to what we call *aisné*.

ANTENATUS, from *ante* and *natus*, *born*, is also sometimes used for a son, the issue of a former marriage.

In which sense, *antenatus* amounts to the same with *privignus*.

ANTENATI, in the modern *English History*, is chiefly understood of the subjects of Scotland, born before king James the First's accession to the English crown, and alive after it.

In relation to these, those who were born after the accession were denominated POSTNATI.

The *antenati* were considered as aliens in England, whereas the *postnati* claimed the privilege of natural subjects.

ANTENCLEMA, *ἀντεγκλημα*, in *Oratory*, is where the whole defence of the person accused turns on criminating the accuser.

Such is the defence of Oreſtes, or the oration for Milo, *Oreſtes ſic ſed iratus. Expellus ſed rapter.* See RECRIMINATION.

ANTENICENE, in *Eccleſiaſtical Writers*, denotes a thing or perſon prior to the firſt council of Nice.

We ſay the *Antenicene* faith, *Antenicene* creeds, *Antenicene* fathers.

ANTENNÆ, in *Natural Hiſtory*. See FEELERS.

ANTENUPTIAL, ſomething that precedes marriage.

In this ſenſe, we ſay *antenuptial* promiſes, *antenuptial* preſents, *antenuptial* covenants, *antenuptial* fornication, &c.

Noodt has a treatiſe *De Pactis Antenuptialibus*.

ANTEPAGMENTA, or ANTEPAGMENTUM, in the *Ancient Architecture*, the jambs of a door, or lintels of a windows

The word is alſo uſed for the entire *chambranle*, i. e. the *door-caſe*, or *window-frame*.

ANTEPENULTIMA, or ANTEPENULTIMATE, in *Grammar*, the third ſyllable of a word, reckoning from the latter end; or the laſt ſyllable except two.

The word is compounded of the propoſition *ante*, *before*; and *penultimate*, *laſt but one*, or *pene ultimam*.

It was upon this ſyllable, that the Greeks placed their acute accents, and alſo on the laſt and laſt but one; but they never placed the accent before the *antepenultima*.—The *antepenultimate* of a dactyle is always long.

ANTEPILANI, among the ancient Romans, denote the *haſtati*, or *principes* of a legion.

They are ſuppoſed to have been thus called becauſe ranged before the *triarii*, who were alſo called *pilani*.

Some will have the word to be a corruption for *ante ſignani*.

ANTEPILEPTIC, in *Medicine*, denotes a quality in bodies, whereby they reſiſt or oppoſe the epilepſy and convulſive motions.

The chief *antepileptics* from the vegetable kingdom are, the roots of peony, valerian, the flowers of the lime tree, muſtetoe of the oak, hazel, and lime.

The animal kingdom affords a great number of *antepileptics* either real or imaginary. Such are elks claws, caſtoreum, divers parts of the deer, ſwallow-hearts, the human *cranium*, blood, ſecundines, &c. the *hippomanes*, ſtarch, frogs and moles liver and *ſpina*, lions and peacocks dung, earth-worms, &c.

The mineral kingdom affords hyacinths and ſmaragds prepared, alſo tinctura of lunæ.

ANTEPOSITION, from *ante* and *pono*, *I place*, a grammatical figure, whereby a word which by the ordinary rules of ſyntax ought to follow another, comes before it. As when in Latin the adjective is put before the ſubſtantive, the verb before the nominative caſe, &c.

Antepoſition ſtands oppoſed to *poſtpoſition*. One caſe or ſpecies of this figure is called by a particular name, *anaſtrophe*.

ANTEPRÆDICAMENTS, ANTEPRÆDICAMENTA, in *Logic*, certain previous matters, requiſite to a more eaſy and clear apprehenſion of the doctrine of PREDICAMENTS or CATEGORIES.

Such are definitions of common terms; as equivocals, univocals, &c. See DEFINITION, DIVISION, &c.

They are alſo called, becauſe treated by Ariſtotle, before the predicaments; that the thread of the diſcourſe might not elſewhere be interrupted.

ANTERIDES, in the *Ancient Architecture*, denote buttreſſes erected to ſupport a wall.

Theſe are ſometimes called *antæ*, ſometimes *criſpidæ*, and by the Greeks *ἀντερεισεις*.

Anteridæ anſwer to what the modern builders call *counterforti*, *arcboutants*; the Italians *barbicani*, and *ſproni*, or ſpurs.

ANTERIOR, or ANTERIOUR, ſomething before another, chiefly in reſpect of place.

The word is formed of the propoſition *ante*, *before*.

In which ſenſe the term amounts to the ſame with *prior*, and ſtands oppoſed to *poſterior*.

ANTERIOR *Romæ*. See RAMUS.

ANTEROS, in *Mythology*, one of the two Cupids who were the chief of the number. They are placed at the foot of the Venus de Medici; this is repreſented with a heavy ſullen look, agreeably to the poetical deſcription of him, as the cauſe of Jove's ceaſing. The other was called *Eros*. Ovid. Rem. Amor. V. verſe 549 to 576.

ANTEROTES, a name given by ſome of the ancient writers on gems to a ſpecies of the amethyſt. Some have imagined they meant by it a ſort of opal; but Pliny expreſly contradicts this, making the *anteretes* the fifth kind of AMETHYST in value.

ANTES, in *Architecture*, ſee ANTA.

ANTESIGNANI, in the Roman armies, a kind of ſoldiery poſted before the eagles, and other enſigns of the legions, whence their appellation.

The *antiſignani* ſtand contradiſtinguiſhed from the *ſubſignani*, who were ranged in the ſame line with the enſigns; and from the *poſtſignani*, who were placed behind them.

ANTESTATURE, in *Fortification*, a ſmall retrenchment, made of palliſadoes, or ſacks of earth, ſet up in haſte, to diſpute with the enemy the remainder of a piece of ground, part whereof hath been already gained.

ANTHALUM, among the *Ancients*, a root growing in dry places, and about the bignels of the fruit of the medlar; it was dug up for food, and eſteemed very pleaſant and wholſome.

ANTHELION, from *ἀντι* and *ἡλιος*, *ſun*, in *Phyſics*, ſignifies a mock or ſpurious ſun, and denotes a meteor, but very common, of a luminous appearance, ſomewhat reſembling the ſun, ſeen through clouds, bigger, ſometimes four or five times, than the ſolar diſk. In its moſt reſulgent ſtate, it is as yellow as the ſun; but the lucid tract ſurrounding it is of a paler yellow, or whitiſh caſt, interſperſed ſometimes with a few reddiſh or ſubfuſcous ſpots. The moſt received opinion relative to the formation of this kind of meteor, attributes the *phenomenon* to a multitude of minute icy or ſnowy particles ſuſpended in the air, and either refracting or reflecting the ſolar rays in ſuch a manner, as to multiply the image of the ſun. But the theory of *anthelia*, for want of a proper number of obſervations, ſeems not yet to be brought to ſuch a degree of ſatisfaction as by every lover of phyſiology could be deſired. The inſtances of them are but rare. See Phil. Tranſ. vol. lii. part i. N° 16. an. 1761. See HALO and PARHELION.

ANTHELIX, in *Anatomy*, the inner circuit of the auricle; thus called from its oppoſition to the outer circuit, called the HELIX.

ANTHELMIA, Indian PINK.

ANTHELMINTICS, medicines good to deſtroy worms.

The word is compounded of *ἀντι*, *contra*, *againſt*, and *ἑλμινς*, *worms*.

Purgatives ſeem to be the only proper *anthelmintics*.

ANTHEM, from *ἀντι* and *ὑμνος*, a *hymn*, a church-ſong, performed in cathedral and other ſervice, by the choriſters, divided for that purpoſe into choruſes, who ſing alternately. The word was originally uſed both for pſalms and hymns, when thus performed.

Socrates reporteth St. Ignatius as the author of this way of ſinging among the Greeks; and St. Ambroſe among the Latins.—Theodoret attributes it to Diodorus and Flavian.

Amalarius Fortunatus has written expreſly of the order of *Anthems*, "*De antiphonarum ordine.*"

At preſent the term is uſed in a ſomewhat narrower ſenſe; being applied to certain paſſages taken out of the pſalms, &c. and often accommodated to the particular ſolemnity in hand.

Anthems were firſt introduced into the reformed ſervice of the Engliſh church in the beginning of the reign of queen Elizabeth.

ANTHEMIS, ſee CHAMOMILE.

ANTHERÆ, in *Botany*, a term uſed by ſome authors for the yellow, or ruddy globules in the middle of certain flowers, as of lilies, ſaffron, &c.

Some confine the *anthera* to the yellowiſh globules in the middle of roſes.—Theſe are held more aſtringent than the reſt of the plant.

Others apply the name ANTHERÆ to thoſe little tufts or knobs which grow on the tops of the *ſtamina* of all other flowers; more uſually called APICES.

The *anthera* or apex of the ſtamen, in the Linnæan ſyſtem, is a principal part of the male organ of generation in plants, and contains within it a fine powder called *pollen* or *farina fecundans*, deſtined for the impregnation

of

of the *germen*, and which, when come to maturity, it discharges.

ANTHERICUM, in *Botany*. See SPIDERWORT.

ANTHESPHORIA, in *Antiquity*, a feaſt celebrated in Sicily, in honour of Proſerpine.

The word is derived from ἄνθος, *flower*, and φέρω, *I carry*; in relation to Pluto's having forced away that goddeſs, when ſhe was gathering flowers in the fields. Yet Feſtus does not aſcribe the feaſt to Proſerpine; but ſays it was thus called, becauſe cars of corn were carried on this day to the temples.

Anthesphoria ſeems to be the ſame thing with the *floriferium* of the Latins; and anſwers to the *harvest-home* among us.

ANTHESTERIA, in *Antiquity*, was a feaſt celebrated by the Athenians, in honour of Bacchus.

The moſt natural derivation of the word is from ἄνθος, *flos*, a *flower*; it being the cuſtom of this feaſt to adorn garlands of flowers to Bacchus.

Some are of opinion it took its name from the month *Anthesterion*, in which it was celebrated. Others pretend, that this was not the name of any particular feaſt, but that all the feaſts of Bacchus were called *anthesteria*.

The *anthesteria* laſted three days, the eleventh, twelfth and thirteenth days of the month: each of which day had a name ſuited to the proper office of the day. The firſt day of the feaſt was called πίθοιγια, i. e. opening the veſſels, becauſe on this day they tapped the veſſels, and taſted the wine. The ſecond they called χόες, *cœs*, the name of a meaſure, containing the weight of about ten pounds: on this day they drank the wine prepared the day before. The third day they called χύτροι, *kettles*: on this day they boiled all ſorts of pulſe in kettles; which, however, they were not allowed to taſte, as being all to be offered to Mercury.

ANTHESTERION, in *Ancient Chronology*, the ſixth month of the Athenian year. It contained twenty-nine days, and anſwered to the latter part of our November and beginning of December. The Macedonians called it *Dæſius* or *Dyſius*.

It had its name from the feſtival ANTHESTERIA kept in it.

ANTHIA, in *Ichthyology*, a name by which ſome improperly call the *faba Veneturum*, or fickle fiſh, a long anguilliform fiſh of the TAENIA kind.

ANTHIAS, in *Ichthyology*, the name of a fiſh ſeeming to approach to the TURDUS or wraſſe kind, of which Rondeletius and ſome other authors have deſcribed four ſpecies. Linnæus makes it a ſpecies of the LABRUS. See SACER.

ANTHINE, among *Ancient Naturaliſts*, is an appellation given to certain ſpecies of wine and oil.

In this ſenſe the word is alſo written *anthinus*.

Vinum anthinus, οἶνος ἄνθινος, was that prepared with certain fragrant flowers to give it the more agreeable odour.

Oleum anthinum is alſo denominated *liliacum*, ſometimes *ſuſinum*.

Some alſo give the appellation *anthine* to the compoſition otherwiſe called CYCEON.

ANTHOCEROS, in *Botany*, the name of a genus of moſſes, of the *cryptogamia algæ* claſs, in the Linnæan ſyſtem.

The name was given by Micheli; and Linnæus characteriſes it, as having male and female flowers: the calyx of the male is ſeſſile, cylindric, and entire; the anthera is fubulated, very long, and furniſhed with two valves; the calyx of the female is divided into ſix ſegments, and contains three ſeeds. He reckons three ſpecies.

ANTHOLOGION, a church book in uſe among the Greeks.

It was called ἀνθολογίον, q. d. *florilegium*, or a collection of flowers.

The *anthologion* is a ſort of breviary or maſs-book, containing the daily offices addreſſed to our Saviour, the Virgin, and the principal ſaints; with other common offices of prophets, apoſtles, martyrs, pontiffs, and confeſſors, according to the Greek rite. See BREVIARY, MASS, and OFFICE.

ANTHOLOGY, ANTHOLOGIA, a diſcourſe or treatiſe of flowers; or of beautiful paſſages from any authors.

Thus called from ἄνθος, *flos*, a *flower*, and λόγος, *ſermo*, *diſcourſe*. Though others chooſe rather to derive it from ἄνθος, *flos*, a *flower*, and λέγω, *I gather*; and uſe it to ſignify a collection of flowers.

ANTHOLOGY is frequently uſed for a collection of epigrams of divers Greek poets.

ANTHOLYZA, in *Botany*, a genus of the *triandria monogynia* claſs; we have no Engliſh name for this plant.

The characters are, that it hath an imbricated ſheath, which is permanent; the flower is of one leaf, and opens above with compreſſed jaws. The under lip is trifid and ſhort; the middle ſegment turns downward; under the flower is ſituated the *germen*, which afterward becomes a roundiſh three-cornered veſſel, having three cells, in which are lodged many triangular ſeeds. Mr. Miller enumerates two, and Linnæus four ſpecies.

They are a great ornament to the green-houſe when they are in flowers; and as they require but little culture, they deſerve a place in every good garden.

ANTHONY—Knights of St. *Anthony*, an order of knighthood, eſtabliſhed in 1382, by Albert of Bavaria, &c. who had then taken a reſolution to make war againſt the Turks.

The knights of this order wore a collar of gold, with a hermit's girdle, to which hung a crutch and a little bell. Some authors mention another order of *St. Anthony* in Ethiopia, inſtituted in 370, by Preſter John.

St. *Anthony* alſo gives the denomination to an order of religious founded in France about the year 1095, under the pontificate of Urban II. to take care of thoſe afflicted with St. *Anthony's fire*.

The *Anthonins*, or monks of St. *Anthony*, are by ſome ſaid to be of the begging kind. Their founder was Gaſton Frank, who erected a monaſtery for them at La Motte, near Vienne, where the general ſtill lives; they follow the rule of St. Auguſtine. Others give a different account of their origin, and ſuppoſe them thus called, not on account of St. *Anthony's fire*, but becauſe inſtituted by a St. *Anthony*, prior of a monaſtery in that neighbourhood. The friars of this order came into England in the reign of king Henry III. and had one houſe in London, and another at Hereford.

It is ſaid that, in ſome places, theſe monks aſſume to themſelves a power of giving, as well as removing the *ignis ſacer*, or ERYSIPELAS, a power which is uſually employed for keeping the poor people in ſubjection and extorting alms.

St. ANTHONY'S *Fire*. See ERYSIPELAS.

ANTHOPHYLLI, a denomination given to the larger ſpecies of cloves.

The word is otherwiſe written *antophylli*.

ANTHORA, a medicinal plant, of the ACONITE kind, having yellow flowers, reſembling helmets; growing chiefly on the mountains of Switzerland and Savoy.

This is otherwiſe called *antithora*, as being reputed an antidote againſt the *thora*: ſometimes ACONITUM *ſalutiferum*, in Engliſh the HELMET-*flower*.

The root, *anthoræ radix*, has been chiefly in uſe. It holds a place in the catalogues of the *Materia Medica*, but is not kept at this time in the ſhops. It is of a duſky brown without, and whitiſh within, of a warm bitteriſh taſte, and is reputed a cardine and alexipharmic, much of the ſame qualities with CONTRAYERVA root; on which account ſome alſo denominate it the *German contrayerva*, though it now only obtains in a few officinal compoſitions.

ANTHORISMUS, in *Rhetoric*, denotes a counter definition or deſcription of a thing.

Thus, if the plaintiff urge, that to take any thing away from another, without his knowledge or conſent, is a theft; this is called ὅρος, or definition. If the defendant reply, that to take a thing away from another, without his knowledge or conſent, provided it be done with deſign to return it to him again, is not theft, this is an ἀνθόρισμος.

ANTHOS, in its original Greek, ſignifies *flower*: but by way of excellence is appropriated to roſemary, ſo as to expreſs only that plant.

ANTHOS, in *Chymiſtry*, is uſed to denote the quinteſſence or elixir of gold; and ſometimes for a medicine extracted from pearls.

ANTHOS *philoſophorum* is more particularly uſed to denote a method of tranſmuting metals by means of vitriol.

ANTHOSMIAS, in ſome *Ancient Naturaliſts*, denotes a rich odoriferous kind of wine.

In this ſenſe *anthosmias* differs from *anthinus*, as the latter imports a medicated wine, ſcented with odoriferous herbs, whereas the former derived its fragrancy from the native grapes.

ANTHOSPERMUM, in *Botany*. See AMBER-*tree*.

ANTHOXANTHUM, in the Linnæan ſyſtem of *Botany*, the name of a ſort of graſs which makes a diſtinct genus of plants, of the *diandria digynia* claſs. The characters of this are, that the *calyx*, or flower-cup, is compoſed of two glumes, the exterior containing one flower compoſed of two valves, of an oval figure, pointed, hollow, and the one larger than the other; the interior glume is compoſed of two valves of the ſame length with the exterior large valve, and each ſending out a fine beard or acorn from its hinder part; this alſo contains one flower, which is compoſed of two unequal ſized valves, and is extremely thin in its whole ſtructure, and quickly falls off.

ter; the *stamina* are three capillary filaments; the *antheræ* are long, and split at their ends; the *germen* of the *pistillum* is oblong; the styles are capillary, two in number, and hairy; the *stigmata* are simple; the interior glume grows firmly to the seed, which is single, oblong, and pointed at each end.

ANTHRACIS, in *Natural History*, a word used for a gem by the ancients, but in several different senses: all which seem evidently to refer to the cat's eye, or *asterio* kind.

Many of the ancients have also called the HÆMATITES, or blood-stone, by this name, *anthracitis*, because of its being of the colour of a burning coal.

ANTHRACOSIS, a disease of the eyes, occasioned by a corrosive ulcer, either in the balls of the eye, or the eyelids, covered with skin, and attended with a general swelling of the parts adjoining.

The word denotes an inflammation resembling a coal; ἀνθρακ signifying a coal.

ANTHRAX, in the *Natural History* of the *Ancients*, was a word used by the most early writers for the substance we now call pit-coal and *lithanthrax*. Theophrastus plainly tells us, that the substance strictly and properly called *anthrax* (for they also knew a gem by the same name, used in a metaphorical sense) was an earthy fossil substance, which was broken in pieces to be used and kindled well, and burnt almost like wood-coals, and was used by the smiths.

ANTHRAX, ἀνθρακ, in *Medicine*, means figuratively, a seals or blotch, made by a corrosive humour, which as it were burns the skin, and occasions sharp pricking pains.

The *anthrax* is the same with what is otherwise denominated *carbo* and *carbunculus*.

Some pretend to make a distinction between the *anthrax* and CARBUNCLE, limiting this latter to the glandular parts, and the former to all the others. But the distinction is scarce worth the making.

Riverius, Tolius, Gemma, and Meurerus, have discourses expressly on the *anthrax*.

ANTHROMETRICA *machina*. See ANTHROPOMETRICA.

ANTHROPODÆMON, in *Ancient Writers*, a demon concealed under the figure or appearance of a man.

ANTHROPOGLOTTUS, in *Natural History*, something that has a tongue, or speech resembling that of man.

The parrot kind are denominated *anthropoglotti*, on account of their broad, thick, and muscular tongues, by which they are enabled to speak, and to roll their meat from side to side under the edges of their bills.

ANTHROPOGRAPHIA, a description of man; more particularly, of the structure of his body and the parts thereof.

ANTHROPOLATRÆ, a title given to the Nestorians, on account of their believing Christ to be a mere man, yet paying him the honour of a God.

ANTHROPOLATRIA, the paying divine worship or honours to a man. *Anthropolatria* is supposed by some to have been the most ancient species of IDOLATRY.

ANTHROPOLOGY, a discourse, or treatise upon man, or human nature; considered as in a sound, or healthy state.

It is compounded of ἀνθρωπος, *man*, and λογος, *discourse*.

Anthropology includes the consideration both of the human body and soul, with the laws and effects of their union; as sensation, motion, &c.

It is particularly used in *Theology*, for a way of speaking of God after the manner of men; by attributing human parts and passions to him; as eyes, hands, ears, anger, joy, &c.

We have frequent instances of *anthropology* in Holy Scripture; by which we are only to understand the effect, or the thing which God does, and he had hands, &c.

ANTHROPOMANCY, a method of divination, performed by inspecting the *viscera* of a person deceased.

The word is compounded of ἀνθρωπος, *man*, and μαντια, *divination*.

ANTHROPOMETRIA, a description of the human body, with its several parts and members, according to the three dimensions, length, breadth, and thickness, both considered in themselves, and comparatively to each other.

ANTHROPOMETRICA *machina*, a name which Sanctorius gave to his weighing chair, contrived for measuring the quantity of *insensible* PERSPIRATION.

ANTHROPOMORPHA, in the Linnæan system of nature, a class of animals in some degree resembling the human form.

The word is derived from ἀνθρωπος, *a man*, and μορφη, *form*.

This author makes it comprehend the monkey, the *ignavus*, or sloth, and the *tamandua guaco*, or ant-bear, as it is usually called.

ANTHROPOMORPHITE, in a general sense, one who attributes to God the figure of a man.

The word comes from the Greek ἀνθρωπος, *man*, and μορφη, *shape*.

ANTHROPOMORPHITES were a sect of ancient heretics, who, taking every thing spoken of God in the scriptures in a literal sense, imagined he had real hands, feet, &c. The passage they chiefly insisted on was that in Genesis, where it is said, that God made man after his own image.

Even philosophers, for want of a better acquaintance with metaphysics, seem to have fallen into *anthropomorphism*, representing God much after the manner of a human soul, without considering the difference between a finite and an infinite being, limited and absolute perfections. Wolfius has laboured hard to avoid this rock, by having the difference still present on his mind, and proceeding according to the ancient rule, *Quæ de Deo dicuntur affirmative, ea intelligi oportet eminenter.*

The whole sect of Stoics held God to be corporeal; and, not to mention Tertullian and others among the fathers, Hobbes and his followers assert the same among ourselves. Leibnitz charges Sir Isaac Newton and his followers with representing God under the condition of a man. But with what justice it would be hard to say.

Those who held the contrary, viz. that God is incorporeal, and without any bodily form, the *Anthropomorphites* branded by the name of *Origenists*, because Origen taught how to allegorize these expressions.

Epiphanius calls the *Anthropomorphites*, *Audiani*, or *Odiani*, from *Audius*, the supposed founder of the sect; who lived, about the time of Arius, in Mesopotamia. St. Augustine calls them *Vadiani*.

This System was revived in 939.

ANTHROPOMORPHOUS, something that bears the figure or resemblance of a man. Naturalists give instances of *anthropomorphous* plants, *anthropomorphous* minerals, &c. These generally come under the class of what they call *lusus naturæ*, or monsters.

Anthropomorphous stones make a species of those called figured stones.

ANTHROPOMORPHOUS is an appellation more peculiarly given to MANDRAGORA, or *mandrake*.

ANTHROPOPATHY, a figure, expression, or discourse, whereby some passion is attributed to God, which properly belongs only to man.

It is compounded of ἀνθρωπος, *man*, and παθος, *passion*. *Anthropathy* is frequently used promiscuously with *anthropology*; yet in strictness, they ought to be distinguished as the genus from the species. *Anthropology* may be understood of any thing human attributed to God; but *anthropopathy*, only of human affections, passions, fondnesses, &c.

ANTHROPOPHAGI, people who feed on human flesh. Compounded of the Greek ἀνθρωπος, *man*, and φαγειν, *eat*, *to eat*.

The Cyclops, the Lestrygons, and Scylla, are all represented in Homer as *anthropophagi*, or man-eaters; and the female phantoms, Circe and the Syrens, first bewitched with a shew of pleasure, and then destroyed.—This, like the other parts of Homer's poetry, had a foundation in the manners of the times preceding his own. It was still in many places the age spoken of by Orpheus,

> When men devoured each other like the beasts,
> Gorging on human flesh.——

Some remains of the usage subsisted much longer, even among the most civilized nations, in the practice of offering human sacrifices.

History gives us divers instances of persons driven by excess of hunger to eat their own relations. Others commence *anthropophagi* out of revenge and hatred; these are many instances of soldiers, who in the heat of battle have been carried to such excess of rage, as to tear their enemies with their teeth.

The violence of love has sometimes produced the same effect as the excess of hatred. The *Issedi eat* the bodies of their friends and nearest relations to preserve them from worms and putrefaction, thinking they do not only bestow afford them an honourable grave, but even a new life, a kind of revivification in themselves. Artemisia did something like this when she swallowed the ashes of her dead husband, Mausolus. Among the Scythians, when a man's father died, his neighbours brought him several beasts, which they killed, minced, and mixed up with the flesh of the deceased, and made a feast.

Among the *Massagetæ*, when any person grew old, they killed him and eat his flesh; but if the party died of sickness, they buried him, esteeming him unhappy.

Idolatry and superstition have occasioned the eating more men, than both love and hatred put together. There are few nations but have offered human victims to their deities; and it was an established custom to eat part of the sacrifices they offered.

The Jagos and the subjects of the great Macoco, are said to be *anthropophagi*. This prince is very powerful, having ten kings for his vassals; his court is so numerous, that there are two hundred men butchered every day to supply the table; part of this number are criminals, the rest slaves furnished in the nature of tribute.

It appears pretty certain from Dr. Hawkesworth's Account of the Voyages to the South Seas, that the inhabitants of the island of New Zealand, a country unfurnished with the necessaries of life, eat the bodies of their enemies. It appears also to be very probable, that both the wars and *anthropophagy* of these savages take their rise, and owe their continuance to irresistible necessity, and the dreadful alternative of destroying each other by violence, or of perishing by hunger. See vol. III. p. 447, & seq. and vol. II. p. 389, &c.

M. Petit has a learned dissertation on the nature and manners of the *anthropophagi*. Among other things, he disputes whether or no the *anthropophagi* act contrary to nature? The philosophers Diogenes, Chrysippus, and Zeno, followed by the whole body of Stoics, held it a very reasonable thing for men to eat each other.

According to Sextus Empiricus, the first laws were those made to prevent men from eating each other, as had been done till that time. The Greek writers represent *anthropophagy* as universal before Orpheus. To shew farther, that *anthropophagy* is not contrary to nature, a modern author urges, that cats, dogs, rabbits, and other animals, feed on each other. Pliny, after Aristotle, affirms, that swans eat each other; and the bees also eat their *nymphæ*, which are their young. The Dutch in Nova Zembla saw bears devour each other, and the like has been observed in the fish kind: the *tiburonis*, according to Ovid, are caught with a hook baited with their own flesh. Leonardus Florventius having fed a hog with hog's flesh, and a dog with dog's flesh, found a repugnancy in nature to such food; the former lost all his bristles; and the latter its hair, and the whole body broke out in blotches. The origin of the venereal disease is by some attributed to the eating of human flesh.

It may be said, that whether the dead body of an enemy be eaten or buried, is a matter perfectly indifferent; but whatever the practice of eating human flesh may be in itself, it certainly is, relatively and in its consequences, most pernicious. It manifestly tends to eradicate a principle, which is the chief security of human life, and more frequently restrains the hand of the murderer, than the fear of duty, or the dread of punishment. If even this horrid practice originates from hunger, still it must be perpetuated from revenge. Death must lose much of its horror among those who are accustomed to eat the dead; and where there is little horror at the sight of death, there must be less repugnance to murder. See some farther observations on this subject, equally just and ingenious, by Dr. Hawkesworth, *ut supra*.

It may be asked, whether the use which is made of certain parts of the human body in physic, come under the denomination of *anthropophagy*? How often have tombs been violated on this occasion? To say nothing of mummies and the like. Pliny assures us, that in his time the physicians ordered their epileptic patients to apply their lips to the wounds of gladiators, and swallow the blood as it streamed from them.

Some carry their respect for dead bodies a great length. M. Petit does not think it lawful for anatomists to dissect human bodies, in order to learn their structure, except those of condemned criminals, and such as are denied the rites of burial. The Arabs went farther; notwithstanding all their curiosity and desire to be acquainted with the human structure, they could never be induced to make one dissection; they were contented to borrow all their knowledge of this kind from the Greek physicians.

Some maintain it impossible, whatever precaution is used, to prevent the ingress of the parts of dead bodies with our food and drink. Add, that if we do not feed on our own species, we feed on plants and animals, which derive a great part of their nutriment from us. Whence the impossibility of the RESURRECTION of the same body has been inferred.

ANTHROPOPHAGIA, the act or habit of eating human flesh.

This is pretended by some to be the effect of a disease, which leads people affected with it to eat every thing alike. Some choose only to consider it as a species of PICA.

The annals of Milan furnish an extraordinary instance of *anthropophagy*. A Milanese woman, named Elizabeth, from a depraved appetite, like what women with child, and those whose *menses* are obstructed, frequently experience, had an invincible inclination to human flesh, of which she made provision by enticing children into her house, where she killed and salted them; a discovery of which having been made, she was broken on the wheel and burnt in 1519.

Some physicians vainly think they have discovered the principle of *anthropophagy*; and that it consists in an acid atrabiliary humour, which being lodged in the coats of the ventricle, produces this voracity. And they give several instances of this inhuman hunger, even among their own patients.

ANTHROPOSCOPIA, the art of judging or discovering a man's character, disposition, passions, and inclinations, from the lineaments of his body.

In which sense, *anthroposcopia* seems of somewhat greater extent than PHYSIOGNOMY, or METOPOSCOPY.

Otho has published an ANTHROPOSCOPIA, *sive judicium humanis de hominis ex lineamentis externis*.

ANTHROPOSOPHIA, the science of the nature of man, and his structure and composition, both internal and external.

In this sense, *anthroposophia* amounts to much the same with the medical *physiology* or *anatomy*.

The word is used by Charleton, but with no great propriety; since *sophia*, or wisdom, imports the science of using means to obtain an end, which is foreign to Charleton's intention.

ANTHROPOTHYSIA, in *Ancient Writers*, denotes the offering of human victims.

The *anthropothysia* was a frequent practice among the ancients. Some have imagined that the sacrifice of Abraham was the first instance. Many reasonings and disquisitions have been founded on this supposition; by which the severity of Abraham's trial is thought by some to have been somewhat exaggerated. Human sacrifices were in use among the Gentiles before that time; practised by kings as well as by private persons; nay by entire nations, as the Egyptians, Phœnicians, Canaanites, &c.

ANTHUMON, in the *Materia Medica* of the *Ancients*, a name given to the EPITHYMUM, or *dodder*, growing upon THYME.

ANTHUS, in *Ornithology*, a name by which Aldrovand and some other authors have called that species of the ORNANTHE known in England by the name of the WHINCHAT.

ANTHYLLIS, in *Botany*. See LADY's *finger*.

ANTHYPOMOSIA, in *Ancient Writers*, an oath taken by a prosecutor or accuser, declaring that the absence of the party accused is not for any just cause, and therefore demanding that judgment may no longer be delayed on that account.

ANTHYPOPHORA, in *Rhetoric*, a figure whereby we covertly obviate a reason or objection.

In this sense *anthypophora* stands opposed to *hypophora*, e. g. if the HYPOPHORA be, grammar is very difficult to obtain; the *anthypophora* may be, grammar is indeed a little difficult to obtain, but then its use is infinite.

ANTI, *Anti*, is a preposition used in composition with several words, both in Greek, Latin, English, &c. in different senses. In English, it sometimes happens before; as in *anti-chamber*, a place before the chamber.—In which case it has the same meaning with the Latin *ante, before*.

Sometimes, again, it signifies *contrary*, or *opposite*; and is then derived from *ante, contra, against*.

In this latter sense, the word makes part of the name of various medicines, to denote some peculiar or specific virtue in them against certain *diseases*: such, e. gr. are antivenereals, antiscorbutics, antisephritics, &c.

The preposition is frequently, however, omitted on these occasions, without any alteration of the sense; as in nephritics, arthritics, asthmatics, &c.

ANTI, in matters of *Literature*, is a title given to divers pieces written by way of answer to others, whose names are usually annexed to the *anti*.

See the *Anti* of M. Baillet; and the *Anti-Baillet* of M. Menage: there are also *Anti-Menagiana*, &c. Cæsar the dictator wrote two books by way of answer to what had been objected to him by Cato, which he called *Anti-Catones*; there are mentioned by Juvenal, Cicero, &c. Vives assures us, he had seen Cæsar's *Anti-Catones* in an ancient library.

ANTIADES, a term used by some writers for the glandules, and kernels, more commonly called TONSILS, and ALMONDS *of the ears*.

ANTIADIAPHORISTS, ANTIADIAPHORISTS, opposite to the ADIAPHORISTS.

The word is compounded of *αντι*, *contra*, *against*, and *αδιαφορος*, *indifferent*.

This name was given, in the fourteenth century, to the rigid Lutherans, who disavowed the epiſcopal juriſdiction, and many of the church-ceremonies, retained by the moderate LUTHERANS.

ANTIBACCHIUS, in the *Ancient Poetry*, a foot, conſiſting of three ſyllables; the two firſt whereof are long; and the third ſhort.

Such are the words *cantare*, *virtute*, Ελληνες.

It is ſo called as being contrary to the BACCHIUS, the firſt ſyllable whereof is ſhort, and the two laſt long.

Among the ancients, this foot is alſo denominated *Paean-bacchius*, and *Saturnius*; and, by ſome, *Propontiacus*, and *Theſſalus*. Diom. III. p. 475.

ANTIBARBAROUS, a title given to ſeveral works levelled againſt the uſe of barbarous terms and phraſes, chiefly in the Latin Tongue.

Eraſmus, Nizolius, and Cellarius, have publiſhed *Antibarbara*. Noltenius has given us a Lexicon *Anti-barbarum*, conſiſting of obſervations made by the grammarians of late ages in relation to the purity and corruption of Latin words.

Siat. Amama has given an *Antibarbarus Biblicus*, wherein he pretends to have diſcovered ſeven ſources of the barbariſms which have got footing of late ages in the BIBLE.

Peter de Moulin uſed the title *Antibarbarus* for a book againſt the uſe of an unknown tongue in divine ſervice.

ANTIBIBLOS, in the *Civil Law*, an inſtrument or ſignature, whereby the defendant owns he has received the libel, or copy of it, and notes the day whereon he received it. This is uſually done on the back of the LIBEL.

ANTICADMIA denotes a ſpecies of mineral CADMIA, ſometimes alſo called *pſeudo-cadmia*.

It takes the denomination *anticadmia*, not as being oppoſite in quality to the *cadmia*, but becauſe it is uſed as a ſubſtitute for it.

ANTICARDIUM, in *Anatomy*, &c. that hollow part under the breaſt, juſt againſt the heart, commonly called the *pit of the ſtomach*: called alſo *ſcrobiculus cordis*.

The word is compounded of *αντι*, *contra*, *againſt*; and *καρδια*, *cor*, *heart*.

ANTICATARRHAL, an epithet given to medicines preſcribed for catarrhs.

ANTICATEGORIA, in *Oratory*, denotes a recrimination or mutual accuſation; where the two parties charge each other with the ſame crime.

Apollodorus conſiders the *anticategoria* as two ſeveral cauſes or actions.

ANTICAUSOTICS, among *Phyſicians*, denote medicines againſt burning fevers.

In this ſenſe Juncker has given the deſcription of *anticauſotic* ſyrup.

ANTICHAMBER, ſee ANTECHAMBER.

ANTICHORUS, in *Botany*, a genus of the *octandria monogynia* claſs, which has a four-leaved calyx, four petals, an awl-ſhaped, four-celled capſule, with four valves, and many ſeeds. There is only one ſpecies.

ANTICHRESIS, in the *Civil Law*, a covenant, or convention, whereby a perſon borrowing money of another engages, or makes over his lands or goods to the creditor, with the uſe and occupation thereof, for the intereſt of the money lent. This covenant was allowed of by the Romans; among whom uſury was prohibited: it was afterwards called MORTGAGE, to diſtinguiſh it from a ſimple engagement, where the fruits of the ground were not alienated, which was called *vif-gage*.

ANTICHRIST, in a general ſenſe, denotes an adverſary of Chriſt, or one who denies that the Meſſiah is come.

The word is compounded of *αντι*, *contra*, *againſt*; and Χριστος, *Chriſt*.

In this ſenſe, Jews, infidels, &c. may be ſaid to be *Antichriſts*.

ANTICHRIST is more particularly uſed for a tyrant who is to reign on earth, toward the end of the world; to make the ultimate proof of the elect; and to give a ſhining inſtance of Divine vengeance, before the laſt judgment.

The Bible and the fathers all ſpeak of *Antichriſt* as a ſingle man; though they aſſure, withal, that he is to have divers precurſors, or fore-runners. Yet many Proteſtant writers apply to the Romiſh church, and the pope, who is at the head of it, the ſeveral marks and ſignatures of *Antichriſt* enumerated in the Apocalypſe, which would rather imply *Antichriſt* to be a corrupt ſociety, or a long ſeries of perſecuting pontiffs, than a ſingle perſon. Or rather, a certain power or government, that may be held for many generations, by a number of individuals ſucceeding one another. The *Antichriſt* mentioned by the apoſtle John, 1 Ep. ii. 18. and more particularly deſcribed in the book of Revelation, ſeems evidently to be the ſame with the *Man of Sin*, &c. characteriſed by St. Paul in his ſecond Epiſtle to the Theſſalonians, ch. ii. And the whole deſcription literally applies to the exceſſes of papal power. Had the right of private judgment, ſays an excellent writer, been always adopted and maintained, *Antichriſt* could never have been; and when that ſacred right comes to be univerſally aſſerted, and men follow the voice of their own reaſon and conſciences, *Antichriſt* can be no more.

However, the point having been maturely debated at the council of Gap, held in 1603, a reſolution was taken thereupon, to inſert an article in the confeſſion of faith, whereby the pope is formally declared to be *Antichriſt*. Pope Clement VIII. was ſtung to the life with this deciſion; and even king Henry IV. of France was not a little mortified, to be thus declared, as he ſaid, an imp of *Antichriſt*.

The learned Grotius maintains, that Caligula was *Antichriſt*; others have affirmed the ſame of Nero; but theſe do not agree with his appearance at the end of the world.

F. Malvenda, a Spaniſh Jeſuit, has publiſhed a large and learned work, *De Antichriſto*, in thirteen books. In the firſt, he relates all the opinions of the fathers with regard to *Antichriſt*. In the ſecond, he ſpeaks of the time when he ſhall appear; and ſhews, that all the fathers, who ſuppoſed *Antichriſt* to be near at hand, judged the world, alſo, was near its period. In the third he diſcourſes of his origin and nation; and ſhews that he is to be a Jew, of the tribe of Dan: this he founds on the authority of the fathers; on that paſſage in Gen. xlix. *Dan ſhall be a ſerpent by the way*, &c. on that of Jeremy viii. 16. where it is ſaid, *The armies of Dan ſhall devour the earth*; and on the Apocalypſe, chap. vii. where St. John, enumerating all the tribes of *Iſrael*, makes no mention of that of Dan. In the fourth and fifth books, he treats of the ſigns of *Antichriſt*. In the ſixth, of his reign and wars. In the ſeventh, of his vices. In the eighth, of his doctrine and miracles. In the ninth, of his perſecutions; and, in the reſt, of the coming of Enoch and Eliah; the converſion of the Jews, the reign of Jeſus Chriſt, and the death of *Antichriſt*, after his having reigned three years and a half.

Hippolitus, and others, held that the devil himſelf was the true *Antichriſt*, that he was to be incarnate, and make his appearance in human ſhape before the conſummation of things.

How endleſs are conjectures? Some of the Jews, we are told, actually took Cromwell for Chriſt, while ſome others have laboured to prove him *Antichriſt* himſelf. Peſſius aſſures us that he ſaw a folio book in the Bodleian library, written on purpoſe to demonſtrate this latter poſition.

ANTICHRISTIANISM, a ſtate or quality in perſons or principles, which denominates them antichriſtian, or oppoſite to the kingdom of Chriſt, and the genius and ſpirit of his religion.

ANTICHRISTIANS properly denote the followers or worſhippers of *Antichriſt*.

ANTICHRISTIANS are more particularly underſtood of thoſe who ſet up, or believe in a falſe Chriſt, or Meſſiah.

ANTICHTHON, in its primitive aſtronomic ſenſe, denotes a kind of globe, or earth, reſembling ours, and like it, ſuppoſed to be moving round the ſun, but inviſible to us, becauſe on the oppoſite ſide of the ſun, that luminary being ſtill exactly interpoſed between this other earth and ours.

In this ſenſe it is, that Pythagoras and his diſciples aſſerted an *antichthon*; for which we have the teſtimonies of Ariſtotle, Plutarch, &c.

By reaſon of the perfection of the number ten, they concluded there muſt be juſt ſo many ſpheres; and as our ſenſes only diſcover nine, viz. the ſeven planets, the ſphere of the fixed ſtars, and our earth, they imagined a tenth oppoſite to ours.

Some of the fathers, who endeavoured to accommodate the doctrine of the heathen philoſophers to thoſe of Chriſtianity, aſſert that this Pythagorean earth is no other than the heaven of the righteous.

Thomaſius has a diſſertation on the Pythagorean *antichthon*.

ANTICHTHONES, in *Geography*, are thoſe people who inhabit countries diametrically oppoſite to each other.

The word is compounded of *αντι*, *contra*, and χθων, *terra*, *earth*. They are alſo ſometimes called, by ſome writers, *antigeae*.

In which *ſenſe*, *antichthones* amount to much the ſame with what we more uſually call *antipodes*.

ANTICHTHONES is alſo uſed in *Antient Writers*, to denote the inhabitants of contrary hemiſpheres.

In which ſenſe *antichthones* differs from *antœci*, and *antipodes*.

The ancients conſidered the earth as divided by the equator into two hemiſpheres, the northern and ſouthern; and all thoſe who inhabited one of theſe hemiſpheres, were reputed *Antichthones* to thoſe of the other.

ANTICIPATION, from *ante*, *before*, and *capio*, *I take*, the act of preventing, or being before hand with a perſon, or thing; or of doing a thing before the time.

Anticipating a payment denotes the diſcharging it before it falls due. Such a debt was not yet become due; he *anticipated* the time of payment.

ANTICIPATION is alſo uſed in a *logical* ſenſe, for a preſumption, prejudice, or preconceived opinion.

This is alſo denominated preconception, preſentation, or inſtinct.

ANTICIPATION, in a medicinal ſenſe, is applied to diſeaſes, wherein ſome of the ſymptoms which regularly belong to ſome future period, appear in the beginning; or the word may be underſtood of thoſe diſeaſes, which having their acceſſes and remiſſions at ſtated hours, gain in point of time, and finiſh their period ſooner than ordinary.

In this ſenſe *anticipation*, or *anticipated* diſeaſes, by the Greeks called προλαμβανουσαι, ſtands oppoſed to hyſteretic, υστερουσαι, which come after the time.

ANTICIPATION, in the *Epicurean Philoſophy*, denotes the firſt idea, or definition of a thing, without which we can neither name, think, doubt, or even inquire, concerning it.

This is otherwiſe denominated PRENOTION.

Anticipation, in this ſenſe, makes the ſecond of Epicurus's criterions of truth.

ANTICIPATION is alſo uſed by Shaftesbury, in ſpeaking of painting, to denote the expreſſion of ſome future action, reſolution, or the like.

ANTICIPATION, in *Rhetoric*, a figure otherwiſe called PROLEPSIS.

ANTICK, in *Sculpture* and *Painting*, denotes a fantaſtical compoſure of figures of different natures, ſexes, &c. as men, beaſts, birds, flowers, fiſhes, and even things merely imaginary, or which have no exiſtence in the nature of things.

Antick amounts to much the ſame thing with what the Italians call *groteſco*, and the French *groteſque*.

ANTICLIMAX, from ανα and κλιμαξ, *gradation*, in *Rhetoric*, is a figure, whereby the progreſs of a diſcourſe deſcends from great to little; and this is ſometimes rendered peculiarly agreeable by ſuch a concord between the ſenſe and ſound as may contribute to make diminutions appear ſtill more diminutive. Horace affords a ſtriking example.

Parturiunt montes, naſcetur ridiculus mus.

ANTICNEMION, from αντι, and κνημη, *tibia*, *the ſhin-bone*, in *Anatomy*, denotes the ſhin; or the fore prominent part of the *tibia*.

This is otherwiſe called ακανθα, by the Latins *prima tibiæ*, or *anterior tibia*, and ſtands oppoſed to the *ſura*, or calf of the leg, ſometimes called *nerva*.

ANTICOR, from αντι and κορ, *the heart*, ANTICEUR, or *avant cœur*, among *Farriers*, is uſually deſcribed as a preternatural ſwelling, of the ſize and figure of an apple, occaſioned by a ſanguine and bilious humour, and appearing in a horſe's breaſt, oppoſite to his heart. A late writer affirms, that the generality of authors on that ſubject have been miſtaken as to this diſeaſe, attributing it to the heart; whereas it is by Solleyſel called the *ſwelling of the forecordium*: whereas it is really an inflammation in the gullet and throat; and in the ſame that, in human bodies, is called the *angina*, or *ſquinancy*.

The cure of this diſeaſe ſhould be attempted by copious bleedings, in order to reduce the inflammation. Emollient clyſters ſhould alſo be injected twice or thrice a day, with an ounce of ſal primella in each. The ſwelling ſhould be bathed with marſhmallow ointment; and an opening poultice, with onions boiled in it, ſhould be daily applied to it. If the inflammation be hereby removed, the ſwelling ſhould be brought, if poſſible, to maturation; for this purpoſe the poultice muſt be continued, and two ounces of Venice treacle, diſſolved in a pint of beer, muſt be given to the horſe every night. When the ſwelling is ſoftened, it muſt be opened with a knife, and dreſſed with turpentine digeſtive. But if the ſwelling cannot be brought to matter, and ſhould endanger ſuffocation, Solleyſel, and others, adviſe opening the ſkin, in order to introduce a piece of black hellebore-root ſteeped in vinegar, and to confine it there for twenty-four hours. In order to ſtimulate and promote a diſcharge, the adjacent parts ſhould be fomented, and bathed with ointment of marſhmallows.

ANTICUM, in *Architecture*, a porch before a door; alſo that part of a temple, which is called the outer temple, and lies between the body of the temple and the portico.

It is ſometimes called *antæ*.

ANTICUS, *ſerratus minor*. See SERRATUS.

ANTICUS, *peronæus*. See PERONÆUS.

ANTICUS, *tibialis*. See TIBIALIS.

ANTIDACTYLUS, from αντι, and δακτυλος, *dactyl*, a name given by ſome to a kind of poetical foot, which is the reverſe of a dactyl, as conſiſting of three ſyllables, whereof the firſt two are ſhort, and the laſt long.

ANTIDÆMONICI, from αντι, and δαιμων, *damon*, in *Eccleſiaſtical Hiſtory*, a ſect who denied the exiſtence of devils, or evil ſpirits; alſo all ſpectres, incantations, witch-crafts, &c.

ANTIDICOMARIANITES, from αντιδικος, *adverſary*, and Μαρια, *Mary*, a ſect of ancient Chriſtians who thought that the Holy Virgin did not preſerve a perpetual virginity, but that ſhe had ſeveral children by Joſeph after our Saviour's birth.

Theſe are otherwiſe called *antidicomarianæ*; and *antidicomarites*, and *antidicmarianiſts*; ſometimes alſo *antimarians*.

The opinion was grounded on ſome expreſſions of our Saviour, wherein he mentions his brothers, and his ſiſters; and on that text of St. Matthew, wherein he ſays, that Joſeph knew not Mary till ſhe brought forth her firſt-born ſon.

The *antidicomarianites* were the diſciples of Helvidius and Jovinian, who appeared in Rome towards the cloſe of the fourth century.

ANTIDISMA, in *Botany*, a genus of the *Eucia pentandria* claſs, without any Engliſh name.

ANTIDORON, in *Eccleſiaſtical Writers*, a name given by the Greeks to the conſecrated bread, out of which the middle part, marked with the croſs, wherein the conſecration conſiſted, being taken away by the prieſt, the remainder is diſtributed, after maſs, to the poor.

On the ſides of the *antidoron* are impreſſed the words *Jeſus Chriſtus vicit*.

The word is formed from δωρον, *donum*, *a gift*, as being given away *ex mutuis* or *in charity*.

The *antidoron* is alſo called *panis præſanctificatus*.

Some ſuppoſe the *antidoron* to be diſtributed in lieu of the ſacrament, to ſuch as were prevented from attending in perſon at the celebration; and thence derive the origin of the word, the euchariſt being denominated *doron*, *gift*, by way of eminence.

ANTIDOSIS, from αντι, and δωσις, *I give*, in *Antiquity*, denotes an exchange of eſtates, practiſed by the Greeks on certain occaſions with peculiar ceremonies, and firſt inſtituted by Solon.

When a perſon was nominated to an office, the expence of which he was not able to ſupport, he had recourſe to the *antidoſis*, that is, he was to ſeek ſome other citizen of better ſubſtance than himſelf, who was free from this, and other offices; in which caſe, the former was excuſed. In caſe the perſon thus ſubſtituted denied himſelf to be the richeſt, they were to exchange eſtates, after this manner; the doors of their houſes were cloſe ſhut up and ſealed, that nothing might be conveyed away; then both took an oath to make a faithful diſcovery of all their effects, except what lay in the ſilver mines; which by the law was excuſed from all impoſts; accordingly, within three days, a full diſcovery and exchange of eſtates was made. Porter, Archeol. lib. 1. cap. 15.

ANTIDOTARY is uſed by ſome writers for what we more uſually call a DISPENSATORY.

We have *antidotaries* extant of ſeveral authors, as thoſe of Nicolaus, Meuſe, Myrepſus, Rhaſis, &c.

ANTIDOTE, a remedy taken either to prevent, or cure, ſome contagious, malignant, or other dangerous diſeaſe.

The word is borrowed from αντι, *againſt*, and δωμι, *I give*; as being ſomething given againſt poiſon, either by way of cure or preſervative.

ANTIDOTE, in alſo uſed to ſignify a medicine taken to prevent the ill effects of ſome other; for inſtance, poiſon.

In which ſenſe the word has the ſame ſignification with alexipharmic, alexiterial, and counterpoiſon.

The Indian phyſic conſiſts much in the uſe of *antidotes*; viz. the root *mungo*, and the viper-ſtone; both held ſovereign againſt the bite of the *cobras de capello*, and other venomous creatures.

ANTIDOTE is alſo uſed, in a more general ſenſe, for any compounded medicine.

In which ſenſe, Peter Damian ſpeaks of a perſon who in his whole life never took an *antidote*.

ANTIDOTE is alſo uſed in a leſs proper ſenſe for any remedy againſt any diſeaſe, chiefly if it be inveterate, and ariſe from ſome ulcer or abſceſs.

ANTIDOTE is alſo uſed for a perpetual form of medicines, otherwiſe called *opiates*, or more properly CONFECTIONS.

ANTIDOTE is alſo *myſtically* applied to the philoſopher's ſtone.

ANTIENT. See ANCIENT.

The word is compounded of *anti*, *contra*, *against*, and *διάφορος*, *indifferent*.

This name was given, in the fourteenth century, to the rigid Lutherans, who disavowed the episcopal jurisdiction, and many of the church-ceremonies, retained by the moderate LUTHERANS.

ANTIBACCHIUS, in the *Ancient Poetry*, a foot, consisting of three syllables; the two first whereof are long; and the third short.

Such are the words *cántârê*, *vîrtûtê*, Ἑλλῆνες.

It is so called as being contrary to the BACCHIUS, the first syllable whereof is short, and the two last long.

Among the ancients, this foot is also denominated *Palim-bacchius*, and *Saturnius*; and, by some, *Prepontius*, and *Theſſalius*. Diom. III. p. 475.

ANTIBARBAROUS, a title given to several works levelled against the use of barbarous terms and phrases, chiefly in the Latin Tongue.

Erasmus, Nizolius, and Cellarius, have published *Antibarbaro*. Noltenius has given us a Lexicon *Anti-barbarum*, consisting of observations made by the grammarians of late ages in relation to the purity and corruption of Latin words.

Sixt. Amama has given an *Antibarbarus Biblicus*, wherein he pretends to have discovered seven sources of the barbarisms which have got footing of late ages in the BIBLE.

Peter de Moulin used the title *Antibarbarus* for a book against the use of an unknown tongue in divine service.

ANTIBIBLOS, in the *Civil Law*, an instrument or signature, whereby the defendant owns he has received the libel, or copy of it, and notes the day whereon he received it. This is usually done on the back of the LIBEL.

ANTICADMIA denotes a species of mineral CADMIA, sometimes also called *pſeudo-*CADMIA.

It takes the denomination *anticadmia*, not as being opposite in quality to the *cadmia*, but because it is used as a substitute for it.

ANTICARDIUM, in *Anatomy*, &c. that hollow part under the breast, just against the heart, commonly called the *pit of the ſtomach*: called also *ſcrobiculus cordis*.

The word is compounded of *anti*, *contra*, *against*; and καρδία, *cor*, *heart*.

ANTICATARRHAL, an epithet given to medicines prescribed for catarrhs.

ANTICATEGORIA, in *Oratory*, denotes a recrimination or mutual accusation; where the two parties charge each other with the same crime.

Apollodorus considers the *anticategoria* as two several causes or actions.

ANTICAUSOTICS, among *Phyſicians*, denote medicines against burning fevers.

In this sense Juncker has given the description of *anticaustic* syrup.

ANTICHAMBER, see ANTECHAMBER.

ANTICHORUS, in *Botany*, a genus of the *octandria monogynia* class, which has a four-leaved calyx, four petals, an awl-shaped, four-celled capsule, with four valves, and many seeds. There is only one species.

ANTICHRESIS, in the *Civil Law*, a covenant, or convention, whereby a person borrowing money of another engages, or makes over his lands or goods to the creditor, with the use and occupation thereof, for the interest of the money lent. This covenant was allowed of by the Romans; among whom usury was prohibited: it was afterwards called MORTGAGE, to distinguish it from a simple engagement, where the fruits of the ground were not alienated, which was called *VIF-gage*.

ANTICHRIST, in a general sense, denotes an adversary of Christ, or one who denies that the Messiah is come.

The word is compounded of *anti*, *contra*, *against*; and χριστὸς, *Chriſt*.

In this sense, Jews, infidels, &c. may be said to be *Antichriſts*.

ANTICHRIST is more particularly used for a tyrant who is to reign on earth, toward the end of the world; to make the ultimate proof of the elect; and to give a shining instance of Divine vengeance, before the last judgment.

The Bible and the fathers all speak of *Antichriſt* as a single man; though they assure, withal, that he is to have divers precursors, or fore-runners. Yet many Protestant writers apply to the Romish church, and the pope, who is at the head of it, the several marks and figurations of *Antichriſt* enumerated in the Apocalypse, which would rather imply *Antichriſt* to be a corrupt society, or a long series of persecuting pontiffs, than a single person. Or rather, a certain power or government, that may be held for many generations, by a number of individuals succeeding one another. The *Antichriſt* mentioned by the apostle John, 1 Ep. ii. 18. and more particularly described in the book of Revelation, seems evidently to be the same with the *Man of Sin*, &c. characterised by St. Paul in his second Epistle to the Thessalonians, ch. ii. And the whole description literally applies to the excesses of papal power. Had the right of private judgment, says an excellent writer, been always adopted and maintained, *Antichriſt* could never have been; and when that sacred right comes to be universally asserted, and men follow the voice of their own reason and consciences, *Antichriſt* can be no more.

However, the point having been maturely debated at the council of Gap, held in 1603, a resolution was taken thereupon, to insert an article in the confession of faith, whereby the pope is formally declared to be *Antichriſt*. Pope Clement VIII. was stung to the life with this decision; and even king Henry IV. of France was not a little mortified, to be thus declared, as he said, an imp of *Antichriſt*.

The learned Grotius maintains, that Caligula was *Antichriſt*; others have affirmed the same of Nero; but these do not agree with his appearance at the end of the world.

F. Malvenda, a Spanish Jesuit, has published a large and learned work, *De Antichriſto*, in thirteen books. In the first, he relates all the opinions of the fathers with regard to *Antichriſt*. In the second, he speaks of the time when he shall appear; and shews, that all the fathers, who supposed *Antichriſt* to be near at hand, judged the world, also, was near its period. In the third he discourses of his origin and nation; and shews that he is to be a Jew, of the tribe of Dan: this he founds on the authority of the fathers; on that passage in Gen. xlix. *Dan ſhall be a ſerpent by the way*, &c. on that of Jeremy viii. 16. where it is said, *The ſnortings of Dan ſhall devour the earth*; and on the Apocalypse, chap. vii. where St. John, enumerating all the tribes of Israel, makes no mention of that of Dan. In the fourth and fifth books, he treats of the signs of *Antichriſt*. In the sixth, of his reign and wars. In the seventh, of his vices. In the eighth, of his doctrine and miracles. In the ninth, of his persecutions; and, in the rest, of the coming of Enoch and Elias; the conversion of the Jews, the reign of Jesus Christ, and the death of *Antichriſt*, after his having reigned three years and a half.

Hippolitus, and others, held that the devil himself was the true *Antichriſt*, that he was to be incarnate, and make his appearance in human shape before the consummation of things.

How endless are conjectures? Some of the Jews, we are told, actually took Cromwell for Christ, while some others have laboured to prove him *Antichriſt* himself. Pfaffius assures us that he saw a folio book in the Bodleian library, written on purpose to demonstrate this latter position.

ANTICHRISTIANISM, a state or quality in persons or principles, which denominates them antichristian, or opposite to the kingdom of Christ, and the genius and spirit of his religion.

ANTICHRISTIANS properly denote the followers or worshippers of *Antichriſt*.

ANTICHRISTIANS are more particularly understood of those who set up, or believe in a false Christ, or Messiah.

ANTICHTHON, in its primitive astronomic sense, denotes a kind of globe, or earth, resembling ours, and like it, supposed to be moving round the sun, but invisible to us, because on the opposite side of the sun, that luminary being still exactly interposed between this other earth and ours.

In this sense it is, that Pythagoras and his disciples asserted an *antichthon*; for which we have the testimonies of Aristotle, Plutarch, &c.

By reason of the perfection of the number ten, they concluded there must be just so many spheres; and as our senses only discover nine, viz. the seven planets, the sphere of the fixed stars, and our earth, they imagined a tenth opposite to ours.

Some of the fathers, who endeavoured to accommodate the doctrine of the heathen philosophers to those of Christianity, assert that this Pythagorean earth is no other than the heaven of the righteous.

Thomasius has a dissertation on the Pythagorean *antichthon*.

ANTICHTHONES, in *Geography*, are those people who inhabit countries diametrically opposite to each other.

The word is compounded of *anti*, *contra*, *against*; and χθὼν, *terra*, *earth*. They are also sometimes called [illegible] writers, *antigeae*.

In which ſenſe, *antichthones* amount to much the ſame with what we more uſually call *antipodes*.

ANTICHTHONES is alſo uſed in *Ancient Writers*, to denote the inhabitants of contrary hemiſpheres.

In which ſenſe *antichthones* differs from *antoeci*, and *antipodes*.

The ancients conſidered the earth as divided by the equator into two hemiſpheres, the northern and ſouthern; and all thoſe who inhabited one of theſe hemiſpheres, were reputed *Antichthones* to thoſe of the other.

ANTICIPATION, from *ante*, *before*, and *capio*, *I take*, the act of preventing, or being before hand with a perſon, or thing; or of doing a thing before the time.

Anticipating a payment denotes the diſcharging it before it falls due. Such a debt was not yet become due; he *anticipated* the time of payment.

ANTICIPATION is alſo uſed in a *logical* ſenſe, for a preſumption, prejudice, or preconceived opinion.

This is alſo denominated preconception, preſentation, or inſtinct.

ANTICIPATION, in a medicinal ſenſe, is applied to diſeaſes, wherein ſome of the ſymptoms which regularly belong to ſome future period, appear in the beginning: or the word may be underſtood of thoſe diſeaſes, which having their acceſſes and remiſſions at ſtated hours, gain in point of time, and finiſh their period ſooner than ordinary.

In this ſenſe *anticipation*, or *anticipated* diſeaſes, by the Greeks called προτεριανοι, ſtands oppoſed to hyſteretic, υστεριανοι, which come after the time.

ANTICIPATION, in the *Epicurean Philoſophy*, denotes the firſt idea, or definition of a thing, without which we can neither name, think, doubt, or even inquire, concerning it.

This is otherwiſe denominated PRENOTION.

Anticipation, in this ſenſe, makes the ſecond of Epicurus's criterions of truth.

ANTICIPATION is alſo uſed by Shaftesbury, in ſpeaking of painting, to denote the expreſſion of ſome future action, reſolution, or the like.

ANTICIPATION, in *Rhetoric*, a figure otherwiſe called PROLEPSIS.

ANTICK, in *Sculpture* and *Painting*, denotes a fantaſtical compoſure of figures of different natures, ſexes, &c. as men, beaſts, birds, flowers, fiſhes, and even things merely imaginary, or which have no exiſtence in the nature of things.

Antick amounts to much the ſame thing with what the Italians call *groteſca*, and the French *groteſque*.

ANTICLIMAX, from αντι and κλιμαξ, *gradation*, in *Rhetoric*, is a figure, whereby the progreſs of a diſcourſe deſcends from great to little; and this is ſometimes rendered peculiarly agreeable by ſuch a concord between the ſenſe and ſound as may contribute to make diminutions appear ſtill more diminutive. Horace affords a ſtriking example.

Parturiunt montes, naſcetur ridiculus mus.

ANTICNEMION, from αντι, and κνημη, *tibia*, *the ſhin-bone*, in *Anatomy*, denotes the ſhin; or the fore prominent part of the *tibia*.

This is otherwiſe called αναξων, by the Latins *primo tibia*, or *anterior tibia*, and ſtands oppoſed to the *ſura*, or calf of the leg, ſometimes called *acra*.

ANTICOR, from *ante* and *cor*, *the heart*, ANTICEUR, or *avant cœur*, among *Farriers*, is uſually deſcribed as a preternatural ſwelling, of the ſize and figure of an apple, occaſioned by a ſanguine and bilious humour, and appearing in a horſe's breaſt, oppoſite to his heart. A late writer affirms, that the generality of authors on that ſubject have been miſtaken as to this diſeaſe, attributing it to the heart; whence it is by Solleyſel called the *ſwelling of the pericardium*: whereas it is really an inflammation in the gullet and throat; and is the ſame that, in human bodies, is called the *angina*, or *ſquinancy*.

The cure of this diſeaſe ſhould be attempted by copious bleedings, in order to reduce the inflammation. Emollient clyſters ſhould alſo be injected twice or thrice a day, with an ounce of ſal prunella in each. The ſwelling ſhould be bathed with marſhmallow ointment; and an opening poultice, with onions boiled in it, ſhould be daily applied to it. If the inflammation be hereby removed, the ſwelling ſhould be brought, if poſſible, to maturation: for this purpoſe the poultice muſt be continued, and two ounces of Venice treacle, diſſolved in a pint of beer, muſt be given to the horſe every night. When the ſwelling is ſoftened, it muſt be opened with a knife, and dreſſed with turpentine digeſtive. But if the ſwelling cannot be brought to matter, and ſhould endanger ſuffocation, Solleyſel, and others, adviſe opening the ſkin, in order to introduce a piece of black hellebore-root ſteeped in vinegar, and to confine it there for twenty-four hours. In order to ſtimulate and promote a diſcharge, the adjacent parts ſhould be ſomented, and bathed with ointment of marſhmallows.

ANTICUM, in *Architecture*, a porch before a door; alſo that part of a temple, which is called the outer temple, and lies between the body of the temple and the portico. It is ſometimes called *antæ*.

ANTICUS, *ſerratus minor*. See SERRATUS.

ANTICUS, *peronæus*. See PERONÆUS.

ANTICUS, *tibialis*. See TIBIALIS.

ANTIDACTYLUS, from αντι, and δακτυλος, *dactyle*, a name given by ſome to a kind of poetical foot, which is the reverſe of a dactyl, as conſiſting of three ſyllables, whereof the firſt two are ſhort, and the laſt long.

ANTIDÆMONICI, from αντι, and δαιμων, *daemon*, in *Eccleſiaſtical Hiſtory*, a ſect who denied the exiſtence of devils, or evil ſpirits; alſo all ſpectres, incantations, witch-crafts, &c.

ANTIDICOMARIANITES, from αντιδικος, *adverſary*, and Μαρια, *Mary*, a ſect of ancient Chriſtians who thought that the Holy Virgin did not preſerve a perpetual virginity, but that ſhe had ſeveral children by Joſeph after our Saviour's birth.

Theſe are otherwiſe called *antidicomarite*; and *antidicomarites*, and *antidicomarianiſts*; ſometimes alſo *antimarians*.

The opinion was grounded on ſome expreſſions of our Saviour, wherein he mentions his brothers, and his ſiſters; and on that text of St. Matthew, wherein he ſays, that Joſeph knew not Mary till ſhe brought forth her firſt-born ſon.

The *antidicomarianites* were the diſciples of Helvidius and Jovinian, who appeared in Rome towards the cloſe of the fourth century.

ANTIDISMA, in *Botany*, a genus of the *dioecia pentandria* claſs, without any Engliſh name.

ANTIDORON, in *Eccleſiaſtical Writers*, a name given by the Greeks to the conſecrated bread, out of which the middle part, marked with the croſs, wherein the conſecration reſides, being taken away by the prieſt, the remainder is diſtributed, after maſs, to the poor.

On the ſides of the *antidoron* are impreſſed the words *Jeſus Chriſtus vincit*.

The word is formed from δωρον, *donum*, *a gift*, as being given away *ita nuncupatis or in charity*.

The *antidoron* is alſo called *panis præſanctificatus*.

Some ſuppoſe the *antidoron* to be diſtributed in lieu of the ſacrament, to ſuch as were prevented from attending in perſon at the celebration; and thence derive the origin of the word, the euchariſt being denominated *doron*, *gift*, by way of eminence.

ANTIDOSIS, from αντι, and διδωμι, *I give*, in *Antiquity*, denotes an exchange of eſtates, practiſed by the Greeks on certain occaſions with peculiar ceremonies, and firſt inſtituted by Solon.

When a perſon was nominated to an office, the expence of which he was not able to ſupport, he had recourſe to the *antidoſis*, that is, he was to ſeek ſome other citizen of better ſubſtance than himſelf, who was free from this, and other offices; in which caſe, the former was excuſed. In caſe the perſon thus ſubſtituted denied himſelf to be the richeſt, they were to exchange eſtates, after this manner; the doors of their houſes were cloſe ſhut up and ſealed, that nothing might be conveyed away; then both took an oath to make a faithful diſcovery of all their effects, except what lay in the ſilver mines; which by the law was excuſed from all impoſts; accordingly, within three days, a full diſcovery and exchange of eſtates was made. Porter, Archæol. lib. 1. cap. 15.

ANTIDOTARY is uſed by ſome writers for what we more uſually call a DISPENSATORY.

We have *antidotaries* extant of ſeveral authors, as thoſe of Nicolaus, Meuſe, Myrepſus, Rhaſis, &c.

ANTIDOTE, a remedy taken either to prevent, or cure, ſome contagious, malignant, or other dangerous diſeaſe. The word is borrowed from αντι, *againſt*, and διδωμι, *I give*; as being ſomething given againſt poiſon, either by way of cure or preſervative.

ANTIDOTE, is alſo uſed to ſignify a medicine taken to prevent the ill effects of ſome other; for inſtance, poiſon.

In which ſenſe the word has the ſame ſignification with alexipharmic, alexiterial, and counterpoiſon.

The Indian phyſic conſiſts much in the uſe of *antidotes*; viz. the root *mungo*, and the viper-ſtone; both held ſovereign againſt the bite of the *cobras de capello*, and other venomous creatures.

ANTIDOTE is alſo uſed, in a more general ſenſe, for any compounded medicine.

In which ſenſe, Peter Damian ſpeaks of a perſon who in his whole life never took an *antidote*.

ANTIDOTE is alſo uſed in a leſs proper ſenſe for any remedy againſt any diſeaſe, chiefly if it be inveterate, and ariſe from ſome ulcer or abſceſs.

ANTIDOTE is alſo uſed for a perpetual form of medicines, otherwiſe called *opiates*, or more properly CONFECTIONS.

ANTIDOTE is alſo *myſtically* applied to the philoſopher's ſtone.

ANTIENT. See ANCIENT.

ANTIGRAPHE, from ἀντι, and γραφω, *I write*, in *Antiquity*, denotes a law-fuit about kindred, whereby a perfon claimed relation to fuch or fuch a family.

The *antigraphe* appears to have been the fame with the ἀφανειας δικη.

ANTIGRAPHUS, in *Antiquity*, an officer of Athens, who kept a counterpart of the *apodexis*, or chief treasurer's accounts, to prevent miftakes, and keep them from being falfified. Potter Arch. lib. i. cap. 14.

ANTIGRAPHUS is alfo ufed, in *Middle Age Writers*, for a fecretary or chancellor. He is thus called, according to the old glofsariſts, on account of his writing anfwers to the letters fent to his maſter. The *antigraphus* is fometimes alfo called *archigraphus*; and his dignity *antigraphia*, or *archigraphia*. Du-Cange.

ANTIGRAPHUS is alfo ufed in Iſidorus for one of the notes of fentences, which is placed with a dot to denote a diverſity of fenſe in tranſlations.

ANTIGRAPHUS is alſo applied in *Eccleſiaſtical Writers* to an ABBREVIATOR of the papal letters.

In which fenſe the word is ufed by pope Gregory the Great in his Regiſter.

Of late days the office of *antigraphus* conſiſts in making minutes of bulls from the petitions given in to him by his holineſs, and renewing the BULLS after engroſſing.

ANTIGUGLER, is a crooked tube of metal, ſo bent, as eaſily to be introduced into the necks of bottles, and uſed in decanting liquors, without diſturbing them. For this purpoſe the bottle ſhould be a little inclined, and about half a ſpoonful of the liquor poured out, ſo as to admit an equal quantity of air; let one end of the bent tube be ſtopped with the finger, whilſt the other is thruſt into the body of the liquor near to the bubble of air already admitted. When the finger is taken off, the bottle will have vent, and the liquor will run out ſteadily and undiſturbed. See SIPHON.

ANTIHECTICS, remedies againſt hectical diſorders.

ANTIHECTICUM *Poteri*, in *Pharmacy*, a celebrated chemical preparation, made of equal quantities of tin and chalybeated regulus of antimony, by melting them in a large crucible, and putting to them, by little and little, three times the quantity of nitre: the DETONATION being over, the whole is to be waſhed with warm water till no ſaltneſs remains.

This has been formerly eſteemed as a very penetrating medicine, making way into the minuteſt paſſages, and ſearching even the nervous cells; whence its uſe in hectic diſorders, from which it derives its name. It has been accordingly recommended in heavineſs of the head, giddineſs and dimneſs of ſight, from whence proceed apoplexies, and epilepſies; and in all affections and foulneſſes of the viſcera of the lower belly; and alſo in the jaundice, dropſies, and all kinds of cachexies. Quincy adds, that there is ſcarce a preparation in the chemical pharmacy of greater efficacy in moſt obſtinate chronic diſtempers. But Neumann obſerves, that it has no claim to antihectic virtues, nor indeed to any ſalutary operation; and it is now generally diſregarded. See Neumann's Chem. Works, p. 89, and 138.

It is alſo called *antimonium diaphoreticum ſolidi*.

There are divers methods of preparing it, given by Wedelius, Etmuller, &c.

A learned author ſpeaks of it as fatal to conſumptive perſons.

ANTILEXIS, from ἀντιλεγω, *I contradict*, in *Antiquity*, denotes a new trial granted in the Athenian judicatories, where judgment had before paſſed againſt a party for non-appearance.

ANTILOGARITHM, the COMPLEMENT of the LOGARITHM of a ſine, tangent, or ſecant.

ANTILOGY, a contradiction between two expreſſions, or paſſages, in an author.

The word is ἀντιλογια, q. d. *contrary ſaying*.

Tirinus has publiſhed a large index of the ſeeming *antilogies* in the BIBLE, i. e. of texts which apparently contradict each other, but which are all explained and reconciled by him, in his comments on the Bible. Dom. Magri, a Malteſe of the *Oratory* in Italy, has attempted the like; but he has done little more than rehearſe what occurs of that kind in the principal commentators.

ANTILUTHERANS, a ſect or party among the ancient reformers, who maintained opinions, chiefly in relation to the euchariſt, different from thoſe of Luther.

Such were Carolofadius and his followers, called alſo *Sacramentarians*; and thoſe of Zuinglius denominated *Zuinglians*.

The ſect of *Antilutherans*, at firſt confined within narrow bounds, in a few years time ſubdivided into ſix or ſeven inferior ſects, and ere long into an infinite number more variouſly denominated.

ANTILYSSUS *pulvis*, in *Medicine*, is compoſed of equal parts of the LICHEN *cranei terreſtris* & *piper nigr.* It is reckoned uſeful in preventing the RABIES *canina*. Phil. Tranſ. N° 448.

ANTIMENSIUM, a kind of conſecrated table-cloth, occaſionally uſed in the Greek Church, in places where there is no proper altar.

F. Goar obſerves, that in regard the Greeks had but few conſecrated churches, and that conſecrated altars are not things eaſy to be removed; that church has, for many ages, made uſe of certain conſecrated ſtuffs, or linens, called *antimenſia*, to ſerve the purpoſes thereof.

ANTIMENSIUM, in the Greek *Church*, anſwers to the *altare portabile*, or portable altar, in the Latin Church. They are both only of late invention, though Habertus would have them as old as St. Baſil. But Durant and Bona do not pretend to find them in any author before the time of Gregory and Charlemagne.

ANTIMENSIA is alſo applied to other tables, uſed in offices of religion, beſides thoſe whereon the euchariſt is adminiſtered: ſuch, e. gr. are thoſe whereon the hoſt is expoſed, &c. The origin of the *antimenſia* is deſcribed by Meurſius; when the biſhop had conſecrated a church, the cloth which had been ſpread on the ground, and over the communion table, was torn in pieces, and diſtributed among the prieſts, who carried each a fragment away, to ſerve to cover their tables in their churches and chapels. Not that it was neceſſary that ſuch cloths ſhould be laid on all tables: but only on thoſe which either were not conſecrated, or at leaſt whoſe conſecration was doubted of.

ANTIMENSIUS, an ancient officer in the Greek church, whoſe buſineſs was to introduce and place the communicants at the euchariſt.

Some have imagined that he had the care of the *antimenſia*. But this rather belonged to the office of great *ſecretophylax*. He is otherwiſe called chief of the *antimenſia*.

ANTIMERIA, from ἀντι, and μερος, *a part*, in *Grammar*, a figure whereby one part of ſpeech is uſed for another; e. gr. *velle ſuum cuique eſt*, for *voluntas ſui cuique eſt*. Alſo *populus late rex*, for *populus late regnans*.

ANTIMERIA, in a more reſtrained ſenſe, is a figure whereby the noun is repeated inſtead of the pronoun.

The *antimeria* is frequent in the Hebrew, and is ſometimes retained in our verſion of the Old Teſtament accordingly: e. gr. *Hear my Voice, ye wives of Lamech*, for *my voice*. Gen. ch. iv. ver. 23.

ANTIMETABOLE, in *Rhetoric*, a figure which ſets two things in oppoſition to each other.

The word is compounded of ἀντι, *againſt*, and μεταβαλλω from μεταβολη, *I ſhift*, or *tranſfer*; i. e. a ſhifting, or ſetting two things over-againſt each other.

This figure is twice exemplified in an apophthegm of Muſonius; which, on account of its excellence, is called *aurcum monitum*, the golden maxim or precept.

Ἀν τι πραξῃς καλὸν μετὰ πόνου, τὸ μὲν πόνος ἔρχεται, τὸ δὲ καλὸν μένει. Ἂν τι πονήσῃς αἰσχρὸν μετὰ ἡδονῆς, τὸ μὲν τῆδε ἔρχεται, τὸ δὲ αἰσχρὸν μένει.

In Engliſh thus:

Allowing the performance of an honourable action to be attended with labour; the labour is ſoon over, but the honour immortal: whereas, ſhould even pleaſure wait on the commiſſion of what is diſhonourable, the pleaſure is ſoon gone, and the diſhonour eternal.

ANTIMETATHESIS, from ἀντι, and μετατιθημι, *I tranſfer*, in *Rhetoric*, is the inverſion of the parts or membeis of an ANTITHESIS. Such is that of Cicero, in Verrem, lib. iv. cap. 52. 'Compare this peace with that war; 'the arrival of this governor with the victory of that ge'neral; his profligate troops with the invincible army of 'the other; the luxury of the former with the tempe'rance of the latter: you will ſay, that Syracuſe was 'founded by him who took it; and taken by him, who 'held it when founded.'

ANTIMISIUM, in *Antiquity*, a table placed before the Roman tribunal, or judgment-ſeat.

What relation this has to the *antimenſia* in the Greek church does not appear. Some writers confound them together as the ſame thing.

ANTIMONARCHICAL, from ἀντι, and μοναρχια, of μονος, *alone*, and ἀρχω, *dominion*, ſomething that oppoſes, or ſtands againſt, monarchy, or kingly government.

Antimonarchical is frequently uſed in the ſenſe of *republican*.

ANTIMONARCHIST, a perſon who maintains *antimonarchical* principles.

Buchanan, Milton, Hottoman, Languet, Ludlow, Sydney, and others, are celebrated *antimonarchiſts*.

ANTIMONARCHOMACHI, from ἀντιμοναρχος, and μαχη, *conteſt*, *antimonarchomachiſts*, is uſed by ſome political writers to denote maintainers of monarchical or abſolute power veſted by divine right in the perſons of princes. In which ſenſe, *antimonarchomachi* ſtand oppoſed to *monarchomachi*.

King James the firſt, Salmaſius, Peter du Moulin, biſhop Bramhall, Albericus Gentilis, Ziegler, William and George Barclay, Bochart, &c. have diſtinguiſhed themſelves in the claſs of *antemonarchomachiſts*. Acker has treated profeſſedly of the *monarchomachiſts* and *antimonarchomachiſts*.

ANTIMONIALS, in *Medicine*, denote preparations of antimony; or remedies whereof *antimony* is the baſis, or principal ingredient.

Antimonials are chiefly of an emetic tendency; though they may be ſo qualified, as to become either cathartic, or diaphoretic, or even only alterative. See WARD's *Pill*.

Quincy aſſures us, that there are no medicines in pharmacy to be compared with theſe in *maniacal* affections; for that there are no emetics, or cathartics, of any other tribe, that are ſtrong enough for ſuch patients, unleſs in an over-doſe; which might be dangerous.

An *antimonial* cup, made either of glaſs of *antimony*, or of *antimony* prepared of ſalt-petre, though a ſubſtance indiſſoluble by the ſtomach, will give a ſtrong cathartic, or emetic quality to any liquor poured into it, without any diminution of its own weight.

Beſides thoſe numerous preparations which take their denominations from *antimony*, the chief of which are enumerated under that article, there are ſeveral other *antimonial* medicines. Such are the *crocus metallorum*, Poterius's cordial, the TINCTURA *metallorum*, *mercurius vitæ*, or powder of ALGAROT, *bezoardicum minerale*, *ſulphur metallorum*, the Carthuſian powder, or KERMES mineral, &c.

Lemery deſcribes ſeveral other preparations of this mineral.

ANTIMONIATED, ſomething tinged with the qualities, or reſembling the appearances, of *antimony*.

Dr. Woodward ſpeaks of a kind of ſtriated, or *antimoniated*, lead-ore.

ANTIMONY, in *Natural Hiſtory*, a mineral ſubſtance of a metalline nature; having all the ſeeming characters of a real metal, excepting only *malleability*. It is of a ſhining lead colour, and its maſſes have no determinate figure, but are compoſed of long brittle parallel needles. It is made up of a ſemi-metallic ſubſtance, called its *regulus*, united with ſulphur, as moſt metallic ſubſtances are in their mineral ſtate.

There are two kinds of *antimony*; 1. *Antimony native* or *mineral*, which is in the ſame ſtate as when dug out of the earth. 2. *Antimony fuſed*, ſo called, becauſe it has been actually *fuſed*, to ſeparate it from adhering to ſtones and earth. This operation which ought rather to be called *liquation* than *fuſion*, conſidering theſe words in their metallurgic ſenſe, is made in great perfection upon the grounds whence *antimony* is dug. The proceſs is very ſimple and eaſy. It conſiſts in placing the minerals in earthen pots, pierced in their bottoms with ſmall holes, and put into a furnace, where they receive the neceſſary heat for the *fuſion* of the *antimony*. As it is very *fuſible*, for it melts before it is red, this heat is much leſs than is neceſſary for the fuſion of the earthy and ſtony matters mixed with it; when it is thus melted, it runs through the holes above mentioned, into other pots below, defended from the heat as much as poſſible. In theſe receivers the *antimony* is allowed to cool and fix, and from them it takes the form of cakes, in which it is ſold.

Hungary and Auvergne furniſh moſt *antimony*, though it is alſo found in other countries and in different forms.

Antimony is the *ſtibium* of the ancients; by the Greeks called, *ευιμι*.—The reaſon of its modern denomination, *antimony*, is uſually referred to Baſil Valentine, a German monk, who, as the tradition relates, having thrown ſome of it to the hogs, obſerved, that, after purging them violently, they immediately grew fat upon it. This made him think, that, by giving his fellow-monks a like doſe, they would be the better for it. The experiment, however, ſucceeded ſo ill, that they all died of it; and the medicine, thenceforward, was called *antimony*, q. d. *anti-monk*.

Its ſingular properties and effects have occaſioned it various other denominations; as *Proteus*, by reaſon of its various forms and appearances, *lupus devorator*, SATURN *of the philoſophers*, *balneum ſolis*, *lavacrum leproſorum*, *radix metallorum*, *magneſia Saturni*, &c. all chiefly reſpecting its faculty of deſtroying and diſſipating whatever metals are fuſed along with it, except gold; whence its great uſe in refining and purifying.

Antimony is found in mines of all metals; but chiefly in thoſe of ſilver and lead: that in gold mines is uſually held the beſt.—It has alſo its own peculiar mines.

Antimony is found in clods of ſeveral ſizes, bearing a near reſemblance to black lead; only that it is lighter and harder; whence alſo it is called *marcaſita of lead*; and its metalline part has been by ſome ſuppoſed to be of the ſpecies.

Its texture is ſomewhat particular, being full of little ſhining veins or threads like needles, brittle as glaſs.—Sometimes there are veins of a red, or golden colour intermixed, from which it is called *male antimony*; that without them being denominated *female*.

Antimony ores are found in fiſſures and veins at different depths, and often near the very ſurface, and variouſly accompanied with ſpars, cryſtals, ſulphurs, and other ſubſtances. Sometimes the veins of it are every way ſurrounded by a tolerable pure yellow native ſulphur; ſometimes with a more debaſed matter, made of a mixture of ſulphur, earth, and ſpar, differing according to the different diſpoſition and admixture of theſe bodies.

Antimony is found in great abundance in England and Germany; we have ſeveral mines of it in Cornwall; and many other parts of the world afford it in very great abundance.

ANTIMONY, *ore of*. The way of running down *antimony* out of its ore by the *aſſayers*, is as follows. Take a crucible that will hold ſome pounds of *antimony* ore broken into pieces of the ſize of a hazel-nut, and bore at the bottom of [illegible] place this bottom in the mouth of another ſmaller crucible, put in the ore, and cover the orifice with a tile; then lute all the junctures, and place this on the pavement of the hearth, making a circle of ſtones all round it, at ſix inches diſtance; fill this intermediate ſpace with aſhes ſo high, that the lower pot may be covered up to its rim, then put freſh burning coals upon the whole, and blow the fire ſtrongly with a pair of hand-bellows, to make the upper veſſel red-hot: when it has been ſo a quarter of an hour, take away the fire, and when the veſſels are cold, open them, and the *antimony* will be found in form of a *regulus* in the under veſſel. Cramer's Art of Aſſaying, p. 356.

The moſt ready method of ſuſing *antimony*, yet known, is by means of that mineral ſubſtance called CAWK. A lump of this, of the bigneſs of a wallnut, thrown red-hot into a pound of *antimony* in fuſion, converts almoſt the whole ſubſtance of it into glaſs, fifteen ounces of clear and fine glaſs being thus produced; and what is very remarkable, the *cawk* itſelf never melts in the metal.

ANTIMONY, *texture of*. M. de Reaumur gives the following account of the contexture of *antimony*, or *ſtibium*.

Nothing is more common, than to obſerve on the ſurface of broken *antimony* long and ſhining needles, as it were; and that *antimony*, on which theſe are moſt diſtinct and viſible, is eſteemed the beſt. Sometimes theſe ſtreaks are ranged with ſo much order, and branch out ſo regularly in certain directions, that thoſe who are ever ſo converſant with it, cannot but admire its beauty. The figures of the conſtituent molecules of this mineral may poſſibly contribute ſomething to the formation of theſe needles, but the texture, and configuration of the conſtituent parts, will not alone account for the diſpoſition of theſe ſtreaks, and their arrangements, in regard to one another; ſince upon breaking different lumps of the ſame *antimony*, and thoſe of the ſame ſhape, we frequently obſerve quite different configurations of the needles. Let us take, for inſtance, equal maſſes of *antimony* of a regular conic figure, theſe being moſt frequent, from the ſhape of the veſſel they cool in, which reſembles a funnel, or inverted cone; let ſeveral of theſe conical maſſes be broken into different parts, and we ſhall ſee the needles in very different directions in theſe ſeveral parts. Notwithſtanding, however, all theſe varieties in form, the cauſe of all the appearances is wholly the ſame, and is no other than that refrigeration, by which the maſs is changed from a fluid into a ſolid ſtate; and to the progreſs of this the needles plainly owe their different directions.

All melted metals cool firſt at the tops and ſides, and thence by degrees through the whole body of the maſs: the particles at the ſides and top, which firſt cool, becoming fixt to thoſe which are neareſt them, affix thoſe, and they are the next that cool, and ſo on, in ſucceſſive order; now *molecular*, of whatever ſhape, thus affixed ſucceſſively to each other, form a kind of threads or needles, the ſeveral directions of which ſhew the order in which the refrigeration has been carried on.

If the crucible, or other veſſel, in which the melted *antimony* is ſuffered to cool, were in the ſhape of a hollow bowl; if its ſides were every where equally thick, and equally warm, and acted equally upon by an air equally cold; and if the melted ſubſtance were of the ſame uniform nature, alſo, in all its parts, all the needles or fibres would be then ſo many rays, terminating in the centre of the bowl; and if the ſubſtance were ſuch, that

its

its fixed particles were naturally all of a length, we ſhould find ſo many concentrical beds of needles, formed by parcels of each ray, and lying at equal diſtances from the centre.

But ſo many regular circumſtances do not concur in the cooling of melted *antimony*; and hence the before mentioned irregularities muſt neceſſarily ariſe. In melting *antimony* in conical crucibles, and ſuffering it to cool in them, the needles may be determined ſeveral ways, to any direction one may chooſe.

Lead, when heated to a certain degree, ceaſes to be ductile, and is brittle, and broken at this juncture is found to be granulared, appearing like broken ſteel; there is no reaſon to doubt, but that this is alſo the caſe, when that metal is perfectly cold, but that the force required to ſeparate, or break it, deſtroys its proper ſtructure.

M. Reaumur melted lead in a conical crucible, and ſuffering it to cool to a certain degree only, he broke the maſs into ſeveral large lumps by a ſmart blow of a hammer, and in theſe found the ſame needles as in *antimony*, the granules having cohered in long trains, juſt as the *moleculæ* of the *antimony*; and the diſpoſitions of the ſeveral groups of needles in the lead, in regard to the ſides and bottom of the crucible, were the very ſame with thoſe of *antimony*. But there is this manifeſt difference between the needles of lead, and thoſe of *antimony*, that whereas the latter are flat and extremely gloſſy, the former are viſibly round, and much leſs bright. Mem. Acad. Scienc. Par. 1724.

Antimony is ſuppoſed, by many of the *chemiſts*, to contain the ſeminal principles of all kind of metals; and accordingly the character whereby it is denoted in their writings, is the ſame with the character of the earth; to denote that *antimony* is a kind of microcoſm.

There have not been wanting perſons, who have pretended to extract mere running *mercury* from *antimony*, and Mr. Boyle believed it might be done; but this is one of the many great things pretended to by chemiſtry, of which we have yet no ſufficient proof.

The uſes of *antimony* are very numerous, and important. It is a common ingredient in *ſpecula*, or *burning* CONCAVES, ſerving to give the compoſition a finer texture. It makes a part in BELL *metal*; and renders the ſound more clear. It is mingled with TIN to make it more hard, white, and ſounding; and with LEAD, in the caſting of printers letters, to render them more ſmooth and firm. It is alſo a general help in the melting of metals, and eſpecially in the caſting of cannon balls.

The purification of gold, by means of *antimony*, is performed in this manner. Before you enter on the proceſs, if it is neceſſary to aſſeſs, as nearly as may be, at the alloy of the gold, by the TOUCH *needles*, or otherwiſe. If the quantity of gold in the maſs is not leſs than three quarters, that is, eighteen carats, the maſs muſt be melted in a wind-furnace, and the crucible muſt be covered, to prevent coals falling in; this done put into it, at ſeveral times, double the quantity of crude *antimony* in fine powder, as ſoon as one portion of the *antimony* is melted, putting in another: let the whole continue in fuſion a few minutes, then pour it into a melting cone, warmed, and rubbed with tallow, and ſtrike with a hammer on the floor, near where the cone ſtands, that the heavier part may ſink to the bottom. When all is cold, invert the cone, and ſtrike it, and a maſs will fall out, having at bottom a *regulus*, more or leſs yellow, according to the quantity of the gold in the mixture; this will with a few blows be ſeparated from the ſulphureous cruſt, which is at top. Melt in a ſmaller fire this *regulus*, and when in fuſion add to it a double quantity of crude *antimony* in powder, and pour it out into the cone again a little after; ſeparate the *regulus* from the *antimony* at top, and then repeat this operation once more. When this is done, put the ſeparated *regulus* into a thick good teſt, place this in the furnace immediately before the bellows, put coals round it, and one or two pieces of wood upon them, and make a middling fire, ſuch as is ſufficient to melt the *regulus*, the reguline part of the *antimony* will vaniſh in a thick ſmoak; then increaſe the fire, and keep it ſo, till the fumes are over, and the ſurface of the gold is of a fine green; and afterwards give the gold another fuſion with borax and nitre, and it will be perfectly pure. But gold cannot be ſeparated from *platina* in this way; and ſometimes a little ſilver will remain, which has been defended by the gold from the action of the *antimony*.

When the gold to be purified by this proceſs is impure, to an alloy of eight carats, it is not proper to perform the precipitation by *antimony* alone, but there ſhould be added as many times two carats of common ſulphur, as the alloy of the gold is ſo many carats leſs than eighteen. Cramer's Art of Aſſaying, p. 270.

Mr. Homberg being well aſſured, that water was a *menſtruum* capable of diſſolving all the metals, if properly applied, uſed it, in ſeveral different ways, in his *analyſis* of *antimony*. He made an *infuſion of antimony* in water, putting into ſeveral glaſs veſſels crude *antimony*, coarſely powdered, five pounds into each veſſel, and to each of theſe quantities he added two pints of rain-water; after the *antimony* had ſtood thus for ſix months, the ſeveral parcels were uſed on different occaſions, one only excepted, which had been forgotten, and had at length ſtood two winters and a ſummer; having at length found this veſſel, he obſerved that its inſide was every where coated over with configurations of leaves; he at firſt ſuppoſed this to be owing to ſome ſalts of the *antimony*, which had been diſſolved in the water, and had afterwards cryſtallized themſelves in this manner, as the *butter of antimony* is ſometimes known to do in ſublimation; but on rubbing the ſides of the veſſel with a finger, and afterwards ſcraping them with a knife, he found that they were covered with a yellowiſh pellicle, without the leaſt appearance of ſalt, and that the configurations of the leaves were not raiſed upon this pellicle, but ſunk, as if graved by a tool. The water taſted ſomewhat acid, and being tried on *turnſol*, and on different metallic ſolutions, it turned the *turnſol* to a light red, and turned a ſolution of ſilver white; whence it appeared to be an acid, and of the nature of that of ſea-ſalt. The ſunſhine had turned this water four, had made it act upon the *antimony*, and taken up a part of its ſalt. This ſalt, in the winter, was probably afterwards concreted into figures of leaves, formed upon the mud depoſited by the water on the ſides of the veſſel; and theſe ſalts being afterwards diſſolved again in ſome hotter weather, had eaten their way into this ſediment of mud, in the form of the leaves, &c. in which they had concreted. Mem. Acad. Par. 1693.

Antimony, at firſt, was of ſervice only in the compoſition of paint. Scripture deſcribes it to us as a ſort of paint, with which the women blacken their eye-brows. Jezebel underſtanding that Jehu was to enter Sumaria, painted her eyes with *antimony*, or, according to the Hebrew, "put her eyes in *antimony*."

As large black eyes were thought the fineſt, they of both ſexes, who were careful of their beauty, rubbed their eyes, eye-lids, and round the eyes, with a needle dipped in a box of paint made of *antimony*, with a deſign of blackening them.

At this day the women of Syria, Arabia, and Babylonia, anoint and blacken themſelves about the eyes; and both men and women put black upon their eyes in the Deſert, to preſerve them from the heat of the ſun, and the piercing of its rays. M. Darvieux tells us, that the Arabian women border their eyes with a black colour made of *nuts*, which the Arabians call *rehek*. They draw a line of this kind of blacking without the corner of their eyes, to make them appear larger. Iſaiah, in his enumeration of the ſeveral ornaments belonging to the daughters of Sion, has not forgot the needles which they made uſe of in painting their eyes and eye-lids: nor has this practice eſcaped the laſh of Juvenal.

Ille ſupercilium madida fuligine ſimtum
Obliqua producit acu, pingitque tremontes
Attollens oculos.

Ezekiel, deſcribing the irregularities of the Jewiſh nation under the idea of a debauched woman, ſays, that ſhe bathed, and perfumed herſelf, and that ſhe anointed her eyes with *antimony*. Job ſhews ſufficiently how much *antimony* was in eſteem, by calling one of his daughters a veſſel of *antimony*, or a box to put paint in, *cornu ſtibii*. Tertullian and St. Cyprian have declaimed very warmly againſt this cuſtom of painting the eyes and eye-brows.

ANTIMONY, *medicinal hiſtory of*. Before the fourteenth century, *antimony* had no place in *Medicine*. But, about that time, Baſil Valentine, having found a method of preparing and correcting the dangerous qualities of its ſulphur, publiſhed a book, intituled *Currus triumphalis Antimonii*, wherein he maintained it a ſure remedy for all diſeaſes.—But, in ſpite of all he could ſay in its behalf, though confirmed by experience, *antimony* remained in a general neglect upwards of an hundred years: till about the beginning of the ſixteenth century, when it was brought into vogue by Paracelſus.—The parliament of Paris, immediately upon this reſtoration, condemned the uſe of it in form; and a phyſician, named Belnier, having been found delinquent herein, was expelled the faculty. It ſeems, a great deal of miſchief had been done by it, for want of knowing the proper ways of g[illegible]ing it; ſo that the *arrêt* of parliament repreſents it [illegible]

mere poiſon, incapable of being corrected by any method of preparation, and not to be taken inwardly, without the utmoſt damage.

Several learned men complained of ſo ſevere and unjuſt a prohibition; and, by a courſe of happy experiments, at length brought it into eſteem again: whence, in ſpite of all the inveſtives made againſt *antimony* by divers authors, it was at length replaced, in the year 1637, by public authority, among the number of purgative drugs; and was inſerted, accordingly, in the Pharmacopœia, publiſhed by the faculty that ſame year.

Patin did all he could to decry *antimony*: in his letters we find an unuſual vehemence expreſſed againſt it.—He had even compiled a large regiſter of perſons whom the phyſicians had killed by it; which he called *the Martyrology of Antimony*.

Antimony, in *Medicine*, &c. is not only given in ſubſtance, but many preparations of it are uſed; which are either emetic, cathartic, diaphoretic, or ſudorific. *Crude antimony* in powder is found good for diſſolving viſcidities, in cutaneous diſeaſes, and, as ſome very confidently aſſert, in convulſions and epilepſies.

Crude antimony is recommended in palſies, pains and numbneſs, which come on after a ſalivation, and is ſaid to have cured ſeveral who were paralytic from other cauſes. The method of giving it, is to begin with three grains, increaſing the doſe with three grains every day, to half a drachm; after which the doſe is diminiſhed three grains every day, till it comes down to the quantity of the firſt doſe. Externally, in ointments, it is commended for drying up ulcers, curing the itch, and in plaſters for reſolving of tumors.

There appears no reaſon for people's being afraid of giving crude *antimony* internally; experience ſhews it to be a ſafe medicine, unleſs by accident the acid of the ſtomach ſhould be ſufficient to act as a *menſtruum* to it.

The preparations of *Antimony* are, 1. *Sulphur præcipitatum antimonii*. 2. *Crocus antimonii*, called alſo *crocus metallorum*. 3. *Crocus antimonii lotus*. 4. *Cake antimonii*, called *antimonium diaphoreticum*. 5. *Tartarum emeticum*. 6. *Cauſticum antimoniale*. 7. *Cinnabaris antimonii*. 8. *Regulus antimonii martialis*. 9. *Tinctura antimonii*. 10. The *Kermes* mineral, or *Carthuſian* powder. See theſe articles ſeparately.

The virtues of *antimony*, in the diſeaſes of animals, are very great, and very evident on any trial. Pigs that have the meaſles are at all times recovered by it, which proves it a great purifier of the blood. Horſes who have running heels, that cannot be cured by the common methods uſed by the farriers, will generally be cured by this medicine in a little time. The manner of uſing it is this: mix one drachm with every feeding of oats which the horſe has in a morning; it is beſt put together in one place, buried under a few oats, and the horſe's head being with-held a little, and then let go juſt againſt that place, he will take it all in at a mouthful. Some horſes do not diſlike it, others obſtinately refuſe it, but to theſe it may eaſily be given in balls. The virtues of this drug, in fattening of cattle, have by many been thought imaginary, but experiment proves it to be a real truth. A horſe that is lean and ſcabby, and not to be fatted by any other means, will become fat on taking a doſe of *antimony* every morning, for two months together. A boar fed for brawn, and having an ounce of *antimony* given him every morning, will become fat a fortnight ſooner than others put into the ſtye at the ſame time, and fed in the ſame manner, but without the *antimony*. Phil. Tranſ. N° 39.

It is generally ſuppoſed, that the vapours of *antimony* are poiſonous when raiſed by fire, but it appears otherwiſe from the operations M. Geoffroy made on it; he having once gone through ſixty calcinations of twelve ounces of *antimony*, without receiving any harm from it; whence it is very evident, that the common opinion of the fumes of *antimony* containing an arſenical ſulphur, is an erroneous one; and it may be added, that one great mark of *antimony*'s being good, is, that it loſes a great deal of its weight in calcination. It has more ſulphur in this caſe, which the fire raiſes in a vapour, and leſs of the terreſtrial matter or ſpar, which are uſually very abundant in it. Mr. Geoffroy, by theſe nice obſervations and experiments, diſcovered that *antimony* contained much leſs common ſulphur than had been generally ſuppoſed, ſince it can be made to loſe, at the utmoſt, only three ounces and five drachms in the pound in calcination. The emetic quality of the *regulus* proves, however, that it yet contains a very large ſhare of ſulphur, though of another kind: this Mr. Geoffroy diſtinguiſhes from the common ſulphur, by the name of the *metallic* SULPHUR. Mem. Acad. Scienc. Par. 1736.

It is evident, that whatever acid *antimony* contains, muſt be of the nature of ſpirit of ſulphur, ſince ſulphur ſo greatly abounds in the compoſition of that mineral, and its ſulphur is wholly the ſame with the common brimſtone. Whatever acid, therefore, of this kind could be produced, would be wholly the produce of the common ſulphur in that mineral, and not of the *regulus* part, which alone is properly *antimony*. Experiments prove the truth of this opinion, the *acid of antimony*, truly ſeparated from it, being no way different, in any particular, from that of crude ſulphur.

There are ſeveral ways by which it may be made; however, it is but little that can be obtained, and then it is aſſuredly the pure acid of the ſulphur of *antimony*. The operation, however perfect, is of little value. Mem. Acad. Par. 1700.

ANTIMONY, *butter of*, is a white and thick liquor; otherwiſe called *icy oil of antimony*; compoſed of marine acid united to the reguline part of *antimony*, whence its property of attracting moiſture from the air, and its cauſticity. It is uſually prepared of *crude* (though ſometimes of *regulus* of) *antimony*, and corroſive ſublimate, by pulveriſing, mixing, and diſtilling them by a gentle heat: upon which the butter riſes into the neck of the retort; from which, when full, it is to be melted down into a receiver, by the application of live coals.

It is a very [illegible] metallic taſte, and a poiſon when uſed internally. Externally it is applied as a cauſtic to ſtop gangrenes, and cure carieſes, cancers, &c. This *butter* may be converted into an oil, called alſo *rectified butter of antimony*, by gently diſtilling it a ſecond time; which renders it more fluid, ſubtile, volatile, and efficacious.

This, digeſted with thrice its weight of *alcohal*, makes the purple tincture of *antimony*; a ſecret highly valued by Mr. Boyle, as an excellent vomit.

Of *butter of antimony* are alſo prepared the BEZOAR *mineral*, and *powder of* ALGAROT.

The operation of making *butter of antimony* furniſhes an influence of the power of the Newtonian principle of attraction. When *mercury ſublimate* is ſublimed from *antimony*, or from *regulus of antimony*, the ſpirit of ſalt lets go the *mercury*, and unites with the *antimonial* metal, which attracts it more ſtrongly, and ſtays with it till the heat be great enough to make them both aſcend together, and then carries the metal with it in the form of a *butter of antimony*; though the ſpirit of ſalt alone be almoſt as volatile as water, and the *antimony* alone as fixed as lead.

ANTIMONY, *calx of*, is obtained by expoſing *crude antimony*, groſly powdered, in a flat and ſhallow earthen veſſel, to the action of a moderate fire, taking care to ſtir it conſtantly. During this *calcination* the ſulphur, being leſs fixed than the metalline part, is gradually evaporated, and the *calcination* is continued, till no more ſulphureous vapour ariſe. What remains is the metallic part, ſeparated from the mineral ſulphur, and even deprived of part of its own inflammable principle. This ſubſtance is more fixed and leſs fuſible than *antimony*, as in general all metallic earths are, becauſe deprived of more of their inflammable principle. It is called CALX *of antimony*, and is of a grey aſh colour. This is violently emetic, and purgative. The native *calx of antimony* was lately diſcovered by Mr. Monges; it conſiſts of a group of white cryſtallized filaments diverging from a common centre: urged with a blow-pipe or charcoal, it will be diſſipated; which, together with its infuſibility in nitrous acid, is ſufficient to diſtinguiſh it. Kirwan's El. Min. p. 325.

ANTIMONY, *ceruſs of*, is the *regulus* diſſolved with ſpirit of nitre, in a ſand-furnace; what remains after the fumes are all ſpent, is a white powder; which, being waſhed ſweet, is the *ceruſs* required.—It is diaphoretic; and, by many, is ſet on a footing with the *mineral kermes*.

ANTIMONY, *cinnabar of*, is prepared of mercury, ſulphur, and *antimony*, mixed and ſublimed in a luted bolt-head, and a naked fire.—It is a good diaphoretic and alterative.

There is alſo a *cinnabar of antimony* procured after the *butter of antimony* has done riſing, by increaſing the degree of fire.—This, ſublimed a ſecond time, makes yet a better *cinnabar*.

ANTIMONY, *elyſſus of*. See CLYSSUS.

ANTIMONY, *crocus of*, is the ſame with what we otherwiſe call *crocus metallorum*; excepting that this latter is more mild, and leſs emetic; being made by repeated lotions of the former, in warm water, and then drying it again to a powder. See CROCUS *metallorum*.

It is alſo called *opaline magneſia, terra ſanctæ Rulandi, terra aurea, terra rubra*, &c.

ANTIMONY, *crude*, or *antimony in ſubſtance*, is the native mineral *antimony*, melted down and caſt in cones as above mentioned.—It is much uſed in diet-drinks, and decoctions of the woods, and in compoſitions againſt the ſcurvy, as a diaphoretic, and deobſtruent.

ANTIMONY, *diaphoretic*, is prepared of *antimony*, powdered, and mixed with three times the quantity of nitre; and the mixture thrown, at several times, into an ignited crucible: upon which a detonation enfues. What remains, being kept in fufion a quarter of an hour, turns into a white mafs, called *antimonium diaphoreticum nitratum*, or *diaphoretic antimony with nitre*; the *antimony* being hereby bereaved of its emetic and purgative virtue, and rendered only diaphoretic.

If the air have acceſs to it, it will again become emetic. There is alſo a kind of fweet diaphoretic *antimony*, made of the former, by pulverizing, boiling it in water, and filtrating the decoction: upon which a white powder will be left in the filtre; which being waſhed by repeated affuſions of warm water, and dried, is the *dulcified diaphoretic antimony*.—This is given as an alexipharmic in malignant fevers, fmall-pox, &c. particularly in caſe of deliriums. It is alſo applied in fcorbutic and venereal diſorders: but the learned Boerhaave abſolutely decries it, as a mere metallic calx, deſtitute of all medicinal virtue, and only fit to load and choak up the body, by its inactivity and weight.

ANTIMONY, *diaphoretic nitre of*, is made by exhaling the ſolution of the preceding preparation over a gentle fire, [illegible] compoſed of nitre, and the *ſulphur* of the *antimony*, called *nitrum antimoniatum*.—It is no other than a ſort of SAL *prunelle*, or SAL *polychreſtum*; and accordingly is found aperitive, cooling, diuretic; and good in inflammatory fevers, &c.

ANTIMONY, *eſſence of*. An emetic wine made with *glaſs of antimony*; to which is ſometimes added a ſpicy ſtomachic.

Dr. Huxham ſays, he never found any antimonial preparation better, ſafer, and more efficacious than this ſimple infuſion of the *glaſs of antimony* in a generous white wine, with a little ſpice to render it more grateful to the ſtomach. This medicine given to twenty or thirty drops, operates by gentle ſweats, and purges in larger doſes very mildly. The judicious phyſician, here mentioned, recommends it in obſtinate *rheumatiſms*.

ANTIMONY, *flowers of*, is *antimony* pulveriſed, and ſublimed in an aludel; the volatile parts whereof then ſtick to the ſubliming pot.

This is alſo a powerful vomitive; and is of ſingular efficacy in maniac caſes; being the Herculean remedy, by which ſome have gained ſo much reputation.

Another ſort of flowers are made of the *regulus of antimony*, with SAL *ammoniac*, ſublimed as before; which make a remedy ſomewhat gentler than the former.—Helmont alſo gives us a preparation of purging *flowers of antimony*.

ANTIMONY, *glaſs of, vitrum antimonii*, is crude *antimony*, ground and calcined by a vehement fire, in an earthen crucible, till it ceaſe to fume; which is a proof, that its ſulphur is evaporated. The calx is then vitrified in a wind-furnace; upon which it becomes tranſparent, ruddy, and ſhining, and of a more or leſs deep hyacinthine colour.

This is the ſtrongeſt emetic of any preparation of *antimony*. Yet, if diſſolved in ſpirit of nitre, it ceaſes to be either *emetic* or *cathartic*; even though the *menſtruum* be afterwards drawn from it. See VITRUM *antimonii ceratum*.

ANTIMONY, *liver of*. The *calx*, when fuſed and cooled, ſometimes becomes an opake brown maſs, which is called by this name. This is ſtrongly emetic.

ANTIMONY, *magiſtery of*, is crude *antimony* digeſted with *aqua regia* eight or ten days; to which water is then put, but poured off again ere it ferment: this to be repeated till there remain nothing behind but a yellowiſh powder; which, being ſuffered to ſettle, and the water decanted off, becomes by repeated ablution, an inſipid magiſtery. Its operation is rather cathartic than emetic, though ſometimes only ſudorific.

ANTIMONY, *Ward's pill of*. See WARD's *pill*.

ANTIMONY, *powder of*, is a mixture of two grains of emetic tartar, finely pulveriſed, with half a dram of any of the teſtaceous powders.

This is a ſubſtitute for Dr. James's febrifuge powder; and has the ſame virtues with the antimonial wine above deſcribed, and EMETIC *tartar*.

ANTIMONY, *regulus of*. See REGULUS.

Antimony, purified by ſimple fuſion, is called *regulus of antimony*; or *regulus antimonii philoſophorum*.—But the more common way of reducing it into a *regulus*, is with the addition of FLUX *powders*, as tartar and nitre.

The curious may ſee in the *Arts & Metiers*, an account of the fabrication of the *regulus* and of the *glaſs* of *antimony*, under the *Art du Diſtillateur des Eaux fortes*, p. 141, & ſeq. See ibid. a farther account of *antimony*, and of the utenſils proper for its fabrication, p. 136.

The *ſcoria* found at the top of this *regulus* is violently emetic, as well as the *regulus* itſelf, whereof if cups of drinking-veſſels be caſt, the wine put into them will become ſtrongly vomitive.

Of this *regulus* caſt in moulds are made thoſe commonly called the *antimonial pills*, weighing about eight or ten grains each, one of which being ſwallowed, will operate conſiderably more by vomit and ſtool.

Theſe pills having thus performed their office, and having been diſcharged from the body, will ſerve the ſame purpoſe again and again; whence they have obtained the name of *perpetual pills*.—The virtue of this *regulus* is not however inexhauſtible, as has been imagined: for by repeated infuſions in wine, though the liquor be made violently emetic at firſt, yet by degrees it loſes its force, and at length ceaſes to be vomitive.

ANTIMONY, *martial regulus of*, is made by a mixture of little bits of iron, as the nails of boſſes ſhoes melted with the *regulus*.

In this operation, the iron diſſolving and abſorbing the ſulphureous parts of the *antimony* more ſtrongly than the fluxes in the former caſe, and turning it into a CROCUS, the *antimony* is hereby brought to a greater degree of purity, and rendered more efficacious than in the common *regulus*.

This *regulus* is ſometimes farther purified by repeated fuſions and detonations, with the addition of freſh *antimony*, and more nitre, alternately; in which caſe it becomes *regulus antimonii ſtellatus*, or the *ſtarry regulus of antimony*.

Mr. Geoffroy has been the inventor of a new method of treating this mineral, by which it yields much more *regulus* than according to thoſe preſcribed by Kunkel and Stahl, and is purified without the addition of ſalts, and with very little loſs.

ANTIMONY, *golden ſulphur of*, is made of the *ſcoria* which ariſes in preparing the REGULUS: by boiling it, filtrating the hot decoction, and adding diſtilled vinegar: upon which the whole coagulates, changes into a brown colour, emits a ſtercoraceous odour, and precipitates a red powder. The whole maſs being waſhed by repeated affuſions of water, till the liquor come away freeſtilled and inſipid, and then dried, it becomes a red powder, called the *golden ſulphur*, or *præcipitate of antimony*, either on account of its own colour, or the yellow one it gives to glaſs, metals, &c.

This is alſo called the *panacea of antimony*, and is ſaid to be the baſis of Lockyer's pills.—It either proves emetic, cathartic, diuretic, or ſudorific, as its force happens to be determined.

ANTIMONY, *prepared*, is either crude *antimony* levigated, or that which has undergone ſome chemical proceſs, whereby its nature and powers are altered or abated; and this oftentimes, according to the circumſtances of the preparation.

Antimony, ſays Mr. Boyle, alone, or aſſociated with one or two other ingredients, by a variety of operations and compoſitions, might be brought to furniſh a whole apothecary's ſhop: it will anſwer the phyſician's intention, whether he wants to employ a cathartic, or an emetic, a diuretic, diaphoretic, deobſtruent, bezoardic, or cordial.

ANTIMONY, *revivified, antimonium reſuſcitatum*, is prepared of flowers of *antimony* and SAL *ammoniac*, digeſted in diſtilled vinegar: then exhaled, and the remainder ſweetened by ablution.—It is emetic, and ſometimes alſo ſudorific, and is good in maniacal caſes, &c.

ANTIMONY, *tincture of*. See TINCTURE.

All theſe preparations of *antimony*, how ſevere ſoever alone, may yet be ſo managed as to operate little or nothing at all in the *prima via*, nor be perceived till they are got into the ſmalleſt veſſels.—And then it is they are qualified to combat the gout, pox, evil, &c. See Neumann's Chemical Works. p. 128, &c. And Macquer's Chemical Dictionary, under *Antimony*.

ANTINOEIA, in *Antiquity*, annual ſacrifices, and quinquennial games, in memory of Antinous the Bithynian.

They were inſtituted at the command of Adrian the Roman emperor, at Mantinea, in Arcadia, where Antinous was honoured with a temple and divine worſhip.

ANTINOMIANS, in *Church Hiſtory*, denote thoſe who maintain the law of no uſe or obligation under the goſpel diſpenſation, or who hold doctrines that clearly ſuperſede the neceſſity of good works and a virtuous life.

The *Antinomians* took their origin from John Agricola about the year 1538, who taught that the law is no ways neceſſary under the goſpel; that good works do not promote our ſalvation, nor ill ones hinder it; that repentance is not to be preached from the decalogue, but only from the goſpel.

This sect sprung up in England during the protectorate of Oliver Cromwell; and extended their system of libertinism much farther than Agricola, the disciple of Luther. Some of their teachers expressly maintained, that the elect cannot fall from grace, nor forfeit the divine favour, the wicked actions they commit are not really sinful, nor are to be considered as instances of their violation of the divine law; and that consequently they have no occasion either to confess their sins, or to break them off by repentance. According to them, it is one of the essential and distinctive characters of the elect, that they cannot do any thing which is either displeasing to God, or prohibited by the law.

Luther, Rutherford, Schlusselburg, Sedgwick, Gataker, Wittius, Bull, Williams, &c. have written refutations; Crisp, Richardson, Saltmarsh, &c. defences of the *Antinomians*; Wigandus, a comparison between ancient and modern *Antinomians*.

The doctrine of Agricola was in itself obscure, and perhaps represented worse than it really was, by Luther, who wrote with acrimony against him, and first styled him and his followers *Antinomians*. Agricola stood on his own defence, and complained, that opinions were imputed to him, which he did not hold. Nicolas Amsdorf fell under the same odious name and imputation, and seems to have been treated more unfairly than even Agricola himself. It is rather hard to charge upon a man all the opinions that may be inferred from things that have hastily dropped from him, when he himself disowns such inferences.

ANTINOMY, ANTINOMIA, a contradiction between two laws, or between two articles of the same LAW.

The word is derived from ἀντι, *contra*, and νομος, *lex*.

ANTINOMY, sometimes also signifies an opposition to all law. Whence a sect of enthusiasts, who are for carrying gospel liberty above all moral regards, and who slight the motives of virtue as insufficient to salvation, are called *Antinomians*; and sometimes *Antinomi*.

ANTINOUS, in *Astronomy*, a part of the constellation AQUILA, or the eagle.

ANTIOCHIAN *sect*, or *academy*, a name given to the fifth academy, or branch of academics.

It took the denomination from its being founded by Antiochus, a philosopher, contemporary with Cicero.

The *Antiochian* academy succeeded the Philonian.—As to point of doctrine, the philosophers of this sect appear to have restored that of the ancient academy, except that in the article of the *criterion* of truth, Antiochus was really a Stoic, and only nominally an Academic.

ANTIOCHIAN *epocha*, a method of computing time from the proclamation of liberty granted the city of Antioch, about the time of the battle of Pharsalia.

ANTI-PÆDO-BAPTISTS, derived from ἀντι, *against*, παις, παιδος, *child*, and βαπτισμα, *baptism*, whence βαπτιστης, is a distinguishing denomination given to those who object to the baptism of infants; because, they say, infants are incapable of being instructed, and of making that profession of faith, which entitles them to this ordinance, and an admission into church communion. See ANABAPTISTS and BAPTISTS.

ANTIPAGMENTS, *Antipagmenta*. See ANTEPAGMENTA.

ANTIPAPINIANUS, ἀντιπαπινιανος, a title given by the Greek lawyers to the fourth part of the Digest, including four books, beginning with the title *De pignoribus*.

This is otherwise called *antipapianus*.

The *Antipapinian* was thus denominated, not as being intended in opposition to Papinian, but because it was to serve in the schools of the civil law in lieu of the books of that lawyer, pursuant to an edict of the emperor Justinian; so that the *Antipapinian* was so far from being a refutation of Papinian, that it was only a substitute for his writings, which were not fo proper for the use of the younger fort of students.

ANTIPARALELS, in *Geometry*, are those lines joining the two legs of an angle, which make the same angles like parallel lines, but in opposite directions. M. Leibnitz, however, calls those lines *antiparallels*, which cut two parallels so, that the outward angle being added to the inward one, the sum may be equal to a right angle.

ANTIPARASTASIS, from ἀντι and παραστασις, of παριστημι, *I exhibit*, in *Rhetoric*, a reply made to an opponent, by allowing part of his argument, and denying the rest, e. gr. you may paint whatever you please, provided the public suffer no prejudice from it; but you must not, if it does.

ANTIPASCHA, in *Ecclesiastical Writers*, denotes the first Sunday after Easter.

This is otherwise called DOMINICA *in albis*.

ANTIPATHES, among the *Ancient Naturalists*, was used to express any stone or gem, which, according to their superstitious ideas of the virtues of gems at that time, was supposed to have a power of resisting the force of enchantments. Pliny mentions a very valuable gem, called by the ancients *antipathes* for this very reason; and the black coral had the same name, on the same account.

ANTIPATHES, a species of the *gorgonia*, in the order of *zoophytes*.

ANTIPATHY, a natural enmity or aversion of one body to another.—In which sense the word stands opposed to SYMPATHY.

The word is compounded of ἀντι, *contra*, *against*, and παθος, *passion*.

Such an aversion is commonly said to be between the salamander and the tortoise, the vine and the elm, the toad and the weasel, the sheep and the wolf, the olive and the oak, &c. Phil. Transf. N° 339.

The Peripatetics account for *antipathies*, from certain occult qualities inherent in the bodies.

Some think that the term *antipathy* can only be applied to any certain purpose, when used with the restriction of modern philosophers; among whom it signifies no more than a *vis centrifuga*, or repelling power.

A large part of the instances of *antipathies* are, perhaps, no better [illegible] and leave them on no other footing than vulgar errors.

ANTIPATHY is sometimes also used in a *moral* sense, to denote a contest between the mind and the body, or between reason and inclination.

ANTIPATHY is used in *Painting*, for an opposition between the qualities of colours.

This *antipathy* is chiefly observed between colours, which endeavour, as it were, to predominate over each other, and which by their mixture destroyed each other, e. gr. *ultramarine* and *vermilion*. This does not obtain in the *clare obscure*; for, though there be nothing more opposite to each other than black and white, as the one represents light, and the other darkness; yet they each preserve themselves in the mixture, and form together a grey which partakes of both.

ANTIPELARGIA, among the *Ancients*, a law, whereby children are obliged to furnish necessaries to their aged parents.

The *ciconia*, or stork, is a bird famous for the care it takes of its parents when grown old.

Hence, in some Latin writers, this is rendered LEX *ciconiarum*, or the storks law. Passavant has published a dissertation De *Antipelargia*. Basil, 1672, 4to.

ANTIPERISTALTIC, in *Anatomy*, a motion of the intestines contrary to the PERISTALTIC motion.

The word is derived from ἀντι, *against*, περι, *about*, and στελλω, *that which bids the power of compressing*.

As the *peristaltic* motion is a contraction of the fibres of two intestines from above, downwards; the *antiperistaltic* motion is their contraction from below, upwards.

Physicians, ancient as well as modern, have usually had recourse to the notion of an *antiperistaltic* motion, to account for the action of vomiting, and the *phenomena* of the *miserere mei*, or *iliac passion*. In behalf of the former Mr. Littre alledges, that as the *œsophagus*, the stomach, and intestines, are but one and the same continued canal every where lined with the same fleshy fibres, and as it is allowed, that the intestines, besides their natural or PERISTALTIC motion (whereby, being successively contracted from above downwards, they expel their contents in this direction) have also an *antiperistaltic* or preternatural motion, whereby they contract from below upwards, and thus eject their contents; it is highly probable that the other members of the same canal, viz. the stomach, and *œsophagus*, are also sometimes subject to the like *antiperistaltic* motion; and return their contents to the mouth. Hist. Acad. Scienc. ann. 1700.

The cause of the *antiperistaltic* motion is usually assigned to be a stoppage of some of the intestines, but chiefly of the *ilium*.

Some late ingenious authors seem to have over-turned the whole *antiperistaltic* system, and shewn this motion imaginary, as well as unnecessary for accounting for their disorders. Mess. Chirac and Du Verney have endeavoured to prove this in respect of vomiting; and M. Haguenot, and after him M. St. Andre, in the iliac passion. Mem. Acad. Scienc. an. 1713. Phil. Transf. N° 351.

ANTIPERISTASIS, in *Philosophy*, the action of two contrary qualities; one whereof is supposed, by its opposition, to excite and heighten the force of the other.

The word is formed of ἀντι, *contra*, *against*, and περιστασις, *to stand round*, or *to restrain*; q. d. *circumstantia*.

Antiperistasis is usually defined, "the opposition of a "contrary

" contrary quality, whereby the quality it oppoſes be-
" comes heightened, or intended: or the action where-
" by a body attacked by another, collects itſelf, and
" becomes ſtronger by ſuch oppoſition; or it is an in-
" tention of the activity of one quality, cauſed by the
" oppoſition of another."

Thus cold, ſay the ſchool-philoſophers, on many occaſions, exalts the degree of heat, and dryneſs that of moiſture.

Thus it is, that quick-lime is ſet on fire by the affuſion of cold water: and ſo water becomes warmer in winter than in ſummer, by *antiperiſtaſis*: and to the ſame cauſe it is owing, that thunder and lightning are excited in the middle region of the air, which is continually cold.

This *antiperiſtaſis* was a principle of great uſe and extent in the Peripateticic philoſophy.

Mr. Boyle has canvaſſed this doctrine thoroughly, in his Hiſtory of Cold.—It is certain, that *a priori*, or conſidering the reaſon of the thing abſtracted from the experiments alledged to prove an *antiperiſtaſis*, it appears highly abſurd; ſince, according to the courſe of nature, one contrary ought to deſtroy, not to ſtrengthen another.

It is commonly, indeed, alledged, as a proof of a power in nature has given bodies of flying their contraries, that drops of water, falling on a table, collect into little globules, to avoid the contrary quality in the table, and keep themſelves from being ſwallowed up by the dry wood; but this we can account for on more intelligible principles, viz. the power of ATTRACTION and REPULSION.

In effect, not only reaſon, but experiment alſo, concludes againſt the notion of an *antiperiſtaſis*: the leading argument urged in behalf of it is, the heating of quick-lime in cold water: now how aſtoniſhing the laxineſs and credulity of mankind, who have ſo long and generally acquieſced in what they might ſo eaſily have found to be falſe! for if, inſtead of cold water, the lime be quenched with hot water, the ebullition will always be far greater than if the liquor were cold.

Again; in freezing a baſon to a joint-ſtool, with a mixture of ſnow and ſalt, by the fire-ſide, it is pretended, that the fire ſo intends the cold, as to enable it to congeal the water that ſtagnated upon the ſurface of the ſtool, betwixt that and the bottom of the veſſel. But how little need there is of an *antiperiſtaſis* in this experiment, appears hence, that Mr. Boyle has purpoſely made it with good ſucceſs, in a place where there neither was, nor ever, probably, had been, a fire.

As to the refreſhing coolneſs which ſubterraneous places afford in ſummer, it may be denied, that they are then really colder than in winter; though, if the contrary were allowed, it would not neceſſarily infer an *antiperiſtaſis*. The ſmoking of waters, drawn from deep places in froſty weather, does not neceſſarily infer ſuch water to be warmer than at other times when it does not ſmoke, ſince that effect may proceed, not from the greater warmth of the water, but from the greater coldneſs of the air. For a man's breath in a cold ſummer, or in mild winter weather, becomes very viſible; the cold ambient air ſuddenly condenſing the fuliginous ſteams diſcharged by the lungs; which in warm weather are readily diffuſed in inſpercepible particles through the air. See COLD and EVAPORATION.

ANTIPHERNA, among the ancient Greeks, denoted a kind of ſettlement made on a wife in caſe of ſurviving her huſband, as an equivalent for her dowry.

This word ſeems to anſwer what in our law is called a JOINTURE.

ANTIPHONALLY, from ἀντὶ, and φωνὴ, *voice*, in reſpect of church muſic, imports as much as alternately, or anthem-wiſe.

The Greeks have a method of ſinging *antiphonally*, *antiphonatim*, called by them ψαλμῳδίαν, wherein two perſons ſing together, and then are ſilent, and ſucceeded by two others, who ſing a while and then are ſilent, and ſo on.

ANTIPHONARY, *antiphonarium*, a ſervice book which contained all the invitatories, reſponſories, collects, and whatever elſe was ſaid or ſung in the choir, except the leſſons.

This is otherwiſe called *reſponſarium*, from the reſponſes therein contained.

The author of the Roman *antiphonary* was pope Gregory the Great.

We alſo find mention of nocturnal and diurnal *antiphonaries*, for the uſe of the daily and nightly offices; *ſummer* and winter *antiphonaries*; alſo *antiphonaries* for country churches, &c. By the provincial conſtitutions of archbiſhop Winchelſea, made at Merton, A. D. 1305, it is required that one of theſe ſhould be found in every church within the province of Canterbury.

The uſe of theſe, and many other popiſh books, was forbid by the 3d and 4th of Edward VI. c. 10.

ANTIPHONY, ANTIPHONA, the anſwer made by one choir to another, when the pſalm or anthem is ſung between two.

ANTIPHONY, ſometimes denotes a ſpecies of pſalmody, wherein the congregation, being divided into two parts, repeats the pſalms, verſe for verſe, alternately.

In this ſenſe, *antiphony* ſtands contradiſtinguiſhed from SYMPHONY, where the whole congregation ſings together.

Antiphony differs from *reſponſorium*, becauſe in this latter the verſe is only ſpoken by one perſon, whereas in the former, the verſes are ſung by the two choirs alternately. The original of *antiphonal* ſinging in the weſtern churches is referred to the time of St. Ambroſe, about the year 374. That father is ſaid to have firſt introduced it into the church of Miſan, in imitation of the cuſtom of the eaſtern church, where it appears to be of greater antiquity, though as to the time of its inſtitution, authors are not agreed. It was moſt probably introduced at Antioch, between the year of Chriſt 347 and 356.

ANTIPHONY, is alſo uſed to denote the words given out at the beginning of the pſalm, to which both the choirs are to accommodate their ſinging.

ANTIPHONY, in a more modern ſenſe, denotes a kind of compoſition made of ſeveral verſes extracted out of different pſalms, adapted to expreſs the myſtery ſolemnized on the occaſion.

ANTIPHONA *ad introitum*, that anciently ſung in the introit of the maſs.

ANTIPHONA *invitatoria*, that repeated at the pſalm *Venite exultemus*.

ANTIPHONÆ *majores*, thoſe ſeven uſed to be ſung in the time of Advent, at the Magnificat, and during the ſeven days before Chriſtmas.

ANTIPHONÆ *proceſſionales*, thoſe ſung at proceſſions.

ANTIPHONÆ *regulares*, thoſe rehearſed at rogations.

ANTIPHRASIS, a ſort of figurative expreſſion, which has a contrary meaning to what it carries in appearance. Or, a kind of irony, wherein we ſay one thing, and mean the contrary.

The word is derived from ἀντὶ and φράσις, of φάσω, *I ſpeak*.

Sanctius defines *antiphraſis* to be a form of irony, whereby we ſay a thing, by denying what we ought rather to affirm it to be: as when we ſay, *it did not diſpleaſe me*; or, *he is no fool*; meaning, *I was pleaſed with it*; or, *he is a man of ſenſe*.—On this principle, the *antiphraſes* ought to be ranked among the figures of ſentences, and not among thoſe of words.

It is a common error, to make *antiphraſes* conſiſt in ſingle words; as when we ſay, that the Parcæ are thus called by *antiphraſes*, becauſe they ſpare nobody, PARCÆ, *quia nemini parcunt*.—St. Jerom, in his epiſtle to Riparius againſt Vigilantius, ſays, he ought rather to be called *Dormitantius per antiphraſin*, than Vigilantius, becauſe he oppoſed the Chriſtians holding wakes at the tombs of the martyrs.

Sanctius holds it improper to call theſe *antiphraſes*; becauſe *phraſis* is not applicable to a ſingle word, but ſignifies *orationem, aut loquendi modum*.

ANTIPODES, in *Geography*, a relative term, denoting ſuch inhabitants of the earth as live diametrically oppoſite to one another.

The word comes from ἀντὶ, *againſt*, and πὺς, ποδὸς, *a foot*.

The *Antipodes* are thoſe who live in parallels of latitude equally diſtant from the equator, the one toward the north, the other to the ſouth; and under the ſame meridian, though 180°, or juſt half of that meridian, diſtant from one another.

The *Antipodes* have nearly the ſame degree of heat and cold; and the ſame length of night and day; but at contrary times: it being midnight with one, when it is noon with the other; and the longeſt day with one, when it is the ſhorteſt with the other.

Again, as the horizon of any place is 90° diſtant from its zenith, the *Antipodes* have the ſame HORIZON. And hence, when the ſun riſes to one, he ſets to the other.

Plato is ſaid to have firſt ſtarted the notion of *Antipodes*; and likewiſe to have given them the name: as he conceived the earth to be of a ſpherical figure, it was eaſy for him to infer, that there muſt be *Antipodes*.

Many, and particularly Lactantius and Auguſtine, laughed at the notion.—The latter of theſe fathers is ſtrangely perplexed to think how men and trees ſhould hang pendulous in the air, with their feet uppermoſt, as he thought they muſt do in the other hemiſphere.

And if we may believe Aventine, Boniface, archbiſhop of Mentz, and legate of pope Zachary, in the eighth century, declared a biſhop of that time, called Virgilius, heretic, for maintaining that there was ſuch a thing as *Antipodes*.

But this piece of history is controverted by the authors of the Mem. de Trevoux; as having been made use of, it seems, by some persons, to shew, that the church has been mistaken in its decisions.

As to the sentiments of the primitive Christians with regard to the *Antipodes*, some, rather than admit the conclusions of the philosophers, absolutely denied the whole, even the demonstrations of the geometricians relating to the sphericity of the earth: which is Lactantius's way. Instit. lib. iii. cap. 24. Others only called in question the conjectures of the philosophers; which is St. Auguſtine's method. De Civit. Dei, lib. xvi. cap. 9.—After putting the question, whether there ever were nations of the cyclopes, or pigmies, or of people whose feet stood outward, &c. he comes to the point of *Antipodes*, and asks, "whether the lower part of our earth be inhabited by *Antipodes*?" He made no doubt of the earth's being round, nor of there being a part diametrically oppoſite to ours; but only diſputes its being really inhabited. And the conſiderations he ſuggeſts for that purpoſe are juſt enough; as that they who aſſerted *Antipodes* had no hiſtory for it; that the lower part of the earth may be covered with water; and that to place *Antipodes* there, of a different origin from us (as muſt have been the opinion of the ancients, ſince they thought it impoſſible to go from our world to theirs), is to contradict ſcripture, which teaches, that the whole race deſcended from one man. Such are the ſentiments of that father. It may be added, that the Chriſtian fathers were not the only perſons who diſputed the truth of the *Antipodes*. Lucretius had done it before them, at the end of his firſt book, v. 1063, &c. See alſo Plutarch, lib. De facie in orbe lunæ; and Pliny, who refutes the opinion, lib. ii. cap. 5.

ANTIPOPE, a falſe or pretended pope; or, one that is, or is pretended to be, irregularly elected in oppoſition to another.

Geddes gives the hiſtory of no leſs than twenty-four ſchiſms in the Romiſh church, cauſed by *antipopes*; ſome took their riſe from a diverſity of doctrine of belief, which led different parties to elect each their ſeveral pope; but the greater part from dubious controverted rights of election, the fruits of chicane and ambition.

ANTI-PORTICO is uſed by ſome for a veſtibule, or porch, at the entrance of an edifice.

ANTIPRAXIA, from ἀντὶ and πρᾶττω, *I perform*, in the *Ancient Phyſic*, denotes a contrariety of functions, temperaments, &c. in different parts of the body; invented to account for that contrariety of ſymptoms which frequently concur in hypochondriac caſes, when, e. gr. the liver is charged with being immoderately hot, and the ſtomach exceſſively cold.

The moderns, particuly Etmuller, refute the notion of an *antipraxia*, on this principle, that the blood circulating duly through the whole body, warms all the parts, as well the ſtomach as liver proportionably. To which ſome advocates for the ancient ſyſtem object, that this is confounding the preternatural ſtate with the natural.

ANTIPREDICAMENTS, in *Logic*. See ANTEPREDICAMENT.

ANTIPROBABILISM, the doctrine or ſyſtem of thoſe who hold it unlawful to follow the leſs probable opinion, in oppoſition to the more probable one.

There have been vigorous advocates for *anti-probabiliſm*; for even among its greateſt enemies, the Jeſuits, F. Gilbert has a treatiſe expreſly in favour of *antiprobabiliſm*, viz. ANTIPROBABILISMUS, ſeu tractatus theologicus fidelem totius probabiliſmi ſtateram continens, &c. Par. 1703. 4to.

ANTIPROBOLE, in *Rhetoric*, a figure whereby the defendant adopts or admits the charge brought againſt him by the proſecutor.

E. gr. ſuppoſing the proſecutor's μάκλον to be, *Titus has killed Caius*; the defendant's *antiprobole* may be, *I have killed him, but undeſignedly*.

ANTIPROPEMPTICON, in *Poetry*, a poem wherein a perſon going a journey addreſſes himſelf to his friends. Such is that of Ovid, lib. i. Triſt.

Cum ſubeat illius triſtiſſima noctis imago, &c.

It is oppoſed to PROPEMPTICON.

ANTIPROTASIS, in *Rhetoric*, a ſolution of the PROTASIS.

ANTIPSORA, from ἀντὶ and ψώρα, *itch*, in *Pharmacy*, remedies proper againſt the itch.

ANTIPTOSIS, a figure in *Grammar*, whereby one caſe is put for another.

The word comes from ἀντὶ, *pro*, and πτῶσις, *caſus*.

ANTIPYRETON, from ἀντὶ and πῦρ, *fire*, among *Phyſicians*, an appellation given to the medicines againſt fevers.

ANTIQUARE, among Roman lawyers, properly denotes the rejecting of a new law, or refuſing to paſs it.

In which ſenſe, *antiquating* differs from *abrogating*; as the latter imports the annulling an old law, the former the rejecting a new one. See A.

ANTIQUARE is alſo uſed for a law's growing obſolete, or into diſuſe, either by age or non-obſervance.

ANTIQUARIUM, among the *Ancients*, denoted a place or apartment, wherein their *antique* monuments were preſerved.

ANTIQUARIUM is uſed by ſome modern practitioners, for a ſpecific againſt the quartan ague.

Hence ſome call the Jeſuits bark *antiquartinus Peruvianus*.

Wedelius alſo ſpeaks of an *eſſentia antiquartiæ*.

The *antiquartan* of Riverius is a preparation of *mercurius dulcis, curam fuminans*, ſulphur of antimony, and ſcammony.

ANTIQUARY, ANTIQUARIUS, a perſon who ſtudies and ſearches after monuments and remains of the ancients: as, old medals, books, ſtatues, ſculptures, and inſcriptions: and, in general, all curious pieces that may afford any light into *antiquity*.

Formerly there were ſeveral other kinds of *antiquaries*. The LIBRARII, or copiſts, i. e. thoſe who tranſcribed in fair legible characters, what had been before written in notes, were called by this name. They were alſo denominated *antigraphi*. They were alſo employed in repairing books injured by age.

In the chief cities of Greece and Italy, there were other perſons of diſtinction, called *antiquarii*, whoſe buſineſs it was to ſhew ſtrangers the antiquities of the place, to explain the ancient inſcriptions, and to give them all the aſſiſtance they could in this way of learning.

This was a laudable and uſeful inſtitution; and might well deſerve to be re-eſtabliſhed.—Pauſanias calls theſe *antiquariæ Exegetæ*. The Sicilians call them *mythagogi*.

There was an ancient college of *antiquaries* erected in Ireland by Ollamh Fodhla, 700 years before Chriſt, for compoſing a hiſtory of that country. And to this, ſay the Iriſh hiſtorians, it is owing, that the hiſtory and antiquities of that kingdom may be traced back beyond thoſe of moſt other nations.

Foundations of this kind have often been wiſhed for, and ſometimes alſo attempted in England.

Sir H. Spelman ſpeaks of a ſociety of *antiquaries* in his time, to whom his treatiſe of the terms, written in the year 1614, was communicated, he himſelf being one of the number.

The ſociety was formed by archbiſhop Parker, Camden, ſir Robert Cotton, Stowe, and others; in 1598, R. Carew was admitted into it. Application was made to queen Elizabeth for a charter and houſe, wherein they might hold their meetings, erect a library, and the like. But by the death of that princeſs, their application proved abortive. Her ſucceſſor, king James I. was far from ſavouring their deſign.

In the year 1717, this ſociety was revived again, ſince which time no interruptions having happened, it is at preſent in a very flouriſhing condition; conſiſting of many learned and ingenious men, of the nobility, gentry, clergy, &c. whoſe buſineſs, as members, is to diſcover the antiquities of their own, as well as thoſe of other nations.

This ſociety was incorporated by the king's charter in the year 1751, by the name of the Preſident, Council, and Fellows of the Society of *Antiquaries* of London; their council conſiſts of twenty-one perſons, ten of whom are annually changed: the election of members is by ballot, a certificate ſigned by three or more fellows being previouſly exhibited for ſix ordinary ſucceſſive meetings, except in the caſe of peers, members of the privy council, and judges, who may be propoſed by a ſingle member and balloted for the ſame day: and the choice is determined by a majority of two thirds. Every member pays an admiſſion-fee of five guineas, and two guineas a year, or an additional ſum of twenty-one guineas. They have weekly meetings on Thurſday, from ſeven of the clock in the evening till nine. This ſociety began to publiſh its diſcoveries, &c. in 1770, under the title of *Archæologia*.

ANTIQUARY is alſo uſed, by *ancient Writers*, for the keeper of the *antiquarium*, or cabinet of antiquities.

This officer is otherwiſe called *archæta* or *antiquary* of a king, a prince, a ſtate, or the like.

Henry VIII. gave John Leland the title of his *antiquary*, a title which, ſays the author of his life, no body ever enjoyed beſides himſelf. But the reſtriction, we ſuppoſe, was only intended to be underſtood in reſpect of the kings of England; M. Schott, we find, had the title of *antiquary* to the king of Pruſſia; P. Pedruzzi, that of *antiquary* of the duke of Parma; M. Galland reſided ſome time in Turky, under the title of *antiquary* of the king of France.

The univerſity of Oxford have ſtill their *antiquary*, under the denomination of *cuſtos archivorum*.

The kings of Sweden have been at great expences in order to illuſtrate the *antiquity* of their country, having eſtabliſhed an academy of *antiquaries* with this ſingle view.

The office of the ancient Iriſh *antiquaries* was to preſerve the genealogies of the kings of Ireland, to correct the

regal tables of succession, and deliver down the pedigree of every collateral branch of the royal family.

P. Labbe and Petavius have publiſhed pieces expreſly concerning the apparatus of *antiquaries*.

ANTIQUATED, ANTIQUATUS, ſomething obſolete, or grown out of date, or uſe.

ANTIQUE, ANTIQUUS, in a general ſenſe, ſomething that is ancient.

ANTIQUE is chiefly uſed among architects, ſculptors, and painters; who apply it to ſuch pieces of buildings, ſculpture, painting, &c. as were made at the time when the arts were in their greateſt perfection, among the ancient Greeks and Romans; viz. from the age of Alexander to the time of the emperor Phocas, about the year of Chriſt 600, when Italy became over-run by the Goths and Vandals.

In this ſenſe the word ſtands oppoſed to *modern*. Thus we ſay, an *antique* building, or a building after the *antique*; an *antique* buſt, or baſs-relievo; the *antique* manner, taſte, &c.

The ſcience of *antiques* is alſo called by Spon ARCHÆOGRAPHIA.

Under this is included the knowledge of ancient coins, medals, inſcriptions, buildings, ſtatues, ſculptures, MSS. veſſels, weights, meaſures, &c.

ANTIQUE is ſometimes alſo contra-diſtinguiſhed from *modern*, which denotes the leaſt degree of antiquity, when the art was got to its utmoſt purity.

Thus *antique architecture* is frequently diſtinguiſhed from *ancient architecture*.

Some writers alſo uſe the compound, ANTIQUO-MODERN, in reſpect of the old Gothic churches, and other buildings; to diſtinguiſh them from thoſe of the Greeks and Romans.

ANTIQUITY, ANTIQUITAS, is uſed to denote the times or ages paſt long ago.

Thus we ſay, the heroes of *antiquity*, the marks or footſteps of *antiquity*, monuments of *antiquity*, &c.

ANTIQUITY is alſo uſed to denote the works or remains of ancient times. See MONUMENT, REMAINS, RUINS, &c.

Thus we ſay, a fine curious piece of *antiquity*; Italy, France, and England, abound in *antiquities*.

ANTIQUITY is alſo uſed to denote the great age of a thing, or its duration from times of old.

In this ſenſe we ſay, the *antiquity* of a kingdom, a cuſtom, or the like; moſt nations lay claim to an *antiquity* much greater than they can truly warrant. The preſent age may be ſaid to be the *antiquity* of the world, which was but new in what are commonly called the ancient days, according to the received chronology.

There are great diſputes concerning the *antiquity*, or age of the world.

Ariſtotle carried it even to eternity; and Parmenides, Pythagoras, and the Chaldeans, were of the ſame opinion: but the generality of philoſophers, as well as divines and hiſtorians, have always held an origin of it; though where to fix that origin, is the difficulty. The different ſyſtems of the chronology of the Greeks, the Egyptians, the Jews, the Hebrew text, and the Septuagint verſion, of Scaliger, of Perron, of Sir Iſaac Newton, &c. in ſay nothing of the Chineſe annals, leave the point infinitely embarraſſed.

Dom. Perron thinks he has merited well of the public by adding 2000 years to the age of the world, which had been taken from it by Scaliger and others; but this did not hinder F. Mariana from entering a proſecution againſt him in the archbiſhop's court of Paris, for hereſy.—His crime was following the brethen rather than the Hebrew chronology, in which however he was preceded by the generality of the Fathers and primitive writers of the church; among whom it appears to have been a common practice, to make 3500 years between the creation and the incarnation. In reality, the Jews are charged with having corrupted their chronology; by which the moderns have been miſled.

Some have propoſed to trace out the *antiquity* of the earth, by an obſervation of the ſaltneſs of the ſea; others by obſerving the elevation of the bottom of the ſea, or the growth of its ſtrata.—One mark or proof of *antiquity* that has been ſtarred by Rudbeck, which he pretends to have carried to a demonſtration; it is taken from the thickneſs of a certain black ſtuff, called in the Swediſh tongue, *mo-mulder* and *fiorn-mylla*, which covers the ſurface of the earth, being formed of a mixture of rotten graſs, and other herbs, with duſt and a kind of mud, which the melted ſnow leaves behind it. According to this antiquary, there are at leaſt 300 years requiſite to form an inch thick of this ſtuff, which in many places of Sweden is found to be upwards of ſeven inches thick, where urns have been dug up full of bones and aſhes. From whence it follows, according to this author, that it is upwards of 3500 years ſince burning the dead was practiſed in Scandinavia.

Recupero, the hiſtoriographer of Ætna, ſuggeſts an argument in favour of the *antiquity* of the earth from the ſeveral ſtrata of lava, that have iſſued at different times from this mountain. A ſtream of lava, which Diodorus Siculus relates to have burſt out in the time of the ſecond Punic war, is covered at this day only with a very ſcanty ſoil; and in digging pits and wells, ſeveral ſtrata of lava have been diſcovered with earth to a conſiderable thickneſs over the ſurface of each ſtratum; in one inſtance, ſeven diſtinct ſurfaces of this kind were pierced; and allowing 2000 years for the interval between two eruptions, the lava that compoſed the firſt or loweſt ſtratum, muſt have flowed from the mountain above 14000 years ago. Brydone's Tour, &c. vol i. p. 131.

But this argument is very fallacious, becauſe we learn from ſir William Hamilton's remarks on the ſoil of Naples, that, ſince the firſt eruption of Veſuvius, which deſtroyed the ancient town of Herculaneum in the year 79, there have been ſix eruptions of lava, forming as many different ſtrata, with veins of good ſoil between them. Phil. Tranſ. vol. lxi. N° 1.

There is ſcarce a nation under heaven but lays claim to a greater degree of *antiquity* than the reſt of its neighbours; the Scythians, the Phrygians, the Chaldeans, Egyptians, Greeks, Chineſe, &c. pretend each to have the honour of being firſt inhabitants of the earth; ſeveral of theſe nations, leſt they ſhould be outſtripped in their pretenſions by any of the reſt, have traced up their origin to ages long before the received account of the creation. Hence the appellation *aborigines*, *indigenæ*, *terrigenæ*, *autochthones*, &c. The Athenians were not aſhamed to pretend to be *autochthones*; and what is moſt remarkable, Socrates himſelf gives them this ridiculous appellation, which, as ſome others of the philoſophers have wiſely obſerved, only put them on a level with ants and graſhoppers. Mem. Acad. Inſcr. tom. viii. p. 468.

The Chaldeans pretend to aſtronomical obſervations of 470,000, or 473,000 years; they mention the preciſe king who reigned over them at the time of the deluge, whoſe name was Xiſuthrus, and attribute to him ſeveral things which we aſcribe to Noah.

The Chaldaic *antiquities* of Beroſus are loſt, except a few fragments which have been collected by Joſ. Scaliger, and ſince more fully by Fabricius. Annius of Viterbo, a Dominican monk, towards the cloſe of the fifteenth century, would not ſuffer us to want ſuch a treaſure, but officiouſly went to work, and forged a Beroſus out of his own brain, which he publiſhed at Rome in 1498. The monk went further, and found from the ſame ſhop another produced Manetho's ſupplement to Beroſus, from the time of Ægyptus king of Egypt, to the origin of the Roman ſtate. The misfortune is, Manetho lived before Beroſus; this anachroniſm alone had ſufficed to betray the cheat.

St Auguſtine laughs at the folly of the Egyptians who preſent to obſervations of the ſtars above 100,000 years old: in effect, no people appear to have been warmer in the conteſt for *antiquity* than thoſe of Egypt. They preſent two periods of time; one ſhorter, during which the throne of Egypt had been filled by men, the other almoſt infinite, wherein gods, and demi-gods had worn the crown. From Iſis and Oſiris to Alexander they reckoned a ſpace of 23000 years, the time before that, while the gods reigned, made 42984 years more; the whole duration from the beginning of their monarchy amounting to 66984. De Civ. Dei, lib. xviii. c. 40.

The compilation of their dynaſties as given by Manetho, a writer of their own (of whom we have extracts in Syncellus, taken from Julius Africanus and Euſebius), extends to 5550 years before Alexander's time; and the Egyptian chronicle, cited by the ſame Syncellus, goes farther, reckoning 36525 years. Diogenes Laertius makes no leſs than 48863 years from the reign of Vulcan. Yet the Scythians, the Phrygians, the Ethiopians, and ſome others, ſtill inſiſted on their priority to the Egyptians; and in the judgment of many ſeem to have carried their point. Juſtin, after Trogus, gives the precedency to the Scythians; and affirms, that they were always allowed to have been before the Egyptians.

It is no wonder that their cataloguers ſhould be ridiculouſly incredible, when the Egyptians made their firſt kings reign 1200 years a-piece; and the Aſſyrians theirs about 2000.

But the Chineſe is eſteemed the moſt ancient monarchy in the univerſe; having cultivated the ſciences from the earlieſt ages, and ſubſiſted at leaſt theſe 4000 years with the ſame laws, manners, and uſages.

Some indeed have called in queſtion the truth and authenticity of the Chineſe annals; yet we find them confirmed, at leaſt as high as 660 years before Chriſt, by

the

the annals of Japan. At worst the Chinese *antiquities* stand on as good a footing as those of either Greece or Rome. Their annalists both for order and chronology are not inferior to any of those ancients so much admired among us; but far surpass them in point of *antiquity*, and have a better title to be credited, as having written by public authority, which can be said of few Greek or Roman pieces, except perhaps the Capitoline Marbles, which are not properly a history.

We have no inconsiderable confirmation of the truth of the Chinese account, from an ancient observation of a grand conjunction of the planets under Chuen-Hio, emperor of China, related by Martinius. That prince lived 2513 years before Christ. M. Kirchius has defended the observation against Cassini, and shewn a conjunction must really have happened at the time mentioned by the Chinese annals.

But the authenticity of this observation, and the whole of the *Chinese* CHRONOLOGY, has been lately attacked by an ingenious author, Mr. Costar.

Dionysius Halicarnassæus has traced the Roman *antiquities*, Josephus the Jewish *antiquities*, Berosus the Chaldaic *antiquities*, Sanconiathon the Phœnician *antiquities*, Manetho and Marsham the Egyptian *antiquities*.

The Phœnician *antiquities* of Sanconiathon are preserved in part by Eusebius. We have an English translation of Sanconiathon, with notes, by Bishop Cumberland, and a continuation from the canon of Eratosthenes. Lond. 1720, 8vo.

Dionysius gave his book the title of Roman *Antiquities*, on account of the curious inquiries he had made concerning the origin of the Romans, by tracing them back to the remotest ages. For fidelity as well as instruction he is generally preferred to Livy; his accounts are more ample, and his facts described with more particulars; he gives a full idea of the Roman ceremonies, the worship of their gods, sacrifices, manners, customs, discipline, policy, courts, laws, &c.

To the class of suppositious *antiquities* belong the Hetrurian *antiquities*, pretended to have been found by Scortelli near Volaterra, and published in 1646 by Curtius Inghiramus, who is generally supposed to have been the forger of them. A great number of fictitious names of ancient authors are cited in this book to give the better face to the cheat, but the style betrayed it. Allatius and Eraftius early detected the imposture. Vide Bibl. Lat. lib. iv. cap. 13.

The British *antiquities* before Cæsar's invasion are utterly dubious, not to say fabulous. Old chronicles speak of Samothes, the son of Japhet, as the founder of the British monarchy; Albion, a descendant of Cham, invaded it three hundred years after; and about 600 years after this, Brute, grandson of Æneas, came and took possession of the island in the year of the world 2880, giving it the name which it still retained when Cæsar made his attempt. This is Geoffry of Monmouth's system of the *antiquities* of the British nation, which the generality of our historians admit, for want of a better. It has been defended by A. Thomson of Queen's College, in the preface to his English translation of that writer.

It must not be forgot what the Irish also pretend to be the most ancient of all nations; they trace their origin without interruption up to Japhet. But the Scots still dispute their priority with them, holding themselves to be an elder branch of the Scythians, the first of men.

The *antiquity* of religion has been often urged as a proof of the truth of it. Jews, Gentiles, Christians, Protestants, Papists, have all in their turns made use of the argument from *antiquity*. It is indeed of the inartificial kind; and comes rather under the denomination of a presumption than a proof; on the whole it seems to have served the cause of error as much, if not more, than that of truth.

ANTIQUITY is more peculiarly used to denote the ceremonies, customs, and usages, which obtained in ancient times, either with regard to persons, places, or things.

Antiquities, in this sense, are usually divided into sacred, political, military, literary, and domestic; sometimes only into civil and ecclesiastical.

ANTIQUITIES, *sacred*, those relating to the religious worship, discipline, and belief of ancient times and people. These may be subdivided into heathen, Christian, and Mahometan, &c.

Reland has a treatise expressly on the sacred *antiquities* of the Jews; Struvius on those of the Romans; Lakemacher on those of the Greeks; and Stillingfleet on those of the British churches.

Fabricius has given two plans of a thesaurus or body of *antiquities*; the one of Hebrew *antiquities*, after the manner of Grævius and Gronovius; the other of ecclesiastical *antiquities*, divided into twelve books. He gives the names and titles of 156 authors to be included in the first, and 101 authors for the second.

ANTIQUITIES, *Christian*, those which relate to the ancient state of the Christian church.

These are the same with what we otherwise call *ecclesiastical antiquities*.

The Magdeburg centuries are looked upon by protestants as a library of Christian *antiquities*.

Mr. Bingham has published a learned system of Christian *antiquities*.

As a principal branch of Christian *antiquities*, we may reckon,

ANTIQUITIES, *Biblical*, the notices of ancient laws, ceremonies, events, &c. occurring in the Scriptures.

These make a branch of *ecclesiastical antiquities*, and bear a near relation to the Jewish, &c. *antiquities*.

Some pretend to deduce most of the heathen *antiquities* from the Bible; others, as Spencer, &c. take the contrary course, and deduce the *antiquities* of the Bible from those of *heathenism*.

To interpret Scripture it is absolutely necessary regard be had to the heathen *antiquities* alluded to in them, and these not only such as are directly aimed at, or approved, but also such as are purposely opposed.

Dr. Cave has published a treatise of apostolical *antiquities*, *Antiquitates Apostolicæ*; or the Lives, Acts, &c. of the Apostles, Evangelists, &c. Lond. 1674, fol. 1684, and 1686.

ANTIQUITIES, *civil*, all that belong not to the head of *ecclesiastical*.

ANTIQUITIES, *political*, those relating to the origin of states, governments, magistrates, and laws.

ANTIQUITIES, *national*, those employed in tracing the origin, ancient actions, usages, monuments, remains, &c. of some nation of people.

Gronovius has given a collection of the chief writers on the Greek *antiquities*; Rosse, Pfeiffer, Pitt, and Bishop Potter, have given shorter systems; the last is the best esteemed, though found too short by some in what relates to the religion, the gods, vows, and temples of Greece.

The best system of Roman *antiquities* yet extant is that of Rosinus, with Dempster's notes.

We have compendiums and introductions to the Roman *antiquities* by Hoepfner, Nieuport, Godwin, Castellius, Bayl, Kenner, &c.

Heinec

Jewish sabbath, was only of ceremonial not moral obligation: and consequently is abolished by the coming of Christ.

ANTISAGOGE, in *Rhetoric*, a figure differing little from that called CONCESSION. The following passage from Cicero is an instance of it: *Difficilis ratio belli gerendi, at plena fidei, plena pietatis; et si dicas, magnus labor, multa pericula proponuntur; at gloria ex his immortalis est consecutura.*

ANTISCEPTIC, something opposed to the reasonings and system of Pyrrhonists, or Scepties.

ANTISCII, in *Geography*, denominates people who dwell in the opposite hemispheres of the earth, and whose shadows at noon fall in contrary directions.

The word is compounded of *ανθ*, *against*, and σκια, a *shadow*.

Thus the people of the north are *antiscii* to those of the south. The one project their shadows at mid-day towards the arctic pole; and the others towards the antarctic pole.

The *antiscii* are very often confounded with the ANTÆCI, though the former term is more general than the latter. The *antiscii* stands contradistinguished from *periscii*, &c.

ANTISCII is sometimes also used, among *Astrologers*, for two points of the heavens, equally distant from the tropics.—Thus the sign Leo and Taurus are held *antiscii* to each other.

ANTISCORBUTICS, medicines proper for the cure of the scurvy.

ANTISEPTIC, from *ανθι*, and σηπω, *putrid*, of σαπω, *to putrify*, an appellation given to such substances as resist PUTREFACTION.

We have some curious experiments in relation to *antiseptic* substances by Sir John Pringle, who has ascertained their several virtues. Thus, in order to settle the *antiseptic* virtue of salts, he compared it with that of common sea-salt; which being one of the weakest, he supposes equal to unity, and expresses the proportional strength of the rest by higher numbers, as in the following table.

Salts, their antiseptic virtue.		Salts, their antiseptic virtue,	
Sea salt	1	Saline mixture	3
Sal Gemmæ	1 +	Nitre	4 +
Tartar vitriolated	2	Salt of hartshorn	4 +
Spiritus Mindereri	2	Salt of wormwood	4 +
Tartarus Solubilis	2	*Borax*	12 +
Sal febrifugum	2 +	Salt of amber	20 +
Crude *Sal Ammoniac*	3	Alum	30 +

In this table the proportions are marked in integral numbers; only to some there is added the sign +, to shew, that these have are possessed of a stronger *antiseptic* virtue than the number in the table expresses, by some fractions; unless in the three last, where the same sign imports, that the salt may be stronger by some units.

Some resinous and other substances even exceed the *antiseptic* virtues of the neutral salts; thus myrrh, *asa-fœtida*, *terra Japonica*, and aloes, are at least twelve times more *antiseptic* than sea salt. Two grains of camphor are equivalent to fifty grains of that salt. An infusion of a few grains of Virginia snake-root, in powder, exceeds twelve times its weight of sea-salt. Chamomile flowers have nearly the same extraordinary quality. The Jesuits bark has it also. Besides these, pepper, ginger, saffron, contrayerva-root, are twelve times more *antiseptic* than sea-salt. Dried sage, rhubarb, the root of the wild valerian, mint, angelica, ground-ivy, tea, green-tea, red roses, wormwood, mustard, and horse-radish, were likewise found more *antiseptic* than the standard.

To the class of *antiseptics* medicines may likewise be added fermented liquors, acids, spirits, and even those plants called anti-acids, and erroneously supposed hasteners of putrefaction, particularly horse-radish. Now, vegetables, possessing this virtue are the more valuable, in that, being usually free of acrimony, they may be taken in much greater quantities than either spirits, acids, resins, or even the neutral salts.

Antiseptics are prescribed in all putrid, malignant, and pestilential cases. It is to be remarked, however, that different kinds of them are to be given in different diseases, and even in different stages of the same disease. Thus, the bark is a specific in a gangrene, when the vessels are relaxed, and the blood resolved or disposed to putrefaction; but will fail, if the vessels are too full, or the blood be too thick. With the same caution is the bark to be used in wounds, viz. chiefly in cases of absorbed matter, when it infects the humours, and brings on a hectic fever.

By the great *antiseptic* virtue of alum, the bark, and other astringents, it should seem, that affliction had no small share in the cure of putrid disorders; and, indeed, the very nature of putrefaction consists in a separation or disunion of the parts. But as astringents are improper to be administered in many cases, contrayerva-root, snake-root, camphor, &c. may supply their place; which though highly *antiseptic*, have very little, or any, of an astringent quality. Pringle's Obs. on the Diseases of the Army. See Dr. Macbride's Essay on the respective Powers, &c. of *Antiseptics*.

ANTISIGMA, among the *Ancient Grammarians*, signifies one of the notes of sentences affixed to those verses whose order was to be changed.

ANTISPASMODICS, or medicines proper for the cure of spasms and convulsions. Opium, balsam of Peru, and the essential oils of many vegetables, are the principal in this class of medicines. Opium excels, for its immediate effects. Peruvian balsam, in many instances, produces more lasting benefit than opium, and sometimes succeeds where opium fails. As *antispasmodics*, the essential oils differ in this from opium, that they act more on a particular part than on the system in general, and have no soporific effect. Some medicines remove spasms by immediate contact, as ales milk, cream, oil of almonds; others by repelling heat, as gas, sulphur, nitre, sal ammoniac, &c. And where the strictures are produced by inanition, and a defect of vital heat, spasms are removed by those medicines that restore the *tuni vitæ*, such as valerian, castor, musk, &c.

ANTISPASTUS, a poetical foot, consisting of four syllables, whereof the first is short, the second and third long, and the fourth short.

ANTISPODIUM. See SPODIUM.

ANTI-STANCARIANS, a sect of German protestants who oppose the doctrine of Stancarius, who asserted that justification was the sole effect of Christ's human nature, exclusive of his divinity.

ANTISTASIS, in *Oratory*, a defence of an action from the consideration, that had it been omitted worse would have ensued.

This is called by Latin writers *comparationum argumentum*; such, e. gr. would be the general's defence, who had made an inglorious capitulation, that without it the whole army must have perished.

ANTISTAUS, in *Antiquity*, denotes the gibbous part of the liver in the Grecian victims.

ANTISTES, from *ανθι*, *before*, and *στω*, *I stand*, in *Ecclesiastical Writers*, a title usually given to bishops, though sometimes also to priests or presbyters. Among the ancient Romans, *antistes* was an appellation given to the chief or first orders of the priests in the provinces.

In which sense, *antistes* stands distinguished from *patres* and *magistri*.—In the more usual sense, notwithstanding, *antistes* denotes the same with *sacerdos*.

There were also females of this quality, under the title of *antista*.

ANTISTITIUM, is a term used in ancient chronicles for an abbey or monastery.

ANTISTŒCHON, from *ανθι*, *and* στοιχος, *letter*, a grammatical figure whereby one letter is used instead of another. This is otherwise called *antistichon*, by some writers.

ANTISTROPHE, a kind of dance in use among the ancients; wherein they stepped sometimes to the right and sometimes to the left, still doubling their turns or conversions.

The motion towards the left they called *antistrophe*; from *ανθι*, *against*; and στροφη, of στρεφω, *I turn*.

It was customary among the Greeks, on some occasions, to dance round the altars, whilst they sung the sacred hymns which consisted of three stanzas, or parts; the first of which called *strophe*, was sung in turning from east to west; the other, named *antistrophe*, in returning from west to east. Then they stood before the altar, and sung the epode, which was the last part of the song.—Hence

ANTISTROPHE is also used, in *Lyric Poetry*, in speaking of the ODE, which is usually divided into the *strophe*, *antistrophe*, and *epode*.

The *antistrophe* is a kind of echo, or replication to the *strophe*; and the *epode* is a launching out from them both.

ANTISTROPHE is also a figure in *Grammar*, whereby two terms or things, mutually dependent one on another, are reciprocally converted.

As if one should say, the master of the servant, and the servant of the master.

ANTISTROPHE, in *Rhetoric*, the same with what is more commonly called EPISTROPHE.

ANTISYLLOGISM, in *Logic*, a syllogism, which infers a contrary conclusion to that of another SYLLOGISM.

ANTITACTÆ, or ANTITACTICI, in *Antiquity*, a kind of Gnostics, who owned that God, the Creator of the universe, was good and just; but asserted, also, that one of his creatures had created evil, and had engaged us to follow it, in order to set us in opposition to God the creator; and that it becomes our duty to oppose this author of evil, in order to avenge God of his enemy.

Hence the name; which is derived from *αντιτασσω*, *I oppose*.

ANTITHENAR in *Anatomy*, a name given to divers muſcles, otherwiſe called ADDUCTORS, or *adducent muſcles*. The word is compounded of ἀντὶ, *againſt*, and θένας, because theſe muſcles act as antagoniſts to the *thenars*, or *abductors*.

ANTITHENAR is likewiſe a muſcle called alſo the *ſemi-interoſſeus pollicis*. It is ſmall, flat, and fleſhy, and is ſituated obliquely between the firſt phalanx of the thumb, and firſt bone of the *metacarpus*; it is fixed by one end towards the baſis of the firſt metacarpal bone, near the firſt bone of the ſecond row of the *carpus*; from thence it runs obliquely toward the head of the firſt phalanx of the thumb, and is inſerted in the lateral external part of that bone, or on that ſide which is turned to the firſt metacarpal bone. It croſſes over the *ſemi-interoſſeus indicis*; this muſcle lying toward the back of the hand, the *antithenar* here deſcribed toward the palm.

ANTITHENAR *pedis*, a ſmall compound muſcle lying obliquely under the metatarſal bones, fixed poſteriorly on the lower parts of the ſecond, third, and fourth of theſe bones, near their baſes; in the ligaments of theſe bones, and thoſe of the *tarſus*, and in a lateral *aponeurosis* of the *hypothenar*, all theſe portions contracting into a ſmall compaſs, are inſerted in the outſide of the external ſeſamoide bone of the firſt phalanx of the great toe.

ANTITHESIS, from ἀντιτίθημι, *I oppoſe*, in *Rhetoric*, a ſetting two things together by way of oppoſition to each other, that the different qualities of each may appear the more ſtrongly.

Such is that of Cicero, in the ſecond Catilinarian: 'On 'the one ſide ſtands modeſty, on the other impudence; 'on the one fidelity, on the other deceit; here piety, 'there ſacrilege; here continency, there luſt.' &c.—Such alſo is that of Auguſtus to ſome ſeditious young men; *—audiit, juvenes, ſenem, quem juvenis jones audiere*—Such again is that of Seneca: *Curæ lætis loquuntur, ingentes ſtupent.* And that of Virgil:

Fluctus ſi nequeo ſuperare, Aboreanda movebo.

St. Auguſtine, Seneca, Salvian, and many other ancient writers, ſeem greatly to affect *antitheſes*; but among the moderns they are generally deſpiſed. Deſmaretes repreſents them as the favourites of young writers.

ANTITHESIS is ſometimes uſed for controverſy.

In this ſenſe we meet with *antithetic* method, *antithetic* diſcourſe, &c.

ANTITHESIS is alſo a figure in *Grammar*, whereby one letter is ſubſtituted in the room of another; as *ais* for *illi*.

ANTITHETARIUS, a term occurring in the title of a chapter in the laws of Canutus, but not in the chapter itſelf.

The meaning of the word is, a man who endeavours to diſcharge himſelf of the fact of which he is accuſed, by recriminating, i. e. by charging the accuſer with the ſame fact.

ANTITHETON, in *Rhetoric*, a figure wherein contraries are ſet in oppoſition to each other.

Some diſtinguiſh between the *antitheſis* and *antitheton*. Voſſius thinks that in the *antitheton* nouns and verbs are oppoſed, but in the *antitheſis* epithets only. Others comprehend the *antitheſis* under *antitheton*.

ANTITHORA. See ANTHORA.

ANTITRAGICUS, in *Anatomy*, a name given by Albinus to one of the muſcles of the eye, called by Santorini and others *muſculus auricularis*.

ANTITRAGUS, in *Anatomy*, is the thicker part of the *anthelix*, or that ridge juſt above the TRAGUS.

A ramification of the hard portion of the auditory nerve, running on the back of the *antitragus*, is ſometimes ſucceſsfully cauterized in the tooth-ach. Phil. Tranſ. N° 299. p. 1981.

ANTITRINITARIANS, thoſe who deny the Trinity, and teach, that there are not three perſons in the Godhead.

Thus the Samoſatenians, who do not believe the diſtinction of perſons in God, the Arians, who deny the divinity of the Word, and the Macedonians, who deny that of the Holy Spirit, are all properly *Antitrinitarians*. Among the moderns, *Antitrinitarians* are particularly underſtood of Socinians, called alſo Unitarians.

The *Bibliotheca Antitrinitariorum*, or *Antitrinitarian* Library, is a poſthumous work of Chriſtopher Sandius, an eminent *Antitrinitarian*; wherein he gives a liſt, digeſted in order of time, of all the Socinian or modern *Antitrinitarian* authors, with a brief account of their lives, and a catalogue of their works. See UNITARIAN.

ANTITYPE, a Greek word, properly ſignifying a type or figure correſpondent to ſome other type.

The word *antitype* occurs twice in the New Teſtament; viz. in the Epiſtle to the Hebrews, *ix.* 24. and in St. Peter, 1 Ep. *iii.* 21. where its genuine import has been much controverted.—The former ſays, that 'Chriſt is 'not entered into the holy places made with hands, 'which are ἀντίτυπα, the figures or *antitypes* of the 'true—now to appear in the preſence of God for us.'—Now τύπος, as is elſewhere obſerved, ſignifies the pattern by which another thing is made; and as Moſes was obliged to make the tabernacle, and all things in it according to the pattern ſhewed him in the Mount; the tabernacle ſo formed was the *antitype* of what was ſhewn to Moſes: any thing, therefore, formed according to a model, or pattern, is an *antitype*.

In the latter paſſage, the Apoſtle, ſpeaking of Noah's flood, and the deliverance only of eight perſons in the ark from it, ſays, 'Ὃ καὶ ὑμᾶς ἀντίτυπον νῦν σώζει βάπτισμα, *baptiſm, being an antitype to that, now ſaves us*; 'not putting away the filth of the fleſh, but the anſwer of a 'good conſcience towards God, &c. The meaning is, that righteouſneſs, or the anſwer of a good conſcience towards God, now ſaves us by means of the reſurrection of Chriſt, as formerly righteouſneſs ſaved thoſe eight perſons by means of the ark, during the flood. The word *antitype*, therefore, here ſignifies a general ſimilitude of circumſtances; and the particle ὃ, *whereunto*, refers, not to the immediate antecedent, ὕδατος, *water*, but to all that precedes.

ANTITYPE, among the *Ancient* Greek *Fathers*, and in the Greek *Liturgy*, is alſo applied to the ſymbols of bread and wine in the Sacrament.

Hence it hath been argued, by many proteſtants, that the Greeks do not really believe the doctrine of tranſubſtantiation; becauſe they call the bread and wine *antitypes*, ἀντίτυπα, q. d. figures, ſimilitudes, and this even after the conſecration.

ANTLER, among *Hunters*, the firſt of the pearls that grow about the bur of a deer's horn.

There are alſo ſur-*antlers*, brow-*antlers*, &c.

ANTLIA, an ancient machine, ſuppoſed to be the ſame with our pump.

Hence the phraſe, *in antliam condemnari*, according to the critics, denotes a kind of puniſhment, whereby criminals were condemned to drain ponds, ditches, or the like.

ANTŒCI, in *Geography*, thoſe inhabitants of the earth who live under the ſame meridian, and at the ſame diſtance from the equator; the one toward the north, and the other toward the ſouth.

The word is formed of ἀντὶ, *contra*, and οἶκος, *I inhabit*.—The *Antœci* are contradiſtinguiſhed from the *Periœci*.

Hence the *Antœci* have the ſame longitude, and equal latitudes, only of a different denomination.

The inhabitants of Peloponneſus are nearly *Antœci* to the Hottentots of the Cape of Good Hope.—*Antœci* are frequently confounded with ANTIPODES.

The *Antœci* have preciſely the ſame hour of the day and night, but oppoſite ſeaſons: when it is 12 o'clock in the longeſt ſummer's day with one, it is 12 o'clock of the ſhorteſt winter's day with the other; and hence the night of the one is equal to the day of the other.

ANTOMOSIA, from ἀντὶ and ὄμνυμι, *I ſwear*, in *Ancient Writers*, an oath taken by both the parties in a criminal acculation; whereby the accuſer charges the other with the fact, and the accuſed in his turn denies the ſame.

In which ſenſe *antomoſia* amounts to the ſame with *diomoſia*, though ſome diſtinguiſh between the two, reſtraining *antomoſia* to the oath of the perſon accuſed, whereby he engages to make no other than a fair defence; and *diomoſia* to the proſecutor's oath, whereby he ſwears that his accuſation is juſtly founded.

Others will have *antomoſia* properly to denote a law-ſuit about things to which there are no witneſſes, and which can only be decided by the oaths of the parties. Others again will have it to be, where the accuſed party alleging ſickneſs for his non-appearance, the proſecutor takes an oath, that the ſickneſs is only feigned, upon which the judges proceed to ſentence.

ANTONIAN *water*, in the *Materia Medica*, the name of a medicinal water of Germany, remarkably pleaſant to the taſte, and of ſervice in many caſes as a medicine.

This water, if mixed with any acid liquor, raiſes a conſiderable effervescence, and, when mixed with Rhenish wine and ſugar, which is a common way of drinking it, makes a great hiſſing and bubbling, and becomes turbid and milky. If powder of galls be added to it, it ſuffers no change, but remains limpid and colourleſs; whence it is plain that it contains no iron, nor vitriol. Syrup of vitriol mixed with it, turns the whole green, whence it is plain that it contains an alkali; and if oil of tartar be added to it, it becomes turbid and milky, and precipitates a white ſediment, whence it appears that there is either common ſalt, or a calcareous earth in it. If it be expoſed ſome time to the air in an open veſſel, it, like all the other mineral waters, loſes its pungent taſte and petrifactive quality, becoming turbid and vapid. A quart of it evaporated with a very gentle heat, leaves two ſcruples of a very dry ſediment, which being ſeparated by

another solution, is found to be one half of an alkaline salt, and the other a calcareous earth. Oil of vitriol mixed with the salt, produces a great effervescence, and a penetrating scent arises like that produced by the mixing oil of vitriol and common salt. Hence it appears, that these waters contain a small portion of an alkaline salt, a larger portion of sea-salt, and a yet larger of a calcareous earth, and with these a very considerable quantity of a subtile and penetrating mineral spirit.

It is a very temperate water, not too strongly operating either by stool or urine; and hence it is a very proper drink for persons in chronic and in many acute cases, either alone, or mixed with wine, to supply the place of malt liquor, which is proper but in very few illnesses.

A draught of it alone may also prove of considerable service in hypochondriac cases.

ANTONINE *column*. See COLUMN.

ANTONOMASIA, a figure in rhetoric, whereby a noun appellative is used instead of a proper name, or *vice versa*.

The word is compounded of *ante*, *for*, and *onoma*, *name*. Thus we say, the Philosopher, instead of Aristotle: the Orator, for Cicero: the Apostle, for St. Paul: the Prophet, for Moses, &c.—Thus also we call a voluptuous person, a Sardanapalus, &c. And thus the French say, Henry the Great, meaning Henry IV. of France.

ANTOPHYLLUS, in *Botany*, signifies the fruit of the CLOVE-*tree*.

ANTOSIANDRIANS, a sect of rigid Lutherans, who oppose the doctrine of Osiander relating to justification. These are otherwise denominated *Osiandro-mystics*.

The *Antosiandrians* deny that man is made just, with that justice wherewith God himself is just; that is, they assert, that he is not made essentially, but only imputatively just; or, that he is not really made just, but only pronounced so.

ANTRUM *hocinosum* is used by some anatomists for the COCHLEA of the ear.

ANTRUM *genæ*, a large cavity in the fourth bone of the upper jaw, communicating with the *foramina narium*.

It was thus called by Casserius, but by Dr. Highmore *antrum maxillæ superioris*.

The *antrum genæ* is near two inches long, and above an inch in depth, seated between the lower margin of the orbit of the eye, and *dentes molares* of the same side. Backwards the thin bony parts of this cavity, with the *os sphenoides*, make the *foramen lacrymo-nasale*; its lower surface makes a thin covering to all the roots of the *dentes molares*, as well as the *dens caninus* of the same side. It is very thin, and, on drawing any teeth to which it sticks, is frequently taken along with them, whereby this cavity is opened into the *alveolus*, and consequently into the mouth, to the great terror and surprise of the patient.

The *antrum genæ* appears to be the chief seat of the *ozæna*. Dr. Drake mentions an operation which he put in practice for the cure of that disease; taking out the foremost *dens molaris*, and not finding any aperture from its *alveolus*, as is frequently observed, he bored a hole through the *alveolus* into the *antrum genæ*, whereby the *pus*, which before lay in the *antrum*, run out, and the medicines daily injected by this aperture passed into the nostrils, whereby the patient was cured.

ANTRUM *Highmorianum* is a cavity discovered within the sinus of each maxillary bone.

Surgeons sometimes mistake this for a *caries* of the bone; finding they can penetrate so deep into it with a probe.

ANTRUM *pylori*, a large cavity at the bottom of the PYLORUS.

Antrum pylori was thus denominated by Willis, who assigned it the office of keeping the first digested chyle, till that which was later taken into the stomach be digested; though, if what Dr. Wharton suggests, that there are ladicals at the bottom of the stomach, be true, such a provision seems unnecessary.

ANTYLION, in the *Ancient Pharmacy*, a kind of astringent MALAGMA, described by Ægineta.

ANTYX, from *ante*, in *Antiquity*, the outermost round, or circumference of a shield.

ANVIL, a smith's utensil, serving to place the work on, to be hammered or forged.

The face, or uppermost surface of the *anvil*, must be very flat and smooth, without flaws; and so hard, that a file will not touch it. At one end there is sometimes a pike, bickern, or beak-iron, for the rounding of hollow-work. The whole is usually mounted on a firm wooden block.

Forged *anvils* are better than those of cast work; and the best have the upper part made of steel. Locksmiths have a smaller kind of *anvil*, called the STAKE, which is moveable, and placed ordinarily on their work bench. Its use is for setting small cold work straight, or to cut or punch on with the cold chisel, or cold punch.

ANUBIS, one of the deities of the Egyptians, painted with a dog's head, holding in one hand a branch of palm, and a *caduceus*, or Mercury's wand, in the other.

ANUS, in *Anatomy*, the lower extremity of the *intestinum rectum*; or the orifice of the fundament. See *Tab. Anat. (Splanch.) fig. 9. litt. n.*

The Philistines sent golden *emerods* back with the ark, to be cured of a disease which afflicted them in the *anus*. 1 Sam. ch. vi.

ANUS, *muscles of the*, are the *sphincter*, *levator*, and *sphincter*, or *constrictor ani*.

The *anus* is found to have various uses in different animals. In the pond muscle the same aperture serves indifferently for *mouth* and *anus*. In fowl the *anus* has apparently some concern in the action of respiration; there are found many vesicles extended from the *bronchiæ* through the abdomen to the *anus* of fowls; which may be the cause of its constant motion, the air having both ingress and egress there. Whence it is that they are also found to have an attractive power, and such are used by some to draw out the poison and malignity in certain diseases. It may be added, that a kind of alternate *ejectio* and *deglutio* is perceived, at least on many occasions, in the *anus* of divers quadrupeds, as cows, mares, &c. Hist. Acad. Scienc. 1. 10.

The *ani* of fowls, applied in malignant distempers to draw the infection out of the body, act like cupping-glasses; insomuch that the fowl has often stuck by its *anus* to the part till it died. Mr. Temple affirms he has seen seven chickens thus applied to the groin of one person seized with the plague, which all stuck till they died. The eighth went quickly off and lived. Phil. Trans. N° 86. p. 5031. and Ephem. Acad. N. C. Dec. 2. An. 9. Obs. 138.

The *anus* of birds and quadrupeds is generally constant and regular as to the place it occupies in the body; in fish it confiderably differs in the various kinds, and makes one of their marks of distinction.

Some authors speak of attempts made not without success, for conveying nourishment to the human body by nutritive clysters conveyed up the *anus*, where the common canal by the *gula* has been rendered impassible. Mem. Acad. Scienc. 1716. p. 237.

It may be added, that we have instances of births or deliveries by the *anus*; dead *fœtuses* long detained *in utero*, finding no other out-let, have been frequently voided piece-meal at the *anus*. Dr. Wallis's and Halley's case is much more extraordinary, who speak of a female greyhound delivered of an entire whelp the same way. For *calculi* or stones, instances of their being voided by the *anus* are frequent. Phil. Trans. N° 385 and 380. Mem. Acad. Scienc. an. 1702.

ANUS, *fistules of the*, are a fistula, and the *procidentia*, or *prolapsus ani*; to which may be added the hæmorrhoids, or piles.

ANUS, *imperforate*.—When children are born without an *anus*, it is very difficult to hit on the right part for making a perforation in the *rectum*, because the extremity of the gut is generally formed into a knot. For performing such a perforation, M. Petit recommends a trocar, the *cannula* and circular plate of which are so slit open, as to serve as a groove for a bistoury to be run in, to enlarge the aperture after the trocar has been pushed into the gut. See Mem. de l'Acad. de Chirurg. tom. 1. Affections about the *anus* are difficult to be cured for many reasons. The part is endued with a very tender sense, and therefore is easily irritated by acrimonious and austere medicines. Besides, the superfluities of the aliment in their passage, are not only acrid in themselves, but much more so on account of the bilious, and sometimes serous humours, which pass along with them. Moreover, the physician can fix no certain time for attending his patients, who sometimes cure nature this way at very inconvenient seasons. The humidity and heat of the place also, which require drying as well as cooling remedies, are no small obstacles to the cure of ulcers in those parts; for astringents are acrid, which the place, by reason of its exquisite sense, is not able to bear. Wherefore such remedies agree with them as are astringent without asperity; of this quality are principally metals, which are neither acrimonious nor extremely rough; these, washed, answer the intention effectually, without mordacity. Vegetables, and drastic purges, such as the oil of castor, &c. are best; and aloes exceedingly hurtful to those that are subject to the piles, and the *procidentia ani*.

ANI *speculum*. See SPECULUM.

ANUS is also used for a small hole in the third ventricle of the brain, which leads into the fourth ventricle of the *cerebellum*.

It is properly the posterior orifice of the canal called *aqueductus Sylvii*.

ANUS, in *Botany*, denotes the posterior opening of a monopetalous flower.

ANUS, a species of *murex* in the class of *worms*.

AONIDES, in *Mythology*. See MUSE.

AORISTIA, in the *Sceptic Philosophy*, denotes that state of the mind, where we neither assert nor deny any thing positively, but only speak of things as seeming or appearing to us in such a manner.

The *aoristic* is one of the great points or terms of *scepticism*, to which the philosophers of that denomination had continual recourse by way of explication, or subterfuge. Their adversaries, the *dogmatists*, charged them with dogmatizing, and asserting the principles and positions of their sect to be true and certain.

AORISTUS, in the Greek *Grammar*, an indefinite and indeterminate kind of tense, which sometimes expresses the present, sometimes the future, but most frequently the past time.

The word is compounded of *a* privative, and *ὁρίζω*, to *limit*.

The Greeks have two *aoristi*; the Latins have none.

AORTA, in *Anatomy*, the great ARTERY proceeding from the left ventricle of the heart; from which all the other arteries either mediately or immediately proceed, and by which the whole mass of blood is conveyed to all parts of the body. V. *Tab. Anat. (Angeiol.) fig.* 1. *n.* 1. and *fig.* 3. *(Splanch.) fig.* 12. *lit. r.* and 6. and *fig.* 1. *lit. n.* and *Angeiol. fig.* 1. *n.* 28.

The word is formed of *αειρω*, which signifies a *bag*, *chest*, &c.

Anatomists treat of the structure of the *aorta*, compression of the *aorta*, valves, coats, ramifications, &c. of the *aorta*. Vieussens also speaks of a kind of vesicular glands in the *parietes* of the *aorta*. Dr. Keil gives a computation of the velocity of the blood in the *aorta*.

The *aorta* issuing from the heart by only one trunk, is furnished with three semi-lunar valves, to prevent the blood's regurgitating: immediately above these it sends out to the heart two arteries called *coronariæ*; and afterwards bending down in form of a bow, divides itself into what they call its ascending and descending parts. Phil. Trans. N° 280.

AORTA, *ascending*, or rather trunks of the *aorta*, are those which take their course toward the upper and lateral parts of the body. Such are the two carotids, the subclavian, cervical, scapular, upper intercostal, mediastinal, upper diaphragmatic, mammary, axillary, and brachial arteries.

AORTA, *descending*, or trunk of the *aorta*, sometimes also called simply *aorta*, is that which takes its course downwards, through the thorax and *abdomen* to the *os sacrum*. From this arise Ruysch's bronchial artery, the lower intercostals, œsophageous, lower diaphragmatic, cœliac, epiploic, emulgent, spermatic, mesenteric, and hypogastric arteries.

The division of the *aorta* into ascending and descending trunks, though generally received by anatomists, is excepted to by Heister as less natural; and suited rather to the structure of quadrupeds, as dogs, calves, and the like, from which it seems to have been originally taken, than to that of the human body. In reality the ascending *aorta* is not one single trunk, as the name should import, but consists of three large branches or trunks: in some instances there have even been four observed, scarce ever only two, and never one; which, however, is usually the case in quadrupeds.

The flexure of the *aorta*, after its quitting the heart, and before its division into ascending branches, is noted by Dr. Lower as an instance of the wisdom of the Creator, to effect a more equable and gentle distribution of the blood to the several parts of the body. For whereas the orifice of the heart opens right upwards, if the *aorta*, which receives the first impulse, were continued in a straight line up to the region of the head, the blood would be poured too swiftly and plentifully on the brain, and the inferior parts be defrauded of their vital liquor. To obviate this, the *aorta* is so disposed, that the blood does not run directly into the ascending branches, the axillaries and carotids, but fetches as it were a compass by means of the flexure, which sustains the first effort of the ejected blood, and directs the greatest torrent towards the descending trunk.

The disposition of the *aorta* is varied according to the kinds of animals, their different postures, and other occasions: in man, by reason of his erect situation, the blood tends to flow faster and more plentifully by the descending, than by the ascending trunks; in brutes, which bend downwards, the contrary: in both, proper provisions are made for an equable distribution. In the male sex of our species, Dr. Piccairn assures us, the descending *aorta* has fewer ramifications, and consequently the blood will flow slower proportionably, than in that of the female sex, where there are more ramifications, and consequently the blood finding less resistance will flow more largely to the lower parts of women than men, from which cause arise the menies.

The *descending aorta* is liable to compressions from the stomach and intestinal tube, and that either ordinarily or extraordinarily. The first happens, whenever the stomach, &c. is full; the second, when it is dilated beyond measure, by the *pneumora* and ebullition excited in fevers. The effect in either case will be an interruption or diminution of the flux of blood to the lower parts of the body; and an increase of that to the head, and higher parts. The ordinary, according to Dr. Woodward, is necessary to supply the business of cogitation, furnish matter for animal spirits, &c. The extraordinary serves M. Silva to account for the violent head-aches, deliriums, and other symptoms of fevers.

The *aorta* is found in divers states, natural, morbid, ossified, cartilaginous, aneurismatical, polypose, calculose, &c.

Ossifications or petrifactions of the coats of the *aorta*, as it rises from the heart, are so frequent, that some think it a constant case.—Mr. Cowper, however, has an express discourse to shew, that whenever such ossifications happen in man, they are a disease, and incommode the part in the due execution of its office.

Of this he gives us several instances: one, in which an intermission of pulse was produced; in another, a coldness of the extremes, with a gangrene, &c. Phil. Trans. N° 299.

Some will have ossifications of the *aorta* one of the great causes of sudden deaths. Hist. Acad. Scienc. an. 1701.

In an old man who died at the age of 130, Dr. Keil found the *aorta*, in the abdomen and iliacs to be for the greatest part cartilaginous, which apparently was one cause of his death. Phil. Trans. N° 300.

The academists Naturæ Curiosi give an instance of six nail-like stones, or *calculi*, found in a prominence of the *aorta*, under the kidneys of a person who had died of a most acute pain in the region of the loins. At each pulsation of the artery, these would be driven against the membranous *fibrillæ* of the coat of the vessel, and hence those shooting pains; the cause of concretion is attributed to the too frequent use of the viperine powder, taken for an ulcerated breast. Ephem. Acad. N. C. Cent. 9.

For disorders of the *aorta*, see ANEURISM and SINUS.

AOUTA, the name of the paper mulberry tree at Otaheite, in the South Sea, from which a cloth is manufactured, that is worn by the principal inhabitants. The bark of the trees is stripped off and deposited to soak in running water; when it is sufficiently softened, the fibres of the inner coat are carefully separated from the rest of the bark; they are then placed in lengths of about eleven or twelve yards, one by the side of another, till they are about a foot broad; and two or three layers are laid one upon the other. This is done in the evening; and by the next morning the water is drained off, and the several fibres adhere together in one piece. It is afterwards beaten on a smooth piece of wood with instruments marked longitudinally, with small grooves of different degrees of fineness; and by means of this operation, becomes as thin as muslin; and after bleaching it in the air, in order to whiten it, it is fit for use. If the cloth breaks in the beating, it is easily repaired by putting on a patch with a gluten that is prepared from the root of the *ava*, which is done so nicely that it cannot be discovered. This cloth is cool and soft, but as liable to be rent as paper. The colours with which it is dyed are principally red and yellow. The red is a beautiful scarlet, and produced by mixing the juices of two vegetables, viz. the fruit of the fig called *matte*, and the leaves of the *cordia sebestina*, or *etoo*. The yellow is made of the bark of the root of the *morinda citrifolia*, called *nono*, by scraping and infusing it in water. The inhabitants of the island also dye yellow with the fruit of the *tamanu*. Hawkesworth's Voyages, &c. vol. ii. p. 210. &c.

APÆDUSIA, from *a* and *παιδεια*, *instruction*, denotes ignorance or unskilfulness in what relates to learning and the sciences.

Hence also persons uninstructed and illiterate are called *apædeutæ*.

The term *apædeutæ* was particularly used among the French in the time of Huet; when the men of wit at Paris were divided into two factions, one called by way of reproach, *apædeutæ*, and the other *erudits*.

The *apædeutæ* are represented by Huet, as persons who, finding themselves either incapable or unwilling to undergo a severe course of study, in order to become truly learned, conspired to decry learning, and turn the knowledge of antiquity into ridicule, thus making a merit of their own incapacity.

The *apædeutæ*, in effect, were the men of pleasure; the *erudits* the men of study.

APAGMA, a term uſed, by ſome writers in *Chirurgery*, for the ſhrinking of a bone, or other part out of its proper place. But it is more properly uſed for a fracture of a bone at or near the part whereby it is articulated with another.

APAGOGE, from ἀπο, and ἀγω, *I bring*, or *bear*, in the *Athenian laws*, the carrying a criminal taken in the fact, to the magiſtrate. If the accuſer was not able to bring him to the magiſtrate, it was uſual to take the magiſtrate along with him to the houſe where the criminal lay concealed, or defended himſelf.

APAGOGE, in *Logic*, ſee ABDUCTION.

APAGOGE, in *Mathematics*, is ſometimes uſed to denote a progreſs or paſſage from one propoſition to another; when the firſt having been once demonſtrated, is afterwards employed in the proving of others.

APAGOGICAL *demonſtration*, is ſuch as does not prove the thing directly, but ſhews the impoſſibility and abſurdity which ariſes from denying it.

Hence it is alſo called, *reductio ad impoſſibile*, or *ad abſurdum*.

APALACHINE, in *Botany*, a name given by ſome authors to the ſhrub *taſſino vero Plinianorum* of other writers. This plant is uſed as tea, and celebrated for many virtues.

APANAGE, APENAGE, APPANAGE, APANNAGE, or APENNAGE, in the *French Laws*, the fortune of a king's younger ſon; or a ſettled portion of land, &c. aſſigned for the ſubſiſtence of the cadets, or younger ſons of a ſovereign prince.

Nicod and Menage derive the word from *panis*, *bread*; which frequently includes all other ſorts of proviſion neceſſary for ſubſiſtence.

Some will have the *apanages*, at the firſt inſtitution, to have been only penſions, or annual payments, of a certain ſum of money.—The younger ſons of England have no certain *apanages*, as in France; but only what the good pleaſure of the king beſtows upon them.

Even in France, during the firſt and ſecond races of kings, the right of primogeniture and *apanages* were unknown; but the domains were divided pretty equally among all the children.

Great inconveniences ariſing hence, it was at length found proper to put off the younger-born with counties, duchies, or other diſtricts; on condition of their paying homage and fealty for the ſame, and of their reverting, in defect of heirs male, to the crown.

This has happened, accordingly, to the firſt and ſecond branch of the dukes of Burgundy.—The duchy of Orleans is the *apanage* of the ſecond ſon of France.

The *apanage* is unalienable: collateral branches do not inherit it. The eldeſt ſon alone is heir to the whole *apanage*; but is to allow the younger an honourable maintenance.

In France, *apanages* are of two kinds, *royal* and *cuſtomary*; the firſt only granted to males the king's brothers, exclusive of the females. Theſe are not ſo properly alienations of the king's demeſne, as diſmembering of them.

Cuſtomary apanages are thoſe granted to women, the king's ſiſters.

Joach. Meierus has publiſhed a body of all the writers on *apanage* and *parage*, in one volume in folio.

APARINE, in *Botany*, ſee CLEAVERS.

APARITHMESIS, from ἀπαριθμεω, *I number*, or *enumeration*, in *Rhetoric*, is a figure, whereby that which might be expreſſed in few words is branched out into ſeveral particulars, to enlarge the idea and render it the more affecting; and ſometimes it denotes the anſwer to the *proteſis* or propoſition itſelf. Thus if the *proteſis* be *appellandi tempus non erat*, the *aparithmeſis* is *a town, nor you nor I*.

APARTISMENUS, in the *Ancient Poetry*, an appellation given to a verſe, which comprehended an entire ſenſe or ſentence in itſelf.

This is ſometimes alſo written *apartimenus*, i. e. ſuſpended, as not needing any following verſe.

APARTMENT, a portion of a large houſe, wherein a perſon may lodge ſeparately; having all the conveniences requiſite to make a complete habitation.

The word comes from *apartimentum*, of the verb *partiri*, *to divide*; or, as ſome imagine, *a parte manſionis*, *making part of a dwelling*.

A complete *apartment* muſt conſiſt of a hall, a chamber, an antechamber, a cloſet, and a cabinet or wardrobe.

APATHY, in a moral ſenſe, denotes an inſenſibility; or a privation of all paſſion, all emotion, or perturbation of mind.

The word is formed of the privative α, and παθος, *paſſion*.

The Stoics affected an entire *apathy*: their wiſdom was to enjoy a perfect calmneſs or tranquillity of mind, incapable of being ruffled, and above the reach of any ſenſe either of pleaſure or pain.

In the firſt ages of the church, the chriſtians adopted the term *apathy* to expreſs a contempt of all earthly concerns; a ſtate of mortification, ſuch as the goſpel preſcribes. Clemens Alexandrinus, in particular, brought it exceedingly in vogue; thinking, hereby, to draw the philoſophers to Chriſtianity, who aſpired after ſuch a ſublime piece of virtue.

Quietiſm is only *apathy* diſguiſed under the appearance of devotion.

APATURIA, in *Antiquity*, a ſolemn feaſt celebrated by the Athenians in honour of Bacchus.

The word is uſually derived from ἀπατωρ, *fraud*.

It is ſaid to have been inſtituted in memory of a fraudulent victory obtained by Melanthus, king of Athens, over Xanthus, king of Boeotia, in a ſingle combat, which they agreed upon, to put an end to a debate between them relating to the frontiers of their countries.—Hence Buddeus calls it *feſtum deceptionis*, *the feaſt of deceit*.

Other authors give a different etymology of this feaſt, from what we have now related: they tell us, that the young Athenians were not admitted into the tribes on the third day of the *Apaturia*, till their fathers had firſt ſworn, that they were their own children; and that, till that time, they were ſuppoſed in ſome meaſure, to be without fathers, ἀπατορες: whence the feaſt, they ſay, took its name.

Xenophon, on the other hand, informs us, that the relations and friends met on this occaſion, and joined with the fathers of the young people who were to be received into the tribes; and that from this aſſembly the feaſt took its name: that in ἀπατορια, the α, far from being a privative, being here a conjunctive, ſignifies the ſame thing with συν, *together*.

This feaſt laſted four days: the firſt day, thoſe of the ſame tribe made merry together; and this they called δορπια. The ſecond day, which they called ἀναρρυſις, they ſacrificed to Jupiter and Minerva. The third day which they called κουρεωτις, ſuch of their young men and maids as were of age were admitted into their tribes.

The fourth day they called ἑορτη.

APAULIA, in *Antiquity*, the third day of a marriage ſolemnity.

It was thus called, becauſe the bride, returning to her father's houſe, did ἀπαυλιζεσθαι τον γαμον, lodge apart from the bridegroom. Some will have the *apaulia* to have been the ſecond day of the marriage, viz. that whereon the chief ceremony was performed; thus called by way of contradiſtinction from the firſt day, which was called ὁρμιαιον. On the day called ἀπαυλια, (whenever that was) the bride preſented her bridegroom with a garment called ἀπαυλιαμα.

APE. See SIMIA.

APECHEMA, Ἀπεχημα, in *Medicine*, the ſame with CONTRAJUSURE.

APEDIA, a ſpecies of ape.

APEIBA of the Braſilians. See SLOANEA.

APELLA, among *Phyſicians*, a name given to thoſe whoſe prepuce is either wanting or ſhrunk, ſo that it can no longer cover the glans.

APELLA, a ſpecies of ape found in America.

APELLITÆ, in the *Primitive Church*, denote thoſe who taught in the ſecond century, that Chriſt left his body diſſolved in the air; and ſo aſcended into heaven without it.

APENE, ἀπενη, *chariot*, in *Antiquity*, a kind of chariot wherein the images of the gods were carried in proceſſion on certain days, attended with a ſolemn pomp, ſongs, hymns, dancings, &c.

The *apene*, or ſacred chariot of the Greeks, is called *tenſa*.

It was very rich, made ſometimes of ivory, or of ſilver itſelf, and variouſly decorated.

APENNAGE. See APANAGE.

APENNIS, in *Ancient Laws*, a deed or inſtrument made in favour of a perſon, who has loſt the title-deeds to his houſe or land by fire. Du-Cange.

In ſuch caſe, an aſſembly of the people of the neighbourhood being called, and an exact enquiry made before the judge, another inſtrument was framed to confirm and ſecure the unhappy perſon's right.

APEPSY, in *Medicine*, denotes crudity, or a want of digeſtion.

The word is formed from the privative particle α, and πεπτω, *I concoct*.

Apepſia may be defined a defect in the ſtomach, which prevents the aliment taken in from affording a proper chyle for ſupplying the blood, and nouriſhing the body. Abſtemiouſneſs and exceſs are alike cauſes of indigeſtion.

The method of treatment in the *apepſy*, is the ſame as in the *anorexy*. The COLUMBO root is particularly uſeful, when the ſtomach is languid, and digeſtion difficult, &c. It may be given in ſubſtance with any grateful aromatic, or in Madeira wine, now and then interpoſing gentle doſes of rhubarb in tinctura. A mixture of muſtard ſeed with the *columbo* root, is of great utility in caſes of this nature.

nature, where acidity and flatulence prevail much in the *prima via*. See Percival's Essays, &c.

APER, *boar*, in *Zoology*. See BOAR and HOG.

APER is also used for the name of a sea-fish, called by some *streulla* and *rondo*. It approaches very much in shape to the *faber* or DORRE, but is much smaller. See *Tab.* II. *of Fish*, N°. 19.

APER *mexicanus*, a name by which many authors have called the TAJACU of America.

APER *piscis*, a name by which some authors have called the sea-fish more usually called the CAPRICUS.

APEREA, in *Zoology*, the name of a small American animal, of the rabbit kind, and seeming to be of a mixt nature between the rabbit and the mouse, having exactly the short roundish ears of the mouse kind, and all the other particulars of the rabbit. It grows, at its full size, to ten or twelve inches long, and its hair is just of the colour of our hares on the back and sides, and whitish on the belly.

APERIENS *Os*, in *Anatomy*, a name given by some writers to a muscle of the mouth, called by Albinus *levantor maxillæ inferioris*, and by others BIGASTRICUS.

APERIENS *palpebram rectus*, in *Anatomy*, is a muscle, which, rising in the orbit of the eye, near the entrance of the optic nerve, passes over the attollent muscle of the eye, and is at last inserted into the whole superior part of the upper eye-lid, which it serves to open.

APERIENTS, or APERITIVE *medicines*, from *aperio*, *I open*, are such as open the obstructed passages of the small nerves, glands, and pores; and, by that means, promote a due circulation of the contained juices.

Aperients, then, coincide with what we otherwise call openers, ANASTOMATICS, and DIOBSTRUENTS.

The five lesser *aperient* or opening roots, are grass, madder, rryngo, capers, and chammoc.

The greater *aperient* or opening roots, are smallage, fennel, asparagus, parsley, and butchers-broom.

APERIENS, *crocus martis*, opening saffron of iron, is a preparation of iron-plates or filings, made by exposing them to the rain or dew, till they contract a rust; which is the medicine required. It is a good *aperient*. See CROCUS.

APERISTATON, from *a*, *without*, and *περισασις*, *unfavourable circumstance*, in the *Ancient Physic*, denotes an ulcer of a mild or benign kind, and not attended with any severe symptom.

APERTIONS, in *Architecture*, are the openings in a building; as doors, windows, flair-cases, chimneys, out-lets and inlets for light, smoke, &c.

The *apertion* should be as few as may be; it being a rule, that all openings are weakenings: and they should not approach too near the angles of the walls.

APERTOR *oculi*, in *Anatomy*, a name given by Spigelius and others to the muscle called the APERIENS *palpebram* and LEVATOR *palpebræ superioris* by others.

APERTURE, the *opening* of any thing; or a hole, cleft, or vacant place, in some otherwise solid or continuous subject. It comes from *aperire*, *to open*.

In *Geometry*, *aperture* is used for the space left between two lines, which mutually incline towards each other to form an angle.

In *Optics*, *aperture* is the hole next the object-glass of a telescope, or microscope: through which the light and image of the object come into the tube, and are thence carried to the eye.

APERTURE is also understood of that part of the object glass itself which covers the former, and which is left pervious to the rays. See TELESCOPE.

A great deal depends on having a just *aperture*.—To find it experimentally; apply several circles of black smutted paper, each bigger than the other, upon the face of the glass, from the breadth of a straw to such as leave only a small hole in the glass; and with each of these, separately view several distinct objects; as the moon, stars, &c. that through which they appear the most distinctly is to be pitched upon.

M. Auzout affirms, that he found, that the *apertures* of telescopes ought to be nearly in the subduplicate ratio of their lengths: but Huygens, who first introduced the use of *apertures*, assures us, he found by experience, that the *aperture* of an object-glass, e. gr. of 30 feet, is to be determined by this proportion; as 30 to 3, that is, as 10 to 1, so is the root of the distance of the focus of any glass multiplied by 30, to its *aperture*: and the focal distances of the eye-glasses are to be proportional to the *apertures*.—A table of *apertures* for telescopes of various lengths, &c. see under the article TELESCOPE.

The greater or less *aperture* of an object-glass, it is to be noted, does not increase or diminish the visible area of the object; all that is effected by this is, the admittance of more or fewer rays, and, consequently, the more bright or obscure appearance of the object; but the largeness of the *aperture* or focal distance, causes the irregularity of its refractions. See ABERRATION.

Hence in viewing Venus through a telescope, a much less *aperture* is to be used than for the Moon, Jupiter, or Saturn, because her light is so vivid and glaring.—Which consideration does a little invalidate and disturb M. Auzout's proportion, as is shewn by Dr. Hook. Philos. Trans. N°. 4.

APERTURA *tabularum*, in *Ancient Law-Books*, signifies the breaking open a last WILL and TESTAMENT.

APERTURA *feudi* denotes the loss of a feudal tenure, by default of issue to him to whom the feud or FEE was first granted.

APETALOUS, or APETALOSE *plants*, are such as are without, or have an imperfect or flamineous flower. They are so called because not composed of those tender, fugacious, coloured leaves called PETALA; but only of a calyx or cup, and of flamina or capillamenta or styles. Phil. Trans. N°. 286.

The word comes from the privative particle *a*, and *πεταλον*, *folium*, *a leaf*.

The *apetalous* kind is subdivided by Ray, 1 Into such whose fruits are not contiguous to their flowers, as in hops, hemp, nettle, spinach, mercury, *palma Christi*, the American phytic nut, &c. 2. Such as have a triquetrous or triangular seed, as the docks, sorrels, asparagus, knot-grass, snake-weeds. 3. Those which have round, compressed, and otherwise figured seeds, as the pond-weeds, oraches, sea-purslane, the bites, the amaranths, the beets, some kalies, &c. *See Tab.* X. *of Botany*, *Class* 15 *and* 18. See LEAF.

APEUCTIC, from *απευχομαι*, *I deprecate*, in the *Ancient Poetry*, denotes a kind of poem or prayer preferred to God for the averting some evil.

In which *tenue sapuddicum* stands contradistinguished from *prosecticum carmen*, which begs for some good, e. gr. *dii prohibete minas*, *dii talem avertite casum*, *et placidi servate pios*.

APEX, the vertex or summit of any thing.

APEX is peculiarly used in *Antiquity*, for a kind of cap or covering of the head, worn by the flamens, or priests of Jupiter. This was otherwise denominated *pileus pistrensis*, or *albanus*.

The *apex* is described as a flitched cap in form of a helmet, with the addition of a little flick fixed on the top, and wound about with white wool.

The other flamens only wore the *apex*, in the time of performing divine service; the flamen dialis always wore it out of doors; for within it was allowed him to be bare-headed. See APICULUM.

APEX was also used among the Romans for the creft of a helmet.

APEX is also used by *Grammarians*, for a long accent or mark, to denote that a syllable is to be pronounced long. Quintilian condemns the practice of putting the *apex* on all long syllables; yet in some cases he allows the *apex* necessary, e. gr. where the different lengths of a syllable distinguish the different senses of a word, as in *malus*, which, as long, or short denotes *an ill man*, or *an apple-tree*. See ACCENT.

APHÆRESIS, from *αφαιρεω*, *I take away*, in *Grammar*, a figure, whereby something is taken away from the beginning of a word.

Thus *eicosmo*, by *aphæresis*, is written *cosis*; *contemnere*, *temnere*; *omittere*, *mittere*, &c.

A like retrenchment at the end of a word is called APOCOPE.

APHÆRESIS, in *Medicine*, denotes a necessary taking away or removing of something that is noxious.

In *Surgery*, it fignifies an operation whereby something superfluous is taken away.

APHANES, *Parsley-piert*, in the Linnæan system of *Botany*, the name of a genus of plants, of the *tetrandria digynia* class: the characters of which are these: the cup is a tubular *perianthium*, remaining till the seeds are ripe; it consists of one leaf divided at the extremity into eight segments, which are extremely small, and alternately different in size; there are no petals; the *flamina* are four erect, pointed, and very small filaments, inserted on the rim of the cup; the *antheræ* are roundish; the pistillum has two germina of an oval figure, and two styles of the same length with the flamina inserted on the basis of these germina; the stigmata are headed; the cup supplies the place of a fruit, shutting together at its mouth, and containing two oval, pointed, compressed seeds, of the length of the styles. There is one species.

APHASIA, from *a*, and *φημι*, *I speak*, in the *Sceptic Philosophy*, denotes a state of doubt, wherein a person not knowing what to determine on, it is best for him to be silent.

In this sense, *aphasia* stands opposed to *phasis*, under which are included both affertion and negation.

APHELIA, from *απλους*, *simple*, in *Rhetoric*, is used to denote simplicity of DICTION.

APHELION, in *Astronomy*, that point of the earth's or a planet's orbit, in which it is at the greatest distance from the sun.

The word comes from *απο*, *from*, and *ηλιος*, *sun*.

Thus a planet being in A (*Tab. Astron. fig.* 1.) its utmost distance from the sun S, is said to be in its *aphelion*. In the system or supposition of the sun's moving round the earth, the point in which he appears when the planet is in its *aphelion*, is called *apogee*. The *aphelion* stands opposed to the *perihelion*.

The aphelia of all the primary planets are at rest; excepting that those planets nearest the sun, viz. Mercury, Venus, the Earth, and Mars, being acted upon by Jupiter and Saturn, their *aphelia* move a small matter in consequentia with respect to the fixed stars, and this in the sesquiplicate ratio of the distances of those planets from the sun.

Hence, if the *aphelion* of Mars move 35 minutes in consequentia in respect of the fixed stars in 100 years; the *aphelia* of the Earth, Venus, and Mercury, will move, in 100 years, 18 min. 36 sec. 11 min. 27 sec. and 4 min. 27 sec.

The method of finding the place of the *aphelion* is, by observing several of the greatest digressions of the planet from the sun; till by two or three repeated observations it be found to remain at a stand.—In the Phil. Transf. N° 128, we have a geometrical method of finding the *aphelia* of the planets, given by Dr. Halley.

Kepler places the *aphelion* of Saturn for the year 1700, in 28° 3′ 44″ of Sagittarius: De la Hire, in 29° 14′ 41″.—The *aphelion* of Jupiter in 8° 10′ 40″ of Libra: De la Hire, in 10° 17′ 14″.—The *aphelion* of Mars in 0° 51′ 29″ of Virgo: De la Hire in 0° 35′ 25″.—The *aphelion*, of the earth in 8° 25′ 30″ of Cancer.—The *aphelion* of Venus in 30° 24′ 25″ of Aquarius: De la Hire in 5° 56′ 10″. And the *aphelion* of Mercury in 15° 44′ 29″ of Sagittarius: De la Hire in 13° 3′ 40″.

The annual motion, according to Kepler, of the *aphelion* of Saturn is 1′ 12″, of Jupiter, 47′ Mars, 1° 7″, of Venus, 1′ 18″, and of Mercury, 1′ 45″. According to de la Hire, that of Saturn is 1′ 22″, of Jupiter, 1′ 34″, of Mars, 1′ 7″, of Venus, 1′ 26″, and of Mercury, 1′ 39″.

APHERNOUSIA, a species of pine growing wild on the *Alps*. The timber is large, and the planks made of it are of a finer grain, and more beautifully variegated than deal; and may therefore be applied to many uses. It grows in bleak and barren ground, and much resembles that which is called in England the Weymouth pine.

APHESIS, from ἀφιημι, *I remit*, in the *Athenian Laws*, was applied to the case of a person deeply indebted, who desired the people to remit part of the debt, on account of his disability to make payment.

Voetius has a dissertation express on the words *aphesis* and *paresis*, and their difference.

APHETERIA, in the *Ancient Military Art*, a kind of engines used in the besieging of towns.

Suidas does not mention their particular form or structure. Aquinas takes them to have been of the projectile kind.

APHILANTHROPY, from α, φιλος, *friend*, and ανθρωπος, *man*, among *Physicians*, denotes the state or disorder, wherein a person has an unnatural distelish for mirth and society, and indulges solitude and melancholy.

APHIOCEM, a composition made principally of the buds of hemp before they flower. It is much in use among the Arabs, and has the intoxicating quality of OPIUM.

APHIS, in the history of insects, the name of a genus of animals, otherwise called *pediculus arborum*, and in English the *tree-louse*. The *aphis* belongs to the *hemiptera insecta* of Linnæus.

The trunk of the *aphis* is reflex; the body terminates in two horns behind; the wings are four, and erect, or altogether wanting; and the legs are formed for walking, not leaping.

Of this genus there are a great many species, denominated from the trees and bushes on which they are found. According to Dr. Richardson's observations, the *aphides* are at one time of the year viviparous, and at another time oviparous. Those of the rose-tree came immediately under his notice; and of ten generations of them, which he observed regularly to succeed each other in the course of one spring, summer, and autumn, the first proceeds from eggs laid during the preceding autumn; the eight following are all produced viviparous, and consist entirely of females, as does likewise the first. In the tenth generation, which usually comes forth before the middle of September, a few male insects appear. Their arrive at their full growth in about three weeks, and have an intercourse with the females, who soon afterwards lay their eggs which are hatched in the spring. Phil. Trans. vol. lix. N° 32.

APHLASTUM, from α and φαω, *frangibile*, in the *Ancient Navigation*, a wooden instrument, shaped like a plume of feathers, fastened on the poops's or swan's neck used by the ancient Greeks in the heads of their ships.

The *aphlastum* had much the same office and effect in a ship that the creft had on a helmet. It seems also to have had this further use, viz. by the waving of a party-coloured ribband fastened to it, to indicate from what quarter the wind blew.

The *aphlastum* was the proper ornament of the head, as the *acrostolium* was of the stern.

The Greek *aphlastum* answered to, and was probably the origin of the Latin *aphractes*.

APHONIA, in *Medicine*, the state of a person who is deprived of voice.

The word is compounded of the privative α, and φωνη, *voice*, q. d. a loss of speech or voice.

Hippocrates, Lib. de Rat. Vict. in Morb. Acut. says, "a Hippocrates, Lib. de Rat. Vict. in Morb. Acut. says, "stop not to the circulation of the blood and spirits, "cause a sudden loss of voice." Here Galen observes, that by this one symptom *aphonia*, are denoted the epilepsy, apoplexy, and cardiacal *syncope*. He adds, that an *aphonia* in sick persons is sometimes caused by a disorder affecting the organs of voice or respiration, with a resolution, or by some other depravation of the faculty. An *aphonia* sometimes proceeds from a disorder of the brain, a refrigeration of the natural heat, and total cessation of the loco-motive powers: when the organs of voice are in such a state of resolution, that the patient can neither cry, groan, nor utter any sound. It is more accurate, therefore, to render ἀφωνος, *deprived of voice (voce defectus as privatus)*, rather than dumb (*mutus*): since Hippocrates, περι Σκοπων, and Aristotle, lib. iv. Hist. Anim. attribute voice to the dumb. Foesius.

Among other causes which contribute to an *aphonia*, are the wanton abuse of spirituous liquors, and frequent furfeits. The prognostics vary, according to the respective causes from which they proceed. That species which owes its origin to worms, hysteric disorders, or a different eruption of the *menses*, is eafily cured; whereas, that kind of it which proceeds from a palsy of the tongue, either entirely fruftrates the ufe of all means, or being cured, eafily returns, and proves the direful harbinger of a more terrible disorder of the brain.

The method of cure muft be varied, according to the particular fpecies of the disorder.

Menjotius has a dissertation expreſs *De Aphonia*.

APHORISM, a maxim, general rule, or principle, of a fcience; or a brief fentence, comprehending a great deal of matter in a few words.

The word comes from ἀφοριζω, *I feparate*, q. d. a choice or feleft fentence.

The term is chiefly ufed in *Medicine* and *Law*. We fay, the *aphorifms* of Hippocrates, of Sanctorius, of Boerhaave, &c. *aphorifms* of the civil law, &c.

APHORISM is ufed in *Ecclefiaftical Writers* for the leffer excommunication, by which the delinquent was cut off from the benefit of the facrament and the prayers of the faithful; but allowed to bear a part in the reft of the fervice.

APHORISM is alſo ufed for a kind of figure in *Rhetoric*, whereby fomething that has been faid is limited and corrected. This is otherwife called *diorifmus*.

APHORISTIC, fomething relating to, or partaking of the nature of *aphorifms*.

The *aphoriſtic* method ſtands contradiſtinguiſhed from the *ſyſtematic*, or methodical, as alſo from the *dialectic*, or *diſcurſive way*.

The *aphoriſtic* method has great advantages, as containing much matter in a ſmall compaſs; ſentiments are here almoſt as numerous as expreſſions; and doctrines may be counted by phraſes. Every thing is cloſe and pertinent, no room for uſeleſs diſcuſſions, or for languiſhing connections, and tranſitions; there is hardly a word to be loſt.

APHRACTI, from α, and φραττω, *includo*, in the *Ancient Military Art*, denotes open veſſels, without decks or hatches, furniſhed only at head and ſtern with croſs planks, whereon the men ſtood to fight.

The *aphracti*, or open veſſels, ſtood contradiſtinguiſhed from *cataphracti*, or covered ones.

APHRODISIA, in *Antiquity*, feſtivals in honour of the goddeſs Aphrodite, or Venus. There were ſeveral of theſe *Aphrodiſia* obſerved in divers parts of Greece; the moſt remarkable was that at Cyprus, firſt inſtituted by Cinyras, out of whoſe family certain prieſts of Venus were elected, and for that reaſon named Κινυραδαι. At this ſolemnity ſeveral myſterious rites were practiſed: all who were initiated to them offered a piece of money to Venus as an harlot, and received as a token of the goddeſs's favour a meaſure of ſalt, and a φαλλος; the former, becauſe ſalt is a concretion of ſea-water, to which Venus was thought to owe her birth; the latter, becauſe ſhe was the goddeſs of wantonneſs.

APHRODISIA, or APHRODISIASMUS, in *Medicine*, denotes the uſe of venery, or the act of copulation between male and female.

APHRODISIA is also used for the age of venery, more frequently denominated *puberty*.

APHRODISIACS, in *Pharmacy*, denote medicines proper to increase the feed, and promote luft, or an inclination to venery.

In which fenfe *aphrodifiacs* ftand contradiftinguifhed from *antaphrodifiacs*.

Some authors give the appellation *aphrodifiacs* to the EPILEPSY.

APHRODISIACE, in the writings of the ancients, a name given to a gem, fuppofed, according to the idle traditions of thofe times, to have a power of procuring love to the perfon who wore it about him; all the defcription we have of it is, that it was of a pale flefh-colour; but the ftone, as well as its virtues, are wholly unknown to the world at prefent.

APHRODISIUS, in *Chronology*, denotes the eleventh month in the Bithynian year, commencing on the 24th of July in our's.

APHRODITA, in the *Hiftory of Infects*, a genus of fea-infects about two inches in length and one in breadth, of an oval figure, and aculeated; it has alfo a perforation in the middle of the back, and is called in Engliih the *fea-moufe*. It is one of the *gymnobranchia*, or infects with naked bodies, and may be met with in great abundance on the Kentifh coaft, among rocks. There are feveral fpecies of it. It belongs to the order of *mollofca*, in the Linnæan arrangement of worms.

Columna calls it *pudendum marinum*; Bartholine, *vermis aureus*; others, *erinaceus marinus*; *griffo fufcus*; and fome *mus marinus*, or the *fea-moufe*.

APHRODITARIUM, in the *Ancient Pharmacy*, denotes a kind of dry medicine, compounded of frankincenfe, the fcales of copper, ceruft, ftarch, and pomegranates, mixed in equal quantities.

The name is alfo given to a kind of *collyrium*, mentioned by Galen.

APHRODITE, in *Mythology*, a name of VENUS, derived from ἀφρος, *froth*, becaufe, according to the poets, Venus is fuppofed to be produced from the froth or foam of the fea.

APHRODITES, in *Natural Hiftory*, a name given by fome authors to the fineft fpecies of amethyft. See GEMMA *Veneris*.

APHROGALA, from ἀφρος, *froth*, and γαλα, *milk*, in the *Ancient Phyfic*, denotes a kind of whipt cream, or milk agitated till it be converted wholly into froth.

The *aphrogala* is directed by Galen, as proper againft hot diforders of the ftomach.

APHROLITRUM, in the *Ancient Phyfic*, denotes the fpume, or froth of *litrum*.

In which fenfe, *aphrolitrum* feems to amount to the fame with *aphronitrum*. Hoffman affirms, that the *nitron* and *litron* only differ in dialect. It appears, however, there was a great difference between the two medicines, *aphrolitrum* refembling meal, or farina, and being of a kind of intermediate virtue between *aphronitrum* and fait.

APHRONITRE, a kind of nitre, mentioned by the ancients; fuppofed to be the fpume, or the lighteft and fubtileft part thereof, emerged to the top.

The word is compounded of αφρος, *froth*, and νιτρον, *nitre*. Some modern naturalifts rather take the ancient *aphronitre* to have been a native falt-petre, gathering like an efflorefcence on old walls, &c. now called *falt-petre of the rock*. Greek authors expreffed two different fubftances by the word *aphronitrum*; the one only a particular appearance of the NATRUM, or native nitre of thofe ages; and the other a fcalious fubftance, the froth or fpume of the veffels in which they boiled and purified their nitre. The earlieft authors, however, diftinguifhed thefe two, calling the factitious fubftance *aphros nitron*, and the native *aphronitron*; and Galen plainly tells us, that there were two different fubftances.

APHROSELENOS, among *Ancient Naturalifts*, a denomination given to the SELENITES, or *lapis fpecularis*.

APHTHÆ, in *Medicine*, little ulcers or pimples rifing in the mouth, the palate, gums, and at the root of the tongue; attended with inflammation, and a difficulty of fwallowing. The word feems derived from φθω, *I corrupt*; or from απτω, *I kindle*.

Hippocrates applied the word to ulcers in the *pudenda* of women, alfo to thofe in the *afpera arteria*; and Galen fpeaks of the tefticles as fubject to the fame diforder.

Sucking children are particularly fubject to *aphthæ*, when either the nurfe's milk is corrupted, or the child's ftomach becomes unfit for digeftion: for, in thefe cafes, the fharp acrimonious parts of the milk rifing up, eafily exulcerate thofe tender and delicate parts.

There are fome *aphthæ* white, others red, others livid and blackifh; the white and red forts are the leaft dangerous, and the moft eafily cured; the livid and black often prove mortal. The black THRUSH very rarely occurs; but when it does, it is always a mortal fymptom, and not an original diforder. Dr. Hunter thinks thefe white fpecks are inflammatory exudations, and not ulcers, which appears probable from their dropping off in fucceffion to each other.

When they happen in grown perfons, they are owing to thin, ferous, and fharp humours, turned from the feveral parts of the body to the mouth.

External caufes alfo frequently concur to the production of *aphthæ*; and efpecially a neglect of keeping the tongue and fauces clean; the pernicious and prepoſterous method of curing fevers, and other inflammatory diſeaſes, by hot medicines; and expoſing the bodies of children, when over-heated, to a cold air, which by checking perſpiration, has an almoſt unavoidable tendency to accumulate and hoard up ſaline and ſulphureous *feces* in the maſs of humours. Nor ought we on this occaſion to exclude other cauſes, which have an immediate and direct influence on the lax compages of the *fauces*; ſuch as crumbs of bread or ſugar wrapt up in a piece of linen cloth in form of a teat, as alſo a piece of bread dipped in ale, and given to children to be ſucked.

A liniment of *mel roſatum* and oil of vitriol is eſteemed a good remedy for the *aphthæ*: plantane-water is alſo in uſe on the ſame occaſion. Dr. Cantance recommends the *alvum citius* as a purge in this diſorder, for infants, and the ipecacuanha in the interval of purging, as a perſpiration.

APHTHARTODOCETÆ, a ſect, ſworn enemies to the council of Chalcedon.

The word is derived from αφθαρτος, *incorruptible*, and δοκεω, *I imagine*; and was given them, becauſe they imagined the body of Jeſus Chriſt was incorruptible and impaſſible, and not capable of death.

They aroſe among the Eutychians, and made their firſt appearance in the year 535.

APHUA *cobitis*, in *Ichthyology*, the name of a ſmall fiſh common in the Mediterranean and ſome other ſeas, and called by us the ſea-loach. It never exceeds three or four inches in length, its body is round, and flatted a little on the back; its colour is white, variegated with black ſpots. Rondeletius.

APHYLLANTHES, in *Botany*, the name of a genus of plants, of the *hexandria monogynia* claſs; the characters of which are theſe: the flower is of the liliaceous kind, and is compoſed of ſix petals, which ariſe from the centre in a ſquamoſe, and in ſome degree tubular form; the piſtil ariſes alſo from the cup, and finally becomes a trigonal turbinated fruit, which when ripe burſts into three parts or cells, which contain roundiſh ſeeds.

There is only one known ſpecies of this plant, which is the Montpelier *aphyllanthes*, called by ſome the blue Montpelier *jacinth*.

APHYLLON, in *Botany*. See *Bromus* RAPE.

APIARIA, in *Natural Hiſtory*, the name given by authors to a fly found only in autumn, and frequently met with on parſley; it is a two-winged fly, of a deep and ſhining black, and gathers wax on its legs in the manner of the bee. It is a ſpecies of the ATTELABUS.

APIARY, *bee-houſe*, a place where bees are kept; and furniſhed with all the apparatus neceſſary for that purpoſe.

The word comes from *apis*, a *bee*.

The *apiary* ſhould be ſecured from high winds on every ſide, either naturally or artificially; and well defended from poultry, &c. whoſe dung is offenſive to bees. Columella gives ſeveral directions reſpecting the ſituation of an *apiary*. He recommends a ſouth aſpect, and a proper medium between extreme heat and extreme cold: he prefers a low ſituation to an eminence, that the loaded bees *may* more eaſily deſcend to their habitation. The *apiary* ſhould likewiſe be near the dwelling-houſe, that the bees may be more conveniently watched; and they ſhould be provided with *water*, if they are not ſituated near a running ſtream; and the garden in which the *apiary* ſtands, ſhould be well furniſhed with ſuch plants as afford a proper ſupply of food. Of theſe he ſpecifies thyme, the oak, the pine, the ſweet-ſmelling cedar, and all fruit-trees. Furze, broom, muſtard, clover, heath, buck wheat, &c. are excellent for this purpoſe.

Celſus adviſed that bees ſhould be removed, as occaſion required, to places abounding with autumnal flowers: and this method was practiſed by conveying the bees from Acharia to Attica, from Rubœa and the Cyclad iſlands to Scyrus, and alſo in Sicily, where they were brought to Hybla from other parts of the iſland. The ancient inhabitants of Lower Egypt, likewiſe, obſerving that plants bloſſomed, and fruits ripened, about ſix weeks ſooner in Upper Egypt than with them, availed themſelves of this circumſtance, and removed their bees thither, that they might reap the benefit of the more forward vegetation: and the ſame practice is continued in that country to the preſent day. About the end of October, hives of bees are embarked upon the Nile, and conveyed into Upper Egypt, where they arrive juſt as the inundation ſubſides, and the flowers begin to bud. When they have remained for ſome time at their fartheſt ſtation,

ſtation, they are brought two or three leagues lower down; and thus they are ſucceſſively removed, as the vegetation advances, from one ſtation to another, collecting, as they journey, the rich produce of the banks of the Nile, and return home about the beginning of February. This method of tranſporting bees from place to place, for the convenience of paſture, is practiſed in France, and might be adopted with great advantage in this kingdom. See BEE and HIVE.

APIASTELLUM, in *Botany*, the name of two different ſpecies of plants with different authors; Dodonæus expreſſing by it the common baum, and Apuleius the black bryony.

APIASTER, in *Zoology*, a name given by ſome authors to the bee-eater, called by the generality of authors MEROPS.

APIASTRUM, in *Botany*, a name given by the ancients to two different plants, of ſuch contrary form and qualities, that it is unlikely they ſhould have given occaſion of confounding them together, as miſtaken about them might be of fatal conſequence. The one of theſe plants was the poiſonous *water-CROWFOOT*; which they called *apiaſtrum*, becauſe of its having leaves that ſomewhat reſembled ſmallage. The other *apiaſtrum* is the common garden baum, ſo called by theſe writers, from their having obſerved that the bees were very fond of it. Beſides this they have in ſome places called the SELINUM by this name, from its reſembling parſley, which they alſo called *apium*; and ſome of them have extended the name even to the animal world, and given it to a ſort of bird that feeds on bees.

APICES, *ſummits*, in *Botany*, little knobs growing on the tops of the *ſtamina* or chives in the middle of flowers.

The word is the nominative plural of *apex*, *the top* or *ſummit* of any thing.

They are commonly of a roundiſh figure.—By the microſcope they have been diſcovered to be, as it were, a ſort of *capſulæ ſeminales*, or ſeed-veſſels, containing in them ſmall globular, and often oval particles of various colours, and exquiſitely formed; called the FARINA *fecundans*.

Theſe particles are a kind of male ſperm, which, falling down into the flower, fecundates and ripens the ſeed. See *Generation of* PLANTS.

APICULUM, in *Antiquity*, a kind of thread or filet which the ſtamens were, in the heat of ſummer, in lieu of the APEX.

Feſtus ſpeaks of the *apiculum*, as a cover for the *apex*; but the paſſage ſeems to be corrupt.

APINEL, the name of a gentleman given to an American root called by the natives *Tabaccoui*. See Hiſt. de l'Acad. Roy. an. 1724. Hiſt. 19.

APIOS, in *Botany*, a name given by many authors, to thoſe ſpecies of the EUPHORBIA, or ſpurge, which have tuberous or knobby roots.

APIOS is alſo the name given by Boerhaave to ſome of the leguminous plants, comprized by Linnæus under the name GLYCINE.

APIS. *muſca*, the *bee*, or *fly*, in *Aſtronomy*, a ſouthern conſtellation, containing the following ſtars:

Situation of the ſtars.	Sign.	Long.		Lat.		Magn.
		°	′	°	′	
In the head, - -	♏	16	20	55	11	4
In the right wing,		16	36	29	56	4
In the left ditto,		22	22	15	56	43	27	5
In the tail,		20	14	18	58	47	43	5

APIS, or APES, in *Zoology*, a genus of four winged inſects with wings entirely membranaceous, and their tails furniſhed with a ſting; comprehending the BEE, HORNET, WASP, and HUMBLE-BEE.

This genus is ranged under the *hymenoptera* of Linnæus; and includes a great variety of ſpecies.

APIS, *in Mythology*, a divinity worſhiped by the ancient Egyptians at Memphis. It was an ox, having certain exterior marks; in which animal the ſoul of the great Oſiris was ſuppoſed to ſubſiſt. This animal had the preference to all others, as being the ſymbol of agriculture, the improvement of which that prince had ſo much at heart.

The Egyptians conſulted him as an oracle. If he accepted what was preſented him to eat, it was a good preſage; his refuſal was a bad omen. *Dr.* Bryant apprehends that the name of *api* was an Egyptian term for a father; that it referred to the patriarch Noah; and that the creſcent which was uſually marked on the ſide of the animal, was a repreſentation of the ark. Ancient Myth. vol. ii. p. 426.

APITES, APITES VINUM, from *apios*, *the poma-tree*; *perry*, wine of pears. It is thus prepared by ſome:

Cut and pound the pears, and having preſſed out the juice, to every twelve pints thereof add one pint of honey, and let it ferment.—After the ſame manner are prepared wines of *corbis*, *mediars*, and *ſervices*. All theſe kinds are aſtringents, have a grateful ſourneſs, are good for the ſtomach, and reſtrain inward fluxes. Dioſcorides, lib. v. cap. 32.

APIUM, PARSLEY, in *Botany*, a genus of the *pentandria digynia* claſs. The characters are, that it is a plant with an umbelliferous flower; each flower has five ſtamina; under the flower is ſituated the germen, which afterwards becomes an oval channelled fruit, dividing into two parts, having two oval ſeeds channelled on one ſide, and plain on the other.

There are ſeven ſpecies; 1. *Common parſley*. 2. *Curled parſley*. 3. *Large ſtalked parſley*. 4. *Smallage*, or *water-parſley*. 5. *Upright celery*. 6. *Celeriac*, or *turnip-rooted celery*. 7. *Greateſt Portugal parſley*, *with a ſtony baccy three lobes and a yellowiſh flower*. See CELERY, PARSLEY, &c.

APIUM *anthoſcium*. See CELERY, *wild*.

APIUM *Alexandrinum*. See BUBON.

APIUM *anglicum ſilveſtre*. See ANISE.

APIVORUS BUTEO, in *Ornithology*, the name by which authors call the bird known in England by the name of the *honey-BUZZARD*. It is ſomewhat larger than the common buzzard; its beak is black, very much hooked, and protuberant in the middle, and covered to the noſtrils with a black wrinkled ſkin; its mouth open very wide, and is yellow within. It builds its neſt with ſticks covered with wool, and ſometimes uſes the deſerted neſt of a kite to lay and breed its young in; which it feeds principally with the nymphs, or maggot-worms of bees and waſps; and it is common to find pieces of honey-combs in the neſts. It feeds on newts, frogs, and other ſmall animals, and is remarkable for running very ſwiftly on the ground: the female is larger than the male, as in moſt other birds of prey. Ray.

APLUDA, in *Botany*, a genus of the *polygamia monœcia* claſs of plants.

The calyx is a common bivalve glume, with a female floſculus, and male petaliferous.

APLUSTRE, or APLUSTRA, in the *Ancient Naval Architecture*, a carved table; ſomewhat after the manner of a ſhield, fixed by way of decoration to the extremity of a ſhip's head.

The *roſtra* or beaks of ſhips were ſometimes alſo called *apluſtra*.

But ſome think that the *apluſtre* anſwered to what we call the ſtag, or enſign.

APNOEA, from *a* and πνεω, *I breathe*, in *Medicine*, denotes a want of breath, or loſs of reſpiration.

In this ſenſe is the word uſed among the ancients, not as importing a total privation of breath, which would only be another name for death; but to denote the reſpiration very ſmall, and ſlow, ſo as to ſeem quite gone, as in the caſe in ſuffocation of the *uterus*, apoplexies, ſyncopes, lethargies, &c.

APOBAMINA, is uſed by ſome phyſicians for a liquor wherein pieces of gold, or chains heated red-hot, have been extinguiſhed, in order to fortify the ſpirits and principal members.

APOBATERION, from ἀποβαινω, *I depart*, among the *Ancients*, a farewel ſpeech, or poem, made by a perſon on his departure out of his own country, or ſome other place where he had been kindly received, and entertained.

Such is that of Æneas to Helenus and Andromache. Æn. lib. iii.—The *apobaterian* ſtands oppoſed to the EPIBATERION.

APOBATHRÆ, in *Antiquity*, a kind of little bridges, or ſtairs, joining the land to ſhips, or one ſhip to another.

APOBEE, in *Botany*, a name given by the natives of Guinea to a ſpecies of corn-marygold, called by Petiver CHRYSANTHEMUM *annuum Guineenſe foliis longis anguſtis*, from its having long and narrow leaves, and no ſtalk to ſupport the flower. The people of the place uſe this in the ſmall-pox, and other eruptive fevers, boiled in water, and the liquor drank warm. Phil. Trans. N° 232.

APOBOMIOI, from πως, *below*, and βωμος, *altar*, in *Antiquity*, ſacrifices offered on the bare earth, without altars.

APOCALYPSE, *Revelation*: the name of the laſt book in the canon of Scripture.

The word is formed of ΑΠΟΚΑΛΥΠΤΩ, *I reveal*.

The *Apocalypſe* contains diſcoveries or revelations made to the apoſtle St. John, in the iſle of Patmos, during his baniſhment there, under the perſecution of Domitian.

This, of all the books of the New Teſtament, is that about which the ancient fathers, and the practice of the church, were the moſt, and the longeſt, divided.—When it was firſt univerſally received as canonical, it is not eaſy to decide. St. Jerom relates, that the Greek church doubted of its authenticity, even in his days: St. Baſil and Gregory Nazianzen abſolutely reject it; and the council of Laodicea never mention it in their canon of the ſacred writings.

Some attribute it to Cerinthus; and others, to another John, diſciple of St. John. Dionyſius Alexandrinus cenſures it as written in bad Greek, though he allows

is to contain a mystic sense, which, he says, he admires, even where he does not understand it.

On the other hand, St. Justin, Irenæus, Theophilus, Antiochenus, Melito, Apollonius, Clemens Alexandrinus, and Tertullian, make no doubt of its being canonical. The third council of Carthage, held in 397, placed it in the canon of the New Testament; and the churches both of the East and West have acknowledged it ever since.

The Alogians are represented, by ecclesiastical writers, as great exclaimers against the *Apocalypse*, many of the figures whereof they turned into ridicule; particularly the visions of the seven trumpets, the four angels bound on the river Euphrates, &c. So Epiphanius, besides it against them: the book, he observes, is not a mere history, but a prophecy; so that it is no wonder the author should express himself after the manner of the prophets, whose style is mostly figurative.

Of all their objections against the authority of this book, that seems the best grounded which is drawn from those words in chap. ii. ver. 18, *Write to the angel of the church of Thyatira*: where was not, say they, any Christian church at Thyatira at that time. St. Epiphanius, who grants them this point, is forced to have recourse to the prophetic spirit; as it St. John had foreseen there would be a church there in course of time.

Some late authors have made a good amendment to St. Epiphanius's answer: it is probable, in the time of that father, the catalogue of the bishops, with other acts, which shew that there had been a church established there from the time of the apostles, might not be known. Grotius adds, that though there was not, indeed, any church of Gentile converts at Thyatira when St. John wrote; yet there was one of Jews, as there had been another at Thessalonica, before St. Paul preached there.

Several orthodox writers have rejected the *Apocalypse*, as a book which countenanced the reveries of Cerinthus, touching the carnal reign of Christ on earth.

Though Dionysius Alexandrinus (ap. Euseb. Hist. Eccl. vii. 25.) allowed the *Apocalypse* to be an inspired writing, yet he took it for the work of another John, different from St. John the Evangelist, which he endeavours to make appear from the diversity of style. But we all know how precarious the arguments are, which are drawn from the mere consideration of style. It is true, in most of the ancient Greek copies, both printed and manuscript, we find the name *John the Divine*; but they who put this title, meant no more thereby than to denote the apostle St. John, whom the Greek fathers call *the Divine*, by way of eminence, as distinguishing him from the other Evangelists. There have been several other works published under the title of *Apocalypses*. Sozomen mentions a book titled in the churches of Palestine, called the *Apocalypse*, or *Revelation of St. Peter*. He also mentions an *Apocalypse* of St. Paul; which the Copbtes retain to this day. Eusebius also speaks of both these *Apocalypses*. St. Epiphanius mentions an *Apocalypse* of Adam; Nicephorus, an *Apocalypse* of Esdras; Grotius and Cedrenus, an *Apocalypse* of Moses, another of St. Thomas, and another of St. Stephen; St. Jerom, an *Apocalypse* of Elias.

Porphyry, in his life of Plotin, makes mention of the *Apocalypses* or revelations of Zoroaster, Zostrian, Nicotheus, Allogenes, &c.

APOCARITES, from ἀποκαμνω, *I cut off*, in *Ecclesiastical History*, denotes those who denied that the human soul is part of, or derived from, the substance of God.

The *Apocarites* are ranked as a branch of the Manichæans.

APOCARPASUM, in *Natural History*, a name given by the ancient Greeks to a poisonous drug, called also sometimes simply *carpasum*; it was the exudation of a tree growing in the country of the Abyssines, and was so like the finest myrrh, that it was often mixed with it, and many lives were lost by administering it as myrrh. The wood of the tree which produced it was also poisonous, though in a less degree, and was called by the same writers *apocarpasum*, as the wood of the balm of Gilead tree is *abobalsamum*.

APOCATASTASIS, from ἀποκαθιστημι, *I restore*, denotes the entire restitution, or redintegration of a thing.

In this sense, we read of the *apocatastasis* of the world, or of all things.

APOCATASTARIS, among *Astronomers*, denotes the period of a planet, or the time wherein it returns to the same point of the zodiac from which it set out.

APOCATASTASIS is also used in *Medicine*, to denote the subsiding, or sinking of a thing.

In this sense, we read of the *apocatastasis* of urine, the *apocatastasis* of tumours; and other diseases.

APOCATHARSIS, in a general sense, denotes the same with *catharsis*, or expurgation.

In this sense, we read of *apocathartics* of bile, a symptom mentioned by Thucydides in the plague of Athens.

Quincy defines *apocathartics* a purging upwards and downwards, but without sufficient authority. Hence also *apocatharticks*, a denomination sometimes given to what we otherwise call simply CATHARTICS.

APOCHA, from ἀπο and ἐχω, *I have*, in *Civil Law*, denotes an acquittance, or receipt given by the creditor to his debtor for money paid: in which sense, the word stands contradistinguished from *anapocha*, which is given by the debtor to the creditor. Reasner and Zierlerus have dissertations *de apochâ*.

APOCHYLISMA, from ἀπο, and χυλος, *I extract the juice*, in *Pharmacy*, denotes an inspissated vegetable juice; answering to what is called in the shops a ROB.

APOCOPE, a figure in *Grammar*, wherein part of the end of a word is cut off; as in *ait* for *dicit*, *fac* for *face*, *ait* for *aiebat*, *fop* or *hypo* for *hypocrisis* usual.

The word is compounded of the preposition απο, and the verb κοπτω, *I cut*.

A like retrenchment at the beginning of a word is called *aphæresis*.

When the *apocope* is marked with a superior comma (called an *apostrophus*), the word is said to be *apostrophated*: as *th'* for *through*.

APOCRISIARIUS, in *Antiquity*, an officer appointed to carry or deliver the messages, orders, and answers of a prince or emperor.

The word is formed from ἀποκρισις, *responsum*, *answer*. Hence he is usually called *responsalis*, q. d. *answerer*.

The *apocrisiarius* afterwards became the emperor's chancellor, and kept the seal. In the barbarous latin we sometimes meet with *apocrisiarius*, for *apocrisiary*. Zosimus defines *apocrisiarius*, secretary for foreign affairs; being the same with what Vopiscus, in the life of Aurelian, calls *susceptor secretorum*.

The title of *apocrisiary* became at length appropriated, as it were, to the pope's deputy, or agent, who resided at Constantinople to receive the pope's orders, and the emperor's answer.

St. Gregory was *apocrisiary* of pope Pelagius, at the time when he composed his morals on Job. The *apocrisiary* did the office of the modern NUNTIO. Sometimes, however, he held the rank and quality of the pope's LEGATE.

The institution of *apocrisiaris* seems to have been in the time of Constantine, or not long after, when the emperors being become Christians, foreign churches had some occasion to promote their suits at court than formerly, at least we find the office established by law in the time of Justinian. In one of the Novels it is ordered, that as no bishop was to be long absent from his church without special command from the emperor, if any one had occasion to negociate any ecclesiastical cause at court, he should prefer his petition either by the *apocrisiarius* of his church, appointed for such purpose, or by the ecclesiarchs, or some of his clergy sent on affairs. In imitation of the *apocrisiaris* of churches, almost every monastery had their *apocrisiarius* likewise, whose business was not to reside in the royal city, as the former did, but to act as proctors for their monastery, or any member of it, when they had occasion to enter any appearance at law, before the bishop, under whose jurisdiction they were. This appears from another of Justinian's Novels, which requires the Alcetics in such cases to answer by their *apocrisiarii*, or *responsales*. Du-Cange. Bingham. Orig. Eccles. lib. iii. cap. 13. sect. 6.

The heresy of the Monothelites, and afterwards that of the Iconoclasts, broke off the custom of having a papal *apocrisiary* at Constantinople.

APOCRISIS, ἀποκρισις, literally denotes an *answer*. Under this denomination were anciently included, not only the rescripts of the emperor to the petitions of parties, but all kinds of decrees and mandates.

We have several books extant under the title of *Apocrisis*, and some in opposition to these under the title of *Anapocrisis*.

APOCRUSTICS, in *Medicine*, remedies endued with a repelling and astringent power, whereby they prevent the too great influx of humours to a part distended.

The word is derived from ἀποκρουω, *pello*, *pulso*, *I drive*. *Apocrustics* are usually cold and astringent, and consist of large particles, wherein they differ from drawing medicines, which are hot, and consist of more subtile parts.

APOCRYPHAL, something dubious; or that comes from an uncertain author, on which account credit cannot be reposed. We say, an *apocryphal* book, passage, history, &c. meaning such as are of suspected authority.

Vossius observes, that, with regard to the sacred books, none are to be pronounced *apocryphal*, except such as have neither been admitted into the synagogue, nor the church, so as to be added to the canon, and read in public.

For this reason, also, the books of Sibyls were anciently called *apocryphal*, as being committed to the trust of the *decemviri* alone, and for the like reason the annals of the Egyptians and Tyrians were called by the same name.

Before the Septuagint version, the books of the Old Testament were all *apocryphal* in this sense. But in process of time, the sense of the word was changed, and those books

alone were called *apocryphal*, which were of doubtful or suspected authority.

In the original meaning of the word, all the writings deposited in the temple were called *apocryphal*: because they were kept secret from the people.

When the Jews published their sacred books, they only gave the appellation of *canonical* and *divine* to such as they thus made public; and such as were still retained in their archives they called *apocryphal*, for no other reason, but because they were not public; so that they might be really sacred and divine, though not promulgated as such. Thus, in respect of the Bible, all books were called *apocryphal*, which were not inserted in the Jewish canon of Scripture; and it is to this sense that St. Epiphanius is to be understood, when he says, that the *apocryphal* books are not put in the ark among the other inspired writings.

There has been a great dispute between the Romanists and the Reformed, about the authority of those books, now called, by the latter *apocryphal*; and by the former, *uncontroverted canonical*; as Judith, Tobit, Esdras, Maccabees, &c. the one having the opinions of many of the primitive fathers for their vouchers, and the others, the tradition of their church.

The word is derived from ἀπόκρυπτω, *to hide*; because the origin of such books was unknown, or because they contain some mysteries not fit to be known.

M. Simon contends, that they must have been read in Greek, even by the apostles themselves; which he infers from divers passages in their writings. He adds, that the church received them, with the other books of Scripture, from the Hellenist Jews; and that if the churches of Palestine never admitted them, it was not for their accounting them *apocryphal* in the sense the word is now used, but because they read none but what was written in Hebrew.

To this may be opposed the authority of the greatest part of writers in all ages, till the council of Trent; which makes a precise distinction between the books now called *apocryphal*, and those contained in the Jewish canon. This council, sess. 4. declared six of them to be canonical, viz. Tobit, Judith, Wisdom, Ecclesiasticus, and the 1st and 2d of Maccabees; but joined Baruch with Jeremiah, which makes in all seven.

The *apocryphal* books are also called *canonical*, and by some writers, *ecclesiastical books*, because, though not held of divine authority, they were allowed to be read in churches, as containing many things tending to edification, and godly instruction; on which account they continue still in use in the church of England, though forbidden in the other reformed churches.

Wolfius gives the literary history of the *apocryphal* books, their various editions, translations, commentaries, &c.

We meet with numerous *apocryphal*, or suppositious books, published under the names of patriarchs, prophets, evangelists, apostles, primitive fathers, saints, martyrs, &c. *Apocryphal* prophecies, *apocryphal* gospels, *apocryphal* epistles, *apocryphal* acts, *apocryphal* apocalypses, &c.

The writings of both under spurious names, and obtruding them for the works of inspired authors, though once reputed laudable, and confecrated under the name of pious fraud, was condemned very early by an apostolical canon, in the instance of a priest, who was deposed for forging the acts of Paul and Thecla. Bing. Orig. Eccles. lib. xiii. cap. 5.

Fabricius has published the fragments and remains of the *apocryphal* books both of the Old and New Testament. Fabric. Codex Pseudepigraphus Veteris Testamenti Hamb. 1722 & 1723 8vo. 2 vol. Codex Apocryphus Novi Testamenti, 2 vol. Hamb. 1719. &c. 8vo.

APOCYMA, from ἀπό, and κύμα, *wave*, in the *Materia Medica* of the *Ancients*, a name given by the Greek authors to a sort of cement, used to flush over the bottoms of their ships, to preserve them from injuries by the water; they call this also by the name of ZOPISSA, and Aetius and Serapion call it *hirsa*, *hirra*, or *alithion*. It was a mixture of bees-wax and pitch melted together, and after it had been soaked some time in the sea-water, it was supposed to have peculiar virtues, and was used in many compositions.

APOCYNUM, in *Botany*. See DOGS-BANE.

APODACRYTICA, from ἀπό, and δάκρυον, a *tear*, in *Pharmacy*, medicines proper to excite tears.

Some also use the term *apodacrytica*, for remedies proper to suppress tears.

APODECTÆ, from ἀποδέχομαι, *I receive*, in *Antiquity*, a denomination given to ten general receivers, appointed by the Athenians, to receive the public revenues, taxes, debts, and the like.

The *apodectæ* had also a power to decide controversies arising in relation to money and taxes, all but those of the most difficult nature and highest concern, which were reserved to the courts of judicature.

APODECTÆ, in the Athenian government, officers appointed to see that the measures of corn were just.

The *apodectæ* were nearly related to the *agoranomi*.

APODEMICA, from ἀποδημέω, *I travel*, the doctrine or science of travelling, whether for knowledge or devotion's sake.

Jo. Merckor has published an *Apodemica*. Ramzovius a *Methodus apodemica*.

APODES, in the general sense, from α and πους, denotes things without feet. Zoologists apply the name to a fabulous sort of birds, said to be found in some of the islands of the new world, which being entirely without feet, suppose themselves on the branches of trees by their crooked bills.

The Germans and Dutch have also their *apodes*, a sort of birds somewhat like swallows, whose legs and feet are so very small, that they seem rather formed for creeping than running.

APODES, is one of the four orders of fishes in the Linnean distribution of animals, comprehending eight genera, and 30 species. Their character is, that they have no belly fins.

APODICTICAL *argument*, or SYLLOGISM, signifies a clear, convincing proof, or demonstration of a thing.

The word is formed of ἀποδείκνυμι, *I demonstrate*.

APODICTICAL *method* is used by some writers, to denote the systematical or scientifical method of teaching or writing.

APODIOXIS, from ἀποδίωκω, *I exclude*, in *Rhetoric*, a figure whereby we either pass over a thing slightly, or refer treating of it to some other time or place.

This is also called by Latin writers, *reticentia*, e. gr. *Quid ego summum defendam judicem? Equidem debeo, &c.* Again. *Quid ego tertium hoc loco defendam, judices? Post ad reditum, cum quem, &c.*

APODIOXIS, in *Logic*, the rejection of such things as do not necessarily belong to the question to be considered.

APODIXIS, from ἀποδείκνυμι, in *Rhetoric*, denotes an evident proof, or demonstration of a point.

We have several books extant under the names of *apodixes*, and some by way of answer to these, under that of *antapodixes*.

APODIXIS, in *Middle age Writers*, denotes a receipt for money paid.

In which sense it amounts to the same with *apocha*.

APODIXIS is also sometimes used for a specimen or proof of a thing.

APODOSIS, from ἀποδίδωμι, *I apply*, in *Rhetoric*, makes the third part of a complete *exordium*, being properly the application, or restriction of the *protasis*.

The *apodosis* is the same with what is otherwise called *auxesis*, and stands opposed to *protasis*; e. gr. *protasis*, all branches of history are necessary for a student; *catasterne*, so that without these he can never make any considerable figure; *apodosis*, but literary history is of a more especial use, which recommends it, &c.

APODOSIS is also used, in speaking of similes, for that part which makes the application of them.

APODOSIS is also used, in a rhetorical period, for the consequent opposed to *protasis*, or antecedent preceding.

APODOSIS is also used for a return to something antecedent, or that went before.

This is otherwise called *anaphora*.

APODYTERIUM, in *Antiquity*, a stripping-room, or apartment at the entrance of baths, wherein persons dressed and undressed.

This was otherwise denominated *exedrum*, *gymnasterium*, and *spoliarium*.

Some will have the *apodyterium* to have been the same with the *conisterium*; but Vossius shews they were two different places.

The word is formed of ἀπόδυσις, *to undress*.

APOGEE, APOGEUM, in *Astronomy*, that point in the orbit of the sun, or a planet, which is farthest distant from the earth.

The word is formed of ἀπό, *from*, and γῆ, *earth*.

In the corrupt Latin, *apogæ* sometimes signifies a grotto, or subterraneous vault.

The *apogee* is a point in the heavens at the extreme of the line of the apsides; in which the sun, or a planet, is at the greatest distance that it can be at, from the earth, in its whole revolution.

The opposite point to this is called the PERIGEE.

The ancient astronomers, regarding the earth as the centre of the system, chiefly considered the *apogee* and *perigee*; the moderns, making the sun the centre, change the *apogee* and *perigee* for APHELION and PERIHELION. See SYSTEM.

The quantity of the motion of the *apogee* may be found by comparing two observations thereof made at a great distance of time; converting the difference into minutes, and dividing it by the number of years elapsed between the two observations: the quotient gives the annual motion of the *apogee*. Thus, from an observation made by Hipparchus in the year before Christ 140, whereby the sun's *apogee* was found 5° 30′ of ♋; and another made by Ricciolus, in the year of Christ 1646, wherein

it was found 7° 36′ of ♑; the annual motion of the *apogee* is found to be 1′ 2″.

APOGEE *of the moon*. See MOON.

APOGEE *of the equant*, is its farthest distance from the earth; or that point where the circumference of the EQUANT is intersected by the line of the *absides*, in the remotest part of the diameter.

So the *perigee* of the *equant* is the opposite point, or the nearest part of the diameter.

The mean *apogee* of the *ecliptic* is a point where the epicycle is cut above, by a right line drawn from its centre to the centre of the *equant*, or the point of the epicycle most remote from the earth.

APOGRAPH, a copy or transcript of some book or writing.

The word is formed of ἀπο, *ab, from*, and γραφω, *I write*. In this sense *apograph* stands opposed to *autograph*; as a copy to an original.

APOGRAPSE, in the *Ancient Law*, was, when a person being sued for money supposed due to the public, pleaded that the charge was unjust, and withal produced all the money he was possessed of, and declared by what means it came to his hands.

Suidas adds, that it is sometimes taken for an action against such as neither paid the fines laid upon them before the ninth *prytanis* following their sentence, nor were able to give sufficient security to the city. Potter Arch. Græc. lib. 1. cap 23.

APOGRAPHE, in the Roman *Law*, denotes a catalogue, or inventory of goods.

APOLEPSIS, from ἀπολαμβανω, *I have*, in the Athenian *Law*, an action of divorce; brought when a woman had fled from her husband.

APOLEPSIS, from ἀποκατεχω, *I retain*, in the *Ancient Physic*, denotes a retention of the urine, or any other matter which ought to be evacuated.

APOLEPSIS is also understood of an interception of the blood or spirits, or an extinction of the native heat of the veins.

APOLEPSIS is also a denomination of a species of apoplexy, wherein the speech, sense, motion, &c. suddenly fail.

This seems to coincide with what is otherwise called a CATALEPSIS.

APOLEIDES, from ἀ, and πολις, *city*, in *Antiquity*, those condemned for life to the public works, or exiled into some island, and thus divested of the privileges of Roman citizens.

APOLLINARIANS, APOLLINARISTS, called also by Epiphanius *Demaritæ*, ancient heretics, who denied the proper humanity of Christ, and maintained that the body which he assumed was endowed with a sensitive, and not a rational soul, but that the Divine Nature supplied the place of the intellectual principle in man.

This sect derived its name from Apollinaris, bishop of Laodicea, in the fourth century.

The *Apollinarians* have been charged with other opinions, such as, the *Millenarian* and *Sabellian*, the pre-existence of the body of Christ, and the passion of his Deity; but ecclesiastical writers are not agreed with respect to these and other particulars. Their doctrine was first condemned by a council of Alexandria, in the year 362, and afterwards in a more formal manner by a council at Rome in 375; and by another council in 378, which deposed Apollinaris from his bishoprick. Notwithstanding these censures, his doctrine spread through most of the churches of the East; and his followers were subdivided into various sects. In 388, the emperor Theodosius enacted a law, forbidding them to hold assemblies, to have any ecclesiastics or bishops, or to dwell in cities. The rigorous execution of this law, in concurrence with the decrees of different councils, reduced them to a very small number, and their doctrine had no long duration.

APOLLINARIAN *games*, *ludi Apollinares*, in *Antiquity*, games at Rome, celebrated yearly in honour of Apollo, on the fifth day of July, under the direction of the prætor, in the *Circus maximus*.

The occasion was a kind of oracle delivered by the prophet Marcus, after the fatal battle at Cannæ, declaring that, to expel the enemy, and cure the people of an infectious disease, which then prevailed, sacred games were to be annually performed in honour of Apollo. And that the prætor was to have the direction of them; and the *decemviri* were to offer sacrifices after the Grecian rite.

The senate ordered that this oracle should be observed, because another of the same Marcus, wherein he had foretold the overthrow at Cannæ, had been verified; for this reason they gave the prætor twelve thousand *asses* out of the public cash to defray the solemnity. There were sacrificed an ox to Apollo, as also two white goats, and a cow to Latona; all with their horns gilt. Apollo had also a collection made for him, besides what the people, who were spectators, gave voluntarily. The first prætor by whom they were held, was P. Cornelius Sylla. For some time they were moveable or indictive, but at length were fixed, under P. Licinius Varus, to the fifth of July, and made perpetual.

The men, who were spectators at these games, wore garlands on their heads; the women performed their devotions in the temples at the same time, and at last they caroused together in the vestibules of their houses, the doors standing open.

The tradition reports, that, at the first celebration hereof, the people were suddenly invaded by the enemy, and obliged to take to their arms: upon which occasion a cloud of darts and arrows falling upon their enemies, the Romans soon returned victors to their sports.

The *Apollinarian* games were only scenical; and at first only observed with singing, piping, and other sorts of music; but afterwards there were also introduced all kinds of mountebank-tricks, dances, and the like, yet so as that they still remained scenical, no chariot races, wrestlings, or the like laborious exercises of the body, being ever practised at them. Danet, and others, confound the *ludi Apollinares* with the ACTIACI.

APOLLINARES *ludi* was also a general name given to all SCENICAL games.

These were also called *ludi literales*, and *fatrici*.

They differed from the *ludi theatrales*, in that the former were celebrated with all sorts of plays, farces, poems, recitations, &c. the latter only by dancing and music.

This kind of *Apollinarian* had their share in almost all the solemn games.

APOLLINARIS, in *Botany*, a name given by some authors to henbane.

APOLLO, in *Mythology*, a pagan deity worshipped by the Greeks and Romans. He was the God of light and poetry, and was regarded as the inventor and patron of the fine arts. He had a famous temple at Delphos, where his oracles were in great estimation.

Apollo is principally distinguished in ancient statues by the beauty of his face, and the gracefulness of his figure. Accordingly Virgil calls him, the beautiful: and Tibullus, the well-shaped god. *Æn.* iii. ver. 119. Tibullus, lib. ii. *El.* iii. ver. 11.

APOLLO *Belvedere*, one in the first class of the ancient statues. The excellence of this statue consists in the expression of something divine, whereas the rest excel only in things that are common to men. This statue may, perhaps justly enough, claim the preference, even in the superior and distinguished class of the best remains of all antiquity. There are about twenty ancient statues, which the moderns have discovered, that are referred to the first class; and considered each as the chief beauty in its kind.

APOLLONIA, in *Antiquity*, feasts sacred to Apollo at Egiales.

APOLLONIAN *hyperpola* and *parabola*. See HYPERBOLA, &c.

APOLOGETIC, APOLOGETICAL, something said or written by way of excuse or *apology*, for any action or person.

The *Apologetic* of Tertullian is a work full of strength and spirit. He there vindicates the Christians from all that had been objected to them; particularly from the abominable crimes said to be perpetrated at their meetings, and their want of love and fidelity to their country. The ground of this last accusation was, their refusing to take the accustomed oaths, and swear by the tutelary gods of the empire. Tertullian addresses his *Apologetic* to the magistrates of Rome; the emperor Severus being then absent.

APOLOGUE, APOLOGUS, a moral FABLE; or a feigned relation, intended to inform and amend the manners. Jul. Scaliger derives the name απο λογου, inasmuch as the *apologue* means something more than what at first sight it expresses.

Such are the fables of *Æsop*: whence, moral fables are usually denominated *Æsopic Fables*.

F. De Colonia makes it essential to the *apologue*, that it contain what passes among brutes; and distinguishes it from the *parable* by this, that the latter, though feigned, consists of possible circumstances, which the former does not, since beasts cannot speak. There is this further difference between them, that the latter is a similitude drawn from natural, moral, or any other branches of knowledge; the former only from moral topics.

Apologue, according to some, differs from FABLE, as the former is used in speeches and harangues, to persuade; the latter in tragedies, comedies, and other pieces of poetry, to instruct and correct the manners. *Apologue* also differs from *anus*, as the latter is only calculated for the use of men, and carries a graver and weightier admonition; whereas *apologues* are proposed to children. We find many things in authors concerning the origin of *apologues*, the distinguishing characters of *apologists*, the use and advantages of the way of teaching by *apologues*. See Bayle, Dict. Crit. in voc. & Shaftesb. Charact. tom. iii.

APOLOGY, APOLOGIA, *defence*; a discourse or writing in vindication of a person.

The

The word is formed of ἀποδίδωμι, *to refute*.

The principal ancient *apologies* in favour of the Christians are those of Quadratus, written about the year 124, and addressed to the emperor Adrian; of Aristides, written soon after the former; two of Justin Martyr, one of which was written in the year 150, and addressed to Antonine, and the other in 166, addressed to the Roman senate; one of Athenagoras, in 166, to the emperors M. Aurelius, and Lucius Verus; the APOLOGETIC of Tertullian; and the dialogue of Minutius Felix, called *Octavius*, written in the third century.

APOLYSIS, from ἀπολύω, *I resolve*, in a general sense, the solution, or resolution of any thing. Thus we read of the *apolysis* of a disease, the *apolysis* of a bandage, or the like.

APOLYSIS, in a more particular sense, denotes the exfoliation of any thing. Thus we read of the *apolysis* of the bone, the lenticulæ, and the like.

APOMELI, in *Medicine*, a kind of decoction prepared of honey, or a honey-comb mixed with vinegar, and boiled a short time, till the qualities of both be united, and the acrimony of the vinegar allayed.

The *apomeli* is esteemed as a kind of medium between mulse and oxymel. It was ancientily great use among the Greeks, as a detergent, promoter of stool, urine, &c.

APOMYOS, *Deus*, from ἀπὸ and μυῖα, *fly*, in the *Heathen Mythology*, a name under which Jupiter was worshipped at Elis, and Herculeus well as Jupiter at the Olympic games.

These deities were supplicated under this name, to destroy or drive away the vast number of flies which always attended at the great sacrifices; and in those which accompanied the Olympic games, the first was always to the *Apomyos*, or *Muscarus Deus*, that he might drive away the flies from the rest. The usual sacrifice was a bull.

APONEUROSIS, among *Anatomists*, the spreading or expansion of a nerve, or tendon, breadth-ways in manner of a membrane.

The word is compounded of ἀπὸ, *from*, and νεῦρον, a *nerve*.

APONEUROSIS sometimes also signifies the cutting off a nerve or tendon.—And in some writers we find it used for a TENDON itself.

APONEUROTICUS *musculus*, in *Anatomy*, a name given by Spigelius, and some others, to a muscle of the thigh, called by Cowper and Winslow the *musculus iste tendinis*, and *musculus fasciæ latæ*. Winslow has called it, with more propriety, the *musculus vaginæ femoris*.

APONIA, from α, and πονος, *labour*, among *Physicians*, a state of indolence, or the absence of pain. In which sense, the word answers to the same with *anodynia*. Hence also *aponia* is used by some for medicines which do not excite pain.

APONOGETON, in *Botany*, a name given by Pomedera to a genus of plants, called by Micheli and Linnæus ZANNICHELLIA.

APOPEMPTIC, from ἀποπέμπω, *I dismiss*, in the *Ancient Poetry*, a hymn addressed to a stranger on his departure from a place to his own country.

The ancients had certain holy days, wherein they took leave of the gods with *apopemptic* songs, as supposing them returning each to his own country.

APOPHASIS, from ἀποφημι, *I declare*, and *I deny*, in the *Civil Law*, an answer or rescript of the prince.

Among *Logicians* the word is also used for a negation or denial.

APOPHASIS was also used for the account given of estates, at the exchange of them for the avoiding public employments. When any man would excuse himself from any troublesome and chargeable suit, by calling it on another rather than himself, the person produced had power to challenge him to make an exchange of estates, and thereby compel him to undergo the office he had before refused.

APOPHASIS, in *Rhetoric*, a figure whereby we really say or advise a thing, under a feigned show of passing over, or dissuading it.

Quintilian makes the *apophasis* a species of ironY. Scaliger holds it the same with what is otherwise called *exceptio*.

APOPHLEGMATISM, in *Medicine*, the operation of purging phlegm or *pituita* of the head.

APOPHLEGMATIZANTS, denote medicines proper to purge the head and brain of superfluous phlegm, or serous humours.

These are also, by many writers, denominated *apophlegmatisms*. The word is compounded of ἀπὸ, *from*, and φλεγμα, *phlegm*.

Apophlegmatisms are of two kinds, one administered by the way of the mouth, and intended to operate by spitting; the other given by the nostrils, to operate by sneezing, &c.

APOPHORETA, from ἀποφερω, *I carry away*, in *Antiquity*, presents made to the guests at a feast, or other entertainment which they carry away with them.

APOPHRADES, from ἀποφραδες, ἀποφραδων, derived again from ἀπὸ, and φραδω, *I speak*, in *Philology*, a sort of unhappy days, wherein either no *affairs*, or an ill one is to be expended.

APOPHTHEGM, from ἀπὸ, and φθεγγομαι, *I speak*, a short, wise, and pithy saying.

Such is that of Cyrus: *He is unworthy to be a magistrate, who is not better than his subjects.* Or this: *He that will not take care of his own affairs, will be forced to take care of those of others.* Or that of Artaxerxes Mnemon, when reduced to hunger by the loss of his baggage: *How much pleasure have I had to-day a stranger to it!* Or that of Cato, *Homines nihil agendo discunt male agere.* Or, finally, that of Augustus, *festina lente.* The *apophthegms* of Plutarch are well known.

APOPHYGE, in *Architecture*, that part of a column where it begins to spring out of its base, and shoot upwards.

The word in its original Greek, signifies *flight*, whence the French also call it *congé*, *congé*, &c. and we, sometimes, the *spring* of the column.

The *apophyge*, in its original, was no more than the ring or term wherefore fastened to the extremities of wooden pillars, to keep them from splitting; which afterwards was imitated in stone-work.

It is properly a large concave or arched member, serving either to connect two flat members together, or to join a flat member to another not flat.

In this sense we may dislinguish two *apophyges*, the upper and lower.

APOPHYGE, *upper*, in *Architecture*, that part or sweep, whereby a large flat member of the upper part of an order is connected to the lower.

This is also called by the French *le congé d'enhaut*, and by the Italians *il cavo di sopra*.

APOPHYGE, *lower*, *apophyge inferior*, is a concave member, which connects two flat parts in the lower part of an order. This the French call *le congé d'enbas*, and the Italians, *il cavo di sotto*, sometimes also *il cavo di sotto*.

APOPHYSIS, in *Anatomy*, a protuberance of a bone; or a part eminent, and jutting out beyond the rest.

The word literally denotes a production outwards; formed from ἀπὸ and φυω, *to grow from*.

It is the same with what we otherwise call process, eminence, probole, projecture, protuberance, ecphysis, head, and the like.

Apophyses differ from *epiphyses*, as these latter are only appendages adhering or contiguous to a bone; whereas the former are productions or continuations of the bone itself, shooting out from it like branches from the trunk of a tree.

Apophyses, with regard to figure, may be reduced to two kinds, *round* and *long*.

The former are called by the general name of *heads*. These may be subdivided into two sorts: if the head be large, oblong, and very prominent, it is called simply, *apophysis*; if flat and low, *condylus*.

The long kind are also subdivided into *acute* and *obtuse*; the *acute*, terminating in a point, is called *styloid*. There are divers species of this, distinguished according to their figure, by different names. The obtuse kind terminating in a head, is called *cervix*, *collum*, or neck.

The general use of *apophyses* is, 1. For the greater convenience of articulation, whether it be with or without motion. 2. To afford a more commodious origination and insertion to the muscles; and, 3. To defend other parts. Hether. Their particular use will be indicated under the proper articles of each bone, &c.

APOPHYSES *mammillares* are the beginnings of the olfactory nerves, as far as the *os cribrosum*, where they divide into little fibres, which pass through those bones, and spread themselves through the upper part of the nose.

APOPHYSES *mammillaris* or *mastoides*, also denotes one of the external eminences of the *os petrosum*.

APOPHYSES *styloides* denotes the larger process of the MALLEUS of the ear, into which the muscles of the bone are inserted.

APOPHYSIS is also applied by Hippocrates to certain fleshy excrescences found in males and female *foetuses* of seven months, as appearing rather processes, and origins of members, than distinct members, such as he says may be found in male *foetuses*.

APOPHYSIS, in *Botany*, an excrescence from the receptacle of the *mosses*.

APOPLANESIS, from ἀποπλανάω, *I deceive*, in *Oratory*, a kind of fallacious defence, and flurring over, darkening and concealing things, in order to blind the judges, or thou sulheer.

APOPLANESIS, in a more particular sense, denotes a sort of confutation, wherein the speaker promises to answer what the adversary objects in another place, but which being too difficult to answer, is afterwards forgot, and left to pass unanswered.

APOPLECTIC, relating to an apoplexy. Thus we say, an *apoplectic* fit, an *apoplectic* water, &c.

APOPLECTIC *veins*, a name sometimes given to the *jugulars*.

These are sometimes also denominated among ancient writers, *superiores*.

Some writers reſtrain *apoplectic* to the internal jugular aſcending by the ſide of the *trachea*.

APOPLECTICA, *apoplectical medicines*, a name uſed by ſome for what we more properly call *antapoplectics*.

APOPLECTICAL *balſams* is a name give by ſome writers to a ſort of ſweet-ſcented balms, prepared of diſtilled oils, and uſed by way of perfume.

APOPLEXY, in *Medicine*, a ſudden privation of all the ſenſes, and all the ſenſible motions of the body, excepting thoſe of the heart and lungs; attended with a great depreſſion, or ſuſpenſion of the principal faculties of the ſoul.

The word comes from ἀποπλήσσειν, *to ſtrike*, or *aſtoniſh*; this diſtemper ſtriking ſuddenly; and, as it were, like a thunder-bolt.

Hippocrates diſtinguiſhes two kinds of *apoplexies*; the *one ſtrong*, the other *weak*; only differing in the greater or leſs difficulty of reſpiration, and pulſation: in the former the pulſe and breath ſeem almoſt entirely ſtopped; in the latter there are conſiderable remains of them.

The more modern authors diſtinguiſh *apoplexies* from their cauſe, into *ſanguineous* and *ſerous*, to which may be added the *ſpaſmodic*, *ſymptomatic*, &c.

The fit of an *apoplexy* is uſually preceded by a violent pain in the head, a dimneſs and loſs of ſight or memory: ſometimes by an univerſal indolence; and ſometimes by a flux of pituitous matter by the noſe and mouth.—It is attended with a ſnotting and difficulty of breathing; ſometimes with a fever, rarely with a foaming at the mouth, frequently with a ſweat, hæmorrhoids, or diarrhœa.

A multitude of the moſt accurate obſervations have made it appear, that this diſorder ariſes from any cauſe that is capable of preventing either totally, or in part, the influx of the nervous fluid, ſecreted in the *cerebrum*, to the organs of ſenſe and voluntary motion; and the reflux of the ſame fluid from the above mentioned organs to the common ſenſory in the brain: whilſt the progreſs, and perhaps the return of the fluid, ſupplied by the *cerebellum* to and from the heart and organs of reſpiration, is preſerved in a degree ſufficient to ſupport in ſome meaſure their functions.

All theſe cauſes, as obſerved and delivered by authors, may for the greater perſpicuity be reduced to claſſes; in the firſt of which may be reckoned,

1. The natural make of the body: thus, when the head is naturally large, the neck ſhort, and as it ſometimes happens, conſiſting only of ſix *vertebræ*, whereas there ought to be ſeven; this ſtructure diſpoſes to an *apoplexy*, as it favours the congeſtion of blood and humours in the head. Thus alſo, if the body is corpulent, the capillary arteries will in general be ſubject to compreſſions, and in conſequence thereof a greater quantity of blood and humours will flow into the veſſels which convey them to the brain. Thus alſo a plethoric habit, and a redundancy of pituitous humours in the blood, lay a foundation for a ſtagnation of the juices, and a ſubſequent rupture of the veſſels of the brain.

2. To the ſecond claſs belong all thoſe cauſes which induce ſuch a change in the blood, lymph, and nervous fluid, as to render them incapable of circulating freely through their reſpective veſſels in the brain; among with are—polypous concretions in the carotid or vertebral arteries, whether formed originally about the heart, or within the *cranium*; theſe are diſcovered by a palpitation of the heart, an unequal pulſe, a vertigo, and temporary loſs of ſight often recurring, and which are increaſed by motion or heat: an inflammatory ſtateneſs of the blood, which may be known by an acute continual fever, an inflammatory pain in the head, eyes, &c. —a thick, glutinous, pituitous, and ſluggiſh diſpoſition of the whole maſs of blood; whence old people, thoſe who are much ſubject to catarrhs, whoſe conſtitutions are cold and moiſt, and who are pale and leucophlegmatic, are very ſubject to *apoplexies*. It is not difficult to preſage an *apoplexy* from this cauſe, as it is generally preceded by an univerſal liſtleſſneſs, and dulneſs of the ſenſes, unuſual ſlowneſs of ſpeech, tremors, ſtertors, *incubi* (night mares), frequent diſcharges of pituitous humours by vomit, vertigoes, ſhortneſs of breath on the leaſt motion, with a compreſſion of the cartilages of the noſe.

3. To the third claſs belongs whatever compreſſes the arteries themſelves, or the nervous veſſels of the brain, ſo as to prevent a free circulation of the fluids through them. People who are plethoric and bloated are much ſubject to this ſpecies of *apoplexy*; eſpecially if extraordinary motion or heat increaſe the velocity of the circulation. To ſuch, therefore, high feeding, ſpirituous liquors, acrid medicines, intenſe and long-continued thought, are pernicious. All humours ariſing within the *cranium* properly belong to this claſs; as alſo a too great velocity of the blood in the veſſels of the head, determined by ſome impediment to the circulation in the arteries of the inferior parts, which may ariſe from an infinite number of cauſes. Hither alſo may be referred all compreſſions from whatever cauſe, of the veins without the head, which convey the reſluent blood from the contents of the *cranium* toward the heart; as alſo effuſions of blood, *pus*, *ichor*, or lymph, which preſs externally on the *dura* or *pia mater*.

4. To the fourth claſs belong all thoſe cauſes, which by any means ſo diſſolve the texture of the arteries, veins, or lymphatics, belonging to the internal parts of the *cerebrum*, as to cauſe an extravaſation of their reſpective fluids, which then preſs upon and injure the medullary origins of the nerves of the *cerebrum*.

5. Some ſorts of poiſons, which are ſuddenly deleterious, may be ranked in the fifth claſs: but theſe may either be reduced to the ſecond, third, or fourth, or may be more properly ſaid to act on the lungs than the brain. Among theſe are the fumes of mineral ſulphurs, of charcoal, or that *gas ſylveſtris*, or inconcretible ſpirit which exhales from vegetable juices during fermentation.

The anatomical inſpection of bodies which have died of *apoplexies*, and the hiſtorical obſervation of ſuch circumſtances as occur in the treatment of theſe caſes, furniſh us with a knowledge of their cauſes; and a due reflection upon theſe naturally leads us to a diſtribution of them into the preceding claſſes, which are admirably adapted to the inveſtigation of the beſt methods of cure.

The part affected in a perfect *apoplexy* is the entire common ſenſory of the brain; but in a *paraplexy* thoſe parts only of the common ſenſory which are more compreſſed than the reſt; whilſt the *cerebellum*, and its dependencies, remain in the beginning of the diſorder unaffected. Boerhaave.

As to the prevention and cure of an *apoplexy*, no invariable rules can be laid down; for as the *prediſpoſing* and exciting cauſes, together with the parts principally affected, are various, the method of relief muſt alſo vary; and muſt be attempted before the diſorder grows inveterate; otherwiſe ſucceſs will be very precarious.

In general, however, to prevent an *apoplexy*, wine, hard labour, exceſs of eating, and ſleeping after dinner, are to be avoided: exerciſe is to be kept up, and care and chagrin to be reſtrained. To cure an *apoplexy*, medicines muſt be uſed that occaſion large evacuations, and nothing of the opiate or aſtringent kind ſhould be taken.—During the fit, if the *apoplexy* be of the *ſanguineous* kind, copious bleeding in the jugulars is to be uſed, and the patient laid on his back; applying ſtrong volatiles to the noſe; alſo blow up ſtrong ſternutatories, and rub the temples with cephalic mixtures. A mixture of common ſalt diſſolved in a pint of water, has been ſometimes adminiſtered as the means of recovery. A hot iron may alſo be applied near the *vertex* or *occiput*; and an epiſpaſtic to the neck; to which are to be added powerful purgatives, clyſters, &c. Cupping and ſcarification on the head are recommended by ſome, in lieu of veneſection. In the *ſerous* kind of *apoplexy*, bleeding ſhould rarely be admitted.

Dr. Fiemyng recommends trepanning for the cure of *apoplexies*. Med. Muſ. vol. II. p. 300, &c.

The diſeaſe ſometimes degenerates into a *paraliſis*. And ſometimes only half the head is affected; in which caſe the diſeaſe is called ſimply a *hemiplexy*.

Apoplexy differs from *coma*, *lethargy*, and *ecma*, as in thoſe three diſtempers the *ſenſes* are not ſo profound, nor is all ſenſation quite deſtroyed.

It differs from *ſyncope*, in that there is no ſenſible pulſe in this laſt; whereas in an *apoplexy*, the pulſe is perceptible almoſt till death.

It differs from an *epilepſy*, becauſe all motion is not aboliſhed in that, as in this; and it differs from the *palſy*, inaſmuch as the palſy is not attended with any *ſtupor*, nor does it deprive the patient of ſenſe and perception.

APOPLEXY is alſo reckoned among the diſeaſes of hawks, being a diſtemper which ſeizes their heads, occaſioned by too much greaſe and blood, or their having ſtood too long expoſed to the heat of the ſun, or having taken too long flights in the heat of the day.

Horſes are alſo ſaid to be ſubject to *apoplexies* occaſioned by want of exerciſe, or too ſplentiful feeding.

The diſtemper ſhews itſelf by a giddineſs, reeling, trembling, and ſometimes falling ſuddenly down, without ſenſe or motion. The cure is by taking a large quantity of blood from the neck, and applying volatile ſpirits to the noſtrils.

APOLISTÆ, from ἀπο, and ὁπλον, *arms*, in *Ancient Law*, a ſort of officers in the country, appointed to diſarm all private perſons, or thoſe not entitled to have arms; for the prevention of miſchief and violence.

APOPOMPÆ, in *Antiquity*, certain days in which ſacri-

fices were offered to the gods called *pompæ*. Who these deities were, is doubtful.

APOPSYCHIA, from ἀπόλλυμι, *I expire*, is sometimes underlood of effluvia, emitted from the sun, moon, and other heavenly bodies; to which their influence on sublunary things was ascribed by astrologers.

APORIA, from ἄπορος, *I doubt*, in *Rhetoric*, denotes a state of doubt or wavering, wherein the orator appears undetermined whether to say any thing or not: e. gr. *Eloquar an silebo?* Shall I speak out, or hold my tongue?

APORON, or APORIME, a problem difficult to resolve, and which has never been resolved, though it be not, in itself, impossible.

The word is derived from ἄπορος, which signifies something very difficult and impracticable; being formed from the privative α and πορος, *passage*.

Such we conceive the quadrature of the circle; the duplicature of the cube; the trisection of an angle, &c.

When a question was proposed to any of the Greek philosophers, especially of the sect of academics; if he could not give a solution, his answer was, ἄπορον ἐστι μοι, *I cannot see through it.*

This word is also used by some law-writers for an inexplicable speech or discourse.

APORRHŒA, APOZEMATA, in *Philosophy*, sulphureous effluvia, or exhalations, emitted from the earth, and subterraneous bodies.

The word is formed from ἀπορρέω, *defluo*, *to flow from.*

APORRHŒA, in *Physic*, is sometimes particularly used for morbid or contagious *miasmata*, or effluvia from unwholesome bodies. The word is also used to denote a shedding or falling of the hair. See ALOPECIA.

APOS, in *Ornithology*. See the SWALLOW.

APOSCEPARNISMUS, a species of fracture of the skull or other bone, wherein a piece is taken clearly off, as if cut out with a hatchet; from σκεπάρνιον, *an ax, or hatchet.*

APOSIOPESIS, in *Rhetoric*, otherwise called *reticence*, and *suppression*; a figure, by which a person really speaks of a thing, at the same time that he makes a show as if he would fay nothing of it. See PRETERITION.

The word comes from σιωπάω, *I am silent.*

It is commonly used to denote the same with ELLIPSIS. Jul. Scaliger distinguishes them. The latter according to him, being only the suppression of a word; as *nec, mea si non ea fuit*; the former the omitting to relate some part of the action; as

Diserat, atque illam media inter talia ferro
Collapsam aspicient——————

Where the poet does not mention how Dido killed herself. This figure is of use to keep up the grandeur and sublimity of a discourse.

APOSITION, from ἀπο, and σιτος, *food*, in *Medicine*, an aversion to food. It amounts to much the same with *anorexia*; though some make a difference, alledging that the latter imports, no other than an inappetency, or want of desire to eat; the former an aversion or loathing of it.

APOSPASMA, from ἀποσπάω, *I tear off*, in *Medicine*, denotes a solution of continuity in some organical part, as a membrane, ligament, or the like.

APOSPARMA is also applied to mitralline excrements, as *tofi*, *melanoides*, mily, fory, or the like.

APOSPHACELISIS, from ἀποσφακελίζω, *I occasion a mortification*, &c. in the *Ancient Physic*, denotes a mortification of a fleshy part, happening in cases of wounds, and fractures, from too tight a ligature.

APOSPHRAGISMA, from ἀπο and σφραγίζω, *I seal*, in *Antiquity*, the figure or impression of a seal.

It was forbid among the ancients to have the figure or image of God on their rings and seals. To this purpose the precepts of Pythagoras, το μὴ ἐπὶ δακτυλίου ἔχειν θεὸν ἀποσφραγισμα? But in process of time, this was little regarded; it was usual enough to have the figures of Egyptian and other deities, as well as of heroes, monarchs, friends, ancestors, and even brutes, on their *bagues*, or ring-seal. Thus Cæsar had the image of Venus, Pollio of Alexander, Augustus of the *Sphinx*, Pompey of a frog, Lentulus of his grandfather, &c.

APOSPONGISMUS, among *Ancient Physicians*, the application of a sponge, whether dry or soaked with water, either to cleanse the filth from a part, or to ease pains, allay itching, or refresh the spirits.

APOSTAGMA, from ἀποστάζω, *I distil*, in *Natural History*, the must or juice which runs from the grapes before they are trodden or pressed.

This is otherwise called *apolagma*.

APOSTASIS, from ἀφίστημι, *I depart*, &c. in *Physic*, usually signifies the same with abscess. See IMPOSTHUMATION.

In which sense, the word is used by Hippocrates and others, promiscuously with ἀπόστημα, *apostema*.

APOSTASIS in a more particular sense, denotes a departure or removal of the morbid matter, in the crisis or solution of a disease.

APOSTASIS is also used by Hippocrates for a fracture of a bone, wherein some part is entirely separated from the rest.

APOSTACY, a deserting or abandoning of the Christian religion.

The word is borrowed from the Latin *apostatare*, or *apostare*, to *desert*, or *violate*, any thing. Hence *apostates* anciently signified to transgress the laws. *Apostatæ terræ fines sui apud regem.* LL. Inæ.

The Latin *apostatare*, again, comes from ἀπο, *from*, and ἱστημι, *I stand.*

Among the Romanists *apostacy* also signifies the quitting of a religious order, whereof a man had made profession, without a lawful dispensation.

The ancients distinguished three kind of *apostates*: the first, a *superstitione*, is committed by a person religious, who abandons his profession, and returns to lay state; the second, a *mandatis Dei*, by a person of any condition, who abandons the commands of God, though he retains his faith; the third, a *fide*, by him who not only abandons his good works, but also the faith.

There is this difference betwixt an *apostate* and a *heretic*, that the latter only abandons a part of the faith, whereas the former renounces the whole.

Apostacy is said to have been anciently punishable, in England, by burning and tearing to pieces by horses. Thus Flets, lib. 1. cap. 37. §. 2. *Apostatæ & sacrilegi, & incendiarii, detentiores debent et comburi.* And, § 4. *Si inde convincantur, decrucientur, & suspendantur.* Where Du Cange interprets, *excruciari*, by *torqueri quæstionem.*

APOSTATA *capiendo*, a writ which anciently lay against one, who, having entered and professed some order of religion, broke out again, and wandered the country, contrary to the rules of the order.

APOSTATE, in a general sense, signifies a deserter from the true religion.

In which sense *apostata* amounts to much the same with lapsed, perverted, &c.

APOSTERIGMA, from ἀπο and στηρίζω, *I support*, in the *Ancient Physic*, denotes a roll or support for a diseased part, without binding.

Such are pillows, cushions, and the like.

The word seems also to have been used by Hippocrates for a stoppage, or obstruction of some vascular part.

A POSTERIORI. Demonstration *a posteriori*. See DEMONSTRATION.

APOSTHUME, or APOSTEME, APOSTEMA, in *Medicine*, a preternatural tumor; called also ABSCESS, and IMPOSTHUME.

The word comes from ἀφίστημι, *I depart from the place and go to another*, alluding to the manner wherein the tumor is usually formed of a translated humour.

APOSTHUME is particularly used for a *disease of hawks*, which occasions swellings in the head, arising from a redundancy of humours, and a preternatural heat of that part.

The *apostheme* discovers itself by a swelling of the eyes, a moisture issuing from the ears, and their wings extremely slothful.

APOSTIL, *apostilla*, in *Matters of Literature*, a marginal addition, or note to a book, passage, or the like.

APOSTLE, ἀπόστολος, one of the twelve disciples of Jesus Christ, commissioned by him to preach his gospel, and propagate it to all the parts of the earth. They were limited in the number twelve, in allusion to the twelve tribes of Israel.

The word originally signifies a person *delegated*, or *sent*; from ἀποστέλλω, *mitto*; in which sense it occurs in Herodotus, and other profane authors. Hence, in the New Testament, the term is applied to divers sorts of delegates; and to the twelve disciples by way of eminence.

St. Paul is frequently called the *apostle*, by way of eminence; and the *apostle of the Gentiles*, because his ministry was chiefly made use of for the conversion of the Gentile world, as that of St. Peter was for the Jews, who is therefore styled the *Apostle of the Circumcision.*—The several *apostles* are usually represented with their respective badges or attributes: St. Peter with the keys; St. Paul, with a sword; St. Andrew, with a cross or fasces; St. James minor, with a fuller's pole; St. John, with a cup, and a winged serpent flying from it; St. Bartholomew, with a knife; St. Philip, with a long staff, whose upper end is formed into a cross; St. Thomas, with a lance; St. Matthew, with a hatchet; St. Matthias, with a battle-ax; St. James major, with a pilgrim's staff, and a gourd bottle; St. Simon with a saw; and St. Jude, with a club.

This appellation was also given to the ordinary travelling ministers of the church. Thus St. Paul, in the epistle to the Romans, xvi. 7. says, *Salute Andronicum and Junia my kinsmen and fellow-prisoners, who are of note among the* APOSTLES.

It was likewise a title given to those sent by the churches to carry their alms to the poor of other churches. This usage they borrowed from the synagogues, who called those whom they sent on this message, by the same name; and the function or office itself *apostole*, *apostolè*, q. d. *missi*. Acts Thus St. Paul, writing to the Philippians, tells them, that Epaphroditus, their *apostle*, had ministered to his wants, ch. ii. 25. It is applied in like manner to those persons who first planted the Christian faith in any place. Thus Clonyius of Corinth is called the *apostle of France*; Xavier the *apostle of the Indies*, &c. In the East Indies the Jesuit missionaries are also called *apostles*.

In some ages of the church, the pope was peculiarly denominated the *apostle*.

APOSTLE is also used among the *Jews*, for a kind of officers anciently sent into the several parts and provinces in their jurisdiction, by way of visitor, or commissary; to see that the laws were duly observed, and to receive the monies collected for the reparation of the temple, and the tribute payable to the Romans.

The Theodosian code, lib. xiv. *De Judæis*, calls those *apostoli, qui ad exigendum aurum atque argentum à patriarcha certis temporibus diriguntur*. Julian, the apostate, remitted the Jews the *apostle*, *aurum*, that is, as he himself explains it, the tribute they had been accustomed to send him.

These *apostles* were a degree below the officers of the synagogues, called *patriarchs*, and received their commissions from them. Some authors observe, that St. Paul had borne this office; and that it is this he alludes to in the beginning of the Epistle to the Galatians: as if he had said, Paul, no longer an *apostle* of the synagogue, not sent thereby to maintain the law of Moses, but now an *apostle* and envoy of Jesus Christ, &c. St. Jerom, though he does not believe that St. Paul had been an *apostle* of this kind; yet imagines, that he alludes to it, in the passage just cited.

APOSTLE, in the Greek *Liturgy*, is particularly used for a book containing the Epistles of St. Paul printed in the order wherein they are to be read in churches, through the course of the year. Another book of the like kind, containing the Gospels, is called Εὐαγγέλιον, *Gospel*.

The *apostle*, of late days, has also contained the other canonical Epistles, the Acts of the *Apostles*, and the Revelations. Hence it is also called, *Acts of the Apostles*, Πραξαπόστολος, that being the first book in it.

APOSTLE is also thought by many to have been the original name for bishops, before the denomination *bishop* was appropriated to their order. Thus Theodoret says expressly, the same persons were anciently called promiscuously both bishops and presbyters, whilst those who are now called bishops were called *apostles*.

In the arsenal of Bremen, there are twelve pieces of cannon, called the *Twelve Apostles*, on a supposition, that the whole world must be convinced, and acquiesce in the preaching of such *apostles*.

APOSTLE'S *Creed*. See CREED.

APOSTOLÆUM, or APOSTOLIUM, in *Ecclesiastical Writers*, denotes a church dedicated to, and called by, the name of an *apostle*.

Sozomen speaks of the *apostoleum* of St. Peter at Rome, and the *apostoleum* of St. Peter and St. Paul at Quercus, near Chalcedon.

In this sense *apostoleum* stands distinguished from *prophetæum*, *martyrium*, &c.

APOSTOLARE, APOSTOLICARE, *apostolizing*, in some *Middle Age Writers*, denotes the being preferred to the dignity of POPE.

APOSTOLATE, in a general sense, is used for mission.

In this sense, Olearius has a discourse concerning the *apostolate* of Christ. Lipf. 1681. 4to.

APOSTOLATE more properly denotes the dignity or office of an apostle of Christ; but it is also used, in ancient writers, for the office of a bishop.

In this sense, we meet with several letters, petitions, requests, &c. directed to bishops under the title of your *apostolate*, or *apostolatus vester*.

But as the title *apostolicus* had been appropriated to the pope, so that of *apostolate* became at length restrained to the sole dignity of the popedom.

Every bishop's fee was anciently dignified with the title of *sedes apostolica*, an apostolical see, which is now the peculiar denomination of the see of Rome.

APOSTOL, in *Law*, denote those letters missive, which are demanded in cases of appeal.

APOSTOLIC, APOSTOLICAL, something that relates to the *apostles* or descends from them.

Thus we say, the *apostolical* age, *apostolical* doctrine, *apostolical* character, constitutions, traditions, &c.

APOSTOLIC, in the *Primitive Church*, was an appellation given to all such churches as were founded by the *apostles*; and even to the bishops of those churches, as being the reputed successors of the *apostles*.—These were confined to four, viz. Rome, Alexandria, Antioch, and Jerusalem.

In after-times, other churches assumed the same quality, on account, principally, of the conformity of their doctrine with that of the churches which were *apostolical* by foundation, and because all bishops held themselves successors of the apostles, or acted in their diocese with the authority of apostles.

The first time the term *apostolical* is attributed to bishops, as such, is in the letter of Clovis to the council of Orleans, held in 511, though that king does not there expressly denominate them *apostolical*, but *(apostolica sede dignissimi)* highly worthy of the *apostolical* see. In 581, Guntram calls the bishops, met at the council of Maion, *apostolical* pontiffs, *apostolici pontifices*.

In progress of time, the bishop of Rome growing in power above the rest; and the three patriarchates of Alexandria, Antioch, and Jerusalem, falling into the hands of the Saracens, the title *apostolical* was restrained to the pope, and his church alone. Though some of the popes, and St. Gregory the Great, not contented to hold the title by his tenure, began, at length, to insist, that it belonged to them by another and peculiar right, as being the successors of St. Peter. The council of Rheims in 1049 declared that the pope was the sole *apostolical* primate of the universal church.

And hence a great number of *apostolical*; *apostolical* see, *apostolical* nuncio, *apostolical* notary, *apostolical* brief, *apostolical* chamber, *apostolical* vicar, &c.

APOSTOLIC *tiara*, see TIARA.

APOSTOLICAL *constitutions*, see CONSTITUTION.

APOSTOLICAL *traditions*, see TRADITION.

APOSTOLICAL *fathers* is an appellation usually given to the writers of the first century who employed their pens in the cause of Christianity. Of these writers, Cotelerius, and after him Le Clerc, have published a collection in two volumes, accompanied with both their own annotations, and the remarks of other learned men.

APOSTOOLIANS, a sect of the Mennonites, which first sprung up in the year 1664, and derived its name from Apostool, one of the Mennonite ministers at Amsterdam. They concurred with them in doctrine, and admitted to their communion those only who professed to believe all the sentiments which are contained in their public confession of faith.

APOSTOLICI, APOSTOLI, or APOSTLES, was a name assumed by three different sects, on account of their pretending to imitate the manner and practice of the apostles. The first *Apostolici*, otherwise called *Apotactitæ*, and *Apostactici*, rose out of the Encratitæ, and Cathari, in the third century. They made profession of abstaining from marriage, and the use of wine, flesh, money, &c.

Gerhard Sagarelli was the founder of the second sect; he obliged his followers to go from place to place as the *apostles* did, to wander about clothed in white, with long beards, dishevelled hair, and bare heads, accompanied with women, whom they called their *spiritual sisters*. They likewise renounced all kinds of property and possessions, inveighed against the growing corruption of the church of Rome, predicted its overthrow, and the establishment of a purer church on its ruins. Sagarelli was burnt alive at Parma in the year 1300, and was afterwards succeeded by Dulcinus, who added to the character of an apostle those of a prophet and a general, and carried on a bloody and dreadful war for the space of more than two years against Raynerius, bishop of Vercelli; he was at length defeated, and put to death in a barbarous manner, in the year 1307. Nevertheless, this sect subsisted in France, Germany, and in other countries, till the beginning of the fifteenth century, when it was totally extirpated under the pontificate of Boniface IX.

The other branch of *Apostolici* were of the twelfth century. These also condemned marriage, professing celibacy, and calling themselves the chaste brethren and sisters; though each was allowed a spiritual sister, with whom he lived in a domestic relation; and on this account they have been charged with concubinage: they held it unlawful to take an oath; they set aside the use of baptism; and in many things imitated the Manichees. Bernard wrote against this sect of *Apostolici*.

APOSTOLICUM is a peculiar name given to a kind of song or hymn, anciently used in churches.

The *Apostolicum* is mentioned by Greg. Thaumaturgus as used in his time. Vossius understands it as spoken of the apostles creed. Suicer thinks this impossible, because this creed was then unknown in the churches of the East.

APOSTOLORUM *unguentum*, the *apostles ointment*, in *Pharmacy*, is a kind of detergent, or cleansing unguent, compoled of twelve drugs, the number of the apostles; whence its name.

It was invented by Avicenna, and is otherwise called *unguentum veneris*. The principal ingredients are turpentine,

pine, resin, wax, gum ammoniac, birth-wort roots, olibanum, bdellium, myrrh, and galbanum, opopanax, verdegris, litharge, oil of olives, and vinegar.

APOSTROPHE, in *Rhetoric*, a figure, whereby the orator, in an extraordinary commotion, turns his discourse from the audience, and directs it to some other person, present or absent, living or dead, or to inanimate nature.

The word is formed of ἀπὸ, *ab, from*; and στρέφω, *verto, to turn*.

Thus Cicero, in his oration for Milo, addresses himself to the great patriots who had shed their blood for the public; and calls them to the defence of his client. So the same orator in his first *Catilinarian* directs himself to Jupiter the protector of the city and empire, and beseeches him to repel the parricide, &c.

The *apostrophe* is also frequently addressed to inanimates, as tombs, monuments, defuncts, &c. Cicero's *apostrophe* to Tubero, in his oration for Ligarius, is judged one of the finest passages in his works.

That *apostrophe* of Demosthenes, wherein he addresses himself to the Greeks slain at the battle of Marathon, is also famous; Cardinal Perron says, it has procured the orator as much glory as if he had raised them from the dead.

APOSTROPHE, or APOSTROPHUS, in *Grammar*, also denotes a note or character placed over a letter, in lieu of a vowel, to denote that the vowel is cut off, and not to be pronounced.

As *ev'n* for *even*; *th'angelic host*, for *the angelic*, &c.

The affectation of frequent *apostrophes*, so usual among some late English writers, is a great abuse.

In prose, *apostrophes* are indefensible, and tend to vitiate the language; their use in poetry is to reduce a line to the proper measure.

APOSTROPHE, in *Medicine*, denotes a loathing or aversion for food.

In which sense the word amounts to the same with APOSITION.

APOSYRMA, from ἀποσύρω, *I take off*, in *Medicine*, denotes a disquamination or scaling of the skin.

In which sense the word amounts to much the same with ABRASION.

Greek writers use the word *apospasmata*, for what the Latins call *abrasa*, viz. a superficial kind of exulcerations, which raise the skin.

APOTACTITÆ, or APOTACTICI, an ancient sect, who, affecting to follow the evangelical counsels of poverty, and the examples of the apostles, and primitive Christians, renounced all their effects and possessions.

The word is formed from ἀποτάσσω, or ἀποτάομαι, to *renounce*.

It does not appear, that they gave into any errors during their first state; some ecclesiastical writers assure us, they had divers holy virgins, and martyrs, under the persecution of Diocletian, in the fourth century; but they afterwards fell into the opinions of the Encratitæ, and taught, that the renouncing of all riches was not only a matter of counsel and advice, but of precept and necessity. And hence the sixth law in the Theodosian Code joins the *Apotactitæ* with the Eunomians and Ariane.

APOTEICHISMUS, from ἀποτειχίζω, derived from ἀπὸ, and τεῖχος, *I raise a wall*, or τοῖχος, in the *Ancient Military Art*, a kind of line of circumvallation drawn round a place, in order to besiege it.

This was also called *periteichismus*.

The first thing the ancients went about when they designed to lay close siege to a place, was the *apoteichismus*; which sometimes consisted of a double wall, or rampart, raised of earth; the innermost to prevent sudden sallies from the town; the outermost to keep off foreign enemies from coming to the relief of the besieged. This answered to what we call lines of contravallation and circumvallation, among the moderns.

APOTELESMA, from ἀποτελέω, *I perform*, in a general sense, denotes an effect of some cause. It is also used for a prognostic, or natural prediction of an event.

In which sense, Scaliger speaks of the *apotelesmata* of Hippocrates. The answers of astrologers deduced from the considerations of the stars are particularly called *apotelesmi*, or *apotelesmata*; which were the expressions they used, to denote the effects of the stars and planets on sublunary bodies.

In which sense *apotelesmata* amount to the same with influences.

APOTELESMATICA, the science of *apotelesmi*, or the art of foretelling future events, from the aspects and configurations of the heavenly bodies.

In this sense the word amounts to the same with what we otherwise call *judicial astrology*.

Sozomen denominates this *apotelesmatical astronomy*.

Hence also astrologers are called *apotelesmatici*, as synonymous with *mathematici*, *genethliaci*, *Chaldæi*, &c.

APOTHECARY, a person who professes the practice of pharmacy, or that part of physic which consists in the preparation and composition of medicines.

The word is derived from ἀποθήκη, *shop*, the place where he makes up and exposes his medicines to sale.

The *apothecaries* in England are obliged to make up their medicines according to the formulas prescribed in the college dispensatory.

Their shops are subject to the visitation of the censors of the college; who are empowered to destroy such medicines as they think not good.

The company of *apothecaries* were incorporated by charter from James I. procured at the solicitation of Dr. Mayerne and Dr. Arkins; till that time they were only a part of the grocers company; plums, [illegible] Venice-treacle, mithridate, &c. were sold in the same shop, and by the same person. The reason for uniting them was, that medicines might be better prepared, and in opposition to divers persons who sold unwholesome remedies on the people. Observ. on Case of Will. Rose, sect. 2.

In the year 1712, the 10th of queen Anne, an act passed for reviving and continuing several acts therein mentioned, one whereof was for exempting the apothecaries from serving the offices of constable and scavengers, and other parish and ward offices, and from serving upon juries; which act was made perpetual in the ninth year of George I.

They have a hall in Black-Friars, where there are two fine laboratories, out of which all the surgeons chests are supplied with medicines for the royal British navy.

To his majesty belong two *apothecaries*: the salary to the first, 320*l.* to the second, 275*l.* To the houshold belong also two.

Bartholin complains of the too great numbers of *apothecaries* in Denmark; though there are but two allowed in all Copenhagen; and one in every other considerable town.

In Muscovy, we are told, there are no *apothecaries* at all; but then there are no physicians, except two or three retained by the court, and those rather for state than service.

Travellers speak of a famous *apothecary*'s shop at Dresden, furnished with four thousand silver pots, all filled with the choicest drugs.

It is strange, to what an height *apothecaries* have found means to carry their favourite polypharmacy, considering what a few simple easy medicines will answer all the purposes of their vast shops. The physicians of Paris, toward the beginning of the seventeenth century, began to oppose the growing evil. Patin was one of the warmest. They went so far, as at length to exclude the ministry of the *apothecaries* in almost all cases. A valet, or chambermaid, prepared and administered the purges, clysters, &c. The bookseller of the *Medicin Charitable* (which they had procured to be written for the purpose) made up and sold most of the medicines directed in it; and even the physicians, when they wanted, sent to him for them. Patin, Lett. 17. à Berlin.

The charitable dispensation of medicines by the Chinese is well deserving notice. They have a stone, which is ten cubits high, erected in the public squares of their cities; and on this stone are engraven the name of all sorts of medicines, with the price of each; and when the poor stand in need of any relief from physic, they go to the treasury, where they receive the price each medicine is rated at.

APOTHECARY, *apothecarius*, in *Writers of the Middle Age*, denotes a shop-keeper, or ware-house-keeper.

APOTHECARIUS is also used to denote a store-keeper, or officer appointed to have the direction of a magazine, GRANARY, &c.

In which sense *apothecarii* is sometimes rendered by *horrearii* and *cellarii*.

APOTHEOSIS, in *Antiquity*, a heathen ceremony, whereby their emperors and great men were placed among the gods.

The word is derived from ἀπὸ and θεὸς, *God*.

After the *apotheosis*, which they also called *deification* and *consecration*, temples, altars, and images, were erected to the new deity; sacrifices, &c. were offered, and colleges of priests instituted. Dio 47. 56, 59. Suet. Aug. 5. Tib. 40. Paterc. 1. Ovid, Pont. 4.

Images were erected to them, with the attributes of divinity (Lucan 7. Dio 53. Capitolin. Antonin). And to demolish them was deemed treason (Venul. lib. vi. De ad Leg. Jul. Mal.) And even the senate decreed that oaths should be taken in their names (Dio 44. 59. 60. Tac. Ann. 1.) Vide Kirchm. de Fun. Rom. 4. 14.

It was one of the doctrines of Pythagoras, which he had borrowed from the Chaldees, that virtuous persons, after their death, were raised into the order of gods.

And hence the ancients deified all the inventors of things useful

useful to mankind; and those who had done any important service to the commonwealth. Tiberius proposed to the Roman senate the *apotheosis* of Jesus Christ, as is related by Eusebius, Tertullian, and Chrysostom. Juvenal, railing at the frequent *apotheoses*, introduces poor Atlas, complaining that he was ready to sink under the burden of so many new gods as were every day added to the heavens. Seneca ridicules the *apotheosis* of Claudius with admirable humour. Herodian, lib. iv. in speaking of the *apotheosis* of Severus, gives us a very curious description of the ceremonies used in the *apotheosis* of the Roman emperors. After the body of the deceased emperor, says he, had been burnt, with the usual solemnities, they placed an image of wax perfectly like him, but of a sickly aspect, on a large bed of ivory, covered with cloth of gold, in the vestibule of the palace. The greatest part of the day, the senate sat ranged on the left side of the bed, dressed in robes of mourning; the ladies of the first rank sitting on the right side in plain and white robes, without any ornaments. This lasted for seven days successively, during which the physicians came from time to time to visit the sick, always making their report, that he grew worse; till at length they published it that he was dead.

This done, the young senators and Roman knights took the bed of state upon their shoulders, carrying it through the Via Sacra to the Old Forum, where the magistrates were used to divest themselves of their offices. There they set it down between two kinds of amphitheatres, in the one whereof were the young men, and in the other the maidens of the first families of Rome, singing hymns set to solemn airs, in praise of the deceased. These hymns ended, the bed was carried out of the city into the Campus Martius, in the middle of which place was erected a kind of square pavilion, the inside whereof was full of combustible matters, and the outside hung with cloth of gold, and adorned with figures of ivory, and various paintings.

Over this edifice were several others, like the first in form and decoration, but less; always diminishing and growing slenderer towards the top. On the second of these was placed the bed of state; and a great quantity of aromatic perfumes, and odoriferous fruits and herbs, were thrown all around, after which, the knights made a procession or cavalcade in solemn measures around the pile; several chariots also ran round it, those who conducted them being clad in purple robes, and bearing the images of the greatest Roman emperors and generals.

This ceremony ended, the new emperor came to the *catafalco*, or pile, with a torch in his hand; and, at the same time, fire was set to it on all sides; the spices and other combustibles kindling all at once.

While this was doing, they let fly from the top of the building, an eagle, which, mounting into the air with a fire-brand, carried the soul of the dead emperor along with it into heaven, as the Romans believed; and thenceforward he was ranked among the gods. It is for this reason that the medals, wherein *apotheoses* are represented, have usually an altar with fire upon it; or else an eagle taking its flight into the air, and sometimes two eagles.

APOTHERAPIA, from ἀποθεραπεύω, *I cure*, in *Physic*, properly denotes a complete or finished cure.

APOTHERAPIA is also used in the *Gymnastic Art*, for the last part of all regular exercise, viz. friction or unction with oil, before, as well as after bathing.

The design of this was partly to cleanse the skin from any filth or dust it might have contracted during the exercise, and partly to remove weariness.

APOTHERMUM, from ἀπο, and θερμὸς, *hot*, in *Ancient Writers*, a sharp kind of sauce, like that prepared of mustard, oil, and vinegar, or of vinegar alone.

APOTOME, in *Mathematics*, the remainder or difference of two incommensurable quantities.

The word is derived from ἀποτέμνω, *I cut off*.

A An *apotome*, in *Geometry*, is an irrational residue, as CB, arising, when from a rational line AC, called *a*, you cut off a rational part AB, called *b*, only com-
B mensurable in power to the whole line AC. It may be expressed thus, $a - \sqrt{b}$. Such is the difference between the side of an equilateral triangle, and perpen-
C dicular, from the vertex to the base.

Euclid makes six sorts of *apotomes*.

APOTOME *prima*, is when the greater number is a rational number, and the difference of the squares of both numbers is a square number, e. g. $3 - \sqrt{5}$.

APOTOME *secunda*, is where the lesser number is a rational number, and the square root of the difference of the squares of both numbers has a ratio expressible in numbers to the greater number; such is $\sqrt{18} - 4$, since the difference of the squares 18 and 16 is 2, and $\sqrt{2}$ is to $\sqrt{18}$ as 1 to 3, because $\sqrt{18} = 3\sqrt{2}$.

APOTOME *tertia*, is when both the numbers which are subtracted from each other are irrational numbers, and the square root of the difference of their squares has a ratio in numbers to the greater. This holds in $\sqrt{24} - \sqrt{18}$, for the difference of their squares 24 and 18 is 6, and $\sqrt{6}$ is to $\sqrt{24}$ as 1 is to 2, for $\sqrt{24} = 2\sqrt{6}$.

APOTOME *quarta*, is when the greater number is a rational number, and the square root of the difference of the squares of both numbers has no ratio to it in numbers. Such is $4 - \sqrt{3}$ for the difference of the squares 16 and 3, is 13, but the square root of 13, viz. $\sqrt{13}$ has no numerical ratio to 4.

APOTOME *quinta*, is when the lesser number is a rational number, and the square root of the difference of the squares of both numbers has no ratio in numbers to the greater number. Such is $\sqrt{6} - 2$, for the difference of the squares 6 and 4, is 2, and $\sqrt{2}$ has to $\sqrt{6}$ no ratio in numbers.

APOTOME *sexta*, is where both numbers are irrational, and the square root of the difference of their squares has no ratio in numbers to the greater. Such is the case in $\sqrt{6} - \sqrt{2}$, for the difference of the squares 6 and 2 is 4, and the root thereof 2 has to the $\sqrt{6}$ no ratio in numbers. Peter Ramus censures Euclid's doctrine of *apotomes*, and even all the rest delivered in the tenth book concerning irrational lines.

APOTOME, in *Music*, is the difference of the tone *major* and LIMMA, expressed by $\frac{2187}{2048}$.

The Greeks thought that the greater tone could not be divided into two equa parts; for which reason they called the first part *apotome*, and the other λειμμα; in this imitating Pythagoras and Plato.

The *apotome* is by some authors, as Boethius, called *semitonium majus*; and the *limma*, *semitonium minus*. He also calls the difference of these two, *comma*. The interval of two sounds expressed by $\frac{524}{512}$ was called by the ancients *apotome major*, and that expressed by $\frac{2187}{2048}$, *apotome minor*.

APOTRAGOPOGON, in the *Materia Medica*, a name given by some of the old authors to the LADANUM.

APOTROPÆA, from ἀποτρέπω, *I avert*, in the *Ancient Poetry*, verses composed for averting the wrath of incensed deities; and the deities invoked for averting any threatened misfortune were called *Apotropeans*: they were also called *Alexiari*, from ἀλέξω, *I drive away*; and *averruncæ* from *averrunco*, which denotes the same.

APOZEM, in *Medicine*, a form of remedy, otherwise called a DECOCTION.

The word is derived from ἀποζέω, *fervefacio, I make hot*. *Apozems* are a class of liquid medicines, composed of the juices of divers plants, roots, woods, flowers, leaves, fruits, and seeds, drawn out by boiling of water, and sweetened and clarified. An *apozem* differs from a *syrup*, in thickness and consistence; the *syrup* being more dense and viscous than the *apozem*, from the quantity of sugar. It differs from a *julap*, in that it is thicker and more viscous; and is not made with distilled waters, as *julaps* are, but only with common water.

There are purging *apozems*, cephalic *apozems*, hepatic *apozems*, antarthritic, diuretic, styptic, &c. *apozems*.

Apozem differs from *infusion*, on account of the greater degree of heat made use of in preparing the former, whereby the *apozem* becomes more fully impregnated with those parts of the subject which are readily soluble in boiling water.

Apozems are medicines of the extemporaneous kind, and therefore the less used, because that which is once made up will not keep. What is directed in this form, is generally sent to the patient in the quantity of a quart at a time, to be drunk off plentifully as common drink.

APPANAGE, or APPENAGE. See APANAGE.

APPARATOR. See APPARITOR.

APPARATUS, from *apparo*, *I prepare*, properly signifies a formal preparation for some public and solemn action.

We say, the *apparatus* of a feast, coronation, &c. The prince made his entry with great *apparatus* and magnificence.

APPARATUS is also used for the utensils and appendages belonging to some more considerable machine. As, the furniture or *apparatus* of an air-pump, microscope, &c.

APPARATUS is sometimes also used in *Chirurgery*, for the bandages, medicaments, and dressings of a part; or the several matters applied for the cure of a wound, ulcer, or the like.

There is no judging of the quality of a hurt, till after taking off the first *apparatus*, or coverings.

APPARATUS is frequently used for the operation of cutting for the stone.

For this there are three sorts of *apparatus*, viz. the *small* (1), *great* (2), and *high apparatus* (3): which see described under the article LITHOTOMY.

APPARATUS is also used as a title of several books composed in form of catalogues, bibliothecas, dictionaries, &c. for the ease and convenience of study.

The *apparatus* to Cicero, is a kind of concordance, or

collection of Ciceronian phrases, &c. The *apparatus sacer* of Pasevin, is a collection of all kinds of ecclesiastical authors, printed in 1611, in three volumes.—Glossaries, comments, &c. are also frequently called *apparatuses*.

APPARENT, from *apparet, I appear*, that which is visible, or evident to the eye, or the understanding.

APPARENT *conjunction* of the planets is, when a right line, supposed to be drawn through the centre of two planets, does not pass through the centre of the earth, but through the eye of the spectator.

APPARENT *Altitude, Diameter, Distance, Hour, Horizon, Magnitude, Motion, Place, Time*, &c. See the several substantives.

APPARITION, in *Astronomy*, denotes a star's or other luminary's becoming visible, which before was hid.

In which sense the word stands opposed to OCCULTATION.

The HELIACAL rising is rather an *apparition* than a proper rising.

APPARITION, *circle of perpetual*. See CIRCLE *of perpetual apparition*.

APPARITION, in a general sense, is the appearance or semblance of a thing.

APPARITION is also used to denote a spectre, or preternatural appearance of some spirit, or the like.

We read of *apparitions* of angels, genii, demons, fairies, witches, departed souls, &c. *apparitions* of God, of Christ, the Virgin, saints, prophets, and of the devil himself.

Many of the *apparitions*, we are told of by writers, are doubtless mere delusions of the sense; many others were seen but in dreams or deliquiums; many others are fictions, contrived merely to amuse, or answer some purpose. *Apparitions*, it is certain, are machines that, on occasion, have been of good service to generals, to ministers of state, to priests, and others. It has been controverted, whether an *apparition* be any proof of a future state.

The abbé de St. Pierre has a discourse expressly on the physical method of solving or accounting for *apparitions*: he makes them the effect of feverish dreams, disturbed imaginations, &c.

APPARITOR, or APPARITOUR, or APPARATOR, a BEADLE in an UNIVERSITY, who carries the mace before the masters and the faculties.

APPARITOR is also used in some ancient English laws, for a judge or justice.

APPARITOR *exmitatus*. There was formerly an officer called by this name, for which the sheriffs of Buckinghamshire had a considerable yearly allowance; and in the reign of queen Elizabeth, there was an order of court for making that allowance. But the custom and reason of it are now altered.

APPARITORS also denote messengers, who cite men to appear in the ecclesiastical courts.

Among the Romans *apparitors* were the same with serjeants, or tipstaffs, among us; or rather *apparitor* was a general term, and comprized under it all the ministers and attendants of the judges and magistrates, appointed to receive and execute their orders. And hence, they say, the name was derived, viz. from *apparere, to be present, to be in waiting*.

Under the name *apparitores* were comprehended the *scribæ, accensi, interpretes, præcones, viatores, lictores, flatores*, and even the *carnifices*, or hangmen.

They were usually chosen out of the freedmen of the magistrates, and their condition was held in so much contempt, that as a mark of ignominy, the senate appointed a city that had revolted from them to furnish them with *apparitors*.

There were also a kind of *apparitors of cohorts*, called *cohortales*, or *conditionales*, as being attached to a cohort, and doomed to that condition. The *apparitors* of the *prætors, prætoriani*, were those who attended the prætors, or governors of provinces; and who, on their master's birth-day, were always changed, and preferred to better posts. Add, that the pontifices had also their *apparitors*, as appears from an inscription of an ancient marble in the *Via Appia*.

APPARATORI
PONTIFCVM
PARMVLARIO.

APPAUME, from the French *paume, palm of the hand*, in *Heraldry*, denotes one hand extended with the palm appearing, and the thumb and fingers at full length.

APPEAL, in *Law*, signifies the removal of a cause from an inferior judge to a superior; or the having recourse to a superior judge to rectify what is amiss in a sentence passed by an inferior.

Appeals to Rome were first introduced into England in the reign of king Stephen; and though they were not strictly regarded in the succeeding reigns, they continued till the time of king Henry the Eighth, when [illegible] finally abolished by the 24th H. VIII. c. 12. and 25 H. VIII. c. 19.

Appeals lie from the archdeacon or his official to the bishop, and again from the bishop or his [illegible] to the archbishop; and by the 25th H. VIII. [illegible] of justice in the archbishop's courts, the [illegible] to the king in chancery, where commissioners [illegible] and by reason of this appointment they are [illegible] *gates*: and after the decision of this court, [illegible] of review has been sometimes appointed.

Appeals lie from all the ordinary courts of [illegible] house of lords, who judge *en dernier ressort*. [illegible] peal lies from them.

There are *appeals* from ecclesiastical judges [illegible]. The first instance of this is that of Paulus Samosatenus, who being condemned and deposed by the second council of Antioch, refused to surrender the episcopal house to Domnus, who had been elected his successor; and *appealed* to the emperor.

APPEAL is also used in *Common Law* in the same sense with *accusatio* among the *Civilians*. For as, in the *Civil Law*, cognizance in criminal cases is taken either upon *inquisition, accusation*, or *denunciation*; so in ours, it is taken either upon *indictment* or *appeal*.

Indictment comprehends both *inquisition* and *denunciation*. *Appeal* or accusation is a lawful declaration of another man's crime (which, by Bracton, must be felony at the least) before a competent judge, by one that setteth his name to the declaration, and undertakes to make it good on the penalty that may otherwise ensue.

An *appeal* is commenced two ways; either by WRIT or by BILL.

APPEAL by *writ is*, when a writ is purchased out of chancery by one to another; to this end, that he *appeal* a third of some felony committed by him, finding pledges that he shall do it, and deliver this writ to the sheriff to be recorded.

APPEAL by *bill* is, when a man of himself gives up his accusation in writing to the sheriff or coroner, offering to undergo the burden of *appealing* the person therein named.

This practice is drawn from the Normans, as appears from the Grand Customary, wherein is a solemn discourse both of the effects of this *appeal*, viz. the order of the combat, or the trial by inquest, which, by our law, was in the choice of the defendant.

APPEAL *of mayhem* is an accusing one that hath maimed another. But this being heretofore no felony, the *appeal* thereof was but in manner of an action of trespass; so that there was nothing recovered but the damages.

Bracton calls this, *appellum de plagiis mahemio*, and has a whole chapter of it. In king John's time, there is recorded an *appeal* against a Jew, *qui fecit cementiori quendam nepotem suum*.

APPEAL *of rape* lies where a rape is committed on the body of a woman.

APPEAL *of robbery* is a remedy given by the common law, whereby a person robbed of his goods may obtain restitution of them. But the three last kinds of *appeal* are now much out of use, because of the intricacy of the pleadings, and the charge of prosecution; and the method of indictment is generally adopted.

APPEAL *of suing imprisonment* is used by Bracton for an action of wrong or false imprisonment.

APPEAL is more particularly used for a private accusation of a murderer, by one who had interest in the murdered party; or of any felon by one of his accomplices in the fact.

An *appeal* of death, which is now chiefly in use, is a vindictive action, which the law gives to a wife during widowhood, against the murderer of her husband, or to the male heir at law, against one who kills his ancestor. The *appeal* must be lodged in a year and a day after the death of the person murdered. If the person *appealed* be acquitted, the appellant shall be imprisoned for a year, restore damages to the party, and pay a fine to the king. 13 Ed. I. st. 1. c. 13.

If an *appeal* of murder or felony be used by any common person against a peer, he shall be tried by commoners, and not by his peers.

The person who brings an *appeal* is called the *appellant*; and the person *appealed*, the *appellee*.

In an *appeal*, the king cannot pardon.

APPEARANCE, the exterior surface of a thing; or that which first strikes the sense, or the imagination.

The Academics maintain, that the sensible qualities of bodies are only *appearances*; and the like doctrine is held by some later philosophers.

Our errors arise chiefly from a too hasty and precipitate assent of the will, which acquiesces too easily in the *appearances* of truth.

APPEARANCE, in *Law*, is the defendant's engaging to answer

answer a cause or action entered against him in some court of justicature.

Appearance, in the King's Bench, is the defendant's filing either of common or special bail, if the action be by bill. If it be by original, the *appearance* must be with the PHILAZER of the county where the arrest was. *Appearance*, in the Common Pleas, must be entered with the PHILAZER there; but if it be by bill, with the PROTHONOTARY.

APPEARANCE, in *Perspective*, is the representation or projection of a figure, body, or like object, upon the perspective plane.

The *appearance* of an objective right line is always a right line. See PERSPECTIVE. The *appearance* of an opake body and a luminary being given, to find the *appearance* of the shadow. See SHADOW.

APPEARANCE *of a star or planet*. See APPARITION.

APPEARANCES, in *Astronomy*, &c. are more usually called *phænomena* and *phases*.

In *Optics* we use the term *direct appearance* for the view or sight of any object by direct rays; without either refraction or reflection.

APPEARANCES, *to save*, is to discharge one's duty seemingly, or acquit himself of the formalities and externals thereof; so as to save his character, and avoid giving scandal or offence.

APPEARANCES, in *Physiology*. See PNAIMATA.

APPEASING *remedies*, in *Medicine*, are those which assuage the pain in a disease, and give the patient some rest, or respite: and at the same time contribute to the cure.

These amount to the same with what we otherwise call PAREGORICS, ANODYNES, &c.

APPELLANT. See APPEAL.

APPELLANTS is particularly used in our time, for those among the French clergy, who refused to subscribe the constitution or bull *unigenitus*, issued by Clement XI. in 1713, and appeal from it, either to the pope better informed, or a general council.

The French bishops, priests, monks, and even nuns, are divided into *appellants*, and *non-appellants*. The Jansenists and their followers are generally *appellants*.

APPELLATIVE, or NOUN APPELLATIVE, in *Grammar*, a common name; or a name which belongs or is applicable to things of a certain kind.

The word is formed of *appellare, to name a thing*.

Such are the names, *man, angel, horse, plant, tree*, &c. *Appellatives* stand opposed to PROPER names, which belong only to individuals; as *Peter, Gabriel, Bucephalus*, &c.

APPELLEE, in the *Common Law*. See APPEAL.

In the *Civil Law*, *appellee, appellatus*, properly belongs only to the judge before whom an appeal is brought.

APPENAGE. See APANAGE.

APPENDANT, from *appendo, I hang by*, in *Law*, is understood of such things as by time of prescription have belonged, appertained, and been joined, to some other principal thing.

Thus an hospital may be *appendant* to a manor; a common of fishing to a freehold; a seat in a church, to a house; or the like.

APPENDANT, *advowson*. See ADVOWSON.

APPENDANT, *common*. See COMMON.

APPENDICULA denotes a little or diminutive APPENDIX.

The word is seldom used, except by anatomists, in the following phrase.

APPENDICULA *vermiformis*, in *Anatomy*, a name given by some to the intestine *cæcum*, which they consider only as an appendage of the *colon*, and not as the true *cæcum* of the ancients.

APPENDICULÆ *ad arteriarum, venæ & arteriæ*, a name given by the writers on *Natural History*, to certain small branches which are placed in a circular order at different distances upon the columns of the *arteriæ*. *Tab.* III. *Fasc.* 1. fig. 10.

APPENDIX, or APPENDAGE, a thing necessary to, or dependent on another.

The term is chiefly used in matters of literature, for an additional discourse, placed at the end of any piece, or writing; to explain or prosecute something there left deficient, or to draw conclusions therefrom. In which sense the word coincides with SUPPLEMENT.

APPENDIX, in *Anatomy*, is a part, in some measure, detached from another part, to which, however, it adheres, or is contiguous.

There are membranous *appendices*, of various figures, in most of the inner parts of the body.

The *cæcum* is by some writers called *appendix*, or *appendicula vermiformis*.

Mr. Monro assures us, he never saw the *appendix vermiformis* of any of the human fœtuses which he dissected, distended with *meconium*, and therefore he cannot allow it as a reservoir of the *fæces* during gestation. From the numerous mucous *lacunæ* in the human *appendix*, and the like structure in the *cæcum* of brutes, its use seems to be to furnish *mucus* to lubricate the internal surface of the great sac of the *colon*, and to moisten the *fæces* in it, that they may be more easily pushed forward out of this part of the gut, where there is the greatest difficulty in their progress, and where, by stagnating too long, they may bring on troublesome symptoms. Witness the disease called PLACENTA *intestinalis*. Med. Ess. Edinb. vol. iv. art. 12.

APPENDIX is more particularly used in the same sense with EPIPHYSIS.

APPENSA, or APPENDED *remedies*, such as are outwardly applied, by hanging about the neck.

The word comes from *ad*, and *pendo, I hang to*.

Such are divers amulets, necklaces, phylacteries, &c.

APPERCEPTION, or ADPERCEPTION, is used by Leibnitz and his followers, for an attribute of the mind, considered as conscious of, or reflecting on its own perceptions.

In which sense, the word amounts to the same with what Des Cartes and others call CONSCIENCE, or CONSCIOUSNESS.

APPERTINANCES. See APPURTENANCES.

APPETITE, APPETITUS, APPETENCY, in *Philosophy*, a desire of enjoying something wanted; or a complacency in the fruition of a thing present.

The word is formed of *ad, to*, and *peto, I crave*.

Some philosophers define *appetite*, more generally, an inclination of the soul towards some object considered as good; or a propensity to an object, in respect of the good that is apprehended in it.

The Schoolmen distinguish *appetite* into *voluntary* and *natural*.

The first is the will itself, acting under a competent knowledge or information of the thing in hand: such is the *appetite* or desire of being happy. The second is a kind of instinct, whereby we are mechanically driven to consult our own preservation.

Natural *appetite* is subdivided into *concupiscible*, and *irascible*.

Others again divide it into *sensitive* and *rational*.

APPETITE, *sensitive*, is that which arises from a notion of goodness in the object, as impressed by the impulse of the *senses*.

APPETITE, *rational*, is that which arises from an apprehension of good in the object; as conceived by the understanding.

APPETITE is restrained, by Hutcheson, to such of our desires as have a previous, painful, and uneasy sensation, antecedently to any opinion of good in the object; nay, so as that the object is often chiefly esteemed good only for its allaying this pain or uneasiness, or if it give also positive pleasure, yet the uneasy sensation is previous to, and independent of this opinion of good in it.

APPETITES are passions directed to general objects, in contradistinction to passions directed to particular objects, which retain their proper name. Thus we say, an *appetite* for fame, for glory, for conquest, for riches; but we say the *passion* of love, of gratitude, of envy, &c. *Appetite* may be also distinguished from *passion*, since the latter has no existence till a proper object be presented; whereas the former exists first, and then is directed to an Object. Elem. Crit. vol. i. p. 44.

APPETITE, in *Medicine*, is more particularly used to denote a natural periodical call or desire to eat and drink, in order to repair what had been wasted by the several excretions of the body.

A loss or prostration of *appetite* is called ANOREXIA. A preposterous *appetency* of things not proper for food is called PICA.

An immoderate *appetite* is called BULIMIA, or *fames canina*. Some, however, distinguish between the *fames*, and canine *appetite*; making it the distinguishing character of the latter, that it is attended with a hemery, or other coeliacal flux.

APPETITE, *excessive*. See OREXIS.

APPETITE, *defective*. The defect of *appetite* is of two kinds, and is usually divided, by medical writers, under two names, the *anorexia* and *nausea*.

The *anorexia* is a too great abstinence from foods, which sometimes has its origin from depravation of the stomach, sometimes from other causes more remote.

The *nausea* is defined to be a plenary abstinence from foods, being a complaint of the same nature and origin with the *anorexia*, but differing in degree.

The signs are very obvious so far as a distaste to food, which is common to both; but there is this difference, that in an *anorexia*, the patients usually eat something, though without *appetite*, and are troubled always with a pain and uneasiness in the stomach after it; but in the *nausea*, there is a greater dislike of food of all kinds, and frequent straining to vomit. Men of idle lives, and such as drink too freely of strong liquors, are subject to

collection of Ciceronian phrases, &c. The *apparatus sacer* of Pofcevin, is a collection of all kinds of eccleſiaſtical authors, printed in 1611, in three volumes.—Gloſſaries, comments, &c. are alſo frequently called *apparatuſes*.

APPARENT, from *apparet, I appear*, that which is viſible, or evident to the eye, or the underſtanding.

APPARENT *conjunction* of the planets is, when a right line, ſuppoſed to be drawn through the centre of two planets, does not paſs through the centre of the earth, but through the eye of the ſpectator.

APPARENT *Altitude, Diameter, Diſtance, Hour, Horizon, Magnitude, Motion, Place, Time, &c.* See the ſeveral ſubſtantives.

APPARITION, in *Aſtronomy*, denotes a ſtar's or other luminary's becoming viſible, which before was hid.

In which ſenſe the word ſtands oppoſed to OCCULTATION.

The HELIACAL riſing is rather an *apparition* than a proper riſing.

APPARITION, *circle of perpetual*. See CIRCLE *of perpetual apparition*.

APPARITION, in a general ſenſe, is the appearance or ſemblance of a thing.

APPARITION is alſo uſed to denote a ſpectre, or preternatural appearance of ſome ſpirit, or the like.

We read of *apparitions* of angels, genii, daemons, fairies, witches, departed ſouls, &c. *apparitions* of God, of Chriſt, the Virgin, ſaints, prophets, and of the devil himſelf.

Many of the *apparitions*, we are told of by writers, are doubtleſs mere deluſions of the ſenſe; many others were ſeen but in dreams or deliquiums; many others are fictions, contrived merely to amuſe, or anſwer ſome purpoſe. *Apparitions*, it is certain, are machines that, on occaſion, have been of good ſervice to generals, to miniſters of ſtate, to prieſts, and others. It has been controverted, whether an *apparition* be any proof of a future ſtate.

The abbé de St. Pierre has a diſcourſe expreſsly on the phyſical method of ſolving or accounting for *apparitions*; he makes them the effect of ſeverith dreams, diſturbed imaginations, &c.

APPARITOR, or APPARITOUR, or APPARATOR, a BEADLE in an UNIVERSITY, who carries the mace before the maſters and the faculties.

APPARITOR is alſo uſed in ſome ancient Engliſh laws, for a judge or juſtice.

APPARITOR *comitatus*. There was formerly an officer called by this name, for which the theriffs of Buckinghamſhire had a conſiderable yearly allowance; and in the reign of queen Elizabeth, there was an order of court for making that allowance. But the cuſtom and reaſon of it are now altered.

APPARITORS alſo denote meſſengers, who cite men to appear in the eccleſiaſtical courts.

Among the Romans *apparitors* were the ſame with ſergeants, or tipſtaffs, among us; or rather *apparitor* was a general term, and comprized under it all the miniſters and attendants of the judges and magiſtrates, appointed to receive and execute their orders. And hence, they ſay, the name was derived, viz. from *apparere, to be preſent, to be in waiting*.

Under the name *apparitores* were comprehended the *ſcribæ, accenſi, interpretes, præcones, viatores, lictores, ſtatores*, and even the *carnifices*, or hangmen.

They were uſually choſen out of the freedmen of the magiſtrates, and their condition was held in ſo much contempt, that as a mark of ignominy, the ſenate appointed a city that had revolted from them to furniſh them with *apparitors*.

There were alſo a kind of *apparitors of cohorts*, called *cohortales*, or *conditionales*, as being attached to a cohort, and doomed to that condition. The *apparitors* of the prætors, *prætorieni*, were thoſe who attended the prætors, or gove nors of provinces; and who, on their maſter's birth-day, were always changed, and preferred to better poſts. Add, that the pontifices had alſo their *apparitors*, as appears from an inſcription of an ancient marble in the *Via Appia*.

APPARATORI
PONTIFCVM
PARMVLARIO.

APPAUME, from the French *paume, palm of the hand*, in *Heraldry*, denotes one hand extended with the palm appearing, and the thumb and fingers at full length.

APPEAL, in *Law*, ſignifies the removal of a cauſe from an inferior judge to a ſuperior; or the having recourſe to a ſuperior judge to rectify what is amiſs in a ſentence paſſed by an inferior.

Appeals to Rome were firſt introduced into England in the reign of king Stephen; and though they were not ſtrictly regarded in the ſucceeding reigns, they continued till the time of king Henry the Eighth, who finally aboliſhed by the 24th H. VIII. c. 12. and 25th VIII. c. 19.

Appeals lie from the archdeacon or his official to the biſhop, and again from the biſhop or his official to the archbiſhop; and by the 25th H. VIII. from the court of juſtice in the archbiſhop's courts, the party appealing to the king in chancery, where commiſſioners are named, and by reaſon of this appointment they are called *delegates*: and after the deciſion of this court, a court of review has been ſometimes appointed.

Appeals lie from all the ordinary courts of juſtice to the houſe of lords, who judge *en dernier reſſort*. From this *appeal* lies from them.

There are *appeals* from eccleſiaſtical juſtice to Rome. The firſt inſtance of this is that of Paulus Samoſatenus; who being condemned and depoſed by the ſecond council of Antioch, refuſed to ſurrender the epiſcopal houſe to Domnus, who had been elected his ſucceſſor; and *appealed* to the emperor.

APPEAL is alſo uſed in *Common Law* in the ſame ſenſe with *accuſation* among the *Civilians*. For as, in the *Civil Law*, cognizance in criminal cauſes is taken either upon *inquiſition, accuſation*, or *denunciation*; ſo in ours, it is taken either upon *indictment* or *appeal*.

Indictment comprehends both *inquiſition* and *denunciation*. *Appeal* or accuſation is a lawful declaration of another man's crime (which, by Bracton, muſt be felony at the leaſt) before a competent judge, by one that ſetteth his name to the declaration, and undertakes to make it good on the penalty that may otherwiſe enſue.

An *appeal* is commenced two ways; either by WRIT or by BILL.

APPEAL by *writ is*, when a writ is purchaſed out of chancery by one to another; to this end, that he *appeal* a third of ſome felony committed by him, finding pledges that he ſhall do it, and deliver this writ to the theriff to be recorded.

APPEAL by *bill* is, when a man of himſelf gives up his accuſation in writing to the theriff or coroner, offering to undergo the burden of *appealing* the perſon therein named.

This practice is drawn from the Normans, as appears from the Grand Cuſtomary, wherein is a ſolemn diſcourſe both of the effects of this *appeal*, viz. the order of the combat, or the trial by inqueſt; which, by our law, was in the choice of the defendant.

APPEAL *of mayhem* is an accuſing one that hath maimed another. But this being heretofore no felony, the *appeal* thereof was but in manner of an action of treſpaſs; ſo that there was nothing recovered but the damages.

Bracton calls this, *appellum de plagiis mahemii*, and has a whole chapter of it. In king John's time, there is recorded an *appeal* againſt a Jew, *qui fecit emaſculari quendam nepotem ſuum*.

APPEAL *of rape* lies where a rape is committed on the body of a woman.

APPEAL *of robbery* is a remedy given by the common law, whereby a perſon robbed of his goods may obtain reſtitution of them. But the three laſt kinds of *appeal* are now much out of uſe, becauſe of the intricacy of the pleadings, and the charge of proſecution; and the method of indictment is generally adopted.

APPEAL *of wrong imprisonment* is uſed by Bracton for an action of wrong or falſe imprisonment.

APPEAL is more particularly uſed for a private accuſation of a murderer, by one who had intereſt in the murdered party; or of any felon by one of his accomplices in the fact.

An *appeal* of death, which is now chiefly in uſe, is a vindictive action, which the law gives to a wife during widowhood, againſt the murderer of her huſband, or to the male heir at law, againſt one who kills his anceſtor. The *appeal* muſt be lodged in a year and a day after the death of the perſon murdered. If the perſon *appealed* be acquitted, the appellant ſhall be impriſoned for a year, reſtore damages to the party, and pay a fine to the king. 13 Ed. I. ſt. 1. c. 13.

If an *appeal* of murder or felony be uſed by any common perſon againſt a peer, he ſhall be tried by commoners, and not by his peers.

The perſon who brings an *appeal* is called the *appellant*; and the perſon *appealed*, the *appellee*.

In an *appeal*, the king cannot pardon.

APPEARANCE, the exterior ſurface of a thing; or that which firſt ſtrikes the ſenſe, or the imagination.

The Academics maintain, that the ſenſible qualities of bodies are only *appearances*; and the like doctrine is held by ſome later philoſophers.

Our errors ariſe chiefly from a too haſty and precipitate aſſent of the will, which acquieſces too eaſily in the *appearances* of truth.

APPEARANCE, in *Law*, is the defendant's engaging to anſwer

answer a cauſe or action entered againſt him in ſome court of juſticature.

Appearance, in the King's Bench, is the defendant's filing either of common or ſpecial bail, if the action be for bail. If it be by original, the *appearance* muſt be with the PHILAZER of the county where the arreſt was. *Appearance*, in the Common Pleas, muſt be entered with the PHILAZER there; but if it be by bill, with the PROTHONOTARY.

APPEARANCE, in *Perſpective*, is the repreſentation or projection of a figure, body, or like object, upon the perſpective plane.

The *appearance* of an objective right line is always a right line. See PERSPECTIVE. The *appearance* of an opake body and a luminary being given, to find the *appearance* of the ſhadow. See SHADOW.

APPEARANCE *of a ſtar or planet*. See APPARITION.

APPEARANCES, in *Aſtronomy*, &c. are more uſually called *phenomena* and *phaſes*.

In *Optics* we uſe the term *direct appearance* for the view or ſight of any object by direct rays; without either refraction or reflection.

APPEARANCES, *in law*, is to diſcharge one's duty ſeemingly, or acquit himſelf of the formalities and externals thereof; ſo as to ſave his character, and avoid giving ſcandal or offence.

APPEARANCES, in *Phyſiology*. See PHASMATA.

APPEASING *remedies*, in *Medicine*, are thoſe which aſſuage the pain in a diſeaſe, and give the patient ſome reſt, or reſpite: and at the ſame time contribute to the cure. Theſe amount to the ſame with what we otherwiſe call PAREGORICS, ANODYNES, &c.

APPELLANT. See APPEAL.

APPELLANTS is particularly uſed in our time, for thoſe among the French clergy, who refuſed to ſubſcribe the conſtitution or bull *unigenitus*, iſſued by Clement XI. in 1713, and appeal from it, either to the pope better informed, or a general council.

The French biſhops, prieſts, monks, and even nuns, are divided into *appellants*, and *non-appellants*. The Janſeniſts and their followers are generally *appellants*.

APPELLATIVE, or *Noun* APPELLATIVE, in *Grammar*, a common name; or a name which belongs or is applicable to things of a certain kind.

The word is formed of *appellare, to name a thing*.

Such are the names, *man, angel, horſe, plant, tree*, &c. *Appellatives* ſtand oppoſed to PROPER names, which belong only to individuals; as *Peter, Gabriel, Bucephalus*, &c.

APPELLEE, in the *Common Law*. See APPEAL.

In the *Civil Law*, *appellee, appellatus*, properly belongs only to the judge before whom an appeal is brought.

APPENAGE. See APANAGE.

APPENDANT, from *appendo, I hang by*, in *Law*, is underſtood of ſuch things as by time of preſcription have belonged, appertained, and been joined, to ſome other principal thing.

Thus an hoſpital may be *appendant* to a manor; a common of fiſhing to a freehold; a ſeat in a church, to a houſe; or the like.

APPENDANT, *advowſon*. See ADVOWSON.

APPENDANT, *common*. See COMMON.

APPENDICULA denotes a little or diminutive APPENDIX.

The word is ſeldom uſed, except by anatomiſts, in the following phraſe:

APPENDICULA *vermiformis*, in *Anatomy*, a name given by ſome to the inteſtine *cæcum*, which they conſider only as an appendage of the *colon*, and not as the true *cæcum* of the ancients.

APPENDICULÆ *ſeu lacinulæ, uteri & arteriæ*, a name given by the writers on *Natural Hiſtory*, to certain ſmall bunches which are placed in a circular order at different diſtances upon the columns of the *arteriæ*. *Tab.* III. *Foſſils. el.* 10.

APPENDIX, or APPENDAGE, a thing neceſſary to, or dependent on another.

The term is chiefly uſed in matters of literature, for an additional diſcourſe, placed at the end of any piece, or writing; to explain or proſecute ſomething there left deficient, or to draw concluſions therefrom. In which ſenſe the word coincides with SUPPLEMENT.

APPENDIX, in *Anatomy*, is a part, in ſome meaſure, detached from another part, to which, however, it adheres, or is contiguous.

There are membranous *appendices*, of various figures, in moſt of the inner parts of the body.

The *cæcum* is by ſome writers called *appendix*, or *appendicula vermiformis*.

Mr. Monro aſſures us, he never ſaw the *appendix vermiformis* of any of the human ſexes which he diſſected, diſtended with *meconium*, and therefore he cannot allow it as a reſervoir of the *fæces* during geſtation. From the numerous mucous *lacunæ* in the human *appendix*, and the like ſtructure in the *cæcum* of brutes, its uſe ſeems to be to furniſh *mucus* to lubricate the internal ſurface of the great fac of the *colon*, and to moiſten the *fæces* in it, that they may be more eaſily puſhed forward out of this part of the gut, where there is the greateſt difficulty in their progreſs, and where, by ſtagnating too long, they may bring on troubleſome ſymptoms. Witneſs the diſeaſe called PLACENTA *inteſtinalis*. Med. Eſſ. Edinb. vol. iv. art. 12.

APPENDIX is more particularly uſed in the ſame ſenſe with EPIPHYSIS.

APPENSA, or APPENDED *remedies*, ſuch as are outwardly applied, by hanging about the neck.

The word comes from *ad*, and *pendo, I hang to*.

Such are divers amulets, necklaces, phylacteries, &c.

APPERCEPTION, or APPERCEPTION, is uſed by Leibnitz and his followers, for an attribute of the mind, conſidered as conſcious of, or reflecting on its own perceptions.

In which ſenſe, the word amounts to the ſame with what Des Cartes and others call CONSCIENCE, or CONSCIOUSNESS.

APPERTINANCES. See APPURTENANCES.

APPETITE, APPETITUS, APPETENCY, in *Philoſophy*, a deſire of enjoying ſomething wanted; or a complacency in the fruition of a thing preſent.

The word is formed of *ad, to*, and *peto, I crave*.

Some philoſophers define *appetite*, more generally, an inclination of the ſoul towards ſome object conſidered as good; or a propenſity to an object, in reſpect of the good that is apprehended in it.

The ſchoolmen diſtinguiſh *appetite* into *voluntary* and *natural*.

The firſt is the will itſelf, acting under a competent knowledge or information of the thing in hand: ſuch is the *appetite* or deſire of being happy. The ſecond is a kind of inſtinct, whereby we are mechanically driven to conſult our own preſervation.

Natural *appetite* is ſubdivided into *concupiſcible*, and *irraſcible*.

Others again divide it into *ſenſitive* and *rational*.

APPETITE, *ſenſitive*, is that which ariſes from a notion of goodneſs in the object, as impreſſed by the impulſe of the *ſenſes*.

APPETITE, *rational*, is that which ariſes from an apprehenſion of good in the object; as conceived by the underſtanding.

APPETITE is reſtrained, by Hutcheſon, to ſuch of our deſires as have a previous, painful, and uneaſy ſenſation, antecedently to any opinion of good in the object; may, ſo as that the object is often chiefly eſteemed good only for its allaying this pain or uneaſineſs, or if it give alſo poſitive pleaſure, yet the uneaſy ſenſation is previous to, and independent of this opinion of good in it.

APPETITES are paſſions directed to general objects, in contradiſtinction to paſſions directed to particular objects, which retain their proper name. Thus we ſay, an *appetite* for fame, for glory, for conqueſt, for riches; but we ſay the *paſſion* of love, of gratitude, of envy, &c. *Appetite* may be alſo diſtinguiſhed from *paſſion*, ſince the latter has no exiſtence till a proper object be preſented; whereas the former exiſts firſt, and then is directed to an *Object*. Elem. Crit. vol. i. p. 44.

APPETITE, in *Medicine*, is more particularly uſed to denote a natural periodical call or deſire to eat and drink, in order to repair what had been waſted by the ſeveral excretions of the body.

A loſs or proſtration of *appetite* is called ANOREXIA. A prepoſterous *appetency* of things not proper for food is called PICA.

An immoderate *appetite* is called BULIMIA, or *fames canina*. Some, however, diſtinguiſh between the *bulimia*, and canine *appetite*; making it the diſtinguiſhing character of the latter, that it is attended with a lientery, or other coeliacal flux.

APPETITE, *exceſſive*. See OREXIS.

APPETITE, *deficient*. The defect of *appetite* is of two kinds, and is uſually divided, by medical writers, under two names, the *anorexia* and *naufea*.

The *anorexia* is a too great abſtinence from foods, which ſometimes has its origin from depravation of the ſtomach, ſometimes from other cauſes more remote.

The *naufea* is defined to be a plenary abſtinence from foods, being a complaint of the ſame nature and origin with the *anorexia*, but differing in degree.

The ſigns are very obvious ſo far as a diſtaſte to food, which is common to both; but there is this difference, that in an *anorexia*, the patients uſually eat ſomething, though without *appetite*, and are troubled always with a pain and uneaſineſs in the ſtomach after it; but in the *naufea*, there is a greater diſreliſh of food of all kinds, and frequent ſtraining to vomit. Men of idle lives, and ſuch as drink too freely of ſtrong liquors, are ſubject to

idiopathic defects of *appetite*, from actual injuries in the ſtomach; others labouring under the different diſeaſes before mentioned, are as often ſubject to the *ſymptomatic*. People of a ſanguine habit, when afflicted with a loſs of *appetite*, always find great relief in acids of the milder kind; and thoſe of a leucophlegmatic habit are often cured by taking ſmall doſes of *elixir proprietatis* every day before dinner. Some perſons are very fond of external applications to the ſtomach in thoſe caſes, but theſe are rarely found to be of any great ſervice. The beſt of them is a plaiſter of *tacamahaca*, with oil of maſtic.

APPLADES, in *Mythology*, five divinities ſo called becauſe their temples were at Rome near the fountains of Appius; viz. Venus, Pallas, Veſta, Concord, and Peace.

APPIAN *Way*, a great Roman highway, paved by Appius Claudius, cenſor of Rome, in the 444th year of that city. It commenced at the gate Capenna, now called St. Sebaſtian's, and paſſing over the mountain called St Angeli, croſſes the plain of Valdranus, the *Palus Pontina*, and ends at Capua.

Caius Gracchus placed the ſmall columns called *termini*, which marked the miles.

APPLAUSE, properly ſignifies an approbation of ſomething, witneſſed by clapping of hands.

The word comes from the verb *plaudere, to clap the hands*. The ancient way of *applauding* by clapping the hands is ſcarce retained any where but in colleges and theatres. Such a tragedy was acted with great *applauſe*, ſuch a ſtudent maintained a theſis with *applauſe*, &c.

There were three ſpecies of *applauſe*, denominated from the different noiſes made in them, viz. *bombus*, *imbrices*, and *teſtæ*; the firſt a confuſed din, made either by the hands or the mouth; the ſecond and third by beating on a ſort of ſounding veſſels, placed in the theatres for this purpoſe.

Perſons were inſtructed to give *applauſe* with ſkill; and there were even maſters who profeſſed to teach the art. The proficients in this way let themſelves out for hire to the vain-glorious among the poets, actors, &c. and were properly diſpoſed to ſupport a loud *applauſe*. Theſe they called *laudicenæ*.

At the end of the play, a loud peal of *applauſe* was expected, and even aſked of the audience, either by the chorus, or the perſon who ſpoke laſt. The *formula* was, *ſpectatores plaudite, or valete & plaudite*.

The *plauſores*, or applauders, were divided into *chori*, and diſpoſed in theatres oppoſite to each other, like the choriſters in cathedrals; ſo that there was a kind of concert of *applauſes*.

APPLE-*tree*, *malus*, in *Botany*. In the Linnæan ſyſtem, this is a ſpecies of *pyrus*, and belongs to the genus of *icoſandria pentagynia*. The characters of it are, that the branches ſpread, and are more depreſſed than thoſe of the pear-tree. The flower conſiſts of five leaves, which expand in form of a roſe. The fruit is hollowed about the foot-ſtalk, and is for the moſt part roundiſh, and umbilicated at the top; is fleſhy, and divided into five cells or partitions, in each of which is lodged one oblong ſeed. There are three ſpecies; the *wild apple*, with a very four fruit, commonly called *crab*: the *wild crab* of Virginia, with a ſweet-ſcented flower: and the *dwarf apple*, commonly called *Paradiſe apple*.

Apples are no natural fruit, but the mere creatures of art. The way of propagating them, is by ſowing kernels in the ground, which only produce crabs or wildings, different in figure and taſte from the parent fruit. To turn theſe to apples of any particular kind, is the buſineſs of engrafting. A cyon of an *apple*-tree inſerted into a crab-ſtock, occaſions the crab-tree from that time to produce *apples* of the ſame quality with thoſe from whence the cyon was taken. Mr. Ray lays it down as a rule, that the fruit always follows the cyon.

In the nurſeries, there are three ſorts of ſtocks generally uſed to graft *apples* upon; the firſt are called *free-ſtocks*, which are raiſed from the kernels of all ſorts of *apples* indifferently, and by ſome theſe are alſo termed crab-ſtocks; for all thoſe trees which are produced from the ſeeds before they are grafted, are termed crabs without any diſtinction. But ſuch ſtocks ſhould always be preferred, as are raiſed from the kernels of crabs, where they are preſſed for verjuice; and ſeveral old writers on this ſubject are of the ſame opinion. Auſten, who wrote a hundred years ago, ſays, "The ſtock which he accounts beſt for *apple* grafts is the crab, which is better than ſweeter *apples* to graft on, becauſe they are uſually free from canker, and will become very large trees, and, I conceive, will laſt longer than ſtocks of ſweeter *apples*, and will make fruits more ſtrong and hardy to endure fruſts."—It is very certain, that by frequent grafting ſome ſorts of *apples* upon free-ſtocks, the fruits have been rendered larger, but leſs firm, poignant, and of ſhorter duration. The ſecond ſort of ſtocks is the *Dutch creeper*; theſe are deſigned to ſtint the growth of trees, and keep them within compaſs for dwarfs or eſpaliers. The third ſort is the *Paradiſe apple*, which is a very low ſhrub; ſo only proper for trees which are kept in pots by way of curioſity, for theſe do not continue long in the method of grafting, ſee ENGRAFTING.

For the method of planting orchards to the greateſt profit, the ſoil and ſituation are of great importance. The beſt ſituation is the aſcent of gentle hills, facing the ſouth or ſouth-eaſt; but this aſcent muſt not be too ſteep, leſt the earth ſhould be waſhed down by heavy rains.

The ground intended to be planted ſhould be well prepared the year before, by thorough ploughing; wherein ſome dung be laid on, it will be of great ſervice to the trees. If, in the preceding ſpring, a crop of peas or beans is planted on the ground, ſo as that the ground between the rows may be horſe-hoed, it will deſtroy the weeds, looſen the ground, and prove a good preparation for the trees; for the earth cannot be too much wrought or pulverized for this purpoſe. Theſe crops will be off the ground before the ſeaſon for planting the trees, which is to be performed when they begin to ſhed their leaves.

In chuſing the trees, ſuch as are but of two years growth from the graft are to be preferred; old trees, or ſuch as are grafted upon old ſtocks, ought never to be planted. The diſtance they ſhould be planted at, where the ſoil is good, muſt be fifty or ſixty feet; though forty feet may be ſufficient, where the land is not ſo good: nothing can be of worſe conſequence than the crowding trees too cloſe together.

When the trees are planted they ſhould be ſtaked, to prevent their being ſhaken or blown out of the ground by ſtrong winds. But in doing this, particular care ſhould be taken to put ſtraw, hay-bands, or woollen cloth between the trees and the ſtakes, to prevent them from being rubbed or bruiſed by the ſtakes, for if their bark ſhould be rubbed off, it will occaſion wounds which will not heal in ſeveral years, if they ever recover from them. If the winter ſhould prove very ſevere, it will be proper to cover the ground about their roots with ſome muck, to prevent the young fibres from being injured.

It is a common practice in many parts of England, to lay the ground down for paſture, after the trees are grown pretty large in the orchards; but this is by no means adviſeable, for trees of above twenty years growth have frequently been almoſt deſtroyed by horſes in the compaſs of one week: and if ſheep are put into the orchards, they will conſtantly rub themſelves againſt the trees, and their greaſe ſticking to the bark, will ſtint their growth, and finally ſpoil them. Therefore, wherever orchards are planted, it will be much better to keep the ground in tillage; but whatever crops are ſown, ſhould not be too near the trees, leſt the nouriſhment ſhould be drawn away from them: nor ſhould the plough come too near the ſtems, leſt the roots and bark ſhould be injured. But it will be of great ſervice to dig the ground about the trees, where the plough does not come, every ſpring and autumn, for five or ſix years after planting; by which time the roots will have extended themſelves to a greater diſtance.

In pruning orchard trees, nothing more ſhould be done, but to cut out all thoſe branches which croſs each other, and which if left, would rub and tear off the bark from each other; as alſo decayed branches; but never to ſhorten any of their ſhoots. Branches broken by the wind ſhould be cut off, either down to the diviſion of the branch, or cloſe to the ſtem from which it proceeds; all ſuckers or ſhoots from their ſtem ſhould be entirely taken off: the beſt time for this work is in November, for it ſhould not be done in fruſty weather, nor when the ſap begins to be in motion.

In the planting eſpaliers, if there is an extent of ground in the kitchen-garden, it will be proper to plant in this manner not only ſuch ſorts as are for the uſe of the table, but alſo a quantity of trees to ſupply the kitchen. Where the kitchen-garden is but ſmall, the latter muſt be ſupplied from the ſtandard-trees; but as many of theſe kitchen apples are large, and hang late in the autumn they are much more expoſed to ſtrong winds on ſtandards than in eſpaliers: for which reaſon, where the ground will admit of it, eſpaliers are to be preferred. The proper diſtance for theſe trees is not leſs than twenty-five or thirty feet, for ſuch ſorts as are of a moderate growth (if upon crab or free ſtocks); but the larger growing ſorts ſhould not be allowed leſs room than thirty-five feet; which will be found near enough, if the ground is good, and the trees properly trained: for, as their branches ſhould not be ſhortened, but trained at their full length, in a few years they will be found to meet.

The next thing to be obſerved, is the making proper choice of ſuch ſorts of fruit as grow nearly alike, to

plant in the ſame eſpalier. This is of great conſequence to the diſtance to be allowed them; otherwiſe the eſpalier will make an irregular appearance.

The choice of trees is the next article, which ſhould be but one, or at moſt but two years old from the graft. The ſtocks ſhould be young, ſound, and ſmooth, free from canker, which have not been cut down in the nurſery: when taken up, all the ſmall fibres ſhould be entirely cut off from their roots, which, if left on, would turn mouldy, decay, and obſtruct the new fibres in their growth; the extremities of their roots ſhould be ſhortened, and all bruiſed and miſplaced roots ſhould alſo be cut away. As to pruning the heads of theſe trees, nothing more need be done, than to cut off thoſe branches which cannot be trained to the line of the eſpalier. In planting, the roots ſhould not be placed too deep in the ground, eſpecially if the ſoil be moiſt, but rather elevated on a little hill, which it will be neceſſary to allow for the raiſing of the borders afterward. Theſe trees ſhould be ſtaked like thoſe in the orchard, until the eſpalier is put to them.

In pruning theſe trees, the chief point is, never to ſhorten any of the branches, unleſs there is an abſolute want of ſhoots to fill the eſpalier; for where the knife is much uſed, it only multiplies uſeleſs ſhoots, and prevents their fruiting: ſo that the beſt method to manage theſe trees, is to go over them three or four times in the growing ſeaſon, and rub off all ſuch buds and ſhoots as are irregularly produced, training the others down to the ſtakes where they are to remain. If this is carefully minded in the ſummer, there will be little left to be done in the winter. The diſtances at which theſe branches ſhould be trained from each other, are, for the larger ſorts of fruit ſeven or eight inches, and for the ſmaller, five or ſix. If, contrary to theſe plain inſtructions, the trees are ſuffered to grow rude in ſummer, there will be much difficulty to bring down the ſtubborn ſhoots afterward, without breaking. All the ſorts of *apples* produce their fruit upon curſons or ſpurs, ſo that theſe ſhould never be cut off, as they will continue fruitful for ſeveral years. The method of making ESPALIERS is exhibited under that article; it need only therefore be obſerved, that it will be beſt to defer making the eſpalier, till the trees have had three or four years growth: for before that time, the branches may be ſupported by a few upright ſtakes, until there is a ſufficiency of them to furniſh the lower part.

The beſt method of preſerving *apples* for winter uſe, is to let them hang upon the trees until there is danger of froſt, to gather them in dry weather, and then to lay them in large heaps to ſweat for a month or ſix weeks. They ought then to be carefully looked over, all which have the leaſt appearance of decay taken out, the ſound fruit wiped dry, and packed up in large oil jars, which have been thoroughly ſcalded and dry, and then ſtopped cloſe, to exclude the air. If this plan is duly obſerved, the fruit will keep a long time ſound, and their fleſh remain plump; whereas when expoſed to the air, their ſkins will ſhrivel, and their pulp ſoften. See CYDER, and ORCHARD.

Among the various kinds of *apples*, ſome are uſed for the deſert, ſome for the kitchen, and ſome for cyder-making. Thoſe uſed for the deſert, are the following, placed as they ſucceſſively ripen after one another: the white juncating, the margaret *apple*, the ſummer pearmain, the ſummer queening, the embroidered *apple*, the golden rennet, the ſummer white calville, the ſummer red calville, the ſilver pippen, the aromatic pippen, *la reinette griſe*, *la haute boute*, the royal ruſſeting, Wheeler's ruſſet, Sharp's ruſſet, the ſpine *apple*, the golden pippen, the nonpareil, the *d'api*, or *pome d'api*.

Thoſe for the kitchen uſe, in order of their ripening, are theſe; the codling, the ſummer margygold, the ſummer red pearmain, the Holland pippen, the Kentiſh pippen, the courpendu, Loan's pearmain, the French rennet, the French pippen, the royal ruſſet, the monſtrous rennet, the winter pearmain, the *pome violette*, Spencer's pippen, the ſtone pippen, and the oaken pippen.

Thoſe moſt eſteemed for cyder are, the Devonſhire royal wilding, the redſtreak *apple*, the whitſour, the Herefordſhire under-leaf, and the John *apple*, or *dene annet*, everlaſting hanger, and gennet moyle. Miller.

The *apple* is compoſed of four diſtinct parts, viz. the pill, *the parenchyma*, the branchery, and the core. The pill or ſkin, is only a dilatation of the outermoſt ſkin or rind of the bark of the branch on which it grew. The *parenchyma* or pulp, as tender and delicious as it is found, is only a dilatation, or, as Dr. Grew calls it, a ſwelth or ſuperbience of the inner part of the bark of the branch. This appears not only from the viſible continuation of the bark from the one through the pedicle or ſtalk to the other, but alſo from the ſtructure common to both.

The branchery or veſſels, are only ramifications of the woody part of the branch, ſent throughout all the parts of the parenchyma, the greater branches being made to communicate with each other by inoſculations of the leſs. Grew's Anat. of Veget. lib. i. cap. 6. lib. iv. cap. 1.

The *apple* core is originally from the pith of the branch; the ſap of which finding room enough in the parenchyma, through which to diffuſe itſelf, quits the pith, which by this means hardens into core.

The juice of *apples* is a *menſtruum* for iron. A ſolution of iron in the juice of the *apples* called *golden rennets*, evaporated to a thick conſiſtence, proves an elegant chalybeate, which keeps well.

Dr. Lewis obſerves, that the young ſhoots of monk's rhubarb in the ſpring, approach in taſte to ſome ſorts of *apples*, and that of late they have been employed in that early ſeaſon, as a *ſuccedaneum* to *apples* for culinary purpoſes. Newman's Works, p. 316, 4to.

Mr. Boyle has given ſeveral experiments on *apples* in the air-pump, and the production of air, &c. thereby. Vide Phil. Works abridg. tom. ii. p. 367, ſeq. 609, 630, ſeq. 645, ſeq.

APPLE is alſo a name given to divers fruits, bearing ſome reſemblance in figure, rotundity, and the like, to the orchard *apple*.

APPLE, *Adam's*. See CITRON, and *Pomum* ADAMI.

APPLE, *bitter*, a name ſometimes given to the fruit of the COLOCYNTHIS.

APPLE, *blad*, *cactus*. See *Melon* THISTLE.

APPLE, *cuſtard*, *annona*, in *Botany*, a genus of the *polyandria polygynia* claſs. Its characters are theſe: the flower hath in ſome ſpecies three, in others ſix petals, three large, and three alternately ſmaller; the germen becomes an oval or oblong fruit, having a ſcaly rind and one cell, in which are lodged many oval ſmooth ſeeds. There are eight ſpecies.

Theſe plants, which are natives of the warm parts of America, are too tender to produce fruit in this country, where they are only preſerved for the beauty of their leaves.

APPLE, *dwarf*. See DWARF-*trees*.

APPLE-*fly*, in *Natural Hiſtory*, the name given by authors to a ſmall green fly found ſometimes within an *apple*, and hatched of a worm or maggot, very frequently found infeſting that fruit.

APPLE, *love*. See LYCOPERSICON.

APPLE, *mad*. See MAD *apple*.

APPLE, *male balſam*, *momordica*. See *Male* BALSAM *apple*.

APPLE, *marchoſite*, ſo called by Dr. Grew, on account of its figure, as being round except on one ſide, where it falls in, and has a ſtalk like a young *apple*. Muſ. Reg. Soc. P. 3. § 2. cap. 3.

Among the ancient ornaments of churches we read of *golden apples*, *poma aurea*; by which it ſhould ſeem, we are to underſtand the globular parts of candleſticks. Du-Cange.

Some ancient cuſtomaries alſo ſpeak of *apples* of wax, POMA *de cera*.

APPLE, *Moy*. See DUCK's *foot*.

APPLES, *oak*, are a kind of excreſcences or exudations of the nutritious juice of that tree, joined with ſome degree of putrefaction.

The like are ſometimes alſo found in willows.

APPLE *of the eye*. See PUPIL.

APPLE, *pine*. See PINE *apple*.

APPLE, *prickle*, is remarkable for the ſeveral tuſſocks or bunches of thorns, with which it is armed all around; each bunch conſiſting of ſix or eight thorns, ſome erect, others couched a little, and crooked outward, of ſeveral lengths, from one inch to above two.

APPLE, *ſoap*, *ſapindus*. See SOAP *berry tree*.

APPLE, *ſtar*, *chryſophyllum*, in *Botany*, a genus of the *pentandria monogynia* claſs. Its characters are theſe: it hath a bell-ſhaped flower, cut at the brim into ten ſegments, which are alternately ſpread open; and five ſhort ſtamina, with a roundiſh germen which becomes a pulpy fruit with ten cells, in four or five of which is lodged a ſingle ſeed. There are two ſpecies, natives of the Weſt-Indies.

APPLE, *thorn*. See THORN *apple*.

APPLICATE, APPLICATA. *Ordinate* APPLICATE, in *Geometry*, is a right line drawn acroſs a curve, ſo as to be biſected by the diameter thereof.

Applicate is the ſame with what we otherwiſe call *ordinate*.

APPLICATE *number*. See CONCRETE.

APPLICATION. the act of applying one thing to another by approaching or bringing them nearer together.

Motion is defined by a ſucceſſive *application* of any thing to different parts of ſpace.

The *application* of a veſicatory to the neck, or other part, produces an irritation of the bladder.

The true and great secret in physic is, *how to apply a* medicine, not how to make it.

APPLICATION is also used for the adjusting, accommodating, or making a thing quadrate to another.

Thus we say, the *application* of a fable, &c.

APPLICATION, in *Theology*, is particularly used, by some *divines*, for the act whereby our Saviour *transfers*, or makes over to us, what he had earned or purchased by his holy life, and death.

Accordingly it is by this *application* of the merits of Christ, that we are to be justified, and intitled to grace and glory.

The sacraments are the ordinary means, or instruments, whereby this *application* is effected.

APPLICATION is sometimes also used in *Geometry*, for what in *Arithmetic* we call DIVISION.

APPLICATION also signifies the fitting or applying of one quantity to another, whose area, but not figures, are the same.

Thus Euclid shews how, on a right line given, to *apply* a parallelogram that shall be equal to a right lined figure given.

APPLY, among *Mathematicians*, sometimes signifies to transfer a line given into a circle, most commonly, or into any other figure; so that its ends may be in the perimeter of the figure.

APPLY denotes also as much as *divide*, especially among Latin writers; who, as they say, *duc* AB *in* CB, draw AB into CB, when they would have AB multiplied by CB; or rather when they would have a right-angled parallelogram made of those lines: so they say, *applica* AB *ad* CB, *applo* AB *in* CB, when they would have CB divided by AB;

which is thus expressed, $\frac{CB}{AB}$.

APPOGGIATURA, in *Music*, according to Grassineau, is when in any part of a song, there are two notes at some distance from one another, as a third, or fifth; and in singing such passage, the musicians put in small intermediate notes, ascending, or descending; as in the example A.

But the *appoggiatura* is not always intermediate, unless it be in the order of time (see the examples B and C); nor is it confined to distant notes. It may be used in passing from a note to the nearest sound either above or below it. See the examples D, E, and F.

The *appoggiatura* is commonly marked by a smaller kind of note, as in the examples before given, and is essential to musical taste and expression.

The word is derived from *appoggiare, to lean on.*

APPOINTEE, a foot-soldier, in the French army, &c. who for his long service, and bravery, receives pay above private centinels.

These have been *suppressed* in France, except in the regiment of French guards, where forty *appointees* are still retained to each company of 150 men.

Till the year 1670, they had also captains and lieutenants under the appellation of *appointees*, who, without residing in the regiment, received their pay. See ANSPESSADES.

APPOINTEE, in *Heraldry*, is when two or more things are placed touching each other at the points or ends.

APPOINTMENT, a pension or salary given by great lords and princes to persons of worth and parts, in order to *retain* them in their service.

The term is chiefly used among the French.—The king of France gives large *appointments* to several of the officers in his service.

Appointments differ from wages, in that the latter are fixed and ordinary, being paid by the ordinary treasurers; whereas *appointments* are annual gratifications granted by *brevet* for a time uncertain, and are paid out of the privy purse.

APPORTIONMENT, or APPORCIONMENT, APPORTIONAMENTUM, *in Law*, a dividing of a rent into two or more parts, or portions, according as the land whence it issues is divided among two, or more proprietors.

Thus if a man, having a rent-service issuing out of land, purchase a part of the land; the rent shall be *apportioned* according to the value of the land.—So if a man let lands for years, reserving rent, and a stranger afterward recover part of the land, the rent shall be *apportioned*.

But a rent charge cannot be *apportioned*, nor things that are entire; as if one hold land by service, to pay to his lord yearly at such a feast a horse, or a rose; there, if the lord purchase a part of the land, this service is totally extinct; because such things cannot be divided without hurt to the whole.—But if a part of the land, out of which a rent-charge issues, descends to the grantee of the rent, this shall be *apportioned*.—A man may have part of the land where he hath common appendant, the common shall be *apportioned*: of common appurtenant it is otherwise; and if by the act of the party, the common is extinct. Common appendant and appurtenant may be *apportioned* on alienation of part of the land to which it is appendant or appurtenant.—Conditions generally are entire, and cannot be *apportioned* by the act of the party; a contract may not be divided or *apportioned*, so as to subject a man to two actions. Davis, 61. 1 Roll. 149.

APPOSAL *of sheriffs*, is the charging them with money received on their account in the exchequer, 23 and 24 Car. II.

APPOSER signifies an examiner. In the court of exchequer, there is an officer called the foreign *apposer*.

In the office of confirmation, in the first liturgy of Edward VI. the rubric directs the bishop, or such as he shall appoint, to *oppose* a child; and a bishop's examining chaplain was anciently called his *poser*.

APPOSITION, from *ad*, *to*, and *pono*, *I put*, the act of putting or applying one thing to another.

APPOSITION is used in *Physics*, in speaking of bodies which derive their growth from the adjunction or union of neighbouring bodies.

Most bodies of the fossile or mineral kingdom are formed by *juxta-positions*, or the *appositions* of parts, brought to join and adhere to each other.

APPOSITION, in *Grammar*, denotes the putting two or more substantives together in the same case, and without any copulative conjunction between them.

Thus, Flanders, bloody theatre, horrible scene of war; love, enemy of human quiet; peace, parent of riches, source of faction, &c.

APPOSITORIUM, in *Chemistry*, denotes a vessel made of earthen ware or glass, of a conical figure, whose bigger end receives the neck of a retort, while the narrower is inserted into the receiver.

Its use is, where a strong open fire is required, to prevent the red-hot retort, by the immediate contact of its neck, from burstling the receiver.

APPRAISER, from *ad*, *to*, and *pretium*, *value*, one who rates, or sets a value upon goods, &c. He must be a skilful and honest person. It is not a business of itself, but is practised by brokers of household furniture, to which set of men the word is chiefly applied. Yet upholsterers and other brokers are employed, or even any person or persons who are supposed to be skilled in the commodities to be appraised or valued. They are employed in case of death, executions brought in upon goods, or of stock to be turned over from one person to another, or divided between copartners; and are called *sworn appraisers*, from their making an oath to do justice between party and party.

They sometimes appraise on behalf of both sides, each party agreeing to have the same *appraiser* or *appraisers*; sometimes in opposition, each party chusing one or more of a side; and sometimes by commission or deputation of trustees, masters in chancery, &c.

APPREHENSION, in *Logic*, denotes the simple attention of the mind to an object either presented to our sense, or our imagination, without passing a judgment, or making any inference.

The word literally denotes the action of the hand, whereby it takes hold of, and grasps any thing; being formed of *ad*, and *prehendo*, *I catch*.

In this sense, *apprehension* differs from *notion*, as the act of the mind whereby a *notion* is formed, differs from an act of the mind whereby we attend to a notion already formed.

APPREHENSION is likewise used to express an inadequate and imperfect idea: and thus it is applied to our knowledge of God, in contradistinction to *comprehension*.

APPREHENSION, in *Law*, signifies the seizing a criminal, in order to bring him to justice. See ARREST.

APPRENDRE, in our *ancient Law-Books*, a fee or profit to be taken or received.

APPRENTICE, from *apprendre*, *to learn*, one who is bound by covenant to serve a tradesman or artificer a certain time, usually seven years, upon condition of the master's instructing him in his art or mystery.

Apprentices may likewise be bound to husbandmen, or even to gentlemen; and they, as well as tradesmen, are compellable to take the children of the poor, whom the overseers, with the consent of two justices, may bind till the age of twenty-four years. *Apprentices* may be discharged on reasonable cause; but if any, whose premium has been less than ten pounds, run away from their masters, they are compellable to serve out the time of absence, or give satisfaction for it, at any period within seven years after expiration of the original contract. *Apprentices gain* a settlement in that parish where they last served forty days; and by the 5th of Elizabeth,

c. 4. they have an exclusive right to exercise the trade in which they have been instructed, in any part of England. However, the resolutions of the courts have in general rather confined than extended the restriction of this statute. See Blackstone's Com. vol. i. p. 426, &c.

In France, the sons of tradesmen, living in their father's house till seventeen years of age, are reputed to have served an *apprenticeship*. In that country, the times of serving are different in the different professions, from three years to eight.—After serving out an *apprenticeship*, the person becomes what they call an *aspirant*, or candidate for master-ship, and is to be examined by proper officers as to his skill and proficiency, and also to exhibit a *chef d'œuvre* or master-piece in the art he has been bred to, before he be suffered to set up to practise for himself. And the custom of France in regard to *apprentices*, is not unworthy the imitation of other nations.

Anciently, benchers in the inns of court were called *apprentices of the* LAW, in Latin *apprentitii juris nobiliores*; as appears by Mr. Selden's note on Fortescue; and so the learned Plowden styles himself. See BENCHER.

Sir Henry Finch in his *Nomotechnia*, writes himself, *apprentice de ley*: sir Edward Coke, in his Inst. says *apprentitii legis*, in pleading, are called, *homines consiliarii, & in lege periti*; and in another place, *apprentices*, and other counsellors of law.

APPROACH. See ACCESS and APPROXIMATION.

The *curve of equable approach*, *accessus æquabilis*, first proposed by M. Leibnitz, has given the annalists some trouble.—The business is to find a curve, wherein a body descending by the sole power of gravity shall approach the horizon equally in equal times.—This curve has been found by Bernoulli, Varignon, Maupertuis, and others, to be the second cubical parabola, so placed as that its point of regression is uppermost. Vide Hist. Acad. R. Sciences, an. 1699. p. 82. Idem, an. 1730, p. 129. Mem. p. 333.

APPROACH, in *Gardening*, is used in speaking of the method of inarching or INOCULATING, which is called GRAFTING by *approach*.

Some physicians also speak of a method of curing diseases by touching or *approach*. See APPROXIMATION.

APPROACHES, in *Fortification*, the several works made by the besiegers for advancing or getting nearer to a fortress, or place besieged. See *Tab. Fortif. fig.* 21.

Such are trenches, mines, saps, lodgments, batteries, galleries, epaulements, &c.

APPROACHES, or *Lines of* APPROACH, are particularly used for trenches dug in the ground, and their earth thrown up on the side next the place besieged; under shelter or defence whereof the besiegers may approach, without loss, to the parapet of the covered ways, and plant guns &c. wherewith to cannonade the place.

The lines of approach are to be connected by PARALLELS or lines of communication.

The besieged frequently make COUNTER-*approaches*, to interrupt and defeat the enemies *approaches*.

The ancients made their *approaches* towards the place besieged, much after the same manner as the moderns. M. de Folard shews, that they had their trenches, their saps, parallels, &c. which, though usually held of modern invention, appear to have been practised long before, by the Greeks, Romans, Asiatics, &c. In Polyb. t. ii. p. 161.

APPROACHING, in *Fowling*, a term used to express such devices as are contrived for the getting within shot of shy birds. It is principally used in marshy low places.

The best method of *approaching* is by means of three hoops, tied together at proper distances, according to the height of the man that is to use it, and having boughs of trees tied all round it, with cords to hang it over his shoulders; a man getting into this, conceals himself, and approaches by degrees towards his game in the form of a moving bush.

Geese, ducks, and teal, quit the waters in the evening, and pass the night in the fields, but at the approach of morning they return to the water again, and even when on the water they will retire to great distances, on the approach even of a horse or cow, so that the business of the stalking horse is of little use; but this device of *approaching* by the moving bush, succeeds tolerably well with them.

APPROBATION, a state or disposition of the mind wherein we put a value upon, or become pleased with, some person or thing. Moralists are divided on the principle of *approbation*, or the motive which determines us to approve and disapprove. The Epicureans will have it to be only SELF-*interest*; according to them, that which determines any agent to approve his own action, is its apparent tendency to his private happiness: and even the *approbation* of another's action flows from no other cause but an opinion of its tendency to the happiness of the approver, either immediately or remotely. Others resolve *approbation* into a moral sense, or a principle of benevolence, by which we are determined to approve every kind affection either in ourselves or others, and all publicly useful actions, which we imagine to flow from such affection, without any view to our own private happiness.

Dr. Adam Smith thinks it needless to introduce any new power of perception, in order to account for the principle of *approbation*; and apprehends, that *sympathy* is sufficient to account for all the effects ascribed to this peculiar faculty. This system places virtue in utility, and accounts for the pleasure with which the spectator surveys the utility of any quality from *sympathy* with the happiness of those who are affected by it. This *sympathy*, he observes, is different both from that by which we enter into the motives of the agent, and from that by which we go along with the gratitude of the persons who are benefited by his actions: and he says, it is the same principle with that by which we approve of a well-contrived machine.

According to others, reason or the understanding, the same faculty by which we distinguish between truth and falsehood, enables us to distinguish between what is fit and unfit, amiable and odious, both in actions and affections: and they argue, that such are the natures of certain actions, that when perceived, as they are, by a reasonable being, there must result in him certain emotions and affections. An excellent writer adds, that in contemplating the actions and affections of moral agents, we have both a perception of the understanding, and a feeling of the heart; and the latter, or the effects in us accompanying our moral perceptions, are deducible from two springs. They partly depend on the positive constitution of our natures; but the most steady and universal ground of them is the essential congruity between the object and the faculty.

Hutcheson's Inquiry, &c. Tract. 2. Sect. 4. and Ess. on Pass. p. 207. Smith's Theory of Mor. Sent. Part iv. and vi. Cudworth's Immut. Mor. B. i. Price's Review, &c. ch. 2.

APPROBATION, in *Civil Law*. It is a maxim among civilians, *Approbare dicitur qui non improbat. He is judged to approve who does not disapprove.*

By the civil law, a mere *approbation* of a crime after commission, does not make a person guilty, but an *approbation* attended with fact, is equivalent to a command.

APPROBATION is more particularly used, in speaking of recommendations of books, given by persons qualified or authorized to judge of them.

Those appointed to grant licenses, and imprimaturs, frequently express their *approbation* of books.

Books were formerly subjected to a license in England, see 13 Car. II. cap. 33. which act is long since expired; and being incompatible with the noble principles of the REVOLUTION, has never since, and we hope never will be, revived.

APPROPRIARE *ad honorem*, in *Law*, signifies to bring a MANOR within the extent and liberty of such an HONOUR.

APPROPRIARE *communam*, in *Law*, signifies to discommon, i. e. to separate and inclose any parcel of land, which before was open common.

APPROPRIATE, APPROPRIATED, in *Philosophy*, is understood of something which is indeed common to several; yet, in some respects, is peculiarly attributed to one.

APPROPRIATE, in *Law*, is understood of a church or benefice, the patronage whereof is annexed to some church-dignitary, who appoints a vicar to serve the cure; the patron receiving the chief produce of it.

There are computed to be in England 3845 churches *appropriate* and *impropriate*.

APPROPRIATION, the act of *appropriating*, i. e. of applying a church-benefice, which of its own nature is *juris divini*, and no person's patrimony, to the proper and perpetual use of some religious community, to enjoy for ever.

This contrivance seems to have sprung from the interested policy of the monastic orders, who begged and bought, for masses and obits, and sometimes even for money, all the *advowsons* within their reach, and then *appropriated* the benefices to their own corporation. By a clause in the statutes 27 Hen. VIII. cap. 28. and 31 Hen. VIII. cap. 13. which dissolved the monasteries, the *appropriations* of the several parsonages were given to the king, in as ample a manner as they were before held by the abbots, &c. The *alien* PRIORIES had in former reigns been dissolved, and assigned to the crown: and from these two sources have arisen all the lay *appropriations* or secular parsonages now in the kingdom; these having been afterwards granted from time to time by the crown.

Appropriation is where the advowson of a parsonage is given

given or belongs to any bishoprick, religious houſe, college, &c. and to their ſucceſſors; ſo that the houſe or body is both patron and parſon, and ſome one of the members officiates as vicar.

It is called *appropriation*, becauſe the profits of the living are appropriated to the uſe of the patrons; ſo that parſons, though they are not ordinarily accounted *domini ſubfructuarii*, having no right of fee-ſimple; yet, by reaſon of the perpetuity of their ſucceſſion, are here reputed owners of the fee-ſimple, and are therefore called *proprietarii*.

To make an *appropriation*, after licenſe obtained of the king in chancery, the conſent of the dioceſan, patron, and incumbent, is neceſſary, if the church be full: if it be void, the dioceſan and the patron, upon the king's licence, may conclude it.

To diſſolve an *appropriation*, it is enough to preſent a clerk to the biſhop, and for him to inſtitute and induct him: for, that once done, the benefice returns to its former nature. This is called *diſappropriation*. See Blackſtone's Com. vol. i. p. 385, &c. ed. 4.

APPROVEMENT, APPROVEMENTUM, or APPROVIAMENTUM, is ſometimes uſed in ancient writers for an improvement, or riſe of the VALUE and worth of a thing.

Thus to *approve*, *approbare*, is to make the beſt benefit of a thing, by increaſing the rent, &c. *Cum communibus* approviamentis, *& aliis pertinentiis ſuis. &c.*

Hence, in ſome ancient ſtatutes, bailiffs of lords in their franchiſes are called their *approvers*.

A bailiff is not to think it below him to *approve*, *approbare*, his maſter's goods; but of his barley to make malt, of his wool to make cloth, &c.

APPROVEMENT is more particularly uſed where a man hath common in the lords waſte, and the lord incloſeth part of the waſte for himſelf; leaving ſufficient common, with egreſs and regreſs for the commoner. Reg. Jud. 8, 9.

APPROVER, in our *Laws*, one who, confeſſing felony in himſelf, appealeth or impeacheth another or more of his accomplices.

He is ſo called from the French, *approuver*, *comprobare*, becauſe he muſt prove what he hath alledged in his appeal. This proof was anciently either by battle, or by the country, at the choice of the appellee: and the form of this accuſation may be found in Crompt. Juſt. 250. See alſo Bracton, lib. 3. Staundf. Pl. Cor. 52.

APPROVERS of the king, are thoſe who have the feeding of the king's DEMESNES in ſmall manors, &c.

In the ſtatute of the 18. of Ed. 3. c. 8. ſheriffs are called the king's *approvers*.

It being in the diſcretion of the courts to ſuffer one to be an *approver*, this method of late hath ſeldom been practiſed. But we have in caſes of burglary and robbery on the highway, what ſeems to amount to the ſame by ſtatute; it being ordained, that where perſons charged with ſuch crimes out of priſon, diſcover two others concerned in the crime, they ſhall have a pardon, &c. Stat. 5 Anne, c. 31.

APPROVER is particularly uſed in *Ancient Law Writers*, for a bailiff or land ſteward, appointed to have the care of a manor, franchiſe, or the like, and improve and make the moſt of it for the benefit of his maſters.

In this ſenſe, the word is alſo written, *apprower*.

APPROVERS are called, in *Middle-age writers*, *probatores* and *approbatores*.

APPROXIMATION, from *ad*, and *proximus*, *near to*, in *Arithmetic* and *Algebra*, a continual approach ſtill nearer and nearer to a root or quantity ſought, without a poſſibility of ever arriving at it exactly.

We have divers methods of *approximation* delivered by Wallis, Raphſon, Halley, &c. all of them being no other than ſeries's infinitely converging, or approaching ſtill nearer to the quantity required, according to the nature of the ſeries.

It is evident, that if a number propoſed be not a true ſquare, it is in vain to hope for a juſt quadratic root thereof, explicable by rational numbers, integers or fractions; whence, in ſuch caſes, we muſt content ourſelves with *approximations*, ſomewhat near the truth, without pretending to accuracy: and ſo for the cubic root, of what is not a perfect cube; and the like for ſuperior powers.

This the ancients were aware of, and accordingly they had their methods of *approximation*; which, though ſcarce applied by them beyond the quadratic, or perhaps the cubic root, are yet equally applicable, by due adjuſtments, to the ſuperior powers alſo, as is ſhewn in the Philoſoph. Tranſact. N° 215. or Ph. Tr. abr. vol. i. p. 98. ib. vol. iv. p. 80.

If there be a non-quadratic, or non-cubic number; the former being expreſſed by $aa+b$, and the latter by $aaa+b$, where a and aaa are the greateſt ſquare and cube in the propoſed numbers; then $\sqrt{aa+b}=a+\frac{b}{2a}-\frac{bb}{8a^3}$, &c. and $\sqrt[3]{aaa+b}=a+\frac{b}{3aa}-\frac{2bb}{9a^5}$, &c. will be eaſy and expeditious *approximations* to the ſquare and cube root.

To extract the root of an equation by APPROXIMATION.—1°. For a quadratic equation ſuppoſe the equation $x^2-5x-31=0$; let the root be $8+y$, ſo that y may denote the fraction, whereby the aſſumed number either exceeds or comes ſhort of the root; then

$$\begin{array}{r} x^2=64+16y+y^2 \\ -5x=-40-5y \\ -31=-31 \\ \hline -7+11y+y^2=0. \end{array}$$

Since the powers of fractions are continually decreaſing; and we only here want a root nearly true; y^2 is caſt away: upon which

$$\begin{array}{r} -7+11y=0 \\ \hline y=\frac{7}{11}=\frac{4}{7}\text{ nearly}=0.6 \end{array}$$

Wherefore $x=8+0.6=8.6$

Suppoſe $x=8.6+y$. Then

$$\begin{array}{r} x^2=73.96+17.2y+y^2 \\ -5x=-43-5y \\ -31=-31 \\ \hline 73.96-43-31+17.2y-5y=0 \\ -0.04+12.2y=0 \\ \hline 12.2y=0.04 \\ \hline y=0.04\div 12.2=0.0032 \end{array}$$

Therefore $x=8.6+0.0032=8.6032$

Suppoſe $x=8.6032+y$; then will

$$\begin{array}{r} x^2=74.01505024+17.2064+y^2 \\ -5x=-43.0160-5y \\ -31=-31.00000000 \\ \hline -0.00094976-12.2064y=0 \\ \hline y=0.00094976\div 12.2064000 \\ =0.00007808 \end{array}$$

Therefore $x=8.6032+0.00007808=8.60327808$.

Suppoſe, again, the root of a cubic equation $x^3+2x^2-23x-70=0$ be required by *approximation*; here let the root be $5+y$, ſince the terms are omitted wherein y^3 and y^2 are found; there is no neceſſity for expreſſing them in the tranſformation of the equation. Wherefore, we find

$$\begin{array}{r} x^3=125+75y\ldots \\ +2x^2=50+20y\ldots \\ -23x=-115-23y \\ -70=-70 \\ \hline -10+72y=0 \\ \hline y=\frac{10}{72}=0.1\text{ nearly.} \end{array}$$

Therefore $x=5+0.1=5.1$

Suppoſe $x=5.1+y$: Then will

$$\begin{array}{r} x^3=132.651+78.03y\ldots \\ +2x^2=52.02+20.4y \\ -23x=-117.3-23y \\ -70=-70 \\ \hline -2.629+75.43y=0 \\ 75.43y=2.629. \\ \hline y=2.269\div 75.43=0.0348 \end{array}$$

Wherefore $x=5.1+0.0348=5.1348$.

And after the ſame manner might one proceed to infinity, *approximating* by every ſucceſſive operation nearer to the exact value of the root of the propoſed equation. The *rectification* and *quadrature* of the circle, together with many other problems both in geometry and algebra, afford inſtances of *approximation*. See EQUATION.

APPROXIMATION, in *Medicine*, denotes a magnetical kind of cure or method of tranſplanting a diſeaſe into ſome other ſubject, whether animate or vegetable, by bringing it in immediate contact with the patient.

APPUI, in the *Manege*, q. d. reſt or ſtay upon the hand, is the reciprocal effort between the horſe's mouth and the bridle hand; or the ſenſe of the action of the bridle on the hand of the horſeman.

A juſt *appui* of the hand is the nice bearing up or ſtay of the bridle; ſo that the horſe being awed by the ſenſibility and tenderneſs of his mouth, dares not reſt too much upon the bit-mouth, nor check or beat upon the hand to withſtand it.

A dull *appui*, is when a horſe hath a good mouth, but his tongue is ſo thick, that the bit cannot work, or bear upon the bars; the tongue not being ſo ſenſible as the bars

burs; though the like effect is sometimes owing to the thickness of his lips. A horse is said to have no *appui*, when he dreads the bit-mouth, is too apprehensive of the hand, and cannot bear the bit. He is said to have too much *appui*, when he rests or throws himself too much or too hardily upon the bit. Horses designed for the army, ought to have a full *appui* upon the hand.

APPULSE, from *ad*, and *pulso*, *I act on*, in a general sense, a thing's being brought to, or in contact with another.

Articulation is either by *appulse*, i. e. when one of the moveable organs touches and rests on some of those which are immoveable; or without *appulse*, only by inclination of the moveable organ to the immoveable.

APPULSE *of cattle*, *appulsus pecoris*, in the *Civil Law*, the right of driving them to water.

APPULSE, in *Astronomy*, the approach of any planet to a conjunction with the sun, or a star.

It is a step towards a transit, occultation, conjunction, eclipse, &c.

Mr. Flamsteed, M. de la Hire, and others, have given observations of the moon's *appulses* to the Pleiades. Phil. Trans. N° 76. p. 361. M. Acad. Scienc. an. 1708.

The *appulses* of the planets to the fixed stars have always been of great use to astronomers, in order to fix the places of the former. The ancients, wanting an easy method of comparing the planets with the ecliptic, which is not visible, had scarce any other way of fixing their situations, but by observing their tract among the fixed stars, and remarking their *appulses* to some of those visible points. Hist. Acad. Scienc. an. 1710. p. 417.

Dr. Halley has published a method of determining the places of the planets, by observing their near *appulses* to the fixed stars. Phil. Trans. N° 369.

The best method of discovering the longitude at sea, is by observations of the *appulses* of the moon to the fixed stars. See LONGITUDE.

Of all the celestial observations hitherto made, none are capable of so perfect an exactness, as the near *appulses* of the moon and planets to the fixed stars; for though the places of the stars have not as yet attained their ultimate precision, yet such observations are ever good, the places of the planets being thereby ascertained in proportion to the correctness of any catalogues that may be made hereafter. But the ordinary number of stars, with which the planets may be thus compared, being small, the opportunities of observing are consequently rare; whence appears the great use of a full catalogue of all the telescopal stars within the zodiac, viz. that thereby opportunities of observing *appulses* may be more frequent. Since the royal observatory at Greenwich was put under Dr. Halley's care, he endeavoured to put himself in a condition to supply the many and great vacancies to be met with in the present zodiac; and for the service of astronomy published a map, or planisphere of the starry zodiac; wherein are accurately laid down all the stars, to which the moon's *appulse* has been ever observed in any part of the world. Phil. Trans. abr. vol. vi. p. 170.

APPURTENANCES, or APPERTINANCES, in *Common Law*, signify things belonging to some other as their principal.

The word is formed of *ad*, *to*, and *pertinere*, *to belong*. *Appurtenances* may either be things corporeal, as hamlets belonging to a chief manor: or incorporeal, as liberties and services of tenants. See APPENDANT.

APRICOT *Armeniaca*, or *Prunus mala*, in *Botany*, a well-known fruit. The characters of this tree are, that the flower is composed of five large roundish petals, which spread open, whose base is inserted in the empalement: in the centre is placed a round germen, attended by upwards of twenty awl-shaped stamina; the germen afterwards becomes a roundish pulpy fruit, having a longitudinal furrow, inclosing a roundish nut, which is a little compressed on the sides. The specific title given by Linnæus to the *apricot*, is *prunus floribus subsessilibus solitariis subcordatis*: and he ranges it in the class of plants, intitled *icosandria monogynia*.

There are seven varieties; the Masculine, Orange, Algier, Persian, Turky, Breda, and Brussels, *apricots*: and they ripen in the order here enumerated.

The method of cultivating and propagating the several sorts of this fruit, is this: they are all to be propagated by GRAFTING them on plum-stocks, and will readily take with almost any species of plum, provided that the stock be in a thriving condition.

The Breda and Brussels *apricots*, are best to be made standard trees; all the rest are to be propagated against walls, and should have an east or west aspect. The borders under these walls should be six feet wide at least, and should be two feet deep in earth. If the place where they are planted be a loamy soil, the beds are to be raised pretty high above the level of the ground, and if chalk or gravel, it must be removed to a considerable width, to make room for fresh soil to be put in, but it need not be dug more than two feet deep. The best soil for them is fresh earth from a pasture ground, taken to ten inches deep, and laid with the turf among it to rot together, for a twelvemonth before it is used.

Such trees should be chosen for planting as are but of one year's growth from the budding; and where the soil is dry, or moderately so, October is the best season for planting. For the manner of planting, see PLANTING.

No part of the head should be cut off at this time, unless there are some foreright shoots which will not come near the wall. In a good strong soil, or against a low wall, these trees should be planted at eighteen feet asunder; the stem is to be placed four inches from the wall, and the head inclined toward the wall; the branches should be then nailed up to the wall, and the surface of the earth must be covered with rotten dung, to keep out the frosts. In February the dung is to be removed, and the tree being held very steady, the top is to be cut off to about three eyes above the bud, leaving the sloping side towards the wall. If the weather proves dry after this, they must be gently watered, and some turf or mulch laid round the root to keep off the sun's heat: and when branches are produced must be nailed up, except such as are produced foreright, which must be cut off.

At Michaelmas, when the trees have done growing, the branches must be again unnailed, and cut off to a proper length, the stronger shoots being left of nine or ten inches long, the weaker five or six inches. After they are thus shortened, they must be again nailed up, and that as much in an horizontal direction as possible. The second and third summer the same rules must be observed, all the foreright shoots must be displaced as they are produced, nailing in the others horizontally to the wall; so that the middle of the tree may be kept open; and never shorten any of the shoots in summer, unless to furnish branches for some vacant spaces on the wall; and this should never be done later than April.

The *apricot* produces its blossom buds not only on the last year's wood but also on the cursons or spurs from the two years old wood; great care must therefore be taken not to injure or displace these.

The Brussels and Breda *apricots* being planted for standards, require very little management, only in autumn or spring cut away all the dead wood, and such branches as cross one another. The Brussels *apricot* is the finest of all the kinds: it is ripe in the middle of August. Miller.

APRICOT-*water*. To a quart of water, put six or eight *apricots* sliced, and the kernels bruised; boil the whole to extract the taste; and when cold, add four or five ounces of sugar. When that is dissolved, strain it.

APRIL, the fourth month of the YEAR, according to the common computation; but the second, according to that of the astronomers.

The word is derived from *Aprilis*, of *aperio*, *I open*; because the earth, in this month, begins to open her bosom for the production of vegetables.

In this month the sun travels through the sign Taurus.

APRIORI, *Demonstration*. See DEMONSTRATION.

APRON, in *Naval Architecture*, is a piece of curved timber fixed behind the lower part of the stern, immediately above the foremost end of the keel.

APRON is also a name given to a platform or flooring of plank, raised at the entrance of a dock, against which the dock-gates are shut.

APRON, in *Gunnery*, a piece of lead, which caps or covers the vent or touch-hole of a great gun.

APSINTHIATUM, in *Physic*, a kind of potion to strengthen the stomach. See ABSINTHIATUM.

APSIS, or ABSIS, signifies the bowed or arched roof of a house, room, or oven, &c. as also the ring or compass of a wheel.

APSIS, in *Ecclesiastical Writers*, denotes an inner part in the ancient churches, wherein the clergy sat, and where the altar was placed.

It is supposed to have been thus called, because covered with an arch or vault of its own, by the Greeks called *αψις*, and by the Latins *absis*. Isidore, with less probability, imagines it so called as being the most luminous part; from *ardere*, *to give light*.

Apsis, in this sense, amounts to the same with what is otherwise called *choir*, *concha*, *camera*, and *presbyterium*; and stands opposite to the *nave*, or body of the church.

APSIS is more particularly used for the bishop's seat, or throne, in ancient churches.

This was more peculiary called *apsis gradata*, becauſe raiſed on ſteps above the ordinary ſtalls. It was alſo denominated *cecdra*, and in latter times *tribuna*.

APSIS is alſo uſed for a reliquary, or caſe, wherein the relics of ſaints were anciently kept.

It took the name *apſis*, from its being round, or arched at the top; or perhaps from the place where it was kept.

The *apſis* was commonly placed on the altar: it was uſually of wood, ſometimes alſo of gold and ſilver, with ſculptures, &c.

APSIS, in *Aſtronomy*, is applied to two points in the orbits of planets, wherein they are at the greateſt, and the leaſt, diſtance from the ſun, or earth.

The *apſis* at the greateſt diſtance is called the *higher*, or *ſumma apſis*; that at the leaſt diſtance, the *lower*, *ima apſis*, or *infima*.

The two *apſides* are alſo called *auges*.

The higher *apſis* is more particularly denominated the *aphelion*, or *apogee*; the lower, the *perihelion*, or *perigee*.

The diameter which joins theſe two points is called the *line of the apſides*, and this paſſes through the centre of the orbit of the planet, and the centre of the earth or ſun. In the modern aſtronomy this line makes the longer apſis of the elliptical orbit.—Such is the line AP (*Vide Aſtron. fig.* 1.) drawn from the aphelion A to the perihelion P. The eccentricity is reckoned in the line of the *apſides*; being the diſtance between the centre of the orbit of the planet, C, and the centre of the ſun or earth, S, according as the Copernican, or the Ptolemaic ſyſtem is followed. For the motion of the line of the *apſides*, ſee APOGEE.

The motion of a planet from one *apſis* to another, e. gr. of the moon, from apogee to perigee, and back again from perigee to apogee, is conſidered by mechanical philoſophers as oſcillations, and accounted for from the laws of the pendulum; conſequently they muſt one day ceaſe, when the equilibrium is reſtored. Vide Horreb. Clav. Aſtronom. cap. 20.

Others apprehend ſomething immechanical in the motion; and propoſe, as infoluble queſtions, How the equilibrium was firſt deſtroyed; why not reſtored again; and whence the breach is continually renewed? Vide Mem. de Trev. Avril, 1730. p. 709. ſeq. But theſe are perſons unacquainted with the ſecrets of the Newtonian philoſophy. Vide Newt. Prin. lib. i. ſeq. 9. Herman. Phoron. lib i. cap. 4. See alſo DISTANCE, GRAVITATION, ORBIT, PERIOD, and PLANET.

APSYCHIA, from *a*, and ψυχω, *I cool*, a word uſed by the ancients, as the name of a ſtone found in Arcadia, and of the colour of iron, the quality of which they ſay was, that when once heated red-hot, it would never grow cold again. It is eaſy to ſee that this is an impoſſibility; and that ſome errors among the ancients, and miſunderſtandings of their works by later writers, have given the occaſion for propagating ſo idle an opinion.

We have ſome ſtones indeed in England, that when once heated will retain a warmth a long time, but all the other accounts ſeem groundleſs; our warming ſtone, uſed in Cornwall and Yorkſhire to lay at the feet of people's beds, will retain warmth eight or ten hours; and there is a ſort of red ſtone cut out of the ſalt mountains near Cordova, and formed into broad tiles called *raggiolas* by the Italians, which being once well heated, will retain a ſenſible warmth twenty-four hours; but theſe do not all come up to the qualities of this imaginary ſtone of the ancients. See ASBESTOS.

APSYRTUS, in the *Materia Medica* of the ancients, a name given to the common *marrubium*, or horſe-hound, a plant at that time as well as now eſteemed very good, in coughs, and other complaints of the breaſt.

APTERA, from *a*, and πτερον, *wing*, in the *Hiſtory of Inſects*, a claſſical name, comprehending all thoſe INSECTS which have no wings.

They are of the ſeventh order in the claſs of inſects in the Linnæan ſyſtem, comprehending 14 genera and 297 ſpecies.

This ſeries is divided by Hill into two claſſes: 1. Such as have neither wings nor limbs called APTERA ANARTHRA. And, 2. Such as have limbs, but no wings, called, APTERA PODARIA.

AP-THANES, an ancient term for the higher nobility in Scotland. See THANE.

APTITUDE, from *aptus*, *fit*, the natural diſpoſition any thing hath to ſerve for ſuch or ſuch a purpoſe. Thus oil hath an *aptitude* to burn, and water to extinguiſh fire.

APTITUDE, or APTNESS, is often uſed in ſpeaking of the talents of the mind, for a promptitude, or diſpoſition to learn things with eaſe and expedition.

In which ſenſe *aptneſs* amounts to the ſame with what the Greeks call ευμαθια, and the Latins *bona indoles*, and we ſometimes *docility*.

Charlton divides *aptneſs* into theſe parts, viz. *acuteneſs*, *ſagacity*, and *memory*.

APTOTE, in *Grammar*, a noun indeclinable, or which is without any variation or caſe.

The word is derived from the privative *a*, and πτωσις, *caſus*.

Such are the words, *fas*, *nefas*, &c.

APUA, in *Ichthyology*, the name of a ſmall ſea-fiſh, ſuppoſed by many to be produced of the ſlime and mud of the ſhores. But all ſuch opinions are groundleſs. There are two ſpecies of this fiſh. 1. the *apua vera*, 2. the *apua phalerica*.

APUA *membras*, in *Ichthyology*, a name by which ſome have called the PILCHARD.

APUS, *Avis Indica*, in *Aſtronomy*, a conſtellation of the ſouthern hemiſphere placed near the pole, between the *triangulum auſtrale* and the chameleon, ſuppoſed to repreſent the bird of paradiſe.

The *apus* is ſuppoſed one of thoſe birds called APODES, as having no feet.

The ſtars contained in this conſtellation, according to Sharp's catalogue annexed to the Britiſh, are the following eleven.

Situation of the Stars.	Mag.	Longitude	Latitude	Magnitude
		° ′ ″	° ′ ″	
In the head	3	21 0 30	44 32 55	5
In the neck		21 24 49	46 52 22	0

APUS, in *Ornithology*, a ſpecies of the *ſwallow*.

APUS, likewiſe denotes a ſpecies of the *monoculus* genus of inſects.

APUTTASY, in *Botany*, a name given by the people of Guinea to a tree, a decoction of which is in great uſe among them for waſhing the mouth to cure the ſcurvy in the gums, and preſerve the teeth. Phil. Tranſ. N° 235.

APYCNI, in the *Ancient Muſic*, was uſed for ſuch chords or ſounds of the ſcale, as could never enter the ſyſtema. They were fixed, or STABILES.

APYCNON, from *a*, and πυκνος, *nix ſpiſſatum, rarum*, in the *Ancient Muſic*, was applied to thoſe two conjunct intervals of a tetrachord which taken together were greater than the third.

This happened only in the two diatonic genera.

APYRENOS, properly ſignifies without kernels. The Greek writers, however, did not always keep up rigidly to the ſenſe of this word, but ſometimes applied it to ſuch fruits as had ſewer and ſofter kernels than others of the ſame kind.

APYREXY, in *Medicine*, the intermiſſion of a fever, or ague.

The word is formed of the privative *a*, and πυρ, *ignis*, *heat*.

APYROI, in *Antiquity*, a denomination given to ALTARS whereon ſacrifice was offered without fire.

In which ſenſe, the word ſtands contradiſtinguiſhed from EMPYROI.

APYROMETALLUM, in *Metallurgy*, a name by which ſome authors have called gold, from its refuſing the force of fire.

APYRON, ſomething that has not undergone the fire.

In this ſenſe, *ſulphur vivum*, or native ſulphur, is particularly denominated *apyron*.

Some authors alſo give the denomination *apyron* to a modern proceſs for making *æthiops* mineral without fire, by trituration alone.

APYROUS, in *Chemiſtry*, is a word applied to denote that property in ſome bodies, by which they refuſe the moſt violent fire, without any ſenſible alteration.

Apyrous bodies ought to be diſtinguiſhed from thoſe which are *refractory*.

Refractory ſubſtances, are thoſe which cannot by violent heat be fuſed, whatever other alteration they may ſuſtain.

AQUA, in *Natural Hiſtory*, *Phyſics*, *Chemiſtry*, *Medicine*, WATER, &c. which ſee.

The

The word is Latin, and ſuppoſed to be compounded of *a* and *qua*, q. d. *from which*; alluding to the opinion that water is the baſis, or matter of all bodies.

AQUA *alexiteria ſimplex*, the name now given in the London diſpenſatory to the ſimple water commonly called milk-water. It is ordered to be made in the following manner: take mint, a pound and a half; tops of ſea-wormwood, and leaves of angelica, all freſh and green, of each a pound; add as much water as is neceſſary to prevent burning, and diſtil off three gallons.

AQUA *alexiteria ſpirituoſa*, the name of a compound or cordial water, brought into uſe by the London diſpenſatory. It is ordered to be made of half a pound of green mint, and four ounces of angelica leaves, with the ſame quantity of tops of ſea-wormwood, and a gallon of proof ſpirit; adding water enough to prevent burning, and diſtilling off a gallon.

This, with a double portion of the angelica, and the addition of a pint of vinegar after the diſtillation, makes what is called the AQUA *alexiteria ſpirituoſa cum aceto*, which is intended to ſupply the place of the treacle-water, of the former diſpenſatories.

AQUA *aluminoſa Batavana*, a form of medicine in the London Pharmacopœia, compoſed in the following manner: take alum and white vitriol, of each half an ounce; water, a quart; boil the whole together, that the ſalts may be diſſolved; and then letting it ſettle, filtre it through paper.

Quincy gives another proceſs for making alum-water; as alſo its uſe in medicine; for which ſee ALUMINOUS.

AQUA *ethyſica*, a ſubtle kind of *aqua regia*, called alſo *aqua purium*. Three parts of *ſal ammoniac*, and two of nitre, injected into a tubulated retort made red-hot, yield this acid compound ſpirit. Neumann, p. 225.

AQUA *fortis* is a corroſive liquor prepared from nitre and vitriol; and ſerving as a menſtruum wherewith to diſſolve ſilver, and all other metals, except gold; whence its name. See ACID, *nitrous*.

Aqua fortis is made by diſtilling purified nitre with calcined vitriol, or rectified oil of vitriol, in a ſtrong heat: the liquor, which riſes in blood-red fumes, being collected, is the *aqua fortis*.

In preparing compound *aqua fortis*, ſome mix either ſand, or clay, or ochre, with the calcined vitriol and nitre, in order to hinder their melting too readily; and thus prevent the too haſty evaporation: when the fuſion is thus prevented, the parts of the ſalts receive more violent impreſſions from the fire, and are better converted into a volatile ſpirit, which is the *aqua fortis*.

If to the ſpirit of nitre, &c. thus diſtilled, ſea-ſalt, or ſal ammoniac, be added, it commences *aqua regia*; and will no longer diſſolve ſilver, but will now diſſolve gold. Hence, to try whether or no *aqua fortis* be pure; put a grain of a ſolution of ſilver in *aqua fortis*, into a like quantity of the water in queſtion: and, if the ſolution remains without either the water's turning milky, or the ſilver precipitating, the *aqua fortis* is pure. If theſe conſequences happen, the *aqua fortis* is bad.

The fault of ſuch *aqua fortis* happens either from the uſe of too violent and long continued fire, or, becauſe the mixture of the vitriol and the nitre have been carelefsly made, or too large a proportion of the former uſed; in this caſe, when the diſtillation draws towards the end, there appear white milky fumes in the recipient; theſe are vitriolic; and this phenomenon plainly ſhews the fault of the menſtruum, and might ſerve to prognoſticate the before mentioned precipitation. This calx of ſilver ſeldom proves fuſible in the fire, but runs into a kind of *luna cornea*, and ſhews that the nitre has been impure, and has contained ſome portion of ſea-ſalt. Cramer.

It is a liquor of various and extenſive uſe. It is very ſerviceable to refiners for parting or ſeparating of ſilver from gold. To the workers in moſaic, for ſtaining and colouring their woods. See MARQUETRY. To dyers, in their colours, and particularly in ſcarlet. To other artiſts, for the colouring of bone and ivory; which is done by ſteeping the matter therein, after firſt tinging it with copper and verdigriſe, &c.

Aqua fortis converted into *aqua regia*, by diſſolving in it a fourth of its weight of ſal ammoniac, is uſed for ſtaining ivory haſts and bones, of a fine purple colour. Bookbinders throw it on leather, and thereby make marbled covers for books. Diamond-cutters uſe it to ſeparate diamonds from metalline powders. It is, farther, of ſervice in etching copper, or braſs plates. See ETCHING.

Silver is very nicely and finely purified by means of this menſtruum in the following manner: diſſolve ſilver that has been copelled in a clean glaſs body, with a ſufficient quantity of *aqua fortis*; if the ſolution is at all turbid, filtre it through paper into another clean glaſs; pour into this ſolution, by little and little, ſpirit of ſalt, or a ſolution of common ſalt, or ſal ammoniac, enough to produce a perfect *aqua regia*. The limpid ſolution will now immediately become milky: let it reſt for ſome hours, and all the ſilver will ſubſide to the bottom in form of a white powder, which may be ſooner effected, by pouring a large quantity of pure water on the ſolution if highly charged. Waſh the powder with many freſh waters, or with the phlegm of ſpirit of ſalt or *aqua fortis* till the calx and water are both perfectly inſipid; then ſeparate the remaining water by a filtring paper, and dry the calx. Put this into a crucible well rubbed over the inſide with ſoap, and cover it with about one half of any fixed alkaline ſalt, very dry and beaten to a fine powder; ſqueeze the whole well down with a finger; cover the crucible with a tile, and ſet it in a wind furnace; make at firſt a middling fire, only to make the veſſel grow red hot, and then increaſe it to a higher degree; when the fuſion is completed take out the crucible, and let the ſilver either cool in it, or elſe pour it into an ingot. Cramer.

The beſt *aqua fortis* is often tinged with a greeniſh colour, which happens, if to *aqua fortis*, having been expoſed ſome days to the air, and having loſt its red fuming ſpirit, there be poured ſome freſh ſtrong *aqua fortis* ſtill emitting its fumes, or if *aqua fortis* be diluted with water. As this colour may however proceed from copper diſſolved in it, to be certain it does not, a little is to be poured into a cucumber, and as much of ſome alkaline liquor to be added to it as will ſaturate the acid. Then if there be ever ſo little copper in it, the colour becomes a deep blue, and there is a cloudy precipitation made, becauſe the nitre has been regenerated by this proceſs, and does not diſſolve copper ſo much as *aqua fortis* does; but if there be no copper in the *aqua fortis*, the colour diſappears.

The nice aſſayer, after having carefully proved his *aqua fortis*, muſt concentrate it to a certain degree; for, if too weak, it often retards the ſolution, and ſometimes does not even affect the ſilver: but this concentration is only to be in a certain degree; for, if it be carried too far, and the *aqua fortis* be made too ſtrong by it, it vaniſhes into fumes, which ruſh violently out of the receiver, or veſſel, in which the ſolutions are made, though ſufficiently high, and carries away a part of the ſilver with it in vapours; and if there is any thing of gold in the ſilver, it will be corroded into a fine duſt, which it is very difficult afterwards to collect together.

When *aqua fortis* is too weak, it is to be put into a deep cucurbit, and the watery parts is to be drawn from it, by a gentle fire, till yellow fumes begin to ariſe. To find out whether it be too ſtrong, the following method is to be uſed: melt together one part of gold, and four parts of ſilver; of this make a flat plate, which cut into three or more parts; roll up each part, that it may be conveniently put into the neck of a crucible; when rolled up, and gently heated at a fire, put it into a cucurbit, and pour it upon three times its weight of *aqua fortis*, ſetting it in a gentle heat: if the ſilver is expelled from the gold, and the gold retain the ſame figure of a piece of plate rolled up, and there appear no reddiſh duſt at the bottom of the veſſel, then the *aqua fortis* has its proper degree of ſtrength: but if the diſſolution has been made with ſo much violence, that the gold was eroded, or the plate almoſt broken, then the *aqua fortis* was too ſtrong. It muſt then be diluted with a tenth, or an eighth part, of *aqua fortis* phlegm, or, if that is not at hand, with the ſame quantity of common water. This done, the trial is to be repeated, by the diſſolution of a like plate rolled up; and this ſeveral times over, till the ſilver be diſſolved, without the leaſt diminution of the gold. By this the aſſayer is aſſured of a due degree of ſtrength in his menſtruum, for all the purpoſes he requires.

Aqua fortis is better than in the common ſtate, when it is recovered by fire from a metal which had been diſſolved by it. It may be almoſt entirely recovered by fire, from ſuch ſolutions. Lemery, in his curious account of the *arbor martis*, obſerves, that the experiment ſucceeds much better with *aqua fortis*, drawn once from a diſſolution of iron, than with the common kind; and Cramer gives a very accurate and ready way of obtaining ſuch a revived *aqua fortis*, in any quantity, in this manner: put into a glaſs alembic, a pound or more of any metalline ſolution in *aqua fortis*; diſtil it into a large recipient, over a gentle fire, ſo that the drops may follow one another, at the interval of ſome ſeconds. When the liquor of this quantity is thus drawn off, let ſuch another quantity be put warm into the ſame cucurbit, to the reſiduum of the former; let this be diſtilled in the ſame manner, till all its liquor is drawn off, and then more

added,

added, till the whole quantity intended to be diſtilled is thus diveſted of its liquor. After all this, when the yellowiſh vapours begin to appear from the remainder, a dram of ſuet muſt be put into the veſſel, leſt the diſſolved metal ſhould, when dried up, adhere ſo faſt to the ſides of the veſſel, as to give great trouble in ſeparating it; and when, at laſt, the calx ſhall be quite dry, let it be ſeparated and fuſed with pot-aſhes; thus will the metal be recovered, and the receiver will contain the *aqua fortis* revived from it.

AQUA *marina*, AQUE *marine*, in *Natural Hiſtory*, a gem, or precious ſtone, of a ſea-green colour; whence its name.

It is of the ſame hardneſs with the amethyſt.

Some of the critics contend for its being the ſixth ſtone in the *rationale* of the Jewiſh high-prieſt. Others will have this ſtone a *turquoiſe*; and Leo de Juda, and Huiterus, tranſlate it *hyacinthus*.

Several of the lapidaries take it, however, to be the BERYL; which coincides with the firſt opinion; the *beryl* being only another name for the *aqua marina*.—Pliny repreſents this as related to the *ſmaragdus*, but of a colour leſs brisk, and imitating a pure ſea-water green. This gem may be imitated, by adding at ſeveral different times to twenty pounds of cryſtal glaſs made with out magneſia, and well purified from glaſs-gall, ſix ounces of calcined braſs or copper, and a quarter of an ounce of prepared zaffre.

AQUA *mercurialis*, a preparation of *aqua regia*, and ſublimate of mercury, with a little mercury, placed in a ſand-heat till the ſolution of the mercury be made.

It is a mark of perfection of the *aqua mercurialis*, if it turn a piece of copper, caſt into it, of a ſilver colour.

It is by this water, that the alchemiſts pretend, all metalline bodies may be reduced to their firſt matter, or mercury.

AQUA *nephæ*, is a name given to the diſtilled water of orange-flowers.

AQUA *omnium ſterum*, in *Pharmacy*, ſignifies the diſtilled water of cows-dung, when they are at graſs. Some alſo call cows urine by this name: and, in Engliſh, *all-flower water*.

AQUA *pugilum*. See AQUA *chryſulca*.

AQUA *regia*, or AQUA *regalis*, an acid corroſive ſpirit, or water, ſerving as a menſtruum to diſſolve gold.

It is thus called, becauſe it diſſolves gold, which is vulgarly eſteemed the king of metals. It is ſometimes alſo called *aqua chryſulca*, and *ſygin*.—The baſis, or eſſential ingredient of *aqua regia*, is common, or ſea-ſalt; which is the only ſalt in nature that will operate on gold.

By mixing nitrous and marine acids in various ways, *aqua regia* is made, and a menſtruum is obtained, capable of acting upon certain bodies, which no pure acid can diſſolve, or but imperfectly.

In making common *aqua regia*, the ſalt ſhould be previouſly pulverized, in a glaſs or ſtone mortar, and a gentle warmth applied to promote its ſolution in the ſpirit. Neumann, p. 220.

GOLD and PLATINA, in their aggregated ſtate, cannot be diſſolved by any other acid; and TIN and REGULUS of *antimony* are better and moſt eaſily diſſolved by it. The only differences between the ſeveral ſorts of *aqua regia* prepared in different manners, is this, that when it is made by merely diſſolving *ſal ammoniac*, or common ſalt, in nitrous acid, it then contains *ammoniacal*, or cubic nitre; but theſe neutral ſalts do not exiſt in the *aqua regia* made by the mixture of the two acids, or by diſtillation.

The diſſolving power of *aqua regia* is not injured by its containing theſe neutral ſalts; and as the *aqua regia* in which they remain is moſt eaſily and moſt cheaply prepared, it is more generally uſed than any of the other preparations of it.

It is neceſſary, however, to obſerve, that the *ammoniacal* nitre in the *aqua regia* may occaſion conſiderable differences in the nature of the precipitates made from ſolutions of metals in this menſtruum, by ſeparating from theſe precipitates any of thoſe metallic ſubſtances, which it is capable of diſſolving, and alſo by a portion of it adhering to PRECIPITATES. For inſtance, gold precipitated by a fixt alkali from an *aqua regia* made by mixing the pure nitrous and marine acids, does not *fulminate*; but if it be precipitated from an *aqua regia* made by diſſolving *ſal ammoniac* in nitrous acid, it does *fulminate*. See AURUM *fulminans*.

As to the proportions of nitrous and marine acids, or of *ſal ammoniac*, which ought to be employed in the preparation of *aqua regia*, there are no eſtabliſhed rules. Common *aqua regia* is made by diſſolving four ounces of *ſal ammoniac* in ſixteen ounces of nitrous acid; but theſe proportions ought to be varied, according to the nature of the ſolutions intended. To diſſolve, for example, the greateſt quantity of regulus of antimony, the *aqua regia* ought to be compoſed of four parts of nitrous acid to one of marine. To diſſolve the greateſt poſſible quantity of PLATINA, the beſt proportion is equal parts of the two acids. In general, the greater proportion of marine acid, or of *ſal ammoniac*, that there is in *aqua regia*, the imperfect metals, and TIN in particular, are the leſs calcined and precipitated by it.

An *aqua regia* compoſed of two parts of ſpirit of nitre, and one part of ſpirit of ſalt, or of *ſal ammoniac*, makes a clear ſolution of nearly an equal weight of TIN, without forming any precipitate; but for this purpoſe, the operation muſt be performed ſlowly, and heat muſt be avoided as much as poſſible.

The mixture of the nitrous and marine acids, in order to make *aqua regia*, preſents a very ſingular and remarkable phenomenon. For the vapours of this mixture are more expanſive, and more difficult to be confined, than the vapours of either of the acids, before mixing them; which proves a reaction of theſe acids upon each other. This phenomenon is but very little ſenſible, when the acids employed contain much ſuperabundant water, but is more manifeſt in proportion as theſe are more concentrated. M. Macquer obſerved, that upon mixing moderately ſmoaking nitrous and marine acids, which had remained without occaſioning any diſturbance in their bottles, an *aqua regia* has been formed infinitely more ſmoaking, and which has made the ſtopper fly out of the containing bottle, particularly in weather ſomewhat warm. M. Beaumé, when diſtilling a pretty ſtrong nitrous acid upon *ſal ammoniac*, obſerved, that the vapours which paſſed were ſo elaſtic, that notwithſtanding every precaution, it was impoſſible to continue the diſtillation.

Aqua regia does not diſſolve ſilver; but when the quantity of marine acid contained in the *aqua regia* is very ſmall, the acid of nitre does then diſſolve ſilver, which is immediately afterwards attacked by the marine acid, without which it forms the metallic ſalt called LUNA *cornea*, and is precipitated. An exact ſeparation of gold and ſilver is therefore better made by *aqua fortis* than by this acid: as the former can never diſſolve gold, whereas the latter may, and very frequently does, more or leſs, corrode and diſſolve ſilver. *Aqua regia* diſſolves a greater quantity of lead than marine acid. All the other metals it perfectly diſſolves.

According to Gellert's table, the ſubſtances which *aqua regia* diſſolves, are placed in the following order, beginning with thoſe with which it moſt powerfully unites. *Phlogiſton, zinc, iron, regulus of cobalt, copper, tin, ſyderite, biſmuth, mercury, lead, regulus of antimony, gold.*

In this table, copper is erroneouſly placed before tin, as the latter metal readily precipitates the former. Macquer's Dict.

Dr. Prieſtley has found, that an *aqua regia* of much greater power in the ſolution of gold than the common ſort, may be prepared by the impregnation of ſpirit of ſalt with the nitrous vapour. Exp. and Obſ. on Air, vol. iii. p. 219.

AQUA *ſecunda*. This is nothing elſe but *aqua fortis* diluted with much pure water. It is employed in ſeveral arts, to clean the ſurface of metals, and of certain ſtones, and for various other purpoſes.

AQUA *ſicca philoſophorum*, a cant term, invented by ſome alchemiſts for the flowers of zinc, called by ſeveral other as unmeaning names, by theſe writers: as *ſericum*, philoſophic cotton, and TALC.

A preparation of theſe flowers, by means of vinegar, has alſo been called oil of talc, and many great properties aſcribed to it; but it is truly no other than the oil of the grape, from which the vinegar was made, and has no title to any thing that has been ſaid of it.

AQUA *ſulphurata*, *ſulphur water*, a new name for what was originally called *gas ſulphuris* by Van Helmont.

It is water impregnated with the fumes of burning ſulphur; and is conveniently prepared in the following manner: take a quart of water, and half a pound of brimſtone; put the water into a large glaſs receiver; place it with its mouth ſideways, and then let the ſulphur be ſet on fire, in an iron taſte fixed to a wooden plug, made to go freely into the neck of the receiver, which ſhould be pretty long. This plug muſt then keep the taſte up horizontally, that it may not dip into the water, and a cloth is to be thrown ſlightly over the mouth of the receiver, to confine the fumes. Let the burning of the ſulphur be repeated as often as the fumes from the laſt ſubſide, till the whole is burnt away. See GAS.

AQUA *vitæ* is commonly underſtood of what we otherwiſe call *brandy*, or the diſtilled *ſpirit of wine*, either ſimple,

ſimple, or prepared with aromatics, differently, according to the different intentions.

Some, however, diſtinguiſhed between them; appropriating the term *brandy* to what is procured from wine, or the grape; and *aqua vitæ* to that drawn after the ſame manner from malt, &c.

The common *aqua vitæ* is made by diſtilling wine in large copper ſtills, fitted with worms, ſo that the liquor flows out of the beak of the ſtill in a conſtant ſtream, and the diſtillation is continued till the liquor ceaſes to be inflammable. To make pure ſpirit, it ſhould be again diſtilled and rectified.

AQUA *vitriolica cærulea*, a form of medicine in the London Pharmacopœia, made in the following manner: take blue vitriol three ounces; alum and ſtrong ſpirit of oil of vitriol, of each two ounces; water a pint and a half; boil the ſalts in water till they are diſſolved, and then add the oil of vitriol, and finally ſtrain the whole through paper.

Neumann gives a different account of the *aqua cærulea*, or ſapphirina of the ſhops. He ſays, that ſal ammoniac, quick-lime, and water, kept for a night in a copper or braſs veſſel, or along with pieces of copper, diſſolve a part of the metal, by which the liquor is tinged blue, and is called *aqua cærulea*. In this compoſition the copper is diſſolved by the volatile alkali of the *ſal ammoniac*, extricated by the quick-lime. Neumann's Works, p. 220

AQUÆ *& ignis interdictio*. See INTERDICTION.

AQUÆ *bajulus*, an ancient name for the clerk officiating under the chief miniſter, whoſe buſineſs was to aſſiſt him in carrying the holy water. The office correſponding to it at preſent is that of the PARISH-*clerk*.

AQUÆ *hauſtus*, in the *Civil Law*, a right of drawing water, and carrying it through another's ground.

AQUÆ *pluvia* is uſed by ſome to denote the hydrophobia. Phil. Tranſ. N° 147.

AQUÆDUCT, AQUÆDUCTUS, q. d. *ductus aquæ, a conduct of water*, is a conſtruction of ſtone or timber, built on an uneven ground, to preſerve the level of water, and convey it, by a canal, from one place to another. There are *aquæducts* under ground, and others raiſed above it, ſupported by arches.—The Romans were very magnificent in their *aquæducts*; they had ſome that extended an hundred miles. Frontinus, a man of conſular dignity, and who had the direction of the *aquæducts* under the emperor Nerva, tells us of nine that emptied themſelves through 13,594 pipes, of an inch diameter. Vigenere has obſerved, that, in the ſpace of twenty-four hours, Rome received from theſe *aquæducts* no leſs than five hundred thouſand hogſheads of water.—The three chief *aquæducts* now in being are thoſe of the Aqua Virginea, Aqua Felice, and Aqua Paulina. The firſt was repaired by pope Paul IV. The ſecond was conſtructed by pope Sixtus V. and is called from the name which he aſſumed before he was exalted to the papal throne. The third was repaired by pope Paul V. in the year 1611.—The *aquæduct* built by Lewis XIV. near Maintenon, for carrying the river Bure to Verſailles, is perhaps the greateſt in the world. It is 7000 fathoms long, and its elevation 2560 fathoms; containing 242 arcades. Vide Phil. Tranſ. ap. Lowth. i. p. 504

AQUÆDUCT, AQUÆDUCTUS, in *Anatomy*, denotes a bony kind of canal, or paſſage, in the *os petroſum*, ſuppoſed to contribute to the purpoſes of hearing.—It is called *aquæduct*, not only on account of its form, but, as ſome alſo imagine, from its ſerving to diſcharge any foreign matters collected in the inner cavities of the ear.—It is ſometimes alſo called *aquæductus Fallopii*, from the name of its firſt diſcoverer.—Several authors confound it with the *tuba Euſtachiana*.

The *aquæductus Fallopii*, is ſometimes alſo called *meatus cæcus*; by others *meatus cochlearis*, and *meatus auditorius*; by others *canalis particularis*, *meatus auditorius internus*, and *foramen auditorium internum*, called alſo *hydrocapharyngiate*.

AQUÆMANILIS, from *aqua*, *water*, and *manus*, *hand*, is particularly uſed, in *Eccleſiaſtical Writers*, for a kind of baſon or laver, anciently placed in the veſtibules of churches, ſerving to waſh the hands in.

Aquamanilis ſtood contradiſtinguiſhed from *urceolus*, as the former was placed under the hands, the latter above them, from whence the water trickled down by a cock. The prieſt alſo, after celebrating maſs, waſhed his fingers in an *aquamanilis*.

In the inventories of church plate, we frequently find mention of *aquamanules*, *aquaminilia*, *aquaminaria*, of ſilver gilt, wrought, &c. Du-Cange.

AQUAGE, a water-courſe.

AQUALICULUS, in *Anatomy*, a name given by ſome to the region of the body, wherein the trunk terminates, and the thighs commence, and in which alſo the privities are placed.

The *aqualiculus* is the ſame with what others call FUBES, others the *hypogaſtrium*, *lumen*, *imus venter*, &c.

AQUARIANS, AQUARII, a ſect toward the cloſe of the ſecond century, who, inſtead of wine, uſed nothing but water in the ſacrament.

It is ſaid the occaſion of the abuſe was owing to the perſecution which prevailed in thoſe times: for the Chriſtians, being then obliged to celebrate the ſacrament in the night, found it neceſſary to make uſe of water, leſt the ſmell of the wine ſhould betray them to the heathens. But they afterwards went farther, and actually forbid the uſe of wine in the euchariſt, even when it might be uſed with ſafety.

Epiphanius tells us, the *Aquarians* were the followers of Tatian; and were ſo called from the word *aqua*, *water*, becauſe they abſtained wholly from wine, and did not uſe it even in the euchariſt.

AQUARIUS, in *Aſtronomy*, the eleventh ſign in the ZODIAC, reckoning from Aries; from which alſo the eleventh part of the ecliptic takes its name.

The ſun moves through *Aquarius* in the month of January; it is marked thus, ♒.

The Poets feign, that *Aquarius* was Ganymede, whom Jupiter ravithed under the ſhape of an eagle, and carried away into heaven, to ſerve as a cup-bearer, in the room of Hebe and Veſtan; whence the name.—Others hold, that the ſign was thus called, becauſe, when it appears in the horizon, the weather uſually proves rainy.

The ſtars in the conſtellation *Aquarius*, in Ptolemy's catalogue, are 45; in Tycho's 41; in Heveliu's 47; in Flamſteed's Britannic Catalogue 108; the longitudes, latitudes, &c. whereof, according to the former, are given by Hevelius: according to the laſt, they are as follows; to which are added the *informes*.

AQUARTIA, in *Botany*, a genus of the *tetrandria monogynia* claſs; with a bell-ſhaped calyx, and a round corolla, with linear ſegments, and a many-ſeeded berry.

AQUATIA, in *Middle Age Writers*, a right of fiſhing three days in the year. Du Cange.

In ancient deeds, we find divers grants of this privilege of *aquatica*, or *aquarum*, ſometimes alſo called *aquaria*. In ſome writings *aquatica* ſeems alſo to have ſignified a fee, or other ſervice, paid for the privilege of fiſhing.

AQUATIC, ſomething which lives, breeds, or grows, in or about the water.

Thus we have *aquatic* plants, and *aquatic* animals.

Trees which grow peculiarly on the banks of rivers, or in marſhes &c. are alſo called *aquatics*.

The ancient Romans had alſo their *aquatic*, or *aquatile* gods, *dii aquatiles*, called by Catullus, *dii litorales*; concerning whom we have an inſcription in Reineſius, NEPTUNO ET DIS AQUATILIBUS.

To this claſs belonged the Tritons, the miniſters of Neptune.

AQUATIC *inſects*. See INSECTS.

AQUATIC *road*. See ROAD.

AQUATIC *ſpider*, in *Zoology*. See SPIDER.

AQUATICUM, in *Middle Age Writers*, denotes a thing dimed with water. Hence *aquaticum in ſorejis*, &c. Du-Cange.

AQUATUM, in ſome *Phyſical Writers*, denotes a thing diluted with water.

AQUATUM *acetum* is uſed by ſome naturaliſts, for what is otherwiſe called GRANDO, but more uſually CHALAZA.

AQUEOUS, AQUEOUS, ſomething that partakes of the nature of WATER, or abounds therewith.

Thus milk is ſaid to conſiſt of an *aqueous* or *ſerous*, and a butyrous part.

The chemiſts ſeparate the *aqueous* part or phlegm from all bodies by diſtillation.

AQUEOUS *bath*. See BATH.

AQUEOUS *humour*, is the firſt or outermoſt, and the rareſt of the three humours of the eye.

It lies immediately above the *tunica aranea* and ciliary ligament, and under the *cornea*, which it cauſes to protuberate a little; and is ſuppoſed to be furniſhed by certain ducts provided for that purpoſe.—It is found to ſpirituous, that it will not freeze in the ſevereſt froſt.

Anatomiſts are divided about the origin and conveyance of this humour.—It is certain the ſource muſt be pretty plentiful, inaſmuch as, if by any accident the coats it is contained in be wounded, ſo that the humour runs out, and the *cornea* collapſes, the wound readily heals, by only cloſing the eye, and the humour recruits: of which we have numerous inſtances among phyſicians.

Dr. Nuck thinks he has diſcovered the ducts in the ſclerotica, whereby this humour is furniſhed.

Others, denying the reality of thoſe ducts, ſuppoſe it immediately derived from the arteries. Dr. Drake admits the ducts, and takes them to be only branches of the excretory ducts of the glandula innominata, and lachrymalis; which piercing the tunics of the eye, deliver their liquor by ways hitherto unknown.

Mr. Warner obſerves, that this humour is ſecreted by the extremities of the moſt minute lymphatic arteries of the iris; and that a proper quantity of it is received, and occaſionally returned again, into the larger veins, and courſe of general circulation, by means of minute lymphatic, or abſorbent veins, correſponding to thoſe arteries.

AQUETTA, a name for a kind of poiſon made much uſe of by the Roman women, under the pontificate of Alexander VIII.

AQUIFOLIUM. See HOLLY, and BIRD-*lime*.

AQUILA, in *Natural Hiſtory*, &c. See EAGLE.

AQUILA, in *Aſtronomy*, a conſtellation of the northern hemiſphere; uſually joined with Antinous.

The ſtars in the conſtellation *Aquila* and Antinous, in Ptolemy's Catalogue, are 15; in Tycho's, 19; in Hevelius's 42; in the Britannic Catalogue, 71; the longitudes, latitudes, magnitudes, &c. whereof, according to the two firſt, are given by Hevelius; according to the laſt, they are as follow.

AQUILA, in *Chemistry*, has several significations, according to the epithets joined with it.

AQUILA *alba*, is a name given to a combination of corrosive sublimate, with fresh mercury, called *mercurius dulcis*.

AQUILA *arbor*, in *Botany*, a name, given, by some authors, to the tree whose wood is the *agallochum*, or lignum aloes of the shops.

AQUILEGIA, in *Botany*. See COLUMBINE.

AQUILICIUM, or AQUILICIUS, in *Antiquity*, a sacrifice, celebrated among the Romans, in time of excessive droughts, to obtain rain of the gods.

Danet calls this *aquilicium*. The priests who officiated at it were denominated *aquilices*, *quia aquam excitabant*, because they brought down water: but where he finds this new order of priests, he does not tell us.

AQUILIFER, from *aquila*, *eagle*, and *fero*, *I bear*, among the Romans, an ensign-bearer, who carried the standard on which the eagle was represented.

AQUILINE, AQUILINUS, something belonging to an eagle. Hence, *aquiline* nose denotes a hooked nose, or such as is like the beak of an eagle; called also a hawk's nose.

AQUILO, is used by Vitruvius for the north-east WIND; or that which blows at 45° from the north towards the east POINT of the horizon.

The poets gave the name *aquile* to all stormy winds dreaded by the mariners.

AQUILUS, among the *Ancients*, a dark, or dusky colour, approaching to black.

Hence some of the heathen gods were called *di aquili*, q. d. *nigri*.

AQUILUS, in *Ornithology*, a species of pelican.

AQUIMINARIUM, in *Antiquity*, a kind of lustral vessel, wherein the Romans carried their holy water for expiation, and other religious offices.

AQUIQUI, in *Natural History*, the name of a particular species of monkey, called by the people of Brasil, the king monkey, as being much larger than all the other monkies.

AQUO, in *Ichthyology*, a name by which some authors have called the ACQUENS, a fish much approaching to the nature of the ALAUSA, or SHAD.

AQUOSE *ductus*, *ductus* AQUOSI *Nuckii*. See AQUEOUS *Humour*.

AQUULA, the name of a disorder of the eyes, called also *hydatis*.

ARA *thuribuli*, the *Altar of incense*, in *Astronomy*, a southern constellation, not visible in our hemisphere, consisting, according to Ptolemy, of seven stars; and according to Sharp's Catalogue, annexed to that of Mr. Flamsteed, of nine stars, as in the following table.

Situation of the stars	Signs.	Longitud.	Latitude.	Nebulosities.
		° ′	° ′	
In the base, the northern.	♐	21 35	23 5 16	5
The southern		27 18	20 36	5 5
In the middle of the altar.		26 5	20 29 31	6
In the fire-place northern.		1 47	21 30 13	3
southern.		29 27	15 2 14	4

20.		21 44	38 17 17 54	4

ARA *parva*, *the little altar*, a denomination, in the *Ancient Surgery*, given to an elegant kind of BANDAGE, said to have been invented by Soslratus.

ARAB, or ARABIAN *horse*, is said to be nurled with camel's milk: there are many strange reports of this beast. The duke of Newcastle assures us, that the ordinary price of one is 1000, 2000, or 3000 pounds; and that the Arabs are as diligent in keeping the genealogies of their horses, as princes of their families. They strike medals on every occasion to keep up the pedigree. The fortune the Arabians give their sons, when arrived at manhood, is two suits of arms, with two scimeters, and a horse; which always lies in the next room to them. Yet of those of the breed brought into England few have proved very extraordinary. See HORSE.

ARABANT, from *aro*, *I plough*, in *Law*, *ad curiam domini*, was intended of those who held by the tenure of ploughing and tilling the lord's lands within the manor.

ARABESQUE, or ARABESK, something done after the manner of the Arabians.

Arabesques, GROTESQUE, and *Moresque*, are terms applied to such paintings, ornaments of freezes, &c. wherein there are no human or animal figures, but which consist wholly of imaginary foliages, plants, flasks, &c.

The word take their rise from hence, that the Moors, Arabs, and other Mahometans, use these kinds of ornaments; their religion forbidding them to make any images or figures of men, or other animals.

Arabesk is used by Stephen Riou, esq. in his book on Architecture, to denote that style of building which is vulgarly called *Modern Gothic*, which he also terms *Saracenic* and *Moresk*; the introduction of which he ascribes to the Moors, or, which he says is the same thing, to the Arabians or Saracens, who have expressed, he adds, in their architecture, the same taste as in their poetry, which are both falsely delicate, crowded with superfluous ornaments, and often very unnatural. This manner of building, he says, was introduced into Europe through Spain. The Crusades gave the Christians an idea of *Saracenic* architecture, which they afterwards imitated. Sir C. Wren distinguishes the heavy *Gothic* as *Anglo-Saxon*, the lighter as *Gothic*.

ARABIC, or ARABIAN, something that relates to Arabia, or the Arabs.

ARABIC *figures* or *characters*, are the numeral characters commonly made use of in arithmetical computations.

The *Arabic* characters stand contradistinguished to the Roman.

The learned are generally of opinion, that the *Arabic* figures were first taught us by the Saracens, who borrowed them from the Indians.—Scaliger was so satisfied of their novelty, that he immediately pronounced a silver medallion he was consulted about, modern; upon his being told that the numeral figures 254, 255, were upon it. The common opinion is, that Planudes, who lived towards the close of the 13th century, was the first Christian who made use of them. Father Mabillon even assures us, in his work *de Re Diplomatica*, that he has not found them any where earlier than the fourteenth century. Yet Dr. Wallis insists on their being of a much older standing; and concludes they must have been used in

England at leaſt as long ago as the time of Hermannus Contractus, who lived about the year 1050, if not in ordinary affairs, yet at leaſt in mathematical ones, and particularly in the aſtronomical tables. Vide Wall. Algeb. c. 4.

The ſame author gives us an inſtance of their antiquity in England, from a mantle-tree of a chimney, in the parſonage-houſe of Helmdon in Northamptonſhire, wherein is the following inſcription in *baſſo relievo*. N° 133, being the date of the year 1133. Philoſ. Tranſ. N° 154.

Mr. Luffkin furniſhes a yet earlier inſtance of their uſe, in the window of a houſe, part of which is a Roman wall, near the market-place in Colcheſter; where between two carved lions, ſtands an eſcutcheon, containing the figures 1090. Philoſ. Tranſact. N° 155.

Mr. Huet is even of opinion, that theſe characters were not borrowed from the Arabs, but from the Greeks; and that they were originally no other than the Greek letters, which we all know that people made uſe of to expreſs their NUMBERS by.

ARABIC, *gum*. See GUM.

ARABIC, or ARABIAN *learning*, is divided into two ſtates, or periods, viz. Ante-Mahometan, and Mahometan.

The *Arab* learning in this firſt period conſiſted, according to Abulpharagius, in the knowledge of their language, the propriety of diſcourſe, the compoſition of verſe, and the ſcience of the ſtars: but their chief attention ſeems to have been directed to *oratory* and *poetry*. Hiſt. Dynaſt. Renaudot de Barber. Aſiſt. Verſ. Fabricii Bibl. Græca, lib. vi. cap. 5. § 6.

The ſecond period is more diſtinguiſhed, at leaſt from the time of Al Mamon, the ſeventh caliph of the family of the Abaſſides, who flouriſhed about the year 820, and has the honour of being the founder of the modern *Arabian* learning. He ſent for all the beſt books out of Chaldea, Greece, Egypt, and Perſia, relating to phyſic, aſtronomy, coſmography, muſic, chronology, &c. and penſioned a number of learned men, ſkilled in the ſeveral languages and ſciences, to tranſlate them into *Arabic*. By this means, divers of the Greek authors, loſt in their own country and language, have been preſerved in *Arabic*. Elmac. Hiſt. Sar. lib. ii. cap. 8. Leo Africanus de Viris illuſt. ap. Arabes, cap. 1. Fabricii Bib. Græc lib. vi. cap. 9. Groſv. in Præf. ad Tab. Geog. Voſſ. de Sect. Phil. cap. 3. § 17.

From that time *Arabia* became the chief ſeat of *learning*; and we find mention by Abulpharagius, Pococke, D'Herbelot, and Hottinger, of learned men, and books without number.

The revival of *learning* in the tenth century, by Gerbert, known after his elevation to the pontificate by the title of Silveſter II. and afterwards among the Europeans in general, may be aſcribed to the inſtructions and writings of the *Arabian* doctors and philoſophers, and to the ſchools which they founded in ſeveral parts of Spain and Italy. And in the ſame century, the inquiſitive of different countries frequented the ſchools of the Saracens in Spain, and diſſeminated the knowledge which they obtained there after their return. At this time, many of the learned productions of the *Arabians* were tranſlated into Latin, which facilitated the general progreſs of ſcience.

ARABIC, or ARABIAN *logic*, was that of Ariſtotle, as explained by Avicenna and Averrhoes.

ARABIC *marble*, *Arabicum marmor*, a name given by the ancient Greeks, to a ſpecies of marble brought from Egypt and Arabia, and remarkable for its beautiful whiteneſs.

ARABIC, or ARABIAN *oratory*, according to Renaudot, conſiſted in a luxuriancy of quaint, high-flown words, epithets, and deſcriptions.

ARABIC, or ARABIAN *philoſophy*, before Mahomet, was Sabian, and included the ſyſtem and ceremonies of that ſect of idolaters. This it was that Mahomet ſet himſelf to decry; and he is even ſaid by ſome, to have carried his oppoſition ſo far as to prohibit, if not puniſh, all ſtudy of *philoſophy*. But his followers, by degrees, got over this reſtraint; the love of learning increaſed; till, under the memorable caliphate of Al Mamon, Ariſtotle's *philoſophy* was introduced and eſtabliſhed among them; and from them propagated, with their conqueſts, through Egypt, Africa, Spain, and other parts.

As they choſe Ariſtotle for their maſter, they chiefly applied themſelves to that part of philoſophy called *logic*, and this became proficient in the knowledge of words, rather than things. Whence they have been ſometimes denominated, *Maſters of the wiſdom of words*; ſometimes the *Talking ſect*. Their *philoſophy* was involved in quaint arbitrary terms and notions, and their demonſtrations drawn from theſe, as from certain principles, &c. Walch Hiſt. Logic. lib. ii. ſec. 2. § 1.

ARABIC, or ARABIAN *phyſic* and *phyſicians*, ſucceeded the Grecian, and handed down the art to us, having made conſiderable improvements, chiefly in the pharmaceutical and chemical parts.

It is certain we owe to them moſt of our ſpices and aromatics, as nutmegs, cloves, mace, and other matters of the produce of India. We may add, that moſt of the gentler purgatives were unknown to the Greeks, and firſt introduced by the *Arabs*, as manna, ſenna, rhubarb, tamarinds, caſſia, &c. They likewiſe brought ſugar into uſe in *phyſic*, where, before, only honey was uſed. They alſo found the art of preparing waters and oils, of divers ſimples, by diſtillation and ſublimation.

The firſt notice of the ſmall-pox, and the meaſles, is likewiſe owing to them. Laſtly, the reſtoration of *phyſic* in Europe took its riſe from their writings.

M. Le Clerc has given a ſketch, and Dr. Freind, an ample hiſtory of the *Arabian phyſic*. We have alſo a *diſſertation* of all the *Arabian phyſicians*, by Fabricius.

ARABIC, or ARABIAN *poetry*, may be divided into two ages. The ancient, according to Voſſius, was no other than rhiming; was a ſtranger to all meaſure, and rule; the verſes looſe and irregular, confined to no feet, number of ſyllables, or any thing elſe, ſo that they rhimed at the end; oftentimes all the verſes in the poem ended with the ſame rhime. It is in ſuch verſe that the ALCORAN is ſaid to be written.

The modern *Arabian poetry* takes its date from the cabliphate of Al Raſchid, who lived toward the cloſe of the eighth century. Under him *poetry* became an art, and laws of *proſody* were laid down. Clark, Prof. Arab. cap. 1. Their compariſons, in which they abound, are taken, with little choice, from tents, camels, hunting and the ancient manner of the *Arabs*.

ARABIC, or ARABIC *tongue*, is a branch or dialect of the Hebrew.

F. Angelo de St. Joſeph ſpeaks much of the beauty and copiouſneſs of the *Arabic*. He aſſures us it has no leſs than than a thouſand names for a ſword; five hundred for a lion; two hundred for a ſerpent; and eighty for honey. Mr. Richardſon, in his *Arabic* grammar, obſerves, as a proof of the richneſs of this language, that it conſiſts of 2000 radical words. The two principal dialects of it were thoſe ſpoken by the Himyarites and other genuine Arabs, and that of the Koreiſh, in which Mohammed writ the Koran. The old *Arabic* characters are ſaid to be of very high antiquity; for Ebn Haſhem relates, that an inſcription in them was found in Yaman as old as the time of Joſeph: whence ſome have aſcribed the invention of letters to the Arabians, and Sir Iſaac Newton ſuppoſes, that Moſes learned the alphabet from the Midianites, who were Arabians. The *Arabian* alphabet conſiſts of 28 letters, which are ſomewhat ſimilar to the ancient Kufic, in which character the firſt copies of the Koran were written. The preſent *Arabic* characters were formed by Ebn Moklah, a learned Arabian, who lived about 300 years after Mahomet. Aſſe's Origin and Progreſs of Writing, p. 43.

ARABIC *ſections*. See BIBLES.

ARABIC *year*. See YEAR.

ARABICI, a ſect who ſprung up in Arabia, about the year 207, whoſe diſtinguiſhing tenet was, that the ſoul died with the body, and alſo roſe again with it.

Euſebius, lib. vi. c. 38. relates that a council was called to ſtop the progreſs of this riſing ſect; and that Origen aſſiſted at it; and convinced them ſo thoroughly of their error, that they abjured it.

ARABACUS *teſtæ*. See COSTUS.

ARABIS, in *Botany*, a genus of the *tetradynamia ſiliquoſa*; *baſtard tower* MUSTARD.

ARABISM, ARABISMUS, an idiom, or manner of ſpeaking peculiar to the Arabs, or the Arabic language.

R. Martin maintains, that the 1 ſometimes expreſſes an oath in the Hebrew as well as the Arabic.

ARABIST, a perſon curious of, and ſkilled in the learning and languages of the Arabians: ſuch were Erpenius and Golius. The ſurgeons of the 13th century are called *Arabiſts* by Severinus. Freind. Hiſt. Phyſ. tom. ii. p. 301.

ARABLE *land*, anciently called ARALIA, is ſuch as is fit for tillage, or ploughing; or which is actually ploughed up from time to time.

It is thus called from the Latin *arare*, of *aratrum*, a PLOUGH.

ARABUM *lepra*. See LEPROSY.

ARABUS *ſomnarachs*. See SAMNARACHS.

ARAC, or ARRAC, a ſpirituous liquor, imported from the Eaſt Indies; chiefly uſed by way of dram, and in punch. The nature and compoſition of this celebrated liquor has been much controverted.—The name *arrac*, Mr. Lockyer aſſures us, is an Indian word for ſtrong waters of all kinds; for that they call our ſpirits and brandy, *Engliſh arrac*.—But what we underſtand by the name *arrac*, is really no other than a ſpirit procured by diſtillation, from a vegetable juice called *toddy*, which flows by inciſion out of the cocoa-nut tree, and ſome other trees, like the birch-juice procured among us.

The *toddy*, Mr. Lockyer adds, is a pleaſant drink of itſelf, when new, but purges thoſe not uſed to it; and, when ſtale, is heady; and finally makes good vinegar. The Engliſh at Madras uſed it as leaven to raiſe their bread with.

Others

flight caſt of the ſame braſſy yellow. It is much ſofter than any of the pellucid gems; its fineſt pieces do not excel cryſtal in hardneſs, and its coarſer are much ſofter; it takes a good poliſh, however, and in ſome of its finer ſpecimens makes a tolerable figure, though greatly inferior to the other gems.

Our jewellers take very little notice of it; and, inſtead of having two or three names for it, as they have for moſt other of the gems, they call it very often aprafius, and the leſs accurate among them often call the chryſoprafius a *chryſolite*.

The *chryſolite* is found in New Spain, and in ſeveral parts of Europe, as Sileſia, Bohemia, &c. The American, however, are greatly ſuperior to the European, but are uſually ſmall; the Bohemian are large, but very few of them are of a good colour, or free from flaws.

The *chryſolite* has been found to exhibit electrical appearances ſimilar to thoſe of the TOURMALIN. The fluid moves always along the ſlender threads or columns, which form the grain of it, without ſuffering any change from their direction; one end being electrified *plus*, and the other *minus*. Phil. Tranſ. vol. lii. p. 445.

CHRYSOLITE is alſo a general name, which the ancients gave to all precious ſtones, wherein the yellow, or golden, was the prevailing colour.

When the ſtone was green, they called it *chryſoprafius*: the red and blue too had their particular denominations, which expreſſed their colour: the gold being ſignified by *chryſo*, which ſtill began the name.

We know but few of theſe *chryſolites* now; or rather, they are referred to the ſpecies of ſtones which they approach the neareſt to: the green to the emerald, the red to the ruby; and ſo of the reſt.

CHRYSOLITE-*paſte*, the way of making an artificial *chryſolite* paſte is this: take one prepared *cryſtal* two ounces, ordinary red lead eight ounces; mix theſe well together, and add *crocus martis* made with vinegar, twelve grains: mix all together; put them into a crucible, lute it over, and bake the whole for twenty-four hours, or longer, in a potter's kiln, and it will produce a very elegant reſemblance of the true *chryſolite*.

CHRYSOMELA, in *Zoology*, a genus of inſects frequently confounded with the beetles, the *antennæ* of which are made in form of bracelets, or necklaces of beads, and are thickeſt toward their extremity: the body, in figure, approaches to oval, and the *thorax* is oblong and rounded. Of this genus Dr. Hill enumerates a great many ſpecies. See SCARABÆUS.

CHRYSOMYTHRES, in *Ornithology*, the name by which ſome call the GOLD-FINCH. See CARDUELIS.

CHRYSOPAGION, in *Natural Hiſtory*, a name by which ſome of the middle age writers have called the gem deſcribed by Pliny, under the name of the *chryſampelos*. Salmaſius is of opinion that it was only a ſoft kind of the *chryſoprafius*, of which Pliny ſays, that ſome of them were full of ſpecks, and of a variable colour.

CHRYSOPETRON, in *Natural Hiſtory*, a name given by Pliny and others to the yellower kind of the ancient topaz, that is, our chryſolite.

CHRYSOPHYLLUM, in *Botany*. See *Star*-APPLE.

CHRYSOPHRYS, in *Ichthyology*, a name given by the ancient Greek and Latin authors to a fiſh called at this time the AURATA: it is a ſpecies of SPARUS. See GILT-*head*.

CHRYSOPILON, in *Natural Hiſtory*, a name given by ſome ancients to a ſpecies of the beryl, which had a yelloviſh tinge.

CHRYSOPIS, *the golden-eye*, in *Natural Hiſtory*, the name of a ſpecies of fly, ſo called from the beautiful gold colour of its eyes. It is a long-bodied fly, with extremely thin and tranſparent wings of a ſilvery colour, with green ribs or nerves; the body is green, and the *antennæ* very ſlender and blackiſh. This is a very ſlow flyer, and is common in gardens; it is frequently found on the common elder; it is of a very ſtrong ſmell.

CHRYSOPRASUS, in *Chriſtian Antiquity*, the tenth of thoſe precious ſtones which adorned the foundation of the heavenly Jeruſalem; the colour of it was green, much like that of a leek, but ſomething inclining to that of gold, with ſome impreſſions.

CHRYSOSPLENIUM. See *Golden* SAXIFRAGE.

CHRYSOXYLON, in *Botany*, a name given by ſome to the Scytharian, or Scythicum lignum, a wood famous for its beautiful yellow colour, and for tinging the hair yellow. This was one of the many ſubſtances called by the name of THAPSUM by the ancient Greeks, from its colour, the word *thapſus* ſignifying a pale yellow, and being applied by theſe authors to every thing that had that colour in itſelf, or could give it to other things.

CHRYSTAL. See CRYSTAL.

CHRYSTAL *mineral*, the ſame as *ſal prunella*.

CHRYSTALLINE. See CRYSTALLINE.

CHRYSTALLIZATION. See CRYSTALLIZATION.

CHTHONIA, in *Antiquity*, a feſtival kept in honour of Ceres, called *Chthonia*. For the ceremonies obſerved in it, ſee Pott. Archæol. lib. ii. cap. 20.

CHUB, the Engliſh name for the fiſh called the CAPITO and CEPHALUS by authors, and by ſome of the ancient Romans *ſqualus*. It is, according to the Artedian and Linnæan ſyſtem, a ſpecies of the CYPRINUS, and the fiſh called by the French the vilain and teſtard.

The reſorts of this fiſh are eaſily found; for they are generally holes overſhaded by trees, and this fiſh will be ſeen floating in ſuch almoſt on the ſurface of the water in a hot day in great numbers. They are but a poor fiſh for the table, and are very full of bones; but they entertain the angler very much, and are of the number of thoſe that are eaſily taken. The beſt manner of fiſhing for him is thus: prepare a very ſtrong rod of a ſufficient length; fix to the hook a graſſhopper; place yourſelf ſo as to be perfectly out of ſight of the fiſh, and drop in the bait about two feet from the place where a large *chub* lies; if he does not ſee the angler he very ſeldom fails biting, and is immediately taken; but he is ſo ſtrong a fiſh that he ſhould be taken out carefully, after a great deal of playing, otherwiſe the tackle will be in danger; a beetle, or any large fly, will anſwer the purpoſe in the place of a graſſhopper; and if none of them are to be had, the method of fiſhing muſt be altered, and the line be long enough for fiſhing at the bottom. In March and April this fiſh is to be caught with large red worms; in June and July with flies, ſnails, and cherries; but in Auguſt and September the proper bait is good cheeſe pounded in a mortar with ſome taſſion, and a little butter; ſome make a paſte of cheeſe and Venice turpentine for the *chub* in winter, at which ſeaſon this fiſh is better than at any other; the bones are leſs troubleſome in this ſeaſon, and the fleſh is more firm and better taſted; the row is alſo well flavoured in general. The angler muſt keep his bait for this fiſh at the bottom in cold weather, and near the top in hot, and the fiſh will bite eagerly.

CHUCHIA, in *Zoology*, a name given by Cardan, Oviedo, and ſome others, to the OPOSSUM.

CHUNNA, in the *Salic Laws*, is uſed for a hundred; or rather a hundred pence or *denarii*: the pecuniary penalties of that law are eſtimated by *chunnæ*, and reduced to *ſolidi*, by reckoning forty *denarii* to the *ſolidum*.

CHUPMESSAHITES, a ſect among the Mahometans, who believe that Jeſus Chriſt is God, and the true Meſſiah, the redeemer of the World; but without rendering him any public, or declared worſhip.

The word, in the Turkiſh language, ſignifies *protector of the Chriſtians*.

Ricaut ſays there are abundance of theſe *Chupmeſſahites* among the people of faſhion in Turky, and ſome even in the Seraglio.

CHURCH, an aſſembly of perſons united by the profeſſion of the ſame Chriſtian faith, and the participation of the ſame ſacraments.

Bellarmin, and the Roman divines, to this definition add, *Under the ſame pope, ſovereign pontiff, and vicar of Jeſus Chriſt on earth*; in which circumſtance it is that the Romiſh and reformed notion of *church* differ.

Ameloote, and others, make a viſible head, or object, eſſential to a *church*; accordingly, among the Catholics, the pope; in England, the king; are reſpectively allowed heads of the *church*. Biſhop Hoadley ſets aſide the notion of a viſible head: Chriſt alone, according to him, is head of the *church*; which poſition he has maintained with great addreſs, in a celebrated ſermon before king George I. on theſe words: *My kingdom is not of this world*; and in the ſeveral vindications thereof.

Sometimes, we conſider *church* in a more extenſive ſenſe, and divide it into ſeveral branches. The *church militant*, is the aſſembly of the faithful on earth. *Church triumphant*, that of the faithful already in glory. To which the Catholics add the *church patient*, which, according to their doctrines, is that of the faithful in purgatory.

The term *eccleſia*, ἐκκλησία, ſynonymous with our *church*, is uſed in the Greek and Latin profane authors for any kind of public aſſembly; and even to that place where the aſſembly is held. The ſacred and eccleſiaſtical writers ſometimes alſo uſe it in the ſame ſenſe; but ordinarily they reſtrain the term to the Chriſtians; as the term *ſynagogue*, which originally ſignifies nearly the ſame thing, is in like manner reſtrained to the Jews.

Thus, in the New Teſtament, the Greek ἐκκλησία, ſignifies almoſt always, either the place deſtined for prayer, as 1 Cor. xiv. 34. or the aſſembly of the faithful diffuſed over the whole earth, as Epheſ. v. 24. or the faithful of a particular city, or province, as 2 Cor. viii. 1. or even of a ſingle family, as Rom. xvi. 5. or the paſtors or miniſters of a *church*, as Matt. xviii. 17.

The Chriſtian *church* is frequently divided into Greek and Latin.

CHURCH, *Greek, or Eaſtern*, comprehends the *churches* of

all the countries anciently subject to the Greek, or Eastern empire: and through which their language was carried: i. e. all the space extended from Greece to Mesopotamia and Persia, and thence into Egypt; which has been divided ever since the emperor Phocas from the Roman *church*.

The Greek *church*, properly speaking, is that society of Christians, who live in religious communion with the patriarch of Constantinople: and it is divided into two parties; one of which acknowledges his supreme authority and jurisdiction; whilst the other, though joined with him in communion of doctrine and worship, is governed by its own laws, under the jurisdiction of spiritual rulers, independent of all foreign authority. The former branch of the Greek *church* is divided into four provinces; Constantinople, Alexandria, Antioch, and Jerusalem; over each of which a bishop presides, under the title of patriarch, the chief of whom is the patriarch of Constantinople. The power of electing this patriarch is vested in the twelve bishops, who reside nearest this capital; but the right of confirming his election, and of empowering him to exercise his spiritual functions, belongs to the Turkish emperor. The Greeks receive the Holy Scriptures, and the decrees of the seven general councils, as the rule of their faith: but no private person has a right to explain, for himself or others, the declarations of Scripture, or the decisions of these councils; the patriarch and his brethren being the only persons authorised to consult these oracles, and declare their meaning. Many attempts have been made to unite them to the reformed *church*, but they have hitherto been unsuccessful.

CHURCH, *Latin*, or *Western*, comprehends all the *churches* of Italy, France, Spain, Africa, the North, and all other countries, whither the Romans carried their language. Great Britain, part of the Netherlands, of Germany, and of the North, have been separated hence ever since the time of Henry VIII. and constitute what we call the *reformed church*, and what the Romanists call the *western schism*, as the Greek *church* constitutes the eastern one.

The *Reformed* CHURCH is again divided into the Lutheran *church*, the Calvinist *church*, the *church* of England, &c. The denomination of *reformed* is often restricted to those protestant *churches*, which did not embrace the doctrine and discipline of Luther. The title was first assumed by the French Protestants, and afterwards became the common denomination of all the Calvinistical *churches* on the continent. But in England the term *reformed* is generally used in its genuine and extensive sense, as standing in opposition to popery alone.

CHURCH, *Gallican*, denotes the *church* of France, under the direction and government of its bishops and pastors. This *church* has always enjoyed certain immunities and franchises, not as grants from the pope, but derived to her from her first original, which she has carefully maintained. These privileges depend on two maxims; viz. 1. That the pope has no authority or right to command or order any thing, general or particular, in which the temporalities and civil rights of this kingdom are concerned. 2. That notwithstanding the pope's supremacy is owned in cases purely spiritual, yet in France his power is limited and regulated by the decrees and canons of ancient councils received in that realm.

CHURCH, *High*, was a denomination originally given to those, otherwise called NONJURORS, who refused to acknowledge the title of William III. to the crown of Great Britain, under a notion that James II. though excluded, was still their rightful sovereign. This appellation was given them, because they entertained high notions of the dignity and power of the *church*, and the extent of its prerogatives and jurisdiction. And those, on the contrary, were called *low-church* men, who disapproved of the secession and obstinacy of the nonjurors, distinguished themselves by their moderation towards dissenters, and were less ardent in extending the limits of *church* authority. The denomination of *high-church* men is now more generally applied to all who form pompous and ambitious conceptions of the authority and jurisdiction of the *church*, and who would raise it to an absolute independence on all human power.

CHURCH is also used for a Christian temple, built and consecrated to the honour of God; and, anciently, under the invocation of some particular saint, whose name it assumed. In this sense, *churches* are variously denominated, according to the rank, degree, discipline, &c. as metropolitan *church*, patriarchal *church*, cathedral *church*, parochial *church*, cardinal *church*, &c. See each under its proper article, METROPOLIS, PATRIARCH, CATHEDRAL, PAROCHIAL, CARDINAL, &c. In ecclesiastical writers, we meet with grand *church*, for the chief *church* of a place, particularly in the Greek liturgy, for the *church* of St. Sophia at Constantinople, the see of the patriarch, founded by Constantine, and consecrated under Justinian. It was at that time so magnificent, that Justinian is said to have cried out in the consecration thereof, Ἐνενίκηκά σε, Σολομών; *I have out-done thee, Solomon.* The dome, which is said to have been the first that was built, is 330 feet diameter.

The first *church* publicly built by the Christians, some authors maintain to be that of St. Saviour at Rome, founded by Constantine: others contend, that several *churches* abroad, called by the name of St. *Peter Vincu*, were built in honour of that apostle during his life-time.

CHURCH, *Mother*, *Matrix ecclesia*. See MOTHER-*churches*.

CHURCH, with regard to architecture, Da-viler defines a large oblong edifice, in form of a ship, with nave, choir, isles, chapel, belfry, &c. See each part under its proper head.

CHURCH, *simple*, is that which has only a nave and a choir.

CHURCH *with isles*, that which has a row of portico, in form of vaulted galleries, with chapels in its circumference.

CHURCH *in a Greek cross*, that where the length of the traverse part is equal to that of the nave; so called, because most of the Greek *churches* are built in this form.

CHURCH *in a Latin cross*, that whose nave is longer than the cross part, as in most of the Gothic *churches*.

CHURCH *in rotundo*, that whose plan is a perfect circle, in imitation of the Pantheon.

For the form of the ancient Greek *churches*, when they had all their parts, it was as follows: first was a porch, or portico, called the *ουαρτ-nave*, *narthex*; this was adorned with columns on the outside, and on the inside surrounded with a wall; in the middle whereof was a door, through which they passed into a second portico. The first of these porticos was destined for the *energumeni*, and penitents in the first stage of their repentance: the second was much longer, destined for penitents of the second class, and the catechumens, and hence called *narthex*, *ferula*, because those placed in it began to be subject to the discipline of the *church*. These two porticos took up about one third of the space of the *church*. From the second portico, they passed into the nave, *naos*, which took up near another third of the *church*. In the middle, or at one side of the nave, was the ambo, where the deacons and priests read the Gospel, and preached. The nave was destined for the reception of the people, who here assisted in prayers.

Near the entrance of this was the BAPTISTERY, or FONT. Beyond the nave was the choir, *χορος*, set with seats, and round: the first seat on the right, next the sanctuary, being for the chantor, or *choragus*.

From the choir, they ascended by steps to the sanctuary, which was entered at three doors. The SANCTUARY had three apsides in its length; a great one in the middle; under which was the altar crowned with a BALDACHIN, supported by four columns. Under each of the small apsides was a kind of table, or cupboard, in manner of a bench.

Though, of the Greek *churches* now remaining, few have all the parts above described; most of them having been reduced to ruins, or converted into mosques.

M. Frezier, engineer to the French king, and F. Cordemoy, a regular canon, have disputed the form of the ancient and modern *churches*, and the best manner of building them, with a good deal of learning, in the Journals de Trevoux.

For the form of the Latin *churches*, though it be various, yet may all the variety be reduced to two heads; viz. those in form of a ship, and those of a cross.

CHURCH-*yard*, a place adjoining to a *church*, employed commonly for the interment of the deceased. See CORMETERION.

CHURCH-*government*, *discipline*, &c. See ECCLESIASTICAL GOVERNMENT, DISCIPLINE, POLICY, &c.

CHURCH-*rents*. See CHURCH-*wardens*.

CHURCH-*scot*, or CHURCH-*sett*, a payment, or contribution, by the Latin writers frequently called *primitiæ frumenti*; being, at first, a certain measure of wheat, paid to the priest on St. Martin's day, as the first fruits of harvest. This was enjoined by the laws of king Malcolm IV. and Canut. c. 16. But after this, *church-scot* came to signify a reserve of corn-rent paid to the secular priests, or to the religious; and sometimes it was taken in so general a sense as to include poultry, or any other provision that was paid in kind to the religious.

CHURCH-*wardens*, anciently called CHURCH-*reves*, are officers chosen yearly in Easter week, by the parish and his parishioners, according to the custom of the place; to look to the church, church-yard, church-revenues &c. observe the behaviour of the parishioners with regard to faults that come under the jurisdiction of the ecclesiastical court; present scandalous livers to the bishop; take care none preach without licence, &c.

Counsellors and attornies, surgeons and apothecaries, and dissenting ministers, are exempt from this office; and persons who have sued a felon to conviction, and the first assignee of the certificate thereof, are exempted from the office of *church-warden*, in the parish where the offence

offence was committed. The ſame exemption extends to perſons ſerving in the militia, during ſuch ſervice. Diſſenters are allowed to execute the office by a ſufficient deputy. A perſon refuſing the office, is liable to excommunication. They are ſworn into their office by the archdeacon, who is compellable by a mandamus to admit thoſe whom the pariſh appoint.

The *church-wardens* are a kind of corporation; and are enabled by law to ſue, and be ſued, for any thing belonging to the church, or the poor of the pariſh.

CHURCHING *of women after child-birth*, took its riſe from the Jewiſh rite of purification. In the Greek church it was limited to the fortieth day after delivery; but in the weſtern parts of Europe no certain time is obſerved. There is an office in the liturgy for this purpoſe.

CHURLE, CEORLE, or CARL, in Saxon times, ſignified a tenant at will, who held of the thanes on condition of rent and ſervice. They were of two ſorts, one rented the eſtate like our farmers; the other tilled and manured the demeſnes, and were called ploughmen.

CHURN-*Owl*. See OWL.

CHURR-*Worm*, a name given by ſome to the GRYLLOTALPA.

CHYLE, in the *Animal Oeconomy*, a whitiſh juice, into which the food is immediately converted by digeſtion, or more properly by that firſt branch thereof called CHYLIFICATION.

The word comes from χυμος, *juice*.

Some think that all the groſs ſecretions are from the *chyle*, and particularly that *pus* is the product of the *chyle*, and not of the blood or ſerum. Phil. Tranſ. N° 427. § 2.

CHYLIFICATION, the formation of the *chyle*; or the act whereby the FOOD is changed into CHYLE.

Chylification is begun by comminuting, or breaking the aliment in the mouth, mixing it with ſaliva, and chewing it with the teeth.

By ſuch means, the food is reduced into a kind of pulp, which falling through the *œſophagus* into the warm ſtomach, there mixes with the juices thereof; and being thus diluted, begins to ferment, or putrefy, and aſſumes a very different form from what it had before; growing either acid or rancid.

Here it mixes with a juice ſeparated from the blood by the glands of that part, whoſe excretory ducts open into the ſtomach: as alſo with the remains of the former aliment; and thus it becomes better macerated, diluted, diſſolved, and acquires ſtill a greater likeneſs to the animal fluids, and is called *chyme*.

Add to this, that the fleſhy membrane of the ſtomach, continually contracting and preſſing its contents by its periſtaltic motion, occaſions a more intimate mixture, and by degrees works the more fluid parts through the *pylorus* into the *duodenum*; along the ſides whereof, and the reſt of the *inteſtina tenuia* the lacteals are implanted; into the minute orifices whereof, the finer part of the maſs is received.

The fabric of the ſtomach being conſidered, the heat of the circumambient parts, the pulſations of innumerable arteries, the great ſtrokes of the *aorta* underneath, the conſtant compreſſion of the *diaphragma*, and abdominal muſcles; it muſt neceſſarily follow, that the finer part of the aliment will be firſt expelled the ſtomach; and that the groſſer will remain; till, by the repeated action of the fluids, and the contraction and pulſation of the ſolids, they alſo become fine enough to go off: thus in the ſtomach left empty, and by means of its muſcular coat, reduced to a ſtate of contraction, and appetite is renewed.

Thus will even the fleſhy membranes, cartilages, &c. of animals fed on, be ſqueezed, and be obliged to give out their juices; and thus is a fluid obtained, that ſhall have in ſome meaſure the ſame properties with thoſe of our bodies.

This juice being got through the *pylorus* into the *duodenum* and ſmaller inteſtines, its liquefaction is ſtill promoted by its mixture with two other diſſolvents, the pancreatic juice and the bile; and by continued fermentation; which divide and ſubtilize thoſe parts that were left too groſs; and by the periſtaltic motion of the guts it is protruded forwards. In the paſſage through the ſmall inteſtines, the finer part of the maſs, which we call the *chyle*, enters the orifices of the lacteal veins of the firſt kind, wherewith the whole meſentery is intermixed; which either alone, or together with the meſeraic veins, diſcharge themſelves into the glands at the baſis of the meſentery.

Then the *chyle* is taken up by the lacteals of the ſecond kind, and is conveyed into glands between the two tendons of the *diaphragma*, known heretofore under the name of the *lumbary* glands, now called Pecquet's receſſory, and *receptaculum chyli*; whence, being mixed with great quantities of lymph, it is carried to the heart, by the thoracic duct, and the ſubclavian vein: wherein it begins to be mixed with the blood, and to circulate, and in time becomes aſſimilated thereto. A ſpirit or vapour, which is nothing elſe than the *fixed* AIR of the alimentary ſubſtances, is ſet free from the various mixtures during their fermentation in the firſt paſſages, enters the compoſition of the *chyle*, and is tranſmitted with it to the blood, communicating to it its inteſtine motion, and thus preventing the natural tendency of the fluids to putrefaction. See DIGESTION.

CHYLOSIS, in *Medicine*, the action whereby the aliment is converted into *chyle*, or *chyme*, in the ſtomach, &c. whether it be by a ferment in the ſtomach, or the contractile force of the ſtomach, or both.

CHYME, an animal juice, which is, according to ſome, the ſame with that commonly called CHYLE.

Some, however, diſtinguiſh between *chyme* and *chyle*; reſtraining the word *chyme* to the maſs of food, &c. while in the ſtomach, before it be ſufficiently comminuted and liquefied to paſs the *pylorus* into the *duodenum*, and thence into the lacteals, to be farther aſſuted and impregnated with the pancreatic juice; where it commences *chyle*. And others diſtinguiſh and denominate them the contrary way.

In the common ſignification of the word, it denotes every kind of humour which is increaſſated by concoction. Galen uſes it to ſignify the guſtatory faculty or quality in animals and plants.

CHYMICAL. *adj.* See *Chymical* OIL.

CHYMISTRY, or CHEMISTRY, is a ſcience, the object of which is to diſcover the properties of bodies by analyſis and by combination.

Critics are divided as to the etymology of the name *chymiſtry*: it is uſually derived from χυμος, *juice*; or from χεω, *to melt*. Boerhaave, and others, more juſtly derive it from the Egyptian *chema*, or *kema*, *black*; and write it *chemia*, not *chymia*. Others, making Cham the inventor of *chymiſtry* derive the term from his name; ſupporting their etymology on the ſignification of the word חם, *cham*, which in the Hebrew ſignifies *heat*, *hot*, *black*; all of them bearing ſome relation to the operations of *chymiſtry*.

Chymiſtry is alſo known under various other names: it is ſometimes called the *Hermetical art*, from a ſuppoſition of its being invented by Hermes Triſmegiſtus. Others call it the *Egyptian art*, from the people among whom it was firſt practiſed: others, the *ſacred*, or *divine art*; and *philoſophic* or the art of *making gold*, &c. Others call it the *ſpagyric art*; Paracelſus, the *philoſophic art*: and others, *pyrotechnia*. The chief object of *chymiſtry* is to analyſe, or decompound, natural bodies; reduce them to their firſt principles; diſcover their hidden virtues; and demonſtrate their inner contexture, or the centre, as they call it, wherein natural ſubſtances concur. In a word, *chymiſtry* is the anatomy of natural bodies, by means of fire; which is the definition Hanneman gives us of the art.

Boerhaave defines *chymiſtry* more ſcientifically: "An "art whereby ſenſible bodies contained in veſſels, or ca"pable of being contained therein, are ſo changed, by "means of certain inſtruments, and principally of fire, "that their ſeveral powers and virtues are thereby diſ"covered, with a view to philoſophy, medicine, &c."

This definition appears very prolix and circumſtantial, and more like a deſcription than a definition: but with all his endeavours, that author aſſures us, he could not frame a ſhorter, that would expreſs the full ſcope, object, and inſtruments of *chymiſtry*, ſo as to diſtinguiſh it from every other art: which is a point all the writers of *chymiſtry* have ſtumbled at.

For *chymiſtry* cannot juſtly be called the art of *refining bodies*, as Regius, Paracelſus, &c. define it; ſince mechanics will alſo do that: nor is the matter mended, by ſaying, it is the art of *analyſing bodies by fire*: as Helmont has done: nor by *ſalt*, as others would have it. Theſe definitions include only a part, inſtead of the whole. And with as little propriety is it termed, the art of *ſeparating the pure from the impure*; inaſmuch as it compounds as well as ſeparates, and frequently mixes the pure with the impure. *Chymiſtry*, on this footing, appears a very extenſive art: its object, or the *materia chymica*, is all ſenſible bodies, capable of being contained in veſſels; and is accordingly divided into three kingdoms, *foſſil*, *vegetable*, and *animal*. The operations of *chymiſtry* include all the changes produced in bodies by natural agents or inſtruments; viz. *decoction*, *infuſion*, *exhalation*, *calcination*, *extraction*, *diſtillation*, *cryſtallization*, &c.

The effects, or productions of *chymiſtry*, may be reduced to *magiſteries*, *extracts*, *tinctures*, *elixirs*, and *ſpirituous*.

The *inſtruments*, or *agents of chymiſtry*, whereby its operations are performed, are, *fire*, *water*, *air*, *earth*, *menſtruums*; and *inſtruments* properly ſo called, as *alembics*, *cucurbits*, *retorts*, *pelicans*, *furnaces*, and *lutes*. See *Table of Chemical Veſſels*.

Chymiſtry, as now conceived, is an aſſemblage of very different

different parts, which anciently subsisted separate, or at least had a subsistence prior to each other; as the preparing of metals for human uses, the attempts of transmuting the baser metals into gold, the preparing of medicines, &c. If we are to trace the antiquity of *chymistry*, as an art that teaches to convert other metals into gold, or to procure an universal remedy for all diseases, the research will not carry us far back; but as it relates to the discovery of metals in the mine, and the digging, separating, and purifying them, it challenges even the highest antiquity; and is held by some very learned persons to have been practised in the antediluvian world.

Be this as it will, *chymistry*, no doubt, was first practised in Egypt. According to Moses, Tubal Cain should be the first inventor. Profane authors refer it to Vulcan, and some of the latest and best critics endeavour to shew, that Tubal Cain and Vulcan were the same; as indeed there is a great resemblance between their names.

After Tubal Cain, the first *chymist* we read of is Moses; whose skill in *chymistry* is incontestible, from his burning and pulverising the golden calf the Israelites had set up, and giving it the people to drink; there being scarce a more difficult operation in all *chymistry*, than to make gold potable.

Democritus likewise is said to have been instructed by the Egyptian priests in many *chymical* operations; e. g. in the arts of softening ivory, vitrifying flints, and imitating precious stones. In this abstract of the history of *chymistry*, it is needless to mention the claims of Hermes Trismegistus, or to give any account of books on this subject, under his name, as they are generally reckoned to be spurious. Some authors observe, that Diocletian, after the taking of Alexandria, ordered all the books of *chymistry*, anciently written by the Egyptians, for making gold and silver, to be sought out and burnt; that they might not have the power of enriching themselves by this art, or of putting themselves, by this means, into a condition of revolting again.

Chymistry had the common fate of the other arts, at the declension of the Eastern empire; and lay buried and forgot till the time of Roger Bacon, who retrieved it. He was followed by Lully, Ripley, Basil Valentine, Paracelsus, Agricola, Van Helmont, Glauber, Boyle, Lemery, Homberg, &c. by whom the art has been carried to its present degree of perfection.

The first *chymists* confined themselves to metals: and they made many absurd and unsuccessful attempts for transmuting metals into gold; whilst some of them, as Raymond Lully, and Paracelsus in particular, were possessed with the no less extravagant notion of an universal medicine, to which, however, we may attribute the establishment of rational *chymistry* on the ruins of alchemy. In these latter ages, the bounds of *chymistry* have been greatly enlarged; and plants, animals, minerals, &c. have been taken into it.

It is but of late that *chymistry* has been applied to the preparation of medicines: Basil Valentine, and Arnoldus de Villa Nova, seem to have been the first that attempted it. Paracelsus and Van Helmont carried it to such a length, as to render medicine almost wholly *chymical*.

Authors on the subject of *chymistry* are very numerous: Borel has published a catalogue of most of them, under the title of Bibliotheca Chymica; containing the names of above four thousand. Barner, physician to the king of Poland, was one of the first who arranged the principal *chymical* experiments, and added rational explications, in a work entitled Chymia philosophica perfecte delineata, &c. Norimb. 1689. Becher, Stahl, and Boerhaave deserve to be particularly recorded; the former have established an admirable theory, which is the surest guide in *chymical* researches, and the conformity of which with the phenomena of *chymistry* successive experiments have evinced; and the latter has given both the history, theory, and practice, in an orderly and scientifical method. Dr. Freind has attempted to reduce *chymistry* to Newtonianism, and to account for the reasons of the operations on *chymical* principles. There are many later writers, who have either directly or indirectly, in various ways, contributed to the extension of this science. See Dr. Lewis's valuable edition of Neumann's Works; and the English translation of Macquer's Chemical Dictionary, with many additions and improvements annexed to it by the translator.

Chymistry is divided into *metallurgic*, *alchymic*, *chymical pharmacy*, and *chymical philosophy*. See METALLURGIA, ALCHYMY, &c.

Chymistry again is divided into,

CHYMISTRY, *commercial*, used to denote the application both of technical and philosophical *chymistry*, to the establishing, supporting, or improving any branch of trade or commerce.

CHYMISTRY, *economical*, the application of philosophical, technical or commercial *chymistry*, to the service and accommodation of the affairs of the family.

CHYMISTRY, *philosophical*. Philosophic *chymistry* consists of three parts, viz. *invention*, *ratiocinii*, and *experiment*; whence we may define it to be a particular exercise of the rational and inventive faculties of the mind, leading to experiments, and thence to the discovery of causes, so as to form axioms that shall rationally account for phenomena, and discover rules of practice for producing useful effects. And thus philosophical *chymistry* is not only the key to all the other parts, but it discovers of itself the causes of many natural phenomena, as particularly earthquakes, volcanoes, vegetation, the growth of minerals, and the like.

This branch of *chymistry* also explains the general forms and qualities of bodies, wherein their properties and effects depend; as volatility and fixedness, fluidity and firmness, colours, tastes, odours, effervescence, fermentation, solution, precipitation, congelation, extraction, and the like.

To this part of *chymistry* it also belongs to bring new inventions to the test, to discover their validity or insufficiency. Thus when any hint is started for a new trade, or method invented for the improvement of an old one, before any attempt is made to apply it in the larger way, it should be experimented in miniature; as the alchymaster tells the owner of an ore whether it will be worth the erecting large works for it, or not.

CHYMISTRY, *technical*. By technical *chymistry* is meant the application of philosophical *chymistry* to the immediate service of arts, so as by its means to invent, form, assist, promote, or perfect them in the large way of business.

CHYMISTRY, *theory of*. Under the theory of this art are to be laid down all the general truths which the particular experiments of chymists have hitherto demonstrated. These are, on this occasion, to be taken for granted, and the whole body of such truths makes the universal theory of *chymistry*, for *chymistry* is no science formed *a priori*; it is no production of the human mind, or raised by reasoning, but collected *a posteriori* from experiments; it took its rise from various operations casually made, and observing those that had one and the same uniform tendency, without any expectation of what followed; and was only reduced into an art, by collecting and comparing the effects of such uncertain experiments, and noting the tendency thereof: so far then as a number of experiments agree to establish any unquestionable truth, so far they may be considered as constituting the theory of *chymistry*. Such a theory is necessary to be premised to every art; and something equivalent to this is practised by every artisan, in teaching his disciple how to proceed orderly in the exercise of his art; and accordingly it would be impossible to teach the practice of *chymistry* to advantage, without having first given some such theory. In the forming such a theory of *chymistry*, a direct use may indeed be made of the demonstrations in physics, as particularly in mechanics, hydrostatics, and hydraulics; since the properties common to all bodies, and what farther affections certainly flow therefrom, have their place in *chymistry*. One cannot, however, be too reserved in this use, since those singular properties found in some bodies, will, if applied to others, falsify the mechanical demonstrations, which might hold true every where else.

Due regard being had to this rule, the discoveries of naturalists and mathematicians will always be advantageous, never injurious, to the art of *chymistry*.

CHYMOLOGI, among the *Botanical Students*, such as have employed their time in investigating the qualities and properties of plants from their taste and smell.

CHYMOSIS, in *Medicine*, the act of making and preparing CHYME.

The word comes from χυμος, *succus*, of χεω, *fundo*, *I melt*.

Chymosis, according to some, is the second of the concoctions made in the body; being a repeated preparation of the most impure and gross parts of the chyle, which being rejected by the lacteals, is imbibed by the meseraics, and thence carried to the liver, to be there elaborated, purified, and substituted afresh. It is of this, according to Rogers, that the animal spirits are formed.

CHYMOSIS, or rather CHEMOSIS, is also used for an inflammation of the eye-lids, which turns out their inside to sight.

In which sense, the word comes from χαινω, *hisco*, *I gape*.

CHYTLA, in *Antiquity*, a liquor made of wine and oil, and sometimes used in divination.

CHYTRI, among the Athenians, a festival in honour of Bacchus and Mercury, kept on the thirteenth of the month Anthesterion.

CIBDELOPLACIA, in *Natural History*, the name of a genus

genus of spars. The word is derived from *schistos, impure*, and *vitrum, a crust*. The bodies of this genus are terrene spars, that is, are composed of spar, debased by a very large admixture of earth, and are not therefore of the least brightness or transparency; and are found formed into thin crusts, coating over vegetable and other extraneous bodies in form of incrustations. Of this genus there are five known species, some of them used in medicine, and distinguished by particular names.

CIBDELOSTRACIA, in *Natural History*, the name of a genus of spars. The word is derived from *schistos, fouled or adulterated with extraneous matter*, and *ostracon, a crust or shell*.

The bodies of this genus are crustaceous spars, so highly debased with earth, that they appear in the naked eye mere earths: they are destitute of all brightness or transparence, and are formed into thin plates, and usually found incrusting over the sides of fissures of stones.

Of this genus there are seven known species.

CIBORIA, in *Antiquity*, the large flasks of Egyptian glass, which are said to have been so large as to serve for drinking cups; whence they had their name *ciborium*, signifying a *cup*, in the Egyptian language.

CIBORIUM, in *Ecclesiastical Writers*, the covering for the altar. This covering is supported by four high columns, and forms a kind of tent for the eucharist, in the Romish churches. Some authors call it *tecta pensilia*, and others *pyxis*. But the *pyxis* is properly the box in which the eucharist is preserved.

CIBOULS. See ONIONS.

CIBUS *ferinus*, in *Antiquity*, an entertainment peculiar to a funeral; for which purpose, beans, parsley, lettuce, bread, eggs, lentils, and salt were in use.

CICADA, the *bala cracker*, in *Zoology*, the name of a genus of insects of the order of *hemiptera*, common in Italy, and some other parts of the world, but not found in England. It has large wings, and makes a loud noise, somewhat like that of the cricket. See *Tab. of Insects*, N° 5, and HARVEST-*fly*.

They are recommended by some in medicine as remedies for colics, powdered and mixed with pepper, or burnt to ashes alone, are given in nephritic cases.

CICADA *equestris*, the *water-grasshopper*, a name very injudiciously given by Rondeletius to an animal found frequently in standing waters, of a greyish colour, with six legs, and the appearance of the rudiments of wings; it is remarkable also for having a sort of mask before the face, which it removes or lifts up at pleasure. It is a poor defenceless animal, and is a prey to almost all the other water animals, even to many that are smaller than itself: it has no sort of relation to the GRASSHOPPER; but is the hexapode, or worm state of one of the *libellæ*, or DRAGON-*flies*.

The hinder pair of legs are much longer than the others, and are used in swimming, as oars, in the manner of those of the NOTONECTA.

CICADA *of North America*. This insect is seen annually, but in no great numbers, in Pensylvania; but at certain periods of fourteen or fifteen years, they come forth in such swarms, that they are called *locusts*. They are the prey of so many animals, that their numbers soon decrease; and their duration by order of nature being short, they quickly disappear.

There are two distinct species of *cicada* in North America. See a curious account of the largest sort, by Mr. Collinson, Phil. Trans. vol. liv. N° 10 an. 1764.

CICADULA, in *Natural History*, the name given by Mr. Ray to a small species of insect, called by Swammerdam *locusta pulex*, and found in May and June on the stalks and leaves of plants, involved in a spumous white matter, commonly called cuckow-spit. This spume is not exhausted, as some suppose, from the plant, but from the mouth of the animal; and if it be well wiped away, without injuring the creature, more will be immediately seen issuing out of its mouth, till there is as large a quantity of it as before.

There are several species of this animal, and while they lie in froth they are of the shape of a louse, some being of a whitish, some of a yellowish, and some of a green colour. The hinder legs are somewhat larger than the others, and there is an appearance of the rudiments of wings at the shoulders. They often change their skins while they live in this froth, and only creep at this time; but when they leave the plant, they hop and fly, having large wings which cover the whole body.

CICATRICULA, in *Natural History*, a little whitish speck, or vesicle, in the coat of the yolk of an egg; wherein the first changes appear towards the formation of the chick. The *cicatricula* is what is otherwise called the eye of an EGG.

CICATRISIVE, CICATRIZANT, in *Medicine*, is applied to such remedies as are very deficcative; and on that account aid nature to repair the skin, and to form a cicatrix, or eschar.

Such are Armenian bole, powder of tutty, and the unguentum *diapompholygis*, *defensivum rubrum*, &c.

Cicatrisive medicines are otherwise called *ischaratica, epulotica, incrassantia, agglutinantia*, &c.

CICATRIX, in *Medicine*, &c. a little seam, or elevation of callous flesh, rising on the skin, and remaining there after the healing of a wound, &c. ordinarily called a *scar*, or *eschar*.

Some derive the word from *circa cutem*; others form *cicatrix* from *occocatrix*; the *cicatrix* being only *obductio vulneris, the covering up, or hiding of the wound*: but it is better derived from *cæcatrix*, which has the same force as of the verb *cæcare, to blind*.

The *cicatrix* is the same with regard to the joining of the fleshy parts, as a *callus* is to the bones.

In young infants, these callosities, or scars, sometimes much diminish, and oftentimes quite vanish when come to age, as particularly observed in the pits of the small pox: and, in growing, they are sometimes observed to change their situation.

In large wounds, where there has been a loss of substance, an even *cicatrix* is not to be expected, without great care in the surgeon. When an even, thick, and white matter appears in the wound, it is to be dressed either every day, or every other day, as occasion shall require: the superfluous matter must at every dressing be wiped away with a very light hand; and it is indeed much better to leave some of it in the wound, than to treat that roughly in taking it away; for wiping the wound too roughly, hinders the growth of new flesh; but a little matter being left, only performs the office of oil or balsam, in keeping the parts moist. These rules being observed, new flesh will presently spring up, and the WOUND unite: but that an even *cicatrix* may be procured, the surgeon must endeavour by degrees to lessen the new flesh, by the application of dry lint, covered with a tight bandage. When this does not prove sufficient, it may be proper to use some of the drying balsams, or drying powders, such as tutty, *lapis calaminaris*, mastich, colophony, &c. Rectified spirit of wine is frequently used for this purpose also, with great success, for it carries a very great astringent and drying virtue with it.

See observations on a deep wound of the brain that cicatrized, by Tedecius, in the Col. Acad. tom. iii. P. E. p. 407.

CICATRIZING, in *Medicine*. See CICATRISIVE.

CICCA, in *Botany*, a genus of the *monœcia triandria* class; the male flowers of which have a four-leaved calyx, and no corolla; the female have a three-leaved calyx, no corolla, four styles, and a capsule including four berries.

CICELY, in *Botany*. See CHERVIL.

CICER, the *chickpease*, in *Botany*. See CHICK-PEA.

CICERULA, in *Botany*, a name given by some authors to the common fenchus, or fow-thistle.

CICERONIANISM, or CICERONISM, an appellation given by way of contempt to those moderns, who dispute the propriety of all expressions and words not found in Cicero.

CICERUM *lapis*, the *chick-stone*, in *Natural History*, a name given by some authors to a sort of small round stones, of the nature of the pisolithe or pea-stones, but smaller than those usually are, and of a dusky grey colour. They very exactly resemble the fruit of the cicer or chick-pea, and are found in great abundance near the old Jerusalem.

CICERELLUS, in *Ichthyology*, a name given by Boccone, and some other authors, to the AMMODYTES or sand-eel; the *tobianus* of Schonevelder.

CICHORIUM, *succory*, in *Botany*. See ENDIVE.

CICINDELA, in *Natural History*, the name of the GLOW-*worm*.

CICINDELA *volans*. See GLOW-*worm*.

CICISBEO, an Italian term, which in its etymology signifies a *waiting-page*, which has been followed in Italy both on lovers, and on those who by outward appearance act as such, attending on married ladies with as much attention and respect as if they were their lovers. This Italian custom has been spoken of very reproachfully by some writers: Mr. Sareth has taken great pains to vindicate it. He ascribes it to a spirit of gallantry, derived from the ages of chivalry, and much heightened and refined by the revival of the Platonic philosophy in Italy, about the thirteenth century; and by the verses of Petrarch in complement to the beautiful Laura, and his numerous imitators. Account of the Manners, &c. of Italy, vol. i. chap. 8.

CICLA, in *Botany*, a name given by some to the white beet.

CICLA, in *Ichthyology*, a name given by Artedi, and other

late writers, to a species of fish called *chichle* by Ariſtotle and Ælian, and THUNDUS *minor* by the generality of late writers. See VERDONE.

CICONIA, in *Ornithology*, the name by which authors call the ſtork. See STORK.

CICUTA. See HEMLOCK.

There are not wanting authors among the Germans, who recommend the ſeed of the common *hemlock* againſt obſtructions in the ſpleen; but as we have already remedies enough in the ſame intention, which are not ſuſpected as poiſonous, it is beſt to be contented with them, till a great many more trials have been made of this new medicine than we have accounts of at preſent.

CICUTA is alſo uſed, chiefly among the ancients, for a poiſonous juice, or liquor, expreſſed from a plant called *cicuta aquatica*; being the common poiſon wherewith the ſtate criminals at Athens were put to death.

The *cicuta* of the ancients is a ſecret now ſcarce poſſible to be diſcovered. Wepfer in an expreſs treatiſe on the ſubject, will have it the OENANTHE *cicutæ ſuccis, foetæ virgis*; which he deſcribes by the name of *cicuta aquatica*; and of the diſmal effects of which he gives a very ample relation. At leaſt the violence of this plant makes it a much fitter inſtrument of haſty death than the common *cicuta* or hemlock, which is much leſs malignant. Though ſome have ſuggeſted, that the poiſonous draught to which the Athenians doomed their criminals, was an inſpiſſated juice compounded of the juice of *cicuta*, and ſome other *corrective* herbs. Vide Mead's Eſſay on Poiſons, 4to. Bibl. Med. tom. iii. p. 281.

Socrates drank the *cicuta*. Plato, in his Dialogue on the Immortality of the Soul, obſerves, that "The execu-"tioner adviſed Socrates not to talk, for fear of cauſing "the *cicuta* to operate too ſlowly." M. Perit, in his Obſervationes Miſcellaneæ, remarks, that this adverti ſement was not given by the executioner out of humanity, but to ſave the *cicuta*: for he was only allowed ſo much poiſon *per annum*, which if he exceeded, he was to furniſh the reſt at his own expence. This conſtruction is confirmed by a paſſage in Plutarch: the executioner who adminiſtered the *cicuta* to Phocion, not having enough, Phocion gave him money to buy more; obſerving, by the way, that it was odd enough, that at Athens a man muſt pay for every thing, even his own death.

CICUTARIA. See HEMLOCK, and CHERVIL.

CIDARIS, the mitre uſed by the Jewiſh high prieſts. Whenever there is mention of the high prieſt's mitre, the Hebrew word *mitſnephath* is uſed: but *migbaath* is uſed to ſignify the bonnet belonging to common prieſts. The rabbins ſay the ſame thing is meant by both theſe terms, and that the bonnet uſed by prieſts in general was made of a piece of linen cloth fifteen yards long, which covered their heads like an helmet or a turban: and they allow no other difference to be between the high prieſt's bonnet, and that of other prieſts, than this, the one is flatter, and more in the form of a turban, whereas the other worn by ordinary prieſts roſe ſomething more in a point. Exod. xxviii. 4.

It is to be obſerved, that the Hebrew prieſts never appeared in the temple without covering their heads. And this at this day it is reckoned an incivility in the Eaſt, and a mark of contempt, for any man to pull off his hat or turban to another, or to ſhew his naked head before any one.

CIDARIS, in *Conchyliology*. See TURBAN-*ſhell*.

CIDER, a briſk, tart, cool liquor, prepared from apples. See CYDER.

CIERGE, in *Conchyliology*, a name given by the French to a ſea-ſhell, a ſpecies of VOLUTA. This is of the colour of common yellow wax, without any variegations on the ſurface; but when its rough coat is taken off, it makes a very different appearance, having the zones and colours of the onyx. It is preſerved in many cabinets, in this ſtate, under the name of the onyx ſhell.

CIGALE, in *Natural Hiſtory*, the French name for the *cicada*, particularly for the large kind, called *achetæ* by the ancients. See HARVEST-*fly*.

CIGNE, in *Conchyliology*, the SWAN-*ſhell*, a name given by the French to that ſpecies of *voluta*, which, beſide this name, is known by two other very different ones, *cierge* and *wax*, and is taken by the generality of collectors for three different ſhells. When it has its natural coat on, it is of a rough ſurface, and yellow colour, much like that of common wax, whence it is called cierge, or the wax-ſhell. When this coat is juſt taken off, it appears of a very beautiful white, and is then called the *cygne*, or ſwan-ſhell; and when it is poliſhed further down, ſo as to ſhew its inner ſtructure, it appears zoned in the manner of the onyx, and is then called the *onyx*.

CIGALON, in *Natural Hiſtory*, the name by which the French writers call the ſmaller ſpecies of cicada, as they do the larger the cigale. The ancients were acquainted with two ſpecies of cicada; a great one, and a ſmaller one: the laſt of theſe they called *tettigonia*, and the firſt *achæta*. It has been uſually ſuppoſed, that the *cigalon* of the moderns was their *tettigonia*: but Mr. Reaumur obſerves, that we have in reality three kinds of them, a large, a middling, and a ſmall one, and that the large was their *achæta*, the middle one their *tettigonia*; and that the *cigalon*, or ſmall one, which is about the ſize of a hornet, was wholly unknown to them. See HARVEST-*fly*.

CILERY, in *Architecture*, a term uſed to denote the drapery or leavage on the heads of columns.

CILIA, in *Anatomy*, the hairs wherewith the *palpebræ*, or eye-lids, are fringed; eſpecially the upper, which are larger and ſtiffer than thoſe of the under.

Their uſe ſeems to be, to break the too fierce impreſſion of the rays of light; as alſo to keep out flies and moths, and other things floating in the air, which might annoy the eye.

Theſe *cilia* ſpring from a ſmall row of glands, which cover a thin tender cartilage, edging each eye-lid, and ſerving as a kind of rod, or ring, to ſtretch them upon.

CILIARE, in *Anatomy*, an epithet given to a pair of the eye, called *ligamentum ciliare*; becauſe of its relation to the *cilia*, or hair of the eye-lids.

The *ligamentum ciliare*, called alſo *proceſſus ciliaris*, conſiſts of a range of black fibres diſpoſed circularly; having their riſe in the inner part of the *uvea*, and terminating in the prominent part of the cryſtalline, which they encompaſs round.

Anatomiſts generally imagine their uſe to be to ſuſpend the cryſtalline in the globe of the eye, to lengthen or ſhorten its figure, and bring it nearer to, or farther from the *uvea*; and even to open or contract the pupil as occaſion requires, i. e. as near or remote objects, obſcure or bright objects, are to be viewed.

The motion of the pupil, ſome ſay, is effected by the circular and ſtrait fibres of the *uvea*; others attribute it to the *ciliary* ligament: yet, there is no great doubt, but they both concur in the ſame action; and that the *ligamentum ciliare* doth at the ſame time the pupil opens or ſhuts, dilats or compreſſes the cryſtalline, and bring it nearer, or carry it farther off the *retina*. Derham, Phyſ. Theol.

M. Mariotte denies the *ligamentum ciliare* to have any connexion with the cryſtalline, or to ſerve for any purpoſes thereof.

CILIARIS, in *Anatomy*, a muſcle, otherwiſe called ORBICULARIS *palpebrarum*.

CILIATED *leaf*, among *Botaniſts*. See LEAF.

CILICIA *terra*, in the *Natural Hiſtory of the Ancients*, a bituminous ſubſtance, though called an earth, which, by boiling, became tough like bird-lime, and was uſed inſtead of that ſubſtance to cover the flocks of the vines, for preſerving them from the worms. It probably ſerved in this office in a ſort of double capacity, *driving* thoſe animals away by its naſeous ſmell, and *entangling* them if they chanced to get among it.

CILICIUM, a ſort of habit made of coarſe ſtuff, of a black or dark colour, formerly in uſe among the Hebrews, in times of mourning or diſtreſs. It was called *Ciliciom*, becauſe it came from Cilicia, or rather becauſe the Cilicians invented this kind of habit, made of goat's hair, and uſed principally in camps and ſhips, by ſoldiers and mariners.

CIMA, or SIMA, in *Architecture*, a member or moulding, called alſo *ogee*, and *cymatium*. *See Tab. Archit. fig.* 8.

CIMELIANTHUS, in *Natural Hiſtory*, a name given by authors to a ſpecies of the *ocular ſtone*. It is deſcribed to be of a white colour, reſembling that of marble, with a yellow pupil in the middle. It was found on the ſhores of the Euphrates.

CIMELIARC, in *Church Architecture*, the room where the plate, veſtments, &c. belonging to the church are kept. In Engliſh, a veſtry.

CIMEX, BUG, in *Natural Hiſtory*, the name of a genus of inſects, the characters of which are theſe: the head is ſmall; the back, towards the ſhoulders, is broad, and is covered with a cruſtaceous ſubſtance: its ſhoulders are of an angular make; and its wings partly cruſtaceous, partly membranaceous, and are ſo formed, that they exhibit the figure of a croſs, where they meet at the middle of the back; and they have a long probocis, which is bent under the belly, and always lies ſtraight, not in a ſpiral form.

Mr. Ray divides the *cimices* into two kinds, thoſe of a ſhorter, and thoſe of a longer and narrower make. Of the firſt kind he deſcribes eight ſpecies.

Of the other kind of *cimices*, which have longer and narrower bodies, Mr. Ray mentions five kinds.

The

The house-bug, or *cimex lectularius*, so extremely troublesome about beds, is of a roundish figure, of a dark cinnamon colour; and when crushed, emits a most offensive smell.

Many are the compositions and ointments prescribed for destroying them; but it is hardly possible to eradicate them when once they get into furniture. Some recommend to wash the bedsteads with oil of turpentine, or to paint them with verdigreafe ground in linfeed and oil of turpentine: others to make an ointment of wormwood, rue, common oil, and water boiled together, and mixed with fulphur; a mixture of hemp, oil, and oxgall, has been fometimes ufed; and an ointment made of equal quantities of black and common foap, and quickfilver, has been applied to the places infefted with *bugs*. After all, cleanlinefs is the greateft fecurity againft thefe vermin.

There are alfo two fpecies of water-*cimices*.

Befide all thefe, which are properly of the *cimex* kind, there is another fet of infects mentioned by Mr. Ray, as nearly approaching to them, and defcribed under the name of the CIMICIFORMES *muſcæ*.

CIMICIFORMIS *muſca*, in *Natural Hiſtory*, a name given by Mr. Ray to a kind of infects, partly of the fly, and partly of the CIMEX kind. Of thefe there are eleven fpecies defcribed in his hiſtory. Thefe are all found about our hedges in dry places, and are a beautiful fet of infects.

CIMICIFUGA, in *Botany*, a genus of the *dioecia polyandria* clafs, bearing male and female flowers; with a five-leaved calyx, twenty ſtamina, and no corolla; the capſule is polyſpermous.

CIMIER, in the French *Heraldry*. See CREST.

CIMOLIA *terra*, in *Natural Hiſtory*, a name by which the ancients expreſſed a very valuable medicinal earth; but which later ages have ſuppoſed to be no other than our common tobacco-pipe *clay* and FULLER'S *earth*.

The *Cimolia terra* of the ancients was found in ſeveral of the iſlands of the Archipelago, particularly the iſland Cimolus, from which it had its name, and which is now called Argentiere; and was uſed with great ſucceſs in the St. Anthony's fire, inflammations, and other external affections of a like kind, being applied by way of a cataplaſm to the part. They alſo uſed, as we do, what we call *Cimolia*, or fuller's earth, for bleaching linen, and cleaning of cloaths. This earth of the ancients, though ſo long diſregarded, and by many ſuppoſed loſt, is however yet very plentiful in Argentiere, Sphanto, and many other of thoſe iſlands; and is a marle of a lax and crumbly texture, and a pure bright white colour, and very ſoft to the touch. It was evidently the ſubſtance we now call *ſteatites*, or the ſoap-rock, common in Cornwall, and alſo in the iſland of Argentiere or Cimolus.

CIMOLIA *alba*, the officinal name of the earth or clay of which we now make tobacco-pipes. Its diſtinguiſhing characters are, that it is a denſe, compact, heavy clay, of a dull white colour, and very cloſe texture; it will not eaſily break between the fingers, and ſlightly ſtains the ſkin in handling. It adheres firmly to the tongue; melts very ſlowly in the mouth, and is not readily diffuſible in water; and is not acted upon by acids. It is found in many places. That of the iſle of Wight is much eſteemed for its colour. When applied to uſe, it is mixed with another ſort of white clay, there called Hayter's clay. We have vaſt plenty of it alſo near Pool in Dorſetſhire, and near Weddenbury in Staffordſhire.

A third ſort of white *Cimolia*, differing from the former in not being unctuous, and ſuffering no change in the fire, is dug near Lymington in Hampſhire, and likewiſe applied to no uſe. A fourth ſort, tinged and veined with yellow, which turns to a pale red, acquires in the fire a whiter colour, but no hardneſs, is dug on the banks of the Medway, near Maidſtone, and uſed for the manufacture of gallypots at Vauxhall. A fifth ſort diſſolves readily in water, and burns to a greater hardneſs and a cleaner white: it is dug near Barnſtaple in Devonſhire, and uſed in making the broſely tobacco-pipes. A ſixth ſort is gleaſine; ſuffers little change in the fire: is dug near Wareham in Dorſetſhire, and called Pool clay; and uſed for tobacco-pipes.

CIMOLIA *nigra*, is of a dark lead-colour, hard, dry, and heavy; of a ſmooth compact texture, and not friſcid: it does not colour the hands, crumbles when dry, adheres to the tongue; diſſolves ſlowly in water; and is not acted upon by acids. It burns perfectly white, and acquires a conſiderable hardneſs. The chief pits for this clay are near Northampton, where it is uſed in the manufacture of tobacco-pipes. It is alſo mixed with the *cretiſe* clay of Derbyſhire, in the proportion of one part to three, in the manufacture of the hard reddiſh brown ware.

CIMÆA, in *Natural Hiſtory*, the name of a ſtone found in the head of a fiſh, of a whitiſh colour, and oblong figure. The ancients ſuppoſed it preſaged tempeſts when its ſurface looked duſky and obſcure; and, on the contrary, fair weather, when it looked bright and clear.

CINÆDOLOGIA, among the *Ancients*, a kind of ſatirical poetry, the chief ſubjects of which were the *cinædi*.

CINÆDUS, in *Antiquity*, is uſed to ſignify a dancer or pantomime.

At firſt they performed only on the ſtage, but afterwards were admitted to the entertainments of princes.

CINÆRUS, in *Ichthyology*, the name of a fiſh common in the Archipelago, about the ſhores and rocks, ſuppoſed by many to be the ſame ſpecies with the alphefiſes, and of the tunina kind, only with its back-fin prickly all its length. It is of a yellowiſh hue all over, blended and variegated with an admixture of purple; its ſcales are doubled and indented; and its teeth very ſtrong and firm, and diſpoſed in two rows in each jaw, and are long and ſharp.

CINARA, *artichoak*, in *Botany*. See ARTICHOAK.

CINCHONA, in *botany*, the name by which Linnæus calls the tree which produces the Jeſuits bark. This is a peculiar genus of plants, of the *pentandria monogynia* claſs; the characters of which are theſe: the cup is a ſmall perianthume, compoſed of one leaf, divided into five ſegments, and remaining after the flower is fallen. The flower conſiſts of one petal, and is of a funnel ſhape; it is a long and cylindric tube, terminating in a wide expanded edge, which is divided into five ſerrated and pointed ſegments: the ſtamina are five ſmall filaments, and the apices oblong, and placed within the tube of the flower; the piſtil conſiſts of a roundiſh germen placed below the cup, a ſtyle which is of the length of the flower, and a thick oblong ſimple ſtigma; the fruit is a roundiſh capſule, at the top of which ſtands the cup by way of a crown; this capſule contains two cells, and when ripe opens longitudinally into two parts. The ſeeds are very numerous, and are oblong, compreſſed, and ſurrounded with a ſulcaceous edge. See CORTEX *Peruvianus*.

CINCLUS, in *Ornithology*, a ſpecies of the FRINGA. It is given by ſome to the bird called in Engliſh the greater reed-ſparrow, and by the generality of authors JUNCO.

CINCLUS is alſo the name of a ſpecies of STURNUS or STARLING.

CINCLUS *prior*, is alſo a name given by Aldrovandus to a bird, the ſame with what we call the LINNET.

CINCLUS *tertius*. See GIARLOLO.

CINCTURE, or CINCTURE, in *Architecture*, a ring, or liſt, at the top and bottom of the ſhaft of a column; ſeparating the ſhaft, at one end, from the baſe; and at the other from the capital. *See Tab. Archit. fig.* 24. and 25.

The word, in its original French, ſignifies *girdle*; of the Latin, *cinger*, *I girt*.

That at the bottom is peculiarly called *aſtragal*; as if the pillar took its flight hence: and that at top, *collarin*, or collar.

The *cincture* is ſuppoſed to be an imitation of the girths, or ferrils, anciently uſed to ſtrengthen and preſerve the primitive wooden columns. See ORDER.

CINEFACTION. See CINERATION.

CINERARIA, *Ivy-flower*, in *Botany*, a genus of the *ſyngeneſia polygamia ſuperflua* claſs: with a naked receptacle; and ſingle, polyphyllous, equal calyx.

CINERARIA, in *Botany*, a name by which ſome authors have called the *ſtatice maritima*, or ſea-ragwort, becauſe of the grey colour of its leaves.

CINERARIUS, in *Antiquity*, an officer retained by the women, whoſe buſineſs it was to provide aſhes proper for tinging the hair with a deep yellow colour. He was otherwiſe called *cinifo*.

CINERARIUS is alſo uſed to ſignify one who paid a veneration to the aſhes and relics of martyrs and ſaints.

CINERATION, in *Chemiſtry*, the reduction of wood, or any other combuſtible matter, into aſhes, by means of fire.—This, others call *cineſaction*.

CINERES. See ASHES.

CINERES *Etnæi*, a name given by authors to a duſky and ſaline ſubſtance thrown out of mount Ætna, in form of powder, and reſembling aſhes. After an eruption of this mountain, theſe ſaline aſhes are found ſcattered about the opening itſelf, down the ſides of the mountain, and over the country for ten miles, or more, round. Thoſe aſhes, which are found thrown to the diſtance of eight or ten miles, are generally taken up in form of a very dry duſt, almoſt inſipid to the taſte: but what lie upon, and round about the ſkirts of the mountain, are very different; they are never dry, though they lie many months expoſed to the ſun's heat, which is very great there, but always feel damp and wet, and are compoſed of larger or ſmaller lumps, and not of a fine

powder,

powder, as the more distant are. They are of a very strongly vitriolic taste, resembling that of our common green copperas. From this taste, and from the great quantities of matter resembling a sort of crocus Martis, and with these a great abundance of sulphur, which is burnt away, and the vast quantities also which are sublimed about the mouths, and left unburnt, it appears, that the common pyrites is contained in vast abundance in the bowels of the mountain, since green vitriol and sulphur are its produce, and nothing is to easy as to calcine it with the purple powder resembling crocus Martis which is the third substance so frequent there. This gives great weight to the opinion of those who believe all the eruptions of the burning mountains in the several parts of the world to be owing to this mineral. See PYRITES and VOLCANO.

CINERES *clavellati*, among *Chymists*, are the ashes of tartar, or lees of wine, burnt.

CINERITIOUS, a term applied to things resembling ashes; particularly in point of colour and consistence.

Thus, the cortical part of the brain is also called the *cinerious* part.

CINGULUM *fœtorius*. See GIRDLE.

CINIFLO, in *Antiquity*, the same with CINERARIUS.

CINNA, in *Botany*, a genus of the *monandria digynia* class. The calyx is a bivalve single-flowered glume; and the corolla is a bivalve glume. The seed is single.

CINNABAR, in *Natural History*, a mineral substance, red, heavy, and brittant; found chiefly in the quicksilver mines, and being one of the ores of that mineral.

The word comes from *anaxa*, *the smell of goats*, because, says Matthiolus, in digging one kind of mineral *cinnabar*, it yields so strong a scent, that the diggers are obliged to stop their nostrils.

Some have wildly imagined *cinnabar* to be DRAGON'S-*blood*, gathered, as Pliny and Solinus have it, when the dragon and elephant fight together. This fable is refuted by Dioscorides, and Scaliger.

Cinnabar is either *native*, or *factitious*.

CINNABAR, *native*, or *mineral*, which is that above mentioned, is found in most places where there are quicksilver mines.

It may be esteemed as an ore of quicksilver, or rather as quicksilver petrified and fixed, by means of sulphur, and a subterraneous heat; chemistry being found to reduce it, without much trouble or loss, to the nature of MERCURY. Each pound of good *cinnabar* yields fourteen ounces of mercury. Accordingly, the principal property and use of this mineral is to yield a most excellent mercury; and that which the alchemists maintain to be the best disposed for attaining to the transmutation of gold.

The principal mines of *cinnabar* are those of Kremnitz in Hungary; of Hydria in Schavonia; of Horowitz in Bohemia; of Carinthia, of Friouli, and of Guancavelica in Peru. The *cinnabar* of the Philippines in Asia is of the highest colour; but the richest is that of Almaden in Spain, on the frontiers of Estramadura.

Jussieu has given a circumstantial memoir on the subject of *cinnabar*, in the A. D. B. an. 1719.

To discover whether a mineral contains mercury, or is true *cinnabar*, Jussieu recommends reddening a bit of it in the fire; and when it appears covered with a little bluish saline, to put it under a glass cover, through which we are to observe whether the vapours condense under the form of small drops of mercury adhering to the glass, or running down the sides of it. The falsification of *cinnabar*, the same author observes, may be discovered by the colour of its flame when put upon burning coals. If it be blue approaching to violet, and without smell, it is a mark of its purity; if the flame be of a reddish call, there is ground to suspect that it has been adulterated with MINIUM; and if it boils as it were on the coals, it is a presumption, if not a proof, that it contains a mixture of DRAGON'S-*blood*. Fixed alcalies, quick lime, calcareous earths, iron, copper, tin, lead, silver, bismuth, and regulus of antimony, have a greater affinity than mercury has to sulphur, and consequently are capable of decomposing *cinnabar*.

The best mineral *cinnabar* is of a high colour, brilliant, and free from heavy matter. It is used by physicians in venereal cases, and other occasioned by sharp serosities. It is esteemed a good cephalic, and accounted of service in epilepsies, and other nervous distempers: and is reckoned of efficacy in cutaneous cases, as the scurvy; and used in fumigations, when its vapours penetrate the pores of the skin, and produce similar effects to those which are produced by mercury administered by friction. Care must be taken, however, that the patient be not exposed to breathe the vapours of the mercury and burning sulphur by which he might be injured.

CINNABAR, *factitious*, or *artificial*, is formed of a mixture of mercury and sulphur, sublimed, and thus reduced to a kind of fine red globe. The best is of a high colour, and full of fibres, like needles.

The method of preparing factitious CINNABAR is thus: they take sulphur, one part, melt it in a pipkin; then put to it, by a little at a time, from six to eight parts of quicksilver, stirring them together till no mercury appears; then letting them cool, they grind the mixture, put it in a bolt-head, bake it, and place it over a naked fire, which they augment by degrees; a coloured fume arises first to the top of the subliming vessel, which, in the farther progress of the heat, becomes, at length, of a red, crimson hue. Taking it off the fire, the *cinnabar* is found at top.

Hoffman says, that *cinnabar* may be produced without sublimation, by flushing or digesting a little mercury with volatile tincture of sulphur, by which means the mercury imbibes the sulphur from the volatile spirit, and forms with it a deep red powder, not inferior in colour to ordinary *cinnabar*.

This serves for the same medicinal purposes with the *native cinnabar*: besides which it is likewise used by the farriers to make pills for their horses; and by painters, as a colour: it being a very vivid red, but drying with some difficulty.

This *cinnabar*, called also by the painters VERMILION, is rendered more beautiful by grinding it with gum-water, and a little saffron to prevent its growing black.

There is likewise a *blue cinnabar*, made by mixing two parts of sulphur with three of quicksilver, and one of *sal ammoniac*: these being sublimed, produce a beautiful blue sublimate; whereas quicksilver and sulphur alone produce a red.

The chemists prepare other kinds of artificial *cinnabar*; as,

CINNABAR *of antimony*, so called, because its sulphur has been furnished by antimony, is obtained from the decomposition of corrosive sublimate by antimony. These compound substances are mixed together, and distilled: and during the operation, the marine acid of the corrosive sublimate quits the mercury, and combines with the regulus of antimony, forming *butter of* ANTIMONY; and the mercury of the sublimate, disengaged from its marine acid, unites with the sulphur of the antimony disengaged from its regulus: these two substances, thus united, are sublimed in form of *cinnabar*, after the butter of antimony has been distilled. This kind of *cinnabar* contains more sulphur than the *factitious*, and consequently appears of a darker colour.

Mercury revived from *cinnabar* of antimony is greatly to be preferred to that obtained by any other means, both for amalgamating with metals, and for all uses in medicine; for this mercury is perfectly freed and depurated from its metallic, terrene, and heterogeneous particles, by the sulphur of antimony.

The manner of reviving mercury from *cinnabar* of antimony, is variously delivered by different authors; but most of them prefer the use of pot-ashes to any thing else on the occasion. Hoffman, however, who has written expressly on the subject, says, that filings of steel or copper are greatly to be preferred to these salts. In the making *cinnabar* of antimony, it should be sublimed often, in order to render it quite pure, and perfect: and afterwards, when it is to be given internally, it should be powdered extremely fine, since in the common way of giving these medicines grossly ground, they can only exert their operations in the *prima via*, it being impossible for them ever to reach the lacteals, and thence to be received into the mass of blood. Many ways have been thought of for exalting the virtues of this excellent medicine, such as solution, fixation, and the drawing a tincture from it. Solution in acid menstrua is wholly to be condemned, for it renders it corrosive and dangerous to be taken internally; and the other insipid and æthereal dissolvents which many chemists boast of, are not yet known. The only medicinal preparation that has been contrived of *cinnabar* on this plan, is that by pouring sweet spirit of vitriol on it. This makes only a slight and superficial solution; but the liquor becomes very rich, in virtues far exceeding the *cinnabar* itself, when taken in powder.

Many ways have been attempted to fix *cinnabar*, by means of common salt, sweet sulphur, and oil of vitriol; and Hoffman gives a method of doing this in so perfect a manner, by means of spirit of nitre and oil of vitriol, that the mercury of it will not purge gold white, and a piece of the *cinnabar* thus fixed being thrown upon burning charcoal, will burn all away, leaving no remainder. Crucifixus boasts of a preparation of *cinnabar* of this kind, with which he cured the gout; and by his own accounts this seems to be the very preparation; and the same preparation has been found an excellent cure for stubborn quartans,

quartans, mixed with extract of bark, gentian, and salt of wormwood.

The drawing a tincture from *cinnabar* of antimony seemt impracticable for many reasons; all that is pretended to be done of this kind being in reality only drawing a tincture from one part, not from the whole of the medicine; and therefore such a tincture cannot be expected to contain all its virtues.

Cinnabar is the best of all correctors of opium; and an excellent preparation of this kind is published by the same author.

Cinnabar is by some much dreaded as a medicine, in all cases of inflammation, hæmorrhages, and the like distemperatures of the body; but Stahl reports from repeated experience, that it is one of the greatest of all medicines in these very cases, nothing more efficaciously quieting the violent emotions of the blood, or supplying so happily the place of opiates; his general prescription in hæmorrhages, head-achs, and other the like affections, being nitre, crabs eyes, and *cinnabar*. Frid. Hoffman Dissert. de Cin. Ant.

It is held a diaphoretic and alterative; and is used in scrophulous, and other chronic cases.

Hoffman recommends it as a sedative and antispasmodic; Stahl makes it an ingredient in his *temperate powder*. Others deny its internal efficacy, and urge that it is unsoluble by any menstruum.

CINNAMOLOGUS, in *Natural History*, among the ancients, the name given to a bird which built its nest either in the cinnamon-tree, or upon rocks and precipices, with the broken branches of that tree. The ancients have a great many idle traditions concerning this bird: some say it is the phœnix; and others, that it is a peculiar species of fowl. The common opinion of the phœnix building its nest of spices, seems to have given birth to all the idle stories that we hear of this bird in Pliny and other credulous authors.

CINNAMON, an agreeable aromatic spice, brought from the East Indies; the whole taste and flavour of which may be extracted by digestion with spirit of wine.

Cinnamon is allowed to be the bark of a tree growing in the island of Ceylon; and, as some say, also in Java and in Malabar. It is a species of the bay; for the characters of which, see BAY-*tree*.

By *cinnamon* is now understood that only produced in Ceylon; that of Java, Sumatra, and Malabar, is called CASSIA *lignea*.

The *cinnamon*-tree grows in woods, like other trees. It never rises high: its leaves resemble those of the laurel, both as to substance and colour. The flowers, when they first begin to open, are red as scarlet; and if rubbed between the hands, they yield an odour more like that of cloves than of *cinnamon*. Seba says he found them blue, and of the bigness of the Italian bean-flower. The fruit resembles an acorn, or olive; and has neither the smell nor taste of the bark. These berries are an excellent carminative, and are much used in medicine. When boiled in water, it yields an oil, which, as it cools and hardens, becomes as firm and white as tallow; and is called by the Dutch *cinnamon wax*. Its smell is agreeable: and they make candles of it, which are only allowed to be burnt in the king's palace. It is also used in physic, as a balsamic, and healer.

The leaves of the *cinnamon*-tree are called *folia Malabathri*, and yield a bitterish aromatic oil, called *oleum Malabathri*, reputed excellent against cephalalgias, &c.—See an account of the *cinnamon*-tree, by Mr. Watson F. R. S. Phil. Trans. vol. xlvii. an. 1751 N° 46. p. 301.

The chief virtue of the *cinnamon*-tree is in its bark; which, when green, appears to be double: its exterior surface being brownish, and the inner of the common *cinnamon* colour.

It is then divisible into two barks of different colours; but these drying together become inseparable, and pass for the same bark; the brownish colour changing in proportion as it dries.

When the *cinnamon* is fresh taken from the tree, it is flat, and has little taste, smell or colour; but it twists or convolves, as it dries, in form of a stick, or cane; whence the French call it *canelle*.

By thus exhaling its superfluous humidity, it acquires a sweet brisk smell, and a sharp pungent taste. It is said, that after the tree has been stripped of its bark, in three years it forms a new one, which is as good as the first: but this is not very probable. The Ceylonese cut down their *cinnamon*-trees, as soon as they are stripped, close to the root: and from the stump there spring up new ones, which in five or six years time become trees fit for barking. A sort of pigeons which feed on the fruit of the *cinnamon*-tree, are the chief agents in propagating it. In carrying the fruit to a distance to their young, they drop it in various places, where it takes root. Vide Phil. Trans. N° 409. p. 164, &c.

Some hold that the small branches of the same tree make the CASSIA; but that is a great mistake.

The natives draw from the roots of the tree a liquor, which, as it hardens, in all respects resembles camphor; and which in reality is a true camphor.

Cinnamon, to be good, must have a brisk, agreeable taste, and a bright brown colour. Its qualities are, to heat and dry; to promote the menses, to fortify the spirits, and to help digestion: but its chief use, in medicine, is as an astringent; with which intention it is prescribed in diarrhœas, and weaknesses of the stomach.

The *cinnamon* of the ancients was different from that of the moderns; they distinguished five kinds of *cinnamon*: the *nitrites*; *cinnamon of the mountain*; *black* and *branched cinnamon*; another white and spongious; and a fifth, of less value, reddish and of a strong smell: as also a *bastard cinnamon*, called *macrober*. This last species was anciently in very high esteem, but it is now no longer known.

They extract an oil from *cinnamon*, called its *essence*, or *quintessence*, which is an excellent cardiac: it is drawn by distillation, like the oils of other vegetables. Indeed, being heavier than most other essential oils, it requires a greater heat to raise it. And for the same reason it sinks to the bottom of the water that comes over with it into the receiver; whereas others swim on the surface: the essential oil of cloves, sassafras, guaiacum, and box, excepted. The Dutch are said to have a method of preparing, or rather, adulterating oil of *cinnamon*, which is kept a secret among themselves. And the common *cinnamon* is often adulterated with that out of which this essence has been extracted.

Cinnamon, by means of fire, furnishes, besides its oil, watery, extracts, and salts; out of which are compounded syrups, and pastils, called *sico-saccharo*; together with an essence, that serves to turn all manner of wines, white and red, into hypocras.

CINNAMON-*water* is made by distilling the bark (first infused for some days) in spirit of wine, brandy, or white wine.

All the *cinnamon* consumed in Europe comes from the Dutch; who have got the whole commerce thereof in their own hands, by becoming masters of the isle of Ceylon, and destroying all the other *cinnamon*-trees about the kingdom of Cochin.

The Dutch, who are the proprietors of Ceylon, are so jealous of this tree, which affords so valuable an article of their commerce, that the fruit or young plants are forbidden by an order of the states, to be sent from thence, left other powers might avail themselves of it. But it appears, from Mr. Watson's account above referred to, that this prohibition has not been of very long standing. The Dutch, however, have been fortunate enough hitherto to keep it to themselves.

CINNAMON, *wild*, is also the bark of a tree growing in Brasil and Madagascar; where it is known under the name of *ravensara*. The Portuguese call it *arvre de marenhum*.

This bark pulverised, is sometimes substituted for real cloves, though far short of them in respect of flavour. Sassafras is sometimes also called *cinnamon-wood*. See SASSAFRAS.

CINNAMON, *white*, which some call *cortex cariocus*, or *carioxat*, or erroneously *cortex Winteri*, *Winter's bark*, from the person's name who first brought it into England, is the bark of a tree, resembling the olive-tree, frequent in the islands of St. Domingo, Guadaloupe, and Madagascar; called by the natives *simpli*.

This bark, which dries like that of *cinnamon*, is at first brownish, of a sharp biting taste, like pepper, and a smell like musk: as it dries it whitens. Some use it in lieu of nutmeg, and in medicine it is used as a stomachic, and sometimes as an antiscorbutic.

The same tree also yields a gum called *bdellium*, sometimes *bdellium*, which is no disagreeable perfume. See *White-terrene* CORTEX and WINTERANUS.

CINNAMUM, the name given by many of the old writers on the *materia medica* to *cinnamon*.

The Arabian writers, when they treat of *cinnamon*, have three words by which they express it; these are *falicha*, *falfar*, and *karfe*.

CINNUS, in *Ancient Medicine*, a drink made of the decoction of wheat, to which was added some flour of barley, honey, and wine.

CINQUEFOIL, *Quinquefolium*, or *Potentilla*, in *Botany*, a genus of the *icosandria polygynia* class. Its characters are these: the empalement of the flower is of one leaf, which is slightly cut into ten parts; the segments are alternately less and reflexed. The flower is composed of

of five petals, which are inserted into the empalement, and spread open. In hath twenty awl-shaped ſtamina inſerted in the empalement, terminated by moon-ſhaped ſummits. In the centre of the flower are ſeveral germina collected into one head, with very ſlender ſtyles inſerted in the ſides, crowned by obtuſe ſtigmas. After the flower is paſt, the germina become a head of roundiſh ſeeds, included in the empalement.

There are many ſpecies of this genus preſerved in botanic gardens, for variety, but they are not cultivated in other places either for uſe or beauty.

The firſt ſort grows naturally upon cold ſtiff land in moſt parts of England, and is a ſure mark of the ſterility of the ſoil. It ſpreads its ſtalks upon the ground, which ſend out roots from their joints, and thereby propagate to a conſiderable diſtance; but it never flowers in a cold ſoil. The leaves of this plant are uſed in medicine, and are accounted aſtringent and vulnerary.

The other ſorts are natives of different parts of Europe.

CINQUEFOIL, *marſh*. See COMARUM.

CINQUEFOIL *root*, in the *Materia Medica*, the name of a root which is an ingredient in ſeveral of the officinal compoſitions. The plant which produces it is the common *cinquefoil*, which grows every where by way-ſides. The root conſiſts of a cortical and ligneous or ſticky part, but the cortical only is uſed. It is eſteemed drying and aſtringent, and antiſeptic. Some have given it in agues, in as large doſes as the cortex, and have cured with it. In thoſe fluxes of the bowels, and in good in diſorders of the lungs, and in the *fluor albus*, and gonorrhœa, either in men or women. It is, however, very little regarded in the preſent practice. See Phil. Tranſ. vol. xlix. part ii. p. 835.

CINQUE PORTS, *Quinque portus*, five havens that lie on the Eaſt part of England, toward France; thus called by way of eminence, on account of their ſuperior importance; as having been thought by our kings to merit a particular regard for their preſervation againſt invaſions.

Hence, they have a particular policy, and are governed by a keeper, with the title of *lord warden of the cinque-ports*; which office belongs to the conſtable of Dover: and their repreſentatives are called barons of the *cinque-ports*.

They have various privileges granted them, as a particular juriſdiction; their warden having the authority of an admiral among them, and ſending out writs in his own name: and the king's writs do not run there.

Camden tells us, that William the the Conqueror firſt appointed a warden of the *cinque-ports*; but king John firſt granted them their privileges: and that upon condition they ſhould provide eighty ſhips at their own charge, for forty days, as often as the king ſhould have occaſion in the wars; he being then ſtrengthened for a navy to recover Normandy.

There are alſo ſeveral towns adjoining, to which the privileges of the *cinque-ports extend*.

There are ſeveral courts belonging to theſe ports; one before the lord warden; others within the ports themſelves, before the mayor and jurats; another, which is called *curia Quinque Portuum apud Shepway*: a writ of error lies from the mayor and jurats of each port to the lord warden in his court of Shepway; and from this court to the king's bench: and a writ of error lies from all the other juriſdictions to the ſame ſupreme court of juſticature, in token of the ſuperiority of the crown when theſe franchiſes were created. All prerogative writs as thoſe of *habeas corpus*, *prohibition*, *certiorari*, and *mandamus*, may likewiſe iſſue to all theſe juriſdictions. They have likewiſe a court of chancery, to decide matters of equity, but no original writ iſſues thence.

Theſe five ports are, Haſtings, Romney, Hythe, Dover, and Sandwich; to which Winchelſea and Rye have been ſince added.—Thorn tells us, that Haſtings provided twenty-one veſſels, and in each veſſel twenty-one men. To this port belong Seaford, Pevenley, Hedney, Winchelſea, Rye, Hamine, Wakelbourn, Crenecth, and Fortheſlope.—Romney provided five ſhips, and in each twenty-four men. To this belong Bromhal, Lyde, Oſwarthorn, Dungeneſs, and Romenhal.—Hythe furniſhed five ſhips, and in each twenty-one ſeamen. To this belongs Weſtmeſtth.—Dover the ſame number as Haſtings. To this belong Folkſton, Feverſham, and Margc.—Laſtly, Sandwich furniſhed the ſame with Hythe. To this belong Fordwic, Reculver, Serre, and Deal.

CINQUE-PORT *ſed*. See NAT.

CINTRE, in *Building*, the mould in which an arch is turned; popularly called *centre*, ſometimes alſo *cradle*.

CINYRA, in the Jewiſh *Antiquities*, a muſical inſtrument. This and the Hebrew *cannor*, which is generally tranſlated *cithara*, *lyra*, or *pſalterium*, are the ſame. It was made of wood, and was played on in the temple of Jeruſalem. Joſephus ſays, that the *cinyra* of the ſecond had ten ſtrings, and that it was touched with a plectrum. In another place he ſays that Solomon made [illegible] wherein he contradicts the Scripture, which ſays in that Solomon's *cinnors* were of wood.

CION, or CYON, in *Gardening*, a young ſhoot, ſprig, or ſprig, put forth by a tree.

Grafting is performed by the application of the [illegible] of one plant upon the ſtock of another.

To produce a ſtock of *cions* for grafting, planting, &c. the gardeners ſometimes cut off the bodies of trees, a little above the ground, and only leave a ſtump or root ſtanding; in this caſe the redundant ſap will not fail next ſpring to put forth a great number of ſhoots.

In dreſſing DWARF-*trees*, a great many *cions* are to be cut off. See PRUNING.

CION, in *Anatomy*, is ſometimes uſed for the UVULA.

CIONES, in *Antiquity*, a kind of idols very common, being only oblong ſtones erected pillar-wiſe: whence alſo they had their name.

CIPHER, or CYPHER, one of the numeral Characters, or figures; formed thus, 0.

The word *cipher* comes from the Hebrew ספר *ſaphar*, *to number*.

The *cipher* of itſelf implies a privation of value; but when diſpoſed with other characters on the left thereof, in the common arithmetic, it ſerves to augment each of their values by ten; and in decimal arithmetic, to leſſen the value of each figure to the right thereof, in the ſame proportion.

CIPHER denotes alſo a kind of enigmatic character, compoſed of ſeveral letters interwoven; which are ordinarily the initial letters of the perſons names, for whom the *cipher* is intended.

Theſe are frequently uſed on ſeals, coaches, and other moveables. Anciently merchants and tradeſmen were not allowed to bear arms; in lieu thereof they bore their *ciphers*, or the initial letters of their names, artfully interwoven about a croſs; of which we have divers inſtances on tombs, &c.

CIPHER is alſo applied to certain ſecret characters, diſguiſed and varied; uſed for the writing of letters that contain ſecrets not to be underſtood by any but thoſe between whom the *cipher* is agreed on. This is now reduced into a ſeparate art, called *cryptographia*, *polygraphia*, and *ſteganographia*; but it appears to have been little known to the ancients.

De la Guilletiere, in his Lacedæmon Ancient and Modern, endeavours to make the ancient Spartans the inventors of the art of writing in *cipher*.

Their ſcytala, according to him, was the firſt ſketch of this myſterious art; theſe ſcytalæ were two rollers of wood, of equal length and thickneſs; one of them kept by the ephori, the other by the general of the army ſent on any expedition againſt the enemy.

Whenſoever thoſe magiſtrates would ſend any ſecret orders to the general, they took a ſlip of parchment, and rolled it very juſtly about the ſcytala which they had reſerved; and in this ſtate wrote their intentions, which appeared perfect and conſiſtent while the parchment continued on the roller: when taken off, the writing was maimed, and without connexion: but it was eaſily retrieved by the general, upon his applying it to his ſcytale. Polybius ſays, that Æneas Tacticus, two thouſand years ago, collected together twenty different manners of writing, ſo as not to be underſtood by any but thoſe in the ſecret; part whereof were invented by himſelf, and part uſed before his time. Trithemius, Bap. Porta, Vigenere, and P. Niceron, have written expreſsly on the ſubject of *ciphers*.

As the writing in *cipher* is become an art; ſo is the reading, or unravelling thereof, which is called *deciphering*. See DECIPHERING.

CIPHER *with a ſingle key*, is that wherein the ſame character is conſtantly uſed to expreſs the ſame word, or letter; this is eaſily deciphered with a little application.

CIPHER *with a double key*, is that wherein the alphabet, or key is changed in each line, or in each word; and wherein are inſerted many characters of no ſignificancy, to amuſe and perplex the meaning.

CIPHERING, or CYPHERING, is popularly uſed for the art of accompting; properly called *arithmetic*.

CIPPUS, among *Antiquaries*, a little low column, erected in roads, or other places, with an inſcription thereon; either to ſhew the way to travellers, to ſerve as a boundary, or preſerve the memory of ſomething remarkable, and particularly the grave of a defunct.

The

The *cippi* placed in the highway, for the convenience of travellers, were more properly called *miliary* COLUMNS. Hottinger has an express treatise of the *cippi* of the Jews, De *cippis* Hebræorum; wherein he takes *cippus* for the tomb-stone of a defunct.

CIPPUS was also used in antiquity for a wooden instrument wherewith criminals and slaves were punished; being a kind of clog, or stocks for the feet.

CIRCADA, a tribute anciently paid to the bishop or archdeacon, for visiting the churches.

CIRCÆA, in *Botany*. See *Enchanter's* NIGHT *shade*.

CIRCEA. See CIRCÆA.

The name *circea* is given by some to the mandrake, or common mandragora.

CIRCELLIONES. See AGONISTICI.

CIRCENSES *ludi*, CIRCENSIAN *games*, or *games of the* CIRCUS, a general term under which were comprehended all combats exhibited in the Roman *circus*, of what kind soever; whether on foot or horseback, or in a car; wrestling, or boxing with *swords*, *pikes*, *darts*, or *arrows*; against men, or against beasts; on the ground, or aboard vessels.

There were few except slaves that gave the people this cruel pleasure: it was an exercise that would have disgraced people of any account. See the article GLADIATORS.

Some say, the *Circensian games* were so called from the Latin *circumsessi*; because they were held in a place incompassed round with naked swords, that the combatants might not have an opportunity of escaping.

At first they are said to have been exhibited on the brink of the river Tyber, and the ground encompassed toward the land with naked swords.

Most of the feasts of the Romans were accompanied with *Circensian games*; and the magistrates, or other officers of the republic, frequently presented the people with them on other occasions.—The grand ones were held for five days, commencing on the 15th of September.

CIRCERELIUS, in *heliology*, a name used by some authors for a fish usually called AMMODYTES, or the *sandeel*.

CIRCINALEA *Folia*. See LEAF.

CIRCINNALIS, in *Botany*, a name given by some authors to the ADIANTUM, or *maiden-hair*.

CIRCITOR, in *Ancient Military Discipline*, one whose business it was to go the ROUNDS.

CIRCITOR is also used to signify a hawker, or pedlar, who goes about from place to place to vend his goods.

CIRCIUM, a genus of plants according to Tournefort; but comprehended by Linnæus under the carduus. See THISTLE.

CIRCLE, CIRCULUS, in *Geometry*, a plane figure, comprehended under one single line, which returns into itself, having a point in the middle, from which all the lines drawn to its circumference are equal.

Properly speaking, it is the space included within the circumference, or periphery, that is the *circle*: though in the popular use of the word, *circle* is frequently used for the periphery alone. See the article CIRCUMFERENCE.

The area of a *circle* is found by multiplying the periphery by the fourth part of the diameter; or half the periphery by half the diameter.—The area is also had by finding a fourth proportional to 1,000,785, and the square of the diameter: or, to 452,355, or to 14, 11, and the square of the diameter. See DIAMETER.

Circles, and similar figures inscribed in them, are always as the squares of the diameters: so that they are in a duplicate ratio of their diameters; and therefore of their radii.

A *circle* is equal to a triangle whose base is equal to the periphery, and its altitude to the radius. *Circles*, therefore, are in a ratio compounded of the peripheries and the radii: but they are also in the duplicate ratio of their radii; therefore the peripheries are to each other as the radii.

To find the proportion of the diameter of a CIRCLE *to its periphery*. See DIAMETER.

To circumscribe a CIRCLE *about a given regular polygon*: bisect two of the angles of the polygon E and D (*Tab. Geometry, fig.* 28.) by the lines EF and DF; and on the point of concourse F, as on a centre, with the radius EF, describe a *circle*. See CIRCUMSCRIBING.

To describe any given regular polygon in a CIRCLE: divide 360 by the number of sides, to find the quantity of the angle EFD; which being made in the centre, apply the chord ED to the periphery, as often as it will go: thus is the figure inscribed in the *circle*.

Through three given points, not in a right line. A, B, C, *fig.* 7, *to describe a* CIRCLE. On A and C strike arches intersecting in D and E; and others G and H, from C and B; draw the right lines DE and HG: the point of intersection, I, is the centre of the *circle*. Hence, 1st, by assuming three points in the periphery, or the arch of any *circle*, the centre may be found, and the given arch be perfected.

2dly, If three points of any periphery agree, or coincide with three points of another; the whole peripheries agree, and the *circles* are equal.

3dly, Every triangle may be inscribed in a *circle*.

In Optics, it is shown, that a *circle* never appears truly such, unless either the eye be directed perpendicularly to its centre; or the distance of the eye from the centre, when directed obliquely, be equal to the semidiameter of the *circle*: in every other case, the *circle* appears oblong; and to make a *circle* that shall appear such, it must be oblong.

CIRCLES, *parallel*, or *concentric*, are such as are equally distant from each other in every point of their peripheries; or are described from the same centre: or, on the contrary, those struck from different centres are said to be *eccentric*.

CIRCLE, *the quadrature of the*, or the manner of making a square, whose surface is perfectly and geometrically equal to that of a *circle*, is a problem that has employed the geometricians of all ages. See the article QUADRATURE.

Many maintain it to be impossible: Des Cartes, in particular, insists on it, that a right line, and a *circle*, being of different natures, there can be no direct proportion between them: and, indeed, we are likewise at a loss for the just proportion between the diameter and circumference of a *circle*.

Archimedes is the person who has come the nearest to the quadrature of the *circle*: all the rest have made paralogisms. Charles V. offered a reward of 100,000 crowns to the person who should solve this celebrated problem; and the states of Holland have also proposed a reward for the same.

CIRCLES *of the higher kinds*, are curves wherein $AP^m : PM^n :: PM^n : PB$, or, $A^m : PM^n :: PM^n : PB^n$. *Tab. Analyt. fig.* 26. Cor. L. Suppose $A P = x$, $P M = y$, $A B = a$; then will $PB = \frac{a^m - y^n}{a^{m-n}}$. And consequently $x^n : y^n :: a^m - y^n : a^{m-n}$. Hence we have an equation that defines infinite *circles*, viz. $y^n = a^{m-n} x^n - y^n$; and another defining infinite other *circles*, viz. $y = \sqrt[n]{a^{m-n} x^n - y^n}$.

Cor. II. If $n = 1$, then will $y^n = a^{m-n} x^n$; and therefore a *circle* of the first order is contained under this equation alone. If $n = 2$, $y^2 = a^{m-2} x^2$, which equation denotes a *circle* of the second order.

CIRCLE *of curvature*, in *Geometry*, that *circle* the CURVATURE of which is equal to that of any curve at a certain point.

It is also called the *circle* of equi-curvature.

CIRCLES *of the sphere*, are such as cut the mundane sphere and have their periphery either on its moveable surface, or in another immoveable, concentrious, and equidistant surface.

Hence arise two kinds of *circles*, *moveable* and *immoveable*. The first are those whose peripheries are in the moveable surface, and which therefore revolve with its diurnal motion; as the *meridian*, &c.

The latter, having their periphery in the immoveable surface, do not revolve; as the *ecliptic*, *equator*, and its *parallels*, &c.

If a sphere be cut in any manner, the plane of the section will be a *circle*, whose centre is in the diameter of the sphere.

Hence the diameter of a *circle* passing through the centre, being equal to that of the *circle* which generated the sphere; and that of a *circle* which does not pass through the centre, being only equal to some chord of the generating *circle*; the diameter being the greatest of all chords; there hence arises another division of the *circles* of the sphere, viz. into *great* and *less*.

CIRCLES, *greats of the sphere*, is that which divides it into two equal parts, or hemispheres; having its centre in the centre thereof.

Hence, all *great circles* are equal, and cut each other into equal portions, or semicircles.

The *great circles* are the *horizon*, *meridian*, *equator*, *ecliptic*, the *colures*, and the *azimuths*; which see in their places.

CIRCLES, *lesses, of a sphere*, is that which divides the sphere into two unequal parts, and has its centre in the axis of the sphere, but not in the centre thereof.

These are usually denominated from the *great circles* they are parallel to: as *parallels of the equator*, &c.

CIRCLES *of altitude*, otherwise called *almicantars*, are *circles* parallel to the horizon, having their common pole in the zenith, and still diminishing as they approach the zenith. They have their names from their use; which is to shew the altitude of a star above the horizon.

Some

Some have suspected a variation in the apparent solstitial *altitudes* of the sun. Something of this kind was perceived by M. Cassini in 1655, by means of the great gnomon in the church of St. Petronius at Bologna; which was farther confirmed by other observations at the royal observatory at Paris. The variation observed by M. Cassini, during the course of twenty-two years, only amounted to a few seconds. And by comparing the observation made by Pytheas at Marseilles three hundred years before Christ, with another made by Cassini in 1672 at the same place, it appears, that in two thousand years time, this difference of *altitude* has only amounted to a few minutes. V. Mem. Acad. Scienc. 1693. p. 180, seq. See Ecliptic.

The *altitude* of the sun, it is said, may be found to a few seconds, with an instrument of three feet radius. But this is rarely found in fact. A French engineer, M. Hautefeuille, has proposed a new instrument, whereby he pretends to take *altitudes* even to thirds.

To find the sun's *altitude* by the globe, see the article Globe.

Circles of *declination*, are great *circles* intersecting each other in the poles of the world.

Circle of *dissipation*, in *Optics*. See the article Dissipation.

Circles *diurnal*, are immoveable *circles*, supposed to be described by the several stars, and other points of the heavens, in their diurnal rotation round the earth; or rather, in the rotation of the earth round its axis.

Thus if a right line be conceived to be continued from the centre of a star, perpendicular to the axis of the world, as far as the surface of the sphere of the world, it will describe a diurnal *circle* for it, in making one revolution about its axis.

The *diurnal circles* are all unequal: the equator is the greatest.

Circle *equant*, in the *Ptolemaic Astronomy*, is a *circle* described on the centre of the equant.

Its chief use is, to find the variation of the first inequality.

Circles *of excursion*, are *circles* parallel to the ecliptic, and at such a distance from it, as that the excursions of the planets towards the poles of the ecliptic, may be included within them; usually fixed at 10 degrees.

It may here be added, that all the *circles* of the sphere above described, are transferred from the heavens to the earth; and thence come to have a place in geography, as well as in astronomy: all the points of each *circle* being conceived to be let fall perpendicularly on the surface of the terrestrial globe, and so trace out *circles* perfectly similar to them.

Thus, the terrestrial equator is a line, conceived precisely under the equinoctial line, which is in the heavens; and so of the rest.

Circles, *horary*, in *Dialling*, are the lines which shew the hours on dials; though these be not drawn circular, but nearly straight.

Circle, *horary, on the globe*, a brazen circle fixed to the north pole, and furnished with an index, shewing the difference of meridians, and serving for the solution of many problems. The usual position of this *circle* prevents the brass meridian from moving quite round in the horizon; so that globes of the common sort cannot be applied to the solution of many problems. Mr. Harris contrived to remedy this inconvenience, by placing two *horary circles* under the meridian, one at each pole: these are fixed tight between two brass collars, placed about the axis, but so that they may be easily turned by the hand when the globe is at rest; and when the globe is turned, they are carried round with it, the meridian serving as an index to mark out the horary division. The globe, thus prepared, will serve for solving problems in all latitudes, as well as in places near the equator. Philosophical Transactions abridged, vol. viii. p. 354. See Globe.

Circle *of illumination*, is that imaginary *circle* on the surface of the earth, which is formed by a plane passing through the centre of the earth, so that the line which joins the centres of the sun and earth may be perpendicular to it, and which separates the illuminated hemisphere of the earth from the dark. This Mr. Keil calls the illuminated disc of the earth: and all lines passing from the sun to the earth, which are physically parallel, are perpendicular to the plane of this *circle*.

Circles *of latitude*, or *secondaries of the ecliptic*, are great *circles* perpendicular to the plane of the ecliptic, passing through the poles thereof, and through every star and planet.

They are so called, because they serve to measure the latitude of the stars, which is nothing but an arch of one of these *circles*, intercepted between the star and the ecliptic. See Secondary *circles*.

Circles *of longitude*, are several lesser *circles*, parallel to the ecliptic; still diminishing, in proportion as they recede from it.

On the arches of these *circles*, the longitude of the stars is reckoned.

Circle *of perpetual apparition*, one of the lesser circles, parallel to the equator; described by any point of the sphere touching the northern points of the horizon, and carried about with the diurnal motion.

All the stars included within this *circle* never set, but are ever visible above the horizon.

Circle *of perpetual occultation*, is another *circle* at a like distance from the equator, described by the southern point of the horizon; and contains all those stars which never appear in our hemisphere.

The stars situate between these *circles* alternately rise and set at certain times.

Circles *polar*, are immoveable *circles*, parallel to the equator, and at a distance from the poles equal to the greatest declination of the ecliptic.

That next the northern pole is called the *arctic*; and that next the southern one the *antarctic*.

Circles *of position*, are *circles* passing through the common intersections of the horizon and meridian, and through any degree of the ecliptic, or the centre of any star, or other point in the heavens: used for finding out the situation or position of any star.

They are usually made 6 in number; and cut the equator into twelve equal parts, which the astrologers call the *celestial houses*. Hence some call them *circles of the celestial houses*.

Circle *antarctic*. See Antarctic.

Circle, *arch of a*. See Arch.

Circle, *arctic*. See Arctic.

Circle, *axis of a*. See Axis.

Circle, *centre of a*. See Centre.

Circle, *excentric*. See Eccentric.

Circle, *equal*. See Equal.

Circle *fairy*. See Fairy.

Circle, *right*. See Right.

Circles, *secondary*. See Secondary

Circle, *segment of a*. See Segment.

Circles, *vertical*, or *azimuth*. See Vertical, and Azimuth.

Circle, in *Logic*, that fault of an argument that supposes the principle it should prove, and afterwards proves the principle by the thing it seemed to have proved.

Or a *circle* in logic, called also *syllogistic circle*, is when the same terms are proved, *in orbem*, by the same terms: and the parts of the syllogism, alternately, by each other both directly and indirectly.

Thus the papists argue, when they prove the Scriptures to be the word of God by the infallible testimony of their church, and the authority of the church by the Scripture.

There are two kinds of *circles*; the one *material*, the other *formal*.

The *formal* is that which in two reciprocal syllogisms begs the medium, which is the next cause of the greater extreme. This kind is by no means to be admitted; otherwise, the same thing becomes both prior, and posterior; the cause and effect of itself; which is absurd.

The *material circle*, called also *regressus*, consists of two syllogisms, the former whereof proves the cause by the effect; and the latter the effect by the cause: this may be admitted.

Circle, Circulus, is understood among the schoolmen of a vicissitude of generations, arising one out of another.

Thus, good concoction causes a good habit of body; a good habit of body produces strength and vigour; these occasion frequent exercises; and these a good concoction.

It is a celebrated dogma of the Scotists, "There is no "*circle* in causes of the same order, or kind."

Circles *of the empire*, are such provinces, and principalities of the empire, as have a right to be present at diets.

The division of the empire into six *circles* was established by Maximilian I. in 1500, at Augsburg; twelve years afterwards he divided it afresh, into ten *circles*; which partition was confirmed by Charles V. at the diet of Nuremberg, in 1522.

Though the order of these *circles* has never been well regulated; yet in the imperial matricula, it is as follows: the *circle* of Austria, that of Burgundy, of the Lower Rhine, of Bavaria, Upper Saxony, Franconia, Suabia, Upper Rhine, Westphalia, and the Lower Saxony.

Circolo-croce, in the *Italian Music*, is a diminution of four quavers or semiquavers, or notes of equal value, which represent a semicircle proceeding by conjoint degrees.

CIRCUIT, or CIRCUITY, in *Law*, a longer courſe of proceeding, to recover the thing ſued for, than is neceſſary.

Thus, if a man grant a rent-charge of 10*l.* out of his manor, and after, the grantee diſſeiſeth the grantor of the ſame manor, who brings an ASSIZE, and recovers the land, and 20*l.* damages; which being paid, the grantee brings his action for 10*l.* of his rent, due during the time of the diſſeiſin, and which he muſt have had, if no diſſeiſin had been; this is called *circuity of action*; becauſe, whereas the grantor was to receive 20*l.* damages, and to pay 10*l.* rent, he might have received but 10*l.* for damages, and the grantee have kept the other.

CIRCUIT is alſo the journey, or progreſs the JUDGES take, twice every year, through the ſeveral counties of England and Wales, to hold courts, and adminiſter juſtice, where recourſe cannot ſo well be had to the king's courts at Weſtminſter.

Theſe were firſt eſtabliſhed, with ſome little difference, by Henry II. and afterwards expreſly ordained by *Magna Charta*.

England is divided into ſix *circuits*; viz. the Home *circuit*, Norfolk *circuit*, Midland *circuit*, Oxford *circuit*, Weſtern *circuit*, and Northern *circuit*. Two judges are appointed to each *circuit*. In Wales there are two *circuits*, North and South Wales.

There are three *circuits* in Scotland, viz. South, Weſt, and North, which the *lords of juſticiary* go twice a year, viz. in May and October. See JUSTICIARY.

CIRCUIT, *electrical*, denotes the courſe of the electric fluid from the *charged* ſurface of an electric body, to the oppoſite ſurface into which the diſcharge is made. Some of the firſt electricians apprehended, that the ſame particles of the electric fluid, which were thrown on one ſide of the charged glaſs, actually made the whole *circuit* of the intervening conductors, and arrived at the oppoſite ſide, whereas Dr. Franklin's theory only requires, that the redundancy of electric matter on the charged ſurface ſhould paſs into the bodies, which form that part of the *circuit* which is contiguous to it, driving forward that part of the fluid which they naturally poſſeſs, and that the deficiency of the exhauſted ſurface ſhould be ſupplied by the neighbouring conductors, which form the laſt part of the *circuit*. On this ſuppoſition, a vibrating motion is ſucceſſively communicated through the whole length of the *circuit*. This *circuit* is always formed of the beſt conductors, let the length of it be ever ſo great. Many attempts were made both in France and England, at an early period in the hiſtory of electricity, to aſcertain the diſtance to which the electric ſhock might be carried, and the velocity of its motion. The French philoſophers, at different times, made it to paſs through a *circuit* of 900 toiſes, and of 2000 toiſes, or about two Engliſh miles and a half; and they diſcharged the Leyden phial through a baſon of water, the ſurface of which was about an acre. And M. Monnier found, that, in paſſing through an iron wire of 950 toiſes in length, it did not ſpend a quarter of a ſecond; and that its motion was inſtantaneous through a wire of 1319 feet. In 1747, Dr. Watſon, and other Engliſh philoſophers, after many experiments of a ſimilar kind, conveyed the electric matter through a *circuit* of four miles; and they concluded from this and another trial, that its velocity is inſtantaneous. Prieſtley's Hiſt. of Electricity, vol. i. ſect. 2. p. 128. 8vo. ed. 1775. See ELECTRICAL *ſhock*.

CIRCUITORES. See AGONISTICI.

CIRCULAR, any thing that is deſcribed, or moved in a round; as the circumference of a CIRCLE, or the ſurface of a globe.

The *circular* form is of all others the beſt diſpoſed for motion: and the moſt capacious.

The modern aſtronomers ſhew, that the heavenly bodies do not move in *circular*, but in elliptic ORBITS. See PLANET, &c.

CIRCULAR *arches*. See ARCH.

CIRCULAR *letter*, a letter directed to ſeveral perſons, who have the ſame intereſt in ſome common affair: as in the convocation of aſſemblies, &c.

CIRCULAR *line*, an appellation given by ſome to ſuch ſtraight lines as are divided from the diviſions made in the arch of a circle. Such are SINES, TANGENTS, SECANTS, &c.

CIRCULAR *numbers*, are ſuch whoſe powers end in the roots themſelves; as 5, whoſe ſquare is 25, and cube 125. See NUMBER.

CIRCULAR *parts, Neper's*, are the complements of the two oblique angles of a right angled ſpherical triangle, the complement of the hypothenuſe, and the two legs, by having any two of which the third is known. See PART, TRIANGLE and TRIGONOMETRY.

CIRCULAR *ſailing*, is that performed in the arch of a great circle.

Circular ſailing, of all others, goes the neareſt or ſhorteſt way; and yet there are ſuch advantages in SAILING by rhombs, that this latter is generally preferred.

CIRCULAR *ſpots* are made on pieces of metal by large electrical explоſions. See experiments and obſervations upon them, in Dr. Prieſtley's Hiſt. of Electricity, vol. ii. ſect. 6. ed. 8vo. and Phil. Tranſ. vol. lviii. p. 68.

Theſe beautiful ſpots produced by the moderate charge of a large BATTERY, diſcharged between two ſmooth ſurfaces of metals, or ſemimetals, lying at a ſmall diſtance from each other, conſiſt of one central ſpot, and ſeveral concentric circles, which are more or leſs diſtinct, and more or fewer in number, as the metal upon which they are marked is more eaſy or difficult of fuſion, and as a greater or leſs force is employed. They are compoſed of dots or cavities, which indicate a real fuſion. If the exploſion of a battery, iſſuing from a pointed body, be repeatedly taken on the plain ſurface of a piece of metal near the point, or be received from the ſurface on a point, the metal will be marked with a ſpot, conſiſting of all the prismatic colours diſpoſed in circles, and formed of the ſcales of the metal ſeparated by the force of the exploſion. See COLOURS.

CIRCULAR *winding ſtairs*. See STAIRS.

CIRCULAR *ſyphons, reſiſtance of a*. See RESISTANCE.

CIRCULAR *velocity*, a term in *Aſtronomy*, ſignifying the velocity of a planet, or revolving body, which is meaſured by the arch of a circle: as ſuppoſe by AB (*Tab. Aſtronomy, fig.* 10.) deſcribed on the centre of attraction S.

The *circular velocity* of a body moving from B to C, is meaſured by the arch BC.

CIRCULATING *Decimals*. See REPETEND.

CIRCULATION, the act of moving round, or in a *circle*.

We ſay the *circulation* of the blood; the *circulation* of the ſap; of the ſpirits, &c.

As in the great world we find a perpetual and orderly *circulation* of waters, conveyed from the ſea by ſubterraneous paſſages, ſprings, &c. and returned thither again by rivers, &c. ſo in the little world, man, a like circuit is obſerved; the blood being continually driven from the heart, by the arteries, to all parts of the body; and brought back again to the heart by the veins.

CIRCULATION *of the blood*. See BLOOD.

CIRCULATION *of the ſap*, is a natural motion of the nutritious juice of plants, ſuppoſed to be conveyed from the root to the extreme parts, and thence back again to the root.

The experiments of ſeveral naturaliſts and gardeners, ſeem to prove a *circulation* in the body of plants, by veins and arteries, analogous to that in animals.

M. Perrault ſtarted the *circulation* of the ſap in France, and propoſed it, in 1669, to the Royal Academy; though M. Major, a phyſician of Hamburgh, had publiſhed it, unknown to M. Perrault, two years before. A year and a half afterwards, M. Mariotte propoſed the ſame to the academy as a new thing; not knowing that M. Perrault had been before-hand with him; and the great Malpighi appears to have entertained the ſame thought about the ſame time.

The opinion, however, was not univerſally received: ſome of the ableſt botaniſts, and particularly M. Dodart, proteſted openly againſt it.

That author allows of a juice mounting from the root to the extremities of the branches; and of another deſcending from thoſe extremities to the root: the firſt imbibed from the ſoil, and digeſted in the root, for the nouriſhment of the plant; the ſecond received from the moiſt parts of the air, at the extremities of the branches. The riſing and deſcending juices, therefore, according to him, are not the ſame; or that which riſes, never deſcends, and reciprocally; i. e. there is no *circulation*.

Dr. Teng, in the Philoſophical Tranſactions, maintains, that the ſap always riſes, and never properly deſcends; having only a ſubſiding, or recidivation, which he can by no means call a *circulation*.

Mr. Switzer owns himſelf at a loſs for the method wherein a *circulation* ſhould be effected; as well as for the parity of reaſon commonly urged for a *circulation* of the ſap, and of the blood. In animals, he obſerves the degree of growth, or extenſion, is but very ſmall: ſo that the blood, not being employed in any other ſervice, may be eaſily ſuppoſed to circulate: but trees growing to an unlimited tallneſs, it is probable, the great effort of nature is employed in extending them that way; and that the nutritious juice only aſcends. He adds, that, as to the ſwelling or extenſion of trees in bulk, it evidently ariſes from the effuſion of the ſap from the heart of the tree through the pores; which dilates the whole inſenſibly, by accumulating circle on circle; which are annual gradations eaſily obſerved upon cutting a branch, or trunk, acroſs.

On the other hand it is urged in favour of a *circulation*, that the ſame experiments of ligature, and inciſion,

which evince a *circulation* in animals, have been made in plants; particularly in such as abound in sap; as the spurges, &c. and with the same success; the part between the ligature and the root swelling very considerably, and the other much less.

The ligatures are to be made with metalline rings. Dr. Lister gives us an instance, in the catapuna minor, where the ligature being only a silken thread, tied as hard as possible without breaking the skin; no greater swelling arose on one side the ligature than on the other.

Mr. Lawrence gives us a supposed demonstration of the *circulation* of the sap, from an experiment on the yellow-striped jessamine.—Upon a branch of a plain jessamine, whose stem spreads itself in two or three branches, inoculate a bud of the yellow-striped jessamine, as in autumn; as the tree comes to shoot, the following summer, some of the leaves will be found striped here and there with yellow, and this even on the branches not inoculated; till, by degrees, the whole tree, even the very wood of the young branches, will be all variegated, or striped with green and yellow.

Mr. Fairchild confirms this experiment, by a similar one of his own; having inoculated a yellow-spotted jessamine-tree, into another jessamine-tree, he found, that though the bud did not take, yet, in a fortnight's time, yellow spots began to appear on a shoot which came out of the ground from another part of the plant. But this only proves the recess of the sap, as Dr. Hales observed.

Blair is of opinion, that there are certain parts of plants which have their peculiar juices, and maintain a *circulation* in themselves, independent of the rest of the plant. The fleshy and thick roots of some plants, and the fruits of others are of this number of peculiar parts. This is analogous to what we see in some parts of animal bodies also. Of this scheme, the bark, the wood, and the pith of a tree, may be compared to the bones, the skin, and the marrow of animals: while the nourishment is sent in abundance to one part of these, it is allowed more sparingly to the rest. Thus while a young tree shoots out its tender boughs in spring, the juice ascends upward to them from the root; but when these have acquired their due length, the motion of the sap is determined upward with less violence, and the bark and wood are nourished and increased by it. This is the reason why in spring trees grow in height, and in autumn increase in thickness.

As to the manner of the *circulation*, Malpighi, Grew, &c. by means of microscopes, have discovered, that the wood of plants consists of fine capillary tubes, which run parallel from the root, through the trunk, and may be looked on as arteries; and on the outside of these, betwixt the wood and the inner bark, are other large tubes, to do the office of veins.

Now, the root having imbibed a flock of juice from the earth, that juice will be put in motion by the heat; that is, it will be rarefied, and made to ascend in form of a steam, or vapour; meeting, therefore, with the open mouths of the arterial vessels, it will pass through the same to the top and extreme parts of the tree, with a force answerable to the heat by which it is put in motion: when it is there arrived, meeting with the cold of the external air, it is condensed into a liquor, and in that form returns, by its own weight, towards the root through the venal vessels above mentioned.

The ingenious Dr. Hales has clearly shewn, by a variety of experiments and observations, that there is no *circulation* in vegetables analogous to that of the blood in animals. The motion of the sap is solely occasioned by the strong attraction of the capillary sap-vessels, assisted by the vibrations resulting from the warmth of the sun; in consequence of which the sap is carried up to the top of the tallest trees, and perspired off through the leaves. The ascent of the sap is principally promoted by the plentiful perspiration of the leaves; and this power, he observes, does not seem well adapted to make the sap descend from the tops of vegetables, by different vessels, to the root. He allows, indeed, that the sap has an alternate, progressive, and receding motion, occasioned by the interchanges of day and night, warmth and cold, moisture and dryness. That the sap does not descend between the bark and wood, he concludes from the experiment of taking off the bark of a tree, about three or four inches in breadth quite round; the consequence of which will be that the bleeding of the tree above this part will much abate; whereas it ought to have the contrary effect, by intercepting the course of the refluent sap, if it descended by the bark. But this experiment confirms the opinion which he has adopted, that the sap ascends between the bark and the wood, by the vigorous operation of the perspiring leaves, and attracting capillaries. It is likewise alledged, that sea-plants have no longitudinal capillary sap-vessels, but that their whole substance is composed of vesicles, receiving their nourishment immediately from the surrounding water: so that *circulation* is not necessary in order to vegetation. M. Mustel has further confirmed this opinion. Having placed several shrubs in pots near the windows of his hot-house, some within, and some on the outside, he contrived to convey a single branch of each through a hole in the glass; those whose trunks were in the open air had a branch in the hot-house, and those whose trunks were in the hot-house had a branch exposed to the open air. The consequence of this disposition was, that the branches which were in the hot-house very soon began to discover their buds, and to put forth leaves, shoots, and flowers. Some of the external branches were killed by the intense cold; nor was there visible the least sign of vegetation: and yet the branches, within the house, were not in the least affected by the chilled state of their trunks. Those trees, on the contrary, that were within the house, vegetated, and their branches were covered with leaves and flowers, whilst the single branch that was conveyed to the outside was in the same state with those that grew abroad, and derived no advantage from the heat to which the trunks and other branches were exposed. From these curious and decisive experiments, M. Mustel infers, that there is no regular or general *circulation* of the sap in trees between the trunk and the branches; and that each part of a tree is furnished with a quantity of sap, independent of any supply from the trunk or other branches, sufficient to effect the first production of buds, flowers, and fruits, provided that the juices are put into motion by heat. See on this subject Hales's Statical Essays, vol. i. chap. 4. and vol. ii. Appendix, Observation 7, and Phil. Trans. vol. lxiii. part i. art. 15. p. 126, et seq. See PERSPIRATION, PLANTS, and VEGETATION.

CIRCULATION *of the spirits, or nervous juice*. That the spirits circulate, is evinced, in the same manner as some authors choose to prove the *circulation* of the blood, viz. that as the heart drives out, every shour, three or four thousand ounces of blood; whereas ordinarily, there is not above two thousand in the whole body; there is a necessity for the blood, driven out, to return to the heart, in order to supply a fund to be expelled.

In like manner it is shewn, that there is formed, each hour, a large quantity of spirits, which are nothing but the more subtil parts of the blood driven out from the heart; whence it is inferred, that these too must circulate.

The course they are supposed to take, is this. The most subtil parts of the arterial blood, being carried from the heart to the brain by the carotid arteries, are thrown violently into the fine net-work wherewith the bottom of the ventricles of the brain is lined; whence the more delicate parts are driven into the mouths of the choroid arteries, where they continue their rapid motion, and discharge themselves at the pores where those vessels terminate around the pineal gland.

Hence they enter that gland, and there form a constant spring of spirits; which, being here purified, enter the cavities of the brain; and insinuating into the pores of its substance, flow into the lymphatics; whence they are carried to the heart by two ways; those from the upper parts by the subclavian veins, and the adjacent vessels; those from the lower, being discharged into Pecquet's reservoir, proceed by the thoracic duct, and at last, by the descending veins, to the heart; whence they begin their course afresh. See ANIMAL *spirits*.

CIRCULATION, *subterraneous*. Dr. Plot is one of the many authors who have argued for a subterranean *circulation* of water, by means of which many springs and rivers are supplied with that water which they give again to the sea. It is probable, indeed, that many of the smaller springs are supplied by rains, only where the country and situation are favourable; but the larger rivers, and the springs which supply them, must have their origin from such a subterranean *circulation*, since all the water, that falls in a year in the whole earth, is not one five hundredth part the quantity of that discharged into the sea at the mouths of rivers, as appears by careful and moderate calculations. There are some springs which ebb and flow with the sea: these cannot be doubted as to their origin, which is evidently from that body of water whose motions they are influenced by. Nor is the case much less clear in regard to those lakes which have salt water and sea-fish in them, and yet have no communication with any sea by any known cut or passage.

The number of shell-fish and parts of sea-animals dug up in several places, at great depths within land, are also urged by some as proofs of such subterranean passages of the sea-water; but these are too universally distributed through the strata of the earth, to have been brought in this manner, and are, therefore, rather supposed to be owing

owing to the great change made in the earth by the flood *in the days of* Noah. See VAPOUR, &c.

CIRCULATION, in *Chemistry*, is an operation whereby the fame vapours, raifed by fire, falls back, to be returned and diftilled feveral times, and thus reduced into its moft fubtil parts.

Circulation is performed by difpofing the liquor in a fimple veffel, ftopped at top, called a *pelican*; or in a double veffel, conftiting of two pieces, luted on each other; the lower to contain the liquor and its vapours.

It is performed either by the heat of a lamp, or that of afhes, or of fand moderately hot, or in dung, or by the fun. It ufually demands a continued heat of feveral days, fometimes of feveral weeks, or even feveral months. By *circulation*, the fineft part of the fluid mounts to the top of the veffel; and, finding no iffue there, falls back again, and rejoins the matter left behind at the bottom, whence it arofe: and thus, by continuing to rife and fall, alternately, in the veffel, there is effected a kind of *circulation*, or vemixtion, of the fpirituous parts with the grofs ones; whereby the former are rendered finer, and more fubtil, and are better difpofed to exert their activity, when feparated from the latter.

CIRCULATORY, CIRCULATORIUM, in *Chemiftry*, the veffel wherein a fluid is put, to undergo the procefs of CIRCULATION.

There are two kinds of *circulatories*; the *diota*, or DOUBLE *veffel*; and the PELICAN.

CIRCULUS, in *Geometry*, *Logic*, &c. See CIRCLE.

CIRCULUS, among *Chemifts*, is a round iron inftrument, ufed in cutting off the necks of glafs-veffels; which they effect thus. The inftrument, being heated, is applied to the glafs veffel, and there kept till the latter grows hot; then, by a few drops of cold water, or a cold blaft thereon, it flies even and regularly off. Thus they cut off the necks of retorts, or cucurbits.

There is another method of doing the fame; viz. by tying a thread, firft dipped in oil of turpentine, round the place where the fection is to be; and then fetting fire to the thread.

This done, fome cold water being fprinkled on the place, the glafs will be cracked through that part precifely where the thread was tied.

CIRCUMAGENTES *mufculi*, in *Anatomy*. See OBLIQUUS.

CIRCUMAGENTIUM *femoris primus*, in *Anatomy*, a name given by Spigelius, and fome others, to the *iliacus externus*, but more generally, from its fhape, the PYRIFORMIS, and *pyramidalis*.

CIRCUMAMBIENT, an epithet denoting a thing to inveft, or incompafs another round.

We fay, the ambient, or *circumambient air*, &c.

CIRCUMCELLIONES, in *Church Hiftory*, a fet of illiterate favage peafants, and defperate ruffians, who adhered to the party of the DONATISTS towards the end of the fourth century. They aflumed the title of vindicators of juftice, and protectors of the oppreffed, and maintained their caufe by force of arms, and filled the whole province of Africa with flaughter and rapine. Conftantine the Great, in order to quiet the tumults which they occafioned, abolifhed the laws that had been enacted againft the Donatifts; however, after his death, their aflaffinations and maffacres were renewed, till they were defeated by Macarius at the battle of Bagnia. Many of this frantic mob were afterwards treated with great feverity, and the Donatifts fhared their fufferings.

CIRCUMCISION, the act of cutting off the prepuce; or a ceremony, in the Jewifh and Mahomeran religions, wherein they cut away the foreflin of the males who are to profefs the one, or the other law.

Circumcifion commenced in the time of Abraham; and was, as it were, the feal of a covenant ftipulated between God and him: it was in the year of the world 2178, that Abraham, by divine appointment, *circumcifed* himfelf, and all the males of his family: from which time it became an hereditary practice among his defcendants.

The ceremony, however, was not confined to the Jews: Herodotus and Philo Judæus obferve, that it obtained alfo among the Egyptians and Ethiopians. Herodotus fays, that the cuftom was very ancient among each people; fo that there was no determining which of them borrowed it from the other. The fame hiftorian relates, that the inhabitants of Colchis alfo ufed *circumcifion*; whence he concludes, that they were originally Egyptians. He adds, that the Phœnicians and Syrians were likewife *circumcifed*; but that they borrowed the practice from the Egyptians. And, laftly, that a little before the time when he wrote, *circumcifion* had paffed from Colchis, to the people inhabiting near Thermodoon and Parthenius.

Marfham is of opinion, that the Hebrews borrowed *circumcifion* from the Egyptians; and that God was not the firft author thereof; citing Diodorus Siculus, and Herodotus, as evidences on his fide. This latter propofition feems directly contrary to the teftimony of Mofes; who aflures us, Gen. xvii. that Abraham, though ninety-nine years of age, was not *circumcifed* till he had the expreft command of God for it: but as to the former propofition of Marfham, it will admit of more debate. The arguments, on both fides, may be feen in one view, in Spencer de Legibus Hebræor. lib. ii. cap. 2.

Be this as it will, it is certain, the practice of *circumcifion*, among the Hebrews, differed very confiderably from that of the Egyptians. Among the firft, it was a ceremony of religion, and was performed on the eighth day after the birth of the child; among the latter, it was a point of mere decency and cleanlinefs; and, as fome will have it, of phyfical neceffity; and was not performed till the thirteenth year; and then on girls, as well as boys.

Among the Jews, *circumcifion* was performed with a knife of ftone. They fet afide the practice of *circumcifion*, during the forty years of their paffage through the wilderneſs; becaufe *circumcifion* being intended as a mark of diſtinction between the Jews and the Gentiles, it was unneceſſary to make any mark at all, in a place where there was no body to mix with them. M. Fleury obſerves that the Jews were not unanimous as to the neceſſity of *circumcifion*; ſome holding it an eſſential, others only as a circumſtance.

The Turks, before the operation of *circumcifion*, ſqueeze the ſkin with little pincers, to deaden the ſenſation: they then cut it off with a razor, and apply a certain powder, which heals the wound, and takes off the pain. They never *circumcife* till the ſeventh or eighth year; as having no notion of its being neceſſary to ſalvation.

The Perſians *circumcife* their boys at thirteen years, and their girls from nine to fifteen. Thoſe of Madagaſcar cut off the fleſh at three ſeveral times; and the moſt zealous of the relations preſent catches hold of the prepuſium, and ſwallows it.

Herrera tells us, there is a kind of *circumciſion* among the Mexicans, though they are very far both from Judaiſm and Mahometaniſm: they cut off the foreſkin of the virile member, and the cats, as ſoon as the child is born, with great ceremony.

There is a kind of *circumciſion* practiſed at Orabeite, one of the newly diſcovered iſlands in the South Seas. The operation is performed by a prieſt, and conſiſts in ſlitting the prepuce through the upper part, to prevent its contracting over the glans. The practice ſeems to have taken its riſe from motives of cleanlineſs. Hawkeſworth's Voyages, vol. ii. p. 241.

Circumciſion is alſo practiſed on women, by cutting off the foreſkin of the clitoris, which bears a near reſemblance and analogy to the prepuſium of the male penis. Strabo ſays, the Egyptian women were circumciſed; Belon ſays the ſame of the Cophtes; and P. Jovius and Munſter of the ſubjects of Preſter John.

Among the Jews, the father is obliged to have his ſon circumciſed on the eighth day; it may not be ſooner: but the child's weakneſs may allow of its being deferred longer. There is a godfather to hold the child, and a godmother to carry it from the houſe to the ſynagogue, and to preſent it there. He who circumciſes is called, in Hebrew, *Mohel*: any perſon is choſen for the purpoſe indifferently; provided he be but capable of the function; which, among the Jews, is a rule of great merit. The manner of the ceremony, as related by Leo De Modena, is as follows:—Two ſeats are prepared, in the morning, with ſilken cuſhions; one for the godfather who holds the child; the other, as they ſay, for the prophet Elias, whom they ſuppoſe to aſſiſt inviſibly. The perſon, who is to circumciſe, brings the neceſſary inſtruments; the razor, ſtyptic, gum, filer, and oil of roſes: to which ſome add a ſhell full of *ſand*, to put the prepuſium in. A pſalm is ſung till the godmother *brings* the child, attended with a crowd of women, and delivers it to the godfather; none of them entering the door: the godfather, being ſeated, lays the child on his lap; then the *circumciſer*, taking the razor, and preparing the child for the operation, ſays, *Bleſſed be thou, O Lord, who haſt ſanctified us circumciſion*; and in ſo ſaying, cuts off the thick ſkin of the prepuſium, and with his finger-nails tears off another finer ſkin remaining; ſucking the blood two or three times, as it breaks out, and ſpitting it out into a glaſs full of wine: then he lays dragons blood on the wound, with powder of coral, and other things, to ſtaunch the blood; and, laſtly, a compreſs of oil of roſes; and thus binds up the whole: this done, he takes a glaſs of wine, and, bleſſing it, adds another benediction for the child, and impoſes the name.

The manner of circumciſing among the Turks, differs from

from that of the Jews: for the former, after they have cut off the skin, meddle no farther; but the last tear off the edge of the remaining skin in several places with their thumb-nails; which is the reason why the circumcised Jews are cured much sooner than the Turks.

Those among the Jews who perform the operation of *circumcision*, are distinguished by the length of their thumb-nails.

Circumcision is also used medicinally, when the prepuce is affected with a gangrene, and becomes black.

CIRCUMCISION is also the name of a feast celebrated on the first of January in commemoration of the *circumcision* of our Saviour.

This day was anciently kept a fast, in opposition to the pagan superstitions, who feasted on it in honour of the god Janus.

CIRCUMFERENCE, in *Geometry*, the curve line that incloses a CIRCLE, or circular space; called also the PERIPHERY.

The word is formed from *circum*, *about*; and *fero*, *I carry*.

All lines drawn from the centre of a circle to the *circumference*, called *radii*, are equal.

Any part of the *circumference* is called an *arch*; and a right line drawn from one extreme of the arch to the other, a *chord*.

The *circumference* of every circle is supposed to be divided into 360 equal parts, which are called *degrees*.

The angle at the *circumference* is double that at the centre.

The *circumferences* of circles are to each other as their radii.

And, since the *circumference* of one circle is to its radius, as that of any other circle to its radius; the ratio of the *circumferences* to the radius is the same in all circles. See DIAMETER.

CIRCUMFERENTOR, an instrument used in *surveying*, to take angles by.

The *circumferentor* is very simple, yet expeditious in the practice. It consists of a brass circle and an index, all of a piece.—See its figure in *Tab. Surveying*, *fig.* 7.

On the circle is a card, or compass, divided into 360 degrees; the meridian line whereof answers to the middle of the breadth of the index: on the limb, or circumference, of the circle, is soldered a brass ring; which, with another fitted with a glass, make a kind of box for the needle, which is suspended on a pivot in the centre of the circle: to each extreme of the index is fitted a sight. The whole is mounted on a staff, with a ball and socket, for the conveniency of its motion.

To take an angle by the CIRCUMFERENTOR. Suppose the angle required EKG (*Tab. Surveying*, *fig.* 6.): place the instrument, v. g. at K, with the flower-de-luce in the card towards you, then direct the sights, till through them you spy E; and observe what degree is pointed at by the south end of the needle, which suppose 296: then turn the instrument about, the flower-de-luce still towards you, and direct the sights to G; noting the degree at which the south end of the needle points, which suppose, 182.

This done, subtracting the lesser number 182, from the greater 296, the remainder, 114, is the number of degrees of the angle EKG.

If the remainder happens to be more than 180 degrees, it must be again subtracted from 360 degrees; the last remainder is the quantity of the angle sought.

To take the plot of a field, wood, park, &c. by the CIRCUMFERENTOR.—Suppose ABCDEFGK (*fig.* 8.) an inclosure to be surveyed with the *circumferentor*.

1. Placing the instrument at A, the flower-de-luce towards you, direct the sights to B; where suppose the south end of the needle to cut 191°; and the ditch, wall, or hedge, measured with the chain, to contain 10 chains, 75 links; which enter down. See CHAIN.

2. Placing the instrument at B, direct the sights, as before, to C; the south end of the needle, v. g. will cut 279°; and the line BC will contain 6 chains, 83 links, to be noted as before; then move the instrument to C; turn the sights to D, and measure CD, as before.

In the same manner proceed to D, E, F, G, H, and, lastly, to K; still noting down the degrees of every bearing, or angle, and the distances of every side.

Having thus gone round the field, you will have a table in the following form:

Stations.	Degrees.	Min.	Chains.	Links
A	191	00	10	75
B	279	00	6	83
C	219	30	7	82
&c.				

From this table, the field is to be plotted, or protracted; for the manner whereof, see PLOTTING, and PROTRACTOR.

Note, Where security is to be consulted rather than dispatch, it may be convenient to take back-sights; i. e. to place the instrument to, at each station, as that, looking backwards through the sights to the last station, the north end of the needle may point to the same degree as the south end did, in looking forwards from the last station to this; both which instruments are used, on other occasions, as *circumferentors*.

CIRCUMFLEX, in *Grammar*, an accent, serving to mark or distinguish a syllable of an intermediate sound between acute and grave; and generally somewhat long. The Greeks had three accents; the *acute*, the *grave*, and the *circumflex*; formed thus, ´ ` ῀. In Latin, Italian, French, &c. the *circumflex* is made thus ^.

The acute raises the voice, and the grave falls, or lowers it: the *circumflex* is a kind of undulation or wavering of the voice between the two.

It is seldom used among the moderns, unless to shew the omission of a letter which made the syllable long and open; a thing much more frequent in the French, than among us: thus they write *pâte*, for *paste*; *tête*, for *teste*; *fâmes*, for *fusmes*, &c. They also use the *circumflex* in the participles; some of their authors writing *eunes*, *pen*, others, *eunné*, *pû*, &c. Father Buffier is at a loss for the reason of the *circumflex* on this occasion.

The form of the Greek *circumflex* was anciently the same with that of ours, viz. ^; being a composition of the other two accents ´ in one.—But the copists changing the form of the characters, and introducing the running-hand, changed also the form of the *circumflex* accent; and instead of making a just angle, rounded it off, adding a dash, through too much haste; and thus formed an *s*, laid horizontally, which produced this figure ῀, instead of this ^.

CIRCUMGYRATION, the wheeling motion of any body round a centre.

CIRCUMINCESSION, in *Theology*, a term whereby the schoolmen use to express the existence of three divine persons in one another, in the mystery of the Trinity. See PERSON.

The school divines are not the first authors of this term; Damascenus, in the eighth century, having used the word περιχώρησις, which signifies the same thing, in his explication of that text, *I am in my father, and my father is in me*.

CIRCUMLOCUTION, an ambages, or tour of words, used either when a proper term is not at hand, to express a thing naturally and immediately by; or when one chooses not to do it, out of respect, or for some other reason.

The word comes from *circumloquor*, *I speak about*.

CIRCUMLOCUTION, in *Oratory*, is the avoiding of something disagreeable, or inconvenient, to be expressed in direct terms; by intimating the sense thereof in a kind of paraphrase, so conceived as to soften, or break the force thereof.

Thus Cicero, unable to deny that Clodius was slain by Milo, owns it, with this *circumlocution*, "Milo's servants "being prevented from assisting their master, who was "reported to be killed by Clodius; they, in his absence, "and without his privity, or consent, did what every "body would expect from their own servants on such an "occasion."

CIRCUM-POLAR *Stars*, are such stars as, being pretty near our north pole, move round it; and in our latitude, never set, or go below the horizon.

CIRCUMPOTATIO, in *Antiquity*, a funeral feast, provided in honour of the dead.

This was very frequent among the ancient Romans, as well as among the Athenians. Solon, at Athens, and the decemviri at Rome, endeavoured to reform this custom, thinking it absurd that mirth and drunkenness should mingle with sorrow and grief.

CIRCUMSCRIBED *figure*, in *Geometry*. See CIRCUMSCRIBING.

CIRCUMSCRIBED *hyperbola*, one of the second order, according to Sir Isaac Newton, which cuts its asymptotes, and contains the parts cut off within its own space. See HYPERBOLA.

CIRCUMSCRIBING, in *Geometry*, denotes the describing a polygonous figure about a circle, in such manner, as that all its sides are tangents to the circumference.

The term is sometimes also used for the describing of a circle about a polygon; so, as that each side is a chord. But in this case, we more usually say, the polygon is inscribed than the circle circumscribed.

Any regular figure ABCDE, (*Tab. Geometry*, *fig.* 9.) inscribed in a circle, is resolved into equal and similar triangles, by radii drawn from the centre of the *circumscribing* circle F, to the several angles of the figure; and its area is equal to a rectangled triangle, whose base is equal to the perimeter of the whole polygon; and its height a perpendicular let fall from the centre F to one side AB.

The fame may be faid of the area of the *circumfcribing* polygon *a b c d e (fig.* 8.); excepting that the height is to be the radius.

The area of every polygon that can be inferibed in a circle is leſs, and that of every polygon that can be circumſcribed, greater than that of the circle: in like manner, the perimeter of the firſt is leſs, and that of the ſecond is greater, than the circumference of the circle.

On this principle Archimedes attempted the quadrature of the circle; which is nothing elſe, in effect, but the meaſuring of the area, or capacity of a circle.

The ſide of a hexagon is equal to the radius of a circumſcribed circle.

To circumſcribe a circle about any given regular polygon, A B C D E (*fig.* 9.); and *vice verſa*. Biſect two of the angles, v. g. A and B; and on the point F, where the two lines of biſection interſect, as on a centre, deſcribe a circle with the radius F A.

To circumſcribe a ſquare about a circle. Draw two diameters, A B and D E (*fig.* 5.), interſecting each other in the centre C, at right angles. From A E B D, with the interval of the radius, make interſections in F, G, H, I. Draw the right lines F G, G H, I H, and I F. Then is F G H I a ſquare circumſcribed about the circle.

To circumſcribe any regular polygon, v. g. a pentagon, about a circle. Biſect the chord A E (*fig.* 8.) by the perpendicular F O, which continue till it cut the arch in *g*. Through A and E, draw the radii A F and E F: and through *g*, draw a line parallel to A E, meeting the radii continued on each ſide in *a* and *e*: and then is *a e* one ſide of the circumſcribed polygon. Produce the radius F B to *b*, till F *b* = *a* F; and draw *a b*: this is another ſide of the polygon; and in the ſame manner may the reſt of the ſides be drawn.

CIRCUMSPECTE *agatis*, the title of a ſtatute made ann. 13 Edw. I. relating to prohibitions, preſcribing certain caſes to the judges, wherein the king's prohibition lies not.

CIRCUMSTANCES, the incidents of an event, or the particularities that accompany an action.

Divines ſay, the converſion of a ſinner depends on a certain aſſemblage, and a certain management, of external *circumſtances*, in the midſt whereof he is placed; which arrangements of *circumſtances* depends on the providence of God: whence converſion alſo depends on *him*.

The *circumſtances* of the actions of men, are expreſſed in this Latin verſe:

Quis, quid, ubi, quibus auxiliis, cur, quomodo, quando.

Quis, who, denotes the quality, ſtate, age, &c. of the perſon. *Quid*, what, the greatneſs, ſmallneſs, multitude, ſeverity, &c. of the thing. *Ubi*, where, the place. *Quibus auxiliis*, with what aſſiſtances, the inſtruments, means, &c. *Cur*, why, on what account, with what view. *Quomodo*, how, the quality of the action, as to intention or remiſſneſs, deſignedneſs or caſuality, ſecrecy or openneſs. *Quando*, when, the time; as on a holiday, at the hour of prayer, &c.

CIRCUMSTANTIAL *Evidence*, in *Law*, or the *doctrine of preſumption*, takes place next to poſitive proof: circumſtances which either neceſſarily or uſually attend facts of a particular nature, that cannot be demonſtratively evinced are called preſumptions, and are only to be relied on till the contrary be actually proved. See EVIDENCE and PRESUMPTION.

CIRCUMSTANTIBUS, in *Law*, is uſed for the ſupplying, and making up the number of jurors (in caſe any impanelled appear not; or appearing, be challenged by either party), by adding to them ſo many of the perſons preſent, or ſtanding by, as will ſerve the turn. This act of ſupplying is uſually called TALES *de circumſtantibus*.

CIRCUMVALLATION, in *Fortification*, a line or trench, with a parapet, thrown up by the beſiegers, encompaſſing all their camp, to defend it againſt any army that may attempt to relieve the place.

The word is formed from *circum*, *about*; and *vallum*, *wall*. The Romans are thought to have firſt invented lines of *circumvallation* and CONTRAVALLATION at the ſiege of *Veii*.

This line is to be cannon-ſhot diſtant from the place, ordinarily, about twelve feet broad, and ſeven deep. It is bordered with a breaſt-work, and flanked with redoubts, or little forts, erected from ſpace to ſpace. It ſerves both to prevent any ſuccour from being ſent into the place, to keep in deſerters, and to prevent incurſions of the enemy's garriſon.

Care muſt be taken, that the line of *Circumvallation* never paſs by the foot of an eminence; leſt the enemy, ſeizing on the eminence, lodge his cannon, and command the line.

CIRCUMVOLUTIONS, in *Architecture*, the turns of the ſpiral line of the Ionic volute.

The word comes from *circumvolvere*, *to turn around*; and is alſo applied to the turns of a wreathed, or twiſted COLUMN.

CIRCUS, in *Antiquity*, a large building, either round or oval; uſed for the exhibiting of ſhews to the people.

Some derive the word from *Circe*, to whom Tertullian attributes the invention. Calliodorus ſays, *Circus* comes *à circuitu*.—The Romans, Servius obſerves, at firſt had no other *Circus* but that made by the Tiber on one ſide, and a paliſade of naked ſwords on the other. Hence, according to Iſidore, came the term *ludi circenſes*, *cenſa circum autes*. But Scaliger ridicules that etymology.

The Roman *Circus* was a large oblong edifice, arched at one end; encompaſſed with portico, and furniſhed with rows of ſeats, placed aſcending over each other.

In the middle was a kind of foot-bank, or eminence, with obeliſks, ſtatues, and poſts at each end. This ſerved them for the courſes of their *bigæ* and *quadrigæ*.

There were no leſs than ten *Circuſes* at Rome: the largeſt was built by the elder Tarquin, called *Circus Maximus*, between the Aventine and Palatine mounts. It was ſo called, either becauſe of its vaſt circumference, or becauſe the *great* games were celebrated in it, or again, becauſe it was conſecrated to the *great* gods; viz. to Vertumnus, Neptune, Jupiter, Juno, Minerva, and the Dii Penates of Rome. Dionyſius Halicarnaſſenſis ſays, that it was three ſtadia and a half in length, and four jugera broad; and theſe meaſures, according to Pliny, allowing to the Roman ſtadia 625 Roman feet, each of which is 12 inches, will give *ſix* the length 2187 Roman feet, or ſomewhat more than three Engliſh furlongs; and as to breadth, allowing for each of the jugera 240 Roman feet, it will be 960 Roman feet. It was beautified and enlarged by the Roman emperors, ſo as to ſeat 250,000 ſpectators.

The moſt magnificent *Circuſes* were thoſe of Auguſtus and Nero. There are ſtill ſome remains of the *Circuſes* at Rome, Nîmes, and other places.

The Romans were exceſſively fond of the games exhibited in the *Circus*: witneſs that verſe in Juvenal,

——— *Atque duas tantum res anxius optat,*
Panem & Circenſes.——

The Games of the CIRCUS, which ſome call CIRCENSIAN *Games*, were combats celebrated in the *Circus*, in honour of Conſus the god of councils; and thence alſo called *Conſualia*.

They were alſo called *Roman games*, *Ludi Romani*, either on account of their antiquity, as being coeval with the Roman people, or becauſe eſtabliſhed by the Romans: and the games held there, the great games, *ludi magni*, becauſe exhibited with more expence and magnificence than others; and becauſe held in honour of the great god Neptune, who was their Conſus.

Thoſe who ſay they were inſtituted in honour of the ſun, confound the *pompa circenſis*, or proceſſion of the *Circus*, with the games.

The games of the *Circus* were inſtituted by Evander, and re-eſtabliſhed by Romulus: the pomp, or proceſſion, was only a part of the games, making the prelude thereof; and conſiſting of a ſimple cavalcade of chariots.

Till the time of the elder Tarquin, they were held in an iſland of the Tiber; and were called *Roman games*: after that prince had built the *Circus*, they took their name therefrom, as being conſtantly held there.

There were ſix kinds of exerciſes in the *Circus*: the firſt was wreſtling, and fighting with ſwords, with ſtaves, and with pikes; the ſecond was racing; the third, ſaltatio, dancing; the fourth, diſci, quoits, arrows, and ceſtus; all which were on foot: the fifth was horſe-courſing; the fifth courſes of chariots, whether with two horſes, or with four.

In this laſt exerciſe, the combatants were at firſt divided into two ſquadrons or *quadrils*; then into four; each bearing the names of the colours they wore; *factio alba*, *ruſſea*, &c.

At firſt there was only white and red; then green was added, and blue. Domitian added two more colours, but they did not continue.

It was Oenomaus who firſt invented this method of diſtinguiſhing the quadrils by colours. The green was for thoſe who repreſented the earth; the blue for the ſea, &c.

CIRCUS, in *Ornithology*, a name by which Bellonius and ſome others have called the MILVUS *aeruginoſus* or moor-BUZZARD.

CIRLUS *ſtultus*, in *Ornithology*, the name of a bird of the hortulanus kind, and the ſize and ſhape of our common *yellow hammer*.

CIRRHOSE *Leaf*, in *Botany*. See LEAF.

CIRRIS, in *Ornithology*, the name of a small species of heron, called by some the *ardea hæmatopus*, or the *red-legged* HERON. Its legs and feet are very beautifully red.

CIRRUS, in *Ichthyology*, a name given by authors to certain oblong and soft *appendiculæ* hanging from the under jaw of fishes, or from other parts about the mouth, in the manner of little worms, and usually of a cylindric figure, or nearly so. These *cirri* are in some fish hollow at the root, in others they are not so: in those which are hollow at the root, the cavity never runs quite thro'. The way of finding it is by introducing a hog's bristle or a hair into it; but this cannot be forced through to the point, nor can any fluid matter be expressed out of them. These *cirri* often afford characters of distinction to several kinds of fishes, and differ in the several species in regard to number, size, and proportion.

The use that these *cirri* are of to the fish, is little more known than that of the antennæ of insects. If nature had given them only to those fishes which had the eyes placed on the upper part of the head, then they might be supposed to serve to distinguish prey at the bottom, while the eyes were directed to such as offered itself nearer the surface: but as the several kinds of fishes which have them are of different kinds, and have their eyes in various directions, this use cannot be allowed them. It is possible they may be of use to the fish, in giving it the first notice of any distant motion of the water, which they may perceive by their hanging posture sooner than any other part, and thus give notice of the neighbourhood of prey, or of the approach of an enemy.

CIRRUS, in *Antiquity*, an ornament added to the edges and borders of garments, much in the manner of *fimbriæ* or fringes, only that these were single, and run along the borders of the dress; whereas the *cirri* were knotted together, and hung down from the extremities of the robe.

CIRRUS, among *Botanists*, expresses the little fibres which plants send out from their STALKS, and by which they are attached to other bodies.

CIRSIUM. See *genus* THISTLE.

CIRSOCELE, in *Medicine*, a multitude of varices in the testicles, which prodigiously increase their bulk, and hinder the due preparation of the seed; so as sometimes to render castration necessary. This disorder is otherwise called HERNIA *varicosa*.

The word comes from κιρσος, *varix*, *vein*, and κηλη, *hernia*.

CIRSOS, in *Medical Writers*, is used for VARIX.

CISALPINE, any thing on this side the Alps.

The word is formed from the prepositions *cis*, on this side, and *Alpes*; which, though properly confined to the mountains separating Italy and France, yet is used by authors for any very high mountains.—Thus, Antonius speaks of the Alps, of the Pyrenæus, the Alps of the Apennines, &c.

The Romans divided Gaul, and the country now called Lombardy, into *Cisalpine* and *Transalpine*.

That which was *Cisalpine* with regard to the Romans, is *Transalpine* with regard to us.

CISLEU, the ninth month in the ecclesiastical year, and the third in the civil or political year among the Hebrews, containing 30 days: it answers to part of our November and December. An annual fast is observed by the Jews to this day on the 18th of this month, in commemoration of the taking of Jerusalem by Nebuchadnezzar.

CISSAMPELOS, in *Botany*, a genus of the *dioecia monadelphia* class: its characters are these: it is male and female in different plants: the male flowers have no petals, but a single style in the centre, which extends beyond the empalement, terminated by 4 large lamonia having four lobes. The female flowers have four nectariums standing round the oval germen, which is hairy, and after becomes a fusculent berry enclosing a single seed. There are two species which grow naturally in the warm parts of America.

The first sort is supposed to be the pareira, whose root has been so much esteemed as a diuretic.

CISSITES, in *Natural History*, a name given by the ancients to that species of the flinty *ætites*, or EAGLE-*stone*, which is covered with the common white coat of the flints. Pliny mentions it as found principally about Captos, and being externally of a white colour, and rattling when shaken.

CISSOID, in *Geometry*, an algebraic CURVE, first invented by Diocles; whence it is peculiarly called the *cissoid* of Diocles.

The genesis of the *cissoid* may be thus conceived: to the diameter AB (*Tab. Analysis, fig. 9.*) of the semicircle AOB, draw an indefinite line, at right angles, BC: then draw the right line AH, and make AM = HI; or in the other quadrant, LC = AN. Thus will the points M and L be in a curve line, AMOL; which is the *cissoid* of Diocles.

Properties of the CISSOID.—From the genesis it follows,

1. That drawing the right lines PM and KL, parallel to AB; we shall have AP : KB :: AM : KB. But AM = HI; consequently, AP = KB. And therefore, AK = PB; and PN = IK.

2. After the same manner it appears, that the arc AMO bisects the semicircle AOB.

3. Again, AK : KI :: KB. That is, AK : PN :: PN : AP. And again, AK : PN :: AP : PM; therefore, PN : AP :: AP : PM. Consequently, AK, PN, AP, and PM, are four lines in continual proportion. And if PN = *y*, AP = *x*, PM = *y*; $x^2 = xy$. And after the same manner it may be shewn, that AP, PN, AK, and KL, are in continual proportion.

4. In the *cissoid*, the cube of the abciss AP is equal to a solid arising from the square of the semiordinate PM, multiplied into the complement of the diameter of the generating circle PB.

Hence, when the point P falls on B, then $x = a$, and BC $= y$; consequently, $y = \frac{a^3}{0}$. Wherefore, 0 : 1 :: a^3 : y; that is, the value of y becomes infinite; and therefore the *cissoid* AMOL, though it continually approach BC, will never meet it.

5. BC, therefore, is an asymptote of the *cissoid*.

The ancients made use both of the cissoid and *cissoid*, for the finding of two mean continual proportionals between two given right lines.

For the *quadrature*, *solidity*, and *fabricant of the* CISSOID: see QUADRATURE, SEGMENT, &c.

CISSOID *angle*. See ANGLE.

CISSUS. This is properly in the Greek writers the name of the ivy. They write it κισσος. But the word κισσος, *cissus*, when the σ is changed into an *s*, by the Ionian and Cyprian dialect, is also κισσος, *cissus*. See CISTUS.

CISSUS, in *Botany*, a genus of the *tetrandria monogynia* class, with a single-seeded berry, and a quadripartite corolla.

CISSYBIUM, in *Antiquity*, a drinking cup, much in use among country people. It was so called, either because it was made of the wood of ivy, or was usually crowned with its leaves.

CISTERCIANS, an order of religious, reformed from the Benedictines, consisting of an hundred monasteries, and near as many nunneries.

The order took its rise in 1075, from twenty-one zealous monks in the monastery of Molesme in Burgundy; who, with their abbot Robert, complaining that the rule of St. Benedict was not strictly enough observed, obtained permission of Hugh archbishop of Lyons, and legate of the holy see, to settle in a place called *Cistaux*, five miles from Dijon.

Here, Eudes duke of Burgundy erected them a house, into which they were admitted in 1098; endowing it with a considerable revenue. The bishop of Chalons gave Robert the pastoral staff, in quality of abbot; and erected the new monastery into an abbey.

They were, in about a century after their first rise, distinguished by the patronage of St. Bernard, abbot of Clairval, whence they obtained the title of *Bernardin* monks; and in the year 1132, they were exempted from the payment of tythes, and invested with other privileges and immunities by Innocent II. In 1157 this order had no fewer than 500 convents, all dedicated to the Blessed Virgin. They came into England in the year 1128, and had their first house at Waverley in Surry. Before their dissolution they had eighty-five houses here. Such was the beginning of the *Cistercians*, so famous in after-times, and now so extended throughout all Europe.

CISTERN, is properly used for a subterraneous reservoir of rain water.

The word, according to some, comes from *cis*, and *terra*, i. e. *in terram*; others derive it from *cista*, a *chest*, &c.

Eastern *cisterns* must be made with good cement, to retain the water. And the bottom should be covered with sand, to sweeten and preserve it.

Authors mention a *cistern* at Constantinople, the vaults whereof are supported by two rows of pillars, 212 in each row; each pillar being two feet in diameter. They are planted circularly, and in radii tending to that in the centre.

Anciently there were *cisterns* all over the country in Palestine. There were some likewise in cities and private houses. As the cities for the most part were built on mountains,

mountains, and the rains fell regularly in Judea at two seasons of the year only, in spring and autumn, people were obliged to keep water in cisterns in the country, for the use of their cattle; and in cities, for the convenience of the inhabitants. There are *cisterns* of very large dimensions to be seen still at this day in Palestine, some whereof are a hundred and fifty paces long, and fifty four wide. There is one to be seen at Ramah of two and thirty paces in length, and eight and twenty in width. Wells and *cisterns*, fountains and springs, are generally confounded in the scripture language.

If the farmers of England would fall into the method used in Spain, and at Amsterdam, Venice, and other places for saving the rain-water for the whole year, or at least so much of it as would be necessary, in *cisterns*, they would have always water for their cattle in the summer droughts, and many thousand acres of land, now lies waste, might be turned to profit.

The best way of preserving the water for the service of the house, is in *cisterns* in the cellars. These may be made with brick or stone, joined with plaister of Paris, which will keep out the wet very well; or with a kind of mortar made of flaked fifted lime, with fifted oil, and tow or cotton. A bed of good found clay may be laid at the bottom, and on this the bricks for the floor, and then the walls may be raised in the same manner, only leaving places behind them, into which clay is to be rammed in the like manner. Thus it will be a clay *cistern*, faced with brick; and the bricks will keep the clay moift, and prevent it from cracking, though it be not full of water. This will do in any fhadowy place, as well as in cellars: and thus may a *cistern* be made in a garden, in fome fhadowy place, and covered over, which may receive the water running from the walks, and will retain it at hand, for the fervice of the garden, all the year.

Where there is want of water for the cattle in the fields, the way is to dig a pond in fome place into which there is a defcent; then cover the bottom and fides with a double coat of tough clay, each fix inches thick, and each very well rammed: then to cover the bottom with large ftones, which will keep the clay moift, and prevent its cracking, when not covered with water. But this is a troublefome thing; for if there happen to be a crack in any part, it is often found neceffary to go over the whole work again, before the pond will hold a drop of water.

Another method of making a pond hold water, is to daub it over with clay and mortar mixed together, and then with mortar alone. This has an advantage over the other way, becaufe if any crack happen, it may be mended by a cement of clean hair and tallow, mixed with flaked lime and the yolks of eggs, well beat together. This applied to the crack, will cloft it fafely, without neceffity of undoing the whole work, as in the other cafe.

In chalky countries it is common to find a low place on the downs, and, digging a hole by way of a pit there, they cover the bottom evenly with the chalk rubbifh, and when it is wetted by the rain, they ram it well, and afterwards drive cattle into it, and fold fheep in it: the confequence of all fuch trampling is, that the bottom at length becomes fo firm, that it holds the water perfectly well. By one or other of thefe means, *cifterns* or refervoirs may be made in every part of the country: and our farmers, if they would carefully try one or the other of them, as their land moft required, would not have fo much to complain of from droughts.

CISTIS. See CYSTIS, and HYPOCISTIS.

CISTRUM. See SISTRUM.

CISTULA *Catoptrica*. See CATOPTRIC.

CISTUS, the Greeks wrote this word κισθος, and, as the word, in the Latin tongue, is only the Greek name with a Roman termination, it undoubtedly ought to be fpelt *cifthus*, not *ciftus*. The ancient writers have been fubject to many mifrepresentations from the near refemblance of this word κισθος, *cifthus*, to κισσος, *ciffus*: the former being the name of the plant we call *ciftus*, a fhrubby herb, with leaves like fage, and a large flower refembling a rofe: and the other, the name of the common ivy that climbs upon our walls and trees. Pliny has been deceived by the near refemblance of the two words, and has given the qualities of ivy to the *ciftus*, and thofe of *ciftus* to the ivy: but he is the more excufable in this, fince we find the two names ufed indifcriminately, tho' certainly by a miftake of the copyifts, in the books of Theophraftus.

Dwarf CISTUS. See *Dwarf* SUN-*flower*.

Sage-leaf CISTUS. See *Wild* ROSEMARY.

Laffer marfh CISTUS. See ANDROMEDA.

CITADEL, or CITTADEL, a fort, or place fortified with four, five, or fix baftions; built fometimes in the moft eminent part of a city, and fometimes only near the city.

This word is a diminutive of the Italian *citta*, *city*, q. d. little city.

In the firft cafe, the *citadel* ferves to defend the city againft enemies.

In the latter, it ferves to command it, and keep the inhabitants in their obedience, for which purpofe the city is left unfortified on the part toward the *citadel*, but the *citadel* is fortified toward the city.

The moft ufual form for *citadels* is that of a pentagon: a fquare being too weak, and hexagon too large.

There is always a large ESPLANADE between the City and *citadel*.

There are ufually two gates to a *citadel*, one communicating with the town and the other with the country.

The *citadel* ought to be fo formed and fituated, that the ditch may either be defended by the faces of the baftions, or by thofe of the ravelins, in as direct a manner as poffible; otherwife the enemy may attack the town in that place, as being weakeft, and likewife becaufe the fame attacks may ferve to reduce both together. The coverte-way of the *citadel* ought to be uninterrupted, fo that the part next the town may have a free communication with the other.

CITADINESCA, in *Natural Hiftory*, a name given by fome writers to the Florentine marble, which is fuppofed to reprefent towns, palaces, ruins, rivers, &c. Thefe delineations are merely accidental, and are ufually much aflifted by the imagination, though the natural lines of a ftone may fometimes luckily enough reprefent the ruins of fome ancient building, or the courfe of a river. We have in England a kind of a fepraria, or ludus Helmontii, which has fometimes delineations of this kind confiderably beautiful, though very irregular. The Florentine marble, as we fee it wrought up in the ornaments of cabinets, &c. owes a great deal to the fkill of the workmen, who always pick out the proper pieces from the mafs, and difpofe them in the work fo as to make them reprefent what they pleafe.

CITATION, in the *Ecclefiaftical Court*, a fummons to appear before an eccleſiaſtical judge, on fome affair relating to the church.

The word comes from *cito*, of *citum*, *I fhall up*.

In the civil and ordinary courts, it is called *fummons*.

CITATION is alfo ufed in fpeaking of military and monaſtic as well as eccleſiaſtical courts. Such a *citation* was publifhed by the *feigneur d'Arnholt*, *ſeneſchal* of Perigord and Quercy; and was pulled up by his order, on the gates of the city of Libourne, which then belonged to king Edward. And for default in not appearing, all his domains and effects in France were confifcated.

CITATION is alſo an allegation, or quotation of fome law, authority, or paſſage.

CITELLUS, in *Zoology*, the name of a fmall animal of the mouſe kind, which lives in caves and holes of the earth. Its body is of the fhape of the common weafels, very long and thin: the tail is very fhort. Its colour is a pale filvery grey, like that of fome rabbits. It refembles the mole in its want of external ears; but it has apertures which ſerve it to the fame purpofe, in the manner of birds. They live together in communities, great numbers being ufually found in the fame cave, with a large ſtore of nuts, chefnuts and other fruits. Their flefh is very well tafted, and their fkin much ufed in cloathing in the cold countries. They are found not only in the very cold climates, but in Bohemia, Auſtria, and Hungary.

CITHARA, an ancient muſical inſtrument, by ſome ſuppoſed the ſame with the *lyra*; or, at leaſt, a particular ſpecies of it; by others different: though its preciſe ſtructure does not appear to be known.

The ancients deſcribe it as being triangular, in form of a Greek delta, Δ: the poets aſcribe the invention of it to Apollo.

CITHARA *Solata*. See THEORBO.

CITHAREXYLON, in *Botany*, *fiddle wood*, a genus of the *ſyngeneſia angiofperma* claſs: its characters are theſe: the flower is of one leaf, funnel fhaped, and divided at the top into five equal parts; it hath four ſtamina which adhere to the tube, two of them being longer than the other; in the centre is ſituated a roundiſh germen, which afterwards becomes a capſule with two cells, each having a ſingle ſeed. There are two ſpecies, which are natives of the Weſt Indies, and grow to be very large trees, greatly

greatly valued for durability of building; whence the French gave them the name of *fidelle*-wood, which the English have rendered *fiddle*-wood.

CITHAROEDUS, in *Antiquity*, the same with *citharista*. The *citharœdi* had the preference of all other musicians, from whom they were distinguished by an embroidered cloak, which was peculiar to them.

CITHARUS, in *Ichthyology*, the name of a fish common in the markets of Rome and Venice, and frequent in the German and Mediterranean seas. It is a flat fish of the TURBOT kind; but it is covered with large scales.

CITIZEN, or CITIZEN, a native or inhabitant of a city vested with the freedom and rights thereof.

The word comes from *civis*; which authors derive from *ciere*, because the *citizens* live together; or rather from *cio*, *I call together*.

Augustus, upon numbering the Roman *citizens*, found they amounted to upwards of four millions.

To make a good Roman *citizen*, there were three things required: that he was an inhabitant of Rome; that he were inrolled in one of the thirty-five tribes; and that he were capable of dignities.—Those strangers to whom were granted the rights and privileges of Roman *citizens*, were properly only *honorary citizens*.

The seventh law, *de civitate*, makes a great deal of difference between a *citizen* and a mere inhabitant. Birth, alone, made a *citizen*; and intitled to all the privileges of burgesses; time could not acquire it; but the emperor could bestow it.

The Romans were anciently so particularly careful to preserve even their common *citizens* from any mixture of servile blood, that they prohibited all marriages between them and freed slaves, or their children. And it was decreed, as a special privilege and reward to one Hispala, of libertine condition, for her discovery of the impieties of the Bacchanalian mysteries, that a *citizen* might take her to wife, without any disgrace or diminution of his rights. These distinctions, indeed, began to be disregarded towards the end of the republic, with respect to the ordinary *citizens*, but were kept up to the last, with regard to the senate. See SENATOR.

CITIZENS *in Parliament*. See BURGESSES.

CITOLE, the name of a musical instrument mentioned by the old English poet Gower, probably derived from *citolin*, *a little chest*, meaning the DULCIMER.

CITRAGO, in *Botany*, a name given by some authors to the common garden balm.

CITREÆ *mensæ*, called *thyinæ* by the Greeks, in *Antiquity*, tables made of the wood of the citrum-tree, very beautiful, and greatly esteemed by the ancient Romans. See CITRUM.

CITRIL, in *Ornithology*, a name given by many to the citrinella, or verzellino, a bird common in Italy, and kept in cages for its beauty and fine notes: called by many authors alſo THRAUPIS.

CITRINE, *ſtechas*, or ELYCHRISIUM, in *Botany*. See CUDWEED.

CITRINELLA, in *Ornithology*, the name of a ſmall bird, common in Italy, very much reſembling our common linnet in ſhape. Its head and back are green; its rump of a greeniſh yellow, and its neck, with ſomewhat of the hindmoſt part of the head, grey.

It ſings very finely, and is kept in cages in many parts of Italy.

Linnæus enumerates two birds under this name; one a ſpecies of the EMBERIZA, and the other of the FRINGILLA.

CITRINUS, in *Natural Hiſtory*, the name of a peculiar ſpecies of ſpar or cryſtal, which is of a beautiful yellow. Many of the common cryſtals, when in the neighbourhood of lead mines are liable to be accidentally tinged yellow, by an admixture of the particles of that metal; and all theſe, whether finer, or coarſer, have been too frequently confounded together, under the name *citrine*. It is never found colourleſs, like the other cryſtals, but has a great variety of tinges, from that of deeper ochres to a pale lemon-colour. It is very plentiful in the Weſt Indies, and is found in ſome parts of Bohemia. Our jewellers have learnt from the French and Italians, who are very fond of it, to call it *citrine*, and often cut ſtones for rings out of it, particularly out of the pyramid, which is always finer than the columns, and theſe, after they have paſſed through two or three hands, are generally miſtaken for topazes.

CITRON-*tree*, *Citrus*, in *Botany*, a genus of the *polyadelphia icoſandria* claſs; its characters are theſe: the flower hath five oblong thick petals, and ten ſtamina, which are not equal, joining in three bodies at their baſe; the oval germen in the centre afterward becomes an oblong fruit, with a thick ſcaly ſkin, filled with a ſucculent pulp, having many cells, each containing two oval ſeeds.

There are ſeveral varieties of this fruit, with which the Engliſh gardens have been ſupplied from Genoa, where is the great nurſery, which ſupplies the ſeveral parts of Europe with this, as well as orange and lemon trees.

Their culture and management is the ſame with that of the ORANGE; but they are tenderer, and ſhould have a warmer ſituation in winter, otherwiſe they are ſubject to caſt their fruit; they ſhould alſo continue a little longer in the houſe in ſpring, and be watered ſooner and more in autumn, and have a warmer and better defended ſituation in ſummer.

The *citron* is an agreeable fruit in colour, taſte, ſmell, &c. reſembling a lemon; and ſerving, like that to cool, and quench thirſt.

The *citron* is diſtinguiſhed from the lemon, in that it is bigger, and its pulp firmer; its ſmell brisker, and colour higher. It is held excellent againſt peſtilence and other mortal diſeaſes: and Athenæus relates an inſtance of two perſons ſaid to be preſerved ſafe from the moſt dangerous aſpect, by only eating a *citron*.

The diſtillers, perfumers, confectioners, &c. apply *citrons* to various purpoſes; and obtain from them eſſences, oils, confections, waters, &c.

In Italy they make a liquid with the ſmall *citrons*, which they preſerve entire; and a dry ſweetmeat with the large ones, which they preſerve in quarters.

CITRON-*water*, a well known ſtrong water, or cordial, which may be thus made: take of fine thin lemon-peel eighteen ounces, of orange-peel nine ounces, perfect nutmegs one quarter of a pound, alcohol perfect, that is, the fineſt and beſt rectified ſpirit of wine, two gallons and a half, digeſt in balneo Mariæ for one night; draw off with a low fire; then add as much water as will juſt make the mixture milky (which will be about ſeven quarts or two gallons); and add alſo about two pounds of fine ſugar-candy.

This compoſition may be improved by freſh elder-flowers hung in a cloth in the head of the ſtill, ſprinkled with ambergriſe in powder, or its eſſence.

CITRON-*wood*, the wood of an American tree, called by the natives candle-wood, becauſe, being cut into ſplinters it burns like a candle. The tree is frequent in the Leeward iſlands, and grows to a conſiderable ſize; the leaves are like thoſe of the bay-tree, but of a finer green; the flower is ſweet, and much like thoſe of the orange; the fruit ſucceeding theſe is black, and of the ſize of a pepper corn. The trunk is ſo like the yellow ſaunders in colour, that there was an opinion that it was the ſame tree, and much of it was imported into Europe, and ſold as ſuch; but they were ſoon found to be different, the true ſaunders being of a ſweet ſcent, and but moderately heavy and reſinous, but the citron wood is conſiderably heavy, very oily, and of ſtrong ſmell. It is of no known uſe in medicine, but is uſed in France and Germany by the turners, being a firm fine-grained wood, and taking a fine poliſh, and with age becoming of a very beautiful brown.

CITRUL, *citrullus*, in *Botany*, a name given to a genus of plants, otherwiſe called *angaria*. See *Water* MELON.

CITRUM. The *citrus menſa* have been ſuppoſed by ſome to be made of the *citrus* tree, and by others of the cedar; but it appears plainly that they were made of neither, but of a wood peculiar for its fineneſs, and very different from both. The ancient Greeks have deſcribed the cedar under the name *κεδρος*, and the citron-tree under the name *malus medica*; and beſide theſe, they have deſcribed another tree under the name of *thya*.

CITTERN, the old Engliſh name of a muſical ſtringed inſtrument, reſembling the LUTE, and now called GUITAR.

CITULA, in *Ichthyology*, the name given by Paulus Jovius, and others to the fiſh we call the DORLE, and the generality of authors *ſuber*. Pliny calls it *acus*, and Ariſtotle has better made uſe of the generical name, comprehending this and ſeveral other ſpecies under this arrangement. The *ſuber* is called the *acus* with the prickly belly, and with the tail rounded at the end. This is the true ſpecific name of the *citula*.

CITY, or CITTY, *Urbs*, a large town incloſed with a wall.

It is hard to give any juſt definition of a *city*; becauſe cuſtom has referred the appellation of towns, to many places which ſeem to have every thing requiſite to conſtitute *cities*.

Formerly *city*, according to ſome, was only underſtood of ſuch towns as were biſhops ſees; which diſtinction ſeems ſtill to hold in England, though no where elſe. See BISHOP and DIOCESE.

The term *city* had its riſe, among us, ſince the Conqueſt; for in the time of the Saxons there were no *cities*, but all great towns were called BURGHS.—Thus, London was called *London Burgh*.

And for a long time after the Conqueſt, *city* and *burgh* were

were used promiscuously. Thus, in the charter of Leicester, that place is called both *civitas* and *burgus*; which shews a mistake in my lord Coke, where he tells us that every *city* was, or is, a bishop's see. Nor had Gloucester any bishop then; though it is called a city in Domesday. The like may be observed of Cambridge; to which it may be added, that Crompton, reckoning up one *civitas*, leaves out fifty, though it had a bishop and a cathedral.

Yet Chasseneus, De Consuetud. Burgundi, says, France has within its territories 200 *cities*; and gives his reason, because it has so many archbishops and bishops.

Cities and villages held formerly, in the time of the feudal governments, of some great lord, on whom they depended for protection, and to whose arbitrary jurisdiction they were subject. But the freedom of *cities* was first established in Italy towards the beginning of the fourth century, in consequence of the prevalence of commerce: and it was thence introduced into France and other countries of Europe. And this establishment of communities, says Dr. Robertson, contributed more, perhaps, than any other cause to introduce regular government, police, and arts, and to diffuse them over Europe. Hist. Charles V. vol. i. p. 36. & seq. ed. 2. 8vo. See CHARTERS *of Communities*.

CITY, CIVITAS, in speaking of antiquity, signifies a state, or people, with all its dependencies, constituting a particular republic. Such are still several *cities* of the empire, and the Swiss cantons.

Though the ancient Gauls were, in effect, only one nation; they were yet divided into several people, which formed as many different states: or, to speak with Cæsar, as many different *civitates*, *cities*. Besides that each *city* had its peculiar assemblies, its first deputies, too, from time to time, to the general assemblies held on affairs relating to their common interest.

CITY is particularly used to express the hearts of the place. At *Paris* they have the *city* and the *university*; at *London* we have the *city* and the *suburbs*.

It has been observed that large *cities* are more liable than other places to pestilential and putrid disorders, which is owing to the stagnation and corruption of the air. This is always the case in those which are low and unprovided with common sewers; where the streets are narrow and foul, the houses dirty, water scarce, and jails and hospitals crowded: also, when in sickly times the burials are within the walls, or when dead animals and offals are left to rot in the kennels or on dunghills; when drains are not provided to carry off any large body of stagnating water in the neighbourhood; when tenements make the greatest part of the dust, without a proper mixture of grass, bread, wine, or fermented liquors; from the use of old mouldy grain. In proportion to the number of these and the like causes concurring, a *city* will be more or less subject to pestilential diseases, or to receive the leaven of the true plague, brought into it by any merchandize. An excellent writer emphatically calls them the graves of the human species. See *Bills of* MORTALITY.

However, as great *cities* furnish many materials for vitiating the air, they likewise afford two considerable antidotes; the first arises from the circulation of the air, by means of the constant motion of people and carriages, and of the draughts made by fires: the other depends on the great quantity of an acid produced by fuel, the strongest resister of putrefaction.

CITY, *Provost of the*. See PROVOST.

CIVES, in *Botany*, a very small species of onion which never produces any bulb, and seldom grows above six inches high in the blade, which is very small and fleshy, and grows in tufts and bunches. This used to be in great request for salads in spring, as being milder than other onions which had stood the winter, but at present it is not much regarded. The way of propagating it is by parting the roots in autumn, and planting them, at small distances, three or four in a hole; they will stand the winter very well, and be fit for use early in the spring. See ALLIUM, GARLICK, and ONION.

CIVET, a kind of perfume, bearing the name of the animal whence it is taken.

The word comes from the Arabic *zibed*, or *zabed*, *foam*, *froth*.

The *civet*, or *civet-cat*, *zibeta*, is a little animal, in shape resembling the wolf or dog; its snout is long and small; its ears small and roundish; its hair is like those of the badger, but very soft; its feet small and legs short. See *Tab. Quadrupeds*, N° 17.

Some naturalists will have it the same with the hyæna of Aristotle, and call it *hyæna odorifera*. Others suppose it the panther of the ancients, while the generality take it for a kind of wild cat, and call it *felis zibetha*, on account of the perfume it yields, which the Arabs call *zibet*. Linnæus makes it a species of the VIVERRA, with an annulated tail, with wave-like streaks of pale grey and black along the back. It is a native of Africa, the Indies, Peru, Brasil, Guinea, &c.

An ample description of the *civet-bag*, its glands, the reservoirs of the perfume, &c. is given by M. Morand in Mem. Acad. R. Scienc. an. 1728. p. 403. H. 14.

It is gathered from time to time; and still abounds, in proportion as the animal is fed.

There is a very considerable traffic of *civet*, from Russia, Calicut, and other places, where the animal this produces it is bred: though great part of the *civet* among us is furnished by the Dutch; who bring up a considerable number of the animals.

Before any of these animals were seen in Europe, or it had been observed how the perfume had been gathered, the common opinion, founded on the relations of travellers, was, that it was the sweat of that animal, when irritated and provoked into rage. To this effect, it was said, that the animal was inclosed in an iron cage, and after having been a long time beaten with rods, they gathered with a spoon, through the bars of the cage, and between the thighs of the animal, the sweat or foam, which the rage and agitation had produced; and that, without this precaution, the animal would yield no perfume at all; which is undoubtedly false.

The proper *civet* perfume is only a thick oily humour, secreted by certain glands between the two sides of the bag wherein it is amassed, under the creature's tail, beneath the anus, and between it and the sexual parts of the animal.

Civet must be chosen new, of a good consistence, a pale colour, and a strong smell.

However, the sweat and foam of the animal provoked by fretting, which are highly perfumed, are likewise collected, serve to sophisticate the perfume, or increase its quantity.

Besides the Indian and Dutch *civet*, there is also a *civet* from Brasil, or Guinea, like that of India; and an *accidental civet*, which bears no resemblance to it: this being only a term used to express the human excrements.

Civet is little used in medicine, except in a thickness of hearing from cold; where a grain or two being put in a little cotton, or wool, and the ears stopped therewith, is sometimes of service. It is much used among perfumers and confectioners.

This odoriferous, unctuous animal juice is soluble in oils, but not in spirit of wine, or in water even by means of sugar. Neumann.

CIVIC, CIVICUS, an epithet applied to a kind of a crown, made of oaken leaves; anciently bestowed by the Romans on those who saved the life of a fellow-citizen in a battle, or an assault. The civic crown was exceedingly esteemed: and was even given as an honour to Augustus, who on this occasion struck coins with this device, OB CIVES SERVATOS. It was also granted to Cicero, after his discovery of Cataline's conspiracy. See CROWN.

CIVIL, CIVILIS, in its general sense, denotes something that regards the policy, public good, or peace of the citizens, or subjects of a state.

In this sense, we say, *civil* government, *civil* law, *civil* rights; *civil war*, &c.

CIVIL, in a *Legal Sense*, is also applied to the ordinary procedure in an action relating to some pecuniary matter, or interest. In which sense it is opposed to criminal.

CIVIL *Action*. See ACTION.

CIVIL *Architecture*. See ARCHITECTURE.

CIVIL *Corporation*. See CORPORATION.

CIVIL *Day*. See DAY.

CIVIL *Death*, any thing that retrenches, or cuts off a man from *civil* society: as, a condemnation to the galleys, perpetual banishment, condemnation to death, outlawry, and excommunication; all which make a man cease to be looked on as a citizen.

The term is likewise applied to those who are no longer capable of acting in temporal concerns; as those who renounce the world, who retire and make vows in a monastery, &c.

CIVIL *Fruits*. See FRUITS.

CIVIL *History*. See HISTORY.

CIVIL *Law*, *Lex* CIVILIS, is defined in the Institutes, to be the laws peculiar to each city or each people. But in the modern use, it properly implies the Roman law, contained in the Institutes, the Digest, the Code, and the Novels; otherwise called, *jus scriptum*, or the *written law*.

The Roman law, at its commencement, was very inconsiderable. Under the kings, the people were governed by certain laws prepared by the senate, passed by the kings, and confirmed in an assembly of the people.

Papirius was the first who made a collection of the regal laws; which took its name from its author, and was called *jus Papirianum*.

The republic, after abolishing the regal government, still retained the royal laws: to these they added the law of the Twelve Tables, drawn by the decemviri from the laws of twelve of the principal cities of Greece; and the more equitable among the laws hitherto practised at Rome.

During the time of the republic, and even under the emperors, there were jurisconsulti; who making public profession of the study of the law, were consulted on the different senses of the laws, and gave answers to the questions proposed to them thereon; which were called *responsa prudentum*, and by Justinian, the *jurisprudentia media*.

The law of the Twelve Tables was at length found to be severe, and conceived in such obscure terms, that it was judged proper to moderate, restrain, and ascertain it, by other laws, proposed to the senate by the consuls, and passed at general assemblies of the people; according to the practice that had obtained under the kings themselves: and these were called by way of emphasis *leges*, or the *laws*. Afterwards the common people differed with the nobility, and, during their secession, enacted laws of their own, which were called *plebiscita*; and, upon their subsequent reconciliation, these were admitted and universally enforced. The senate was likewise entrusted with a legislative authority; and new laws were made by them, and called *senatus consulta*, and incorporated with the Roman *civil* law. The prætors, likewise, in the absence of the consuls, had a power of supplying and correcting the *civil* law of the Twelve Tables, and of propoling edicts, which, when approved by the people, were incorporated into the *civil* law, under the title of *jus prætorium*. And the ædiles curules did also in some cases enact and establish laws. These several parts, which have been enumerated, compoled the Roman *civil* law, during the republic.

In the time of Julius Cæsar, Offilius, a lawyer, began a collection of the edicts of the prætors; but this was not finilhed till the time of Adrian, by another lawyer; who alio digelted the edicts of the ædiles curules, which were made perpetual by the Cornelian law.

In the year of Rome 731, the republic expired; and the whole power of the people was transferred to Auguftus, who was contented to publish his new laws to the assembly of the people; to keep up lome image of the republic by this formality. Tiberius abolilhed thele occalional assemblies, on pretence of their being too numerous; and, in lieu thereof, offered his laws to the senate, who never failed to confirm them: infomuch that the laws of Tiberius, and his succeflors, who kept the lame measures with the senate, were eilcemed *senatus cuvjulta*. They were alio called *imperial conjtitutions*, and lometimes *placita principum*. The *responsa prudentum*, obtained from those to whom the emperors gave commillion, and to which the judges were obliged to conform, conlhituted a part of the *jus scriptum*, or written law. The *imperial conjtitutions*, after they were become very numerous under succeeding emperors, were digelted into four codes. See Code.

Juftinian, finding the authority of the Roman law almoft abolilhed in the Weft, by the declenlion of the empire, refolved to make a general collection of the whole Roman jurilprudence, and committed the care thereof to his chancellor Trebonianus.

That minilter executed his commillion with a great deal of diligence, not to lay precipitation: a new code was finilhed in 529, and a digeft, or pandect, containing an abridgement of the *responsa prudentum*, in 533.

The lame year he publilhed an abridgement thereof, containing the firft principles and elements of law, under the title of *Injtitutes*.

In the courle of this reign, Juftinian made 168 conftitutions, and 13 edicts; which made a conliderable alteration in the ancient law, and were called *Novels*.

All thele together, viz. the *Code*, the *Digeft*, the *Inftitute*, and the *Novels*, make the *corpus juris civilis*, or body of the *civil law*, as reduced by order of Juftinian.

For the lpace of about 900 years, this lyltem of law obtained without any innovation. But the new conftitutions, made by the emperors from time to time, at length occalioning lome alterations; the emperor Balil, and Leo, his lon, compoled a new body of the Roman law, chiefly from the Juftinian, in the Greek language; dividing it into leven volumes, and lixty books; under the title of *Baflica*. From which time, Juftinian's body had but little credit in the Eaft; the Baflica taking place of it.

In the Weft, the *civil law* had a different fortune; for, though lome traces of its authority remained in Italy, yet it was little known in Europe, till a copy of Juftinian's *Digeft* was accidentally found at Amalfi, in Italy, about the year 1130; and this circumltance, together with the policy of the Romilh ecclelialtics, contributed to introduce it into leveral nations, and occalioned that inundation of voluminous commentators, with which this lyltem of law, more than any other, is now loaded.

It is true, however, it was never taught publicly till the twelfth century; when the ltudy of it was introduced into leveral univerlities abroad, particularly that of Bologna; whence it was carried by Italian ltudents into other countries, and in a little time was taught in all the univerlities.

It was firlt brought over into England by Theobald, a Norman abbot, who was elected to the lee of Canterbury in 1138; and he appointed a profeflor, viz. Roger, lirnamed Vacarius, in the univerlity of Oxford, to teach it to the people of this country. Nevertheless, it gained ground very llowly; king Stephen illued a proclamation, prohibiting the ltudy of it. And though the clergy were attached to it, the laity rather wilhed to preserve the old conltitution. However, the civil and canonical law acquired great reputation from the reign of king Stephen to the reign of king Edward III. both inclulive. Many tranlcripts of Juftinian's Inltitute are to be found in the writings of our ancient authors, particularly of Bracton and Fleta; and judge Blackltone obferves, that the common law would have been loft and over-run by the *civil*, had it not been for the incident of fixing the court of common pleas in one certain lpot, and the forming the profeflion of the municipal law into an aggregate body.

It is allowed, that the *civil* law contains all the principles of natural equity; and that nothing can be better calculated to form good lenle, and found judgment. Hence, though in leveral countries it has no other authority but that of reaton and juftice, it is every where refpected for authority.

It is not received at this day in any nation without lome alterations: and lometimes the feudal law is mixed with it, or general and particular cuftoms; and often ordinances and ltatutes cut off a great part of it.

In Turky, the *Baflica* are only ufed. In Italy, the canon law, and cuftoms, have excluded a good part of it. In Venice, cuftom hath almoft an abloline government. In the Milanele, the feudal law, and particular cuftoms, bear lway. In Naples and Sicily, the conltitutions and laws of the Lombards are faid to prevail. In Germany, and Holland, the *civil* law is eilcemed to be the municipal law: but yet many parts of it are there grown obloletes; and others are altered, either by the canon law, or a different ulage.

In Friealand, it is obferved with more ltrictnels: but in the northern parts of Germany, the lax Saxonicum, Lubecenle, or Culmenle, is preferred before it. In Denmark and Sweden, it hath fcarce any authority at all.

In France only a part of it is received; and that part is in lome places as a cuftomary law: and in thole provinces nearelt to Italy, it is received as a municipal written law. In criminal caules, the *civil* law is more regarded in France: but the manner of trial is regulated by ordinances and edicts.

The *civil law*, in Spain and Portugal, is connected with the *jus regium* and cuftom. In Scotland, the ltatutes of the federunt, part of the regie majeltatis, and ltatute cuftoms, controul the *civil law*.

In England, it is uled in the ecclelialtical courts; in the high court of admiralty; in the court of chivalry; in the two univerlities; and in the courts of equity: yet in all thele it is reltrained and directed by the common law. See Law, Common *Law*, &c.

Civil *Liberty*. See Liberty.

Civil *Lift*, the money allotted for the lupport of the king's houlhold, and for defraying certain neceflary charges of government. See 1 Geo. III. cap. 3.

Civil *Month*. See Month.

Civil *Obligation*. See Obligation.

Civil *State*, conlilts of the nobility and commonalty, exclulive of the clergy, and of the military and maritime orders.

Civil *Subjection*, in *Law*, is a ltecies of compulfive obligation, whereby an inferior is conltrained by a luperior to an action contrary to what his own reaton and inclination would luggelt: it when a legislator eltablilhes impiety by a law, and commands a lubject to do what is inconliltent with religion or found morality. This excule cannot be admitted in *foro conjcientiæ*, but it is a lufficient extenuation of civil *guilt* before the municipal tribunal. Black. Com. vol. iv. p. 23.

CIVIL *War*, a war between people of the same state, or the citizens of the same city.

CIVIL *Year*, is the legal year, or *civil* account of TIME, which every government appoints to be used within its own dominions.

It is thus called, in contradistinction to the natural year; which is measured exactly by the revolution of the heavenly bodies.

CIVILIANS *College*. See COLLEGE.

CIVILISATION, a law or judgment, which renders a criminal process CIVIL.

Civilisation is performed by turning the information into an inquest, or vice versâ.

CLACK *mark*, is to cut off the sheep's mark, which makes it weigh lighter; as to force wool, signifies to clip off the upper and hairy part thereof; and to bard it, is to cut the head and neck from the rest of the fleece. Stat. 8 H. VI. cap. 22.

CLADEUTERIA, in *Antiquity*, a festival celebrated at the time of pruning the vines. It was likewise called *lysæa*.

CLADIUS, in *Natural History*, a name given by the ancients to the flag or sedge, when four years old; in this year, or at the end of it, it was called *xiraxis*. The Greeks had names for all the years growth of this animal up to its perfection: in the first year they called it *nossus*; in the second *pastalon*; in the third *meriscus*; and in the fourth *cladius*, or *xiraxis* toward the end of that year. This name the creature retained all its life afterwards, it being supposed at its full maturity at that time.

CLAIM, in *Law*, a CHALLENGE of interest in any thing that is in POSSESSION of another; at least of a man's own. See NON-CLAIM.

There are divers sorts of *claims*; as *claim by charter*, *by descent*, *by acquisition*, &c.

CLAIM, *Continual*, a *claim* made from time to time, within every year and day, to land, or other thing, which, on some accounts, cannot be attained without danger.

Thus, if I am disseised of land, into which, though I have a right, I do not enter for fear of being beaten; I am to hold on my right of entry at my best opportunity; by approaching as near as I can, once every year, as long as I live: and thus I leave the right of entry to my heir.

CLAIM *of Liberty*, a suit or petition to the king in the court of Exchequer, to have liberties and franchises confirmed there by the king's attorney-general.

CLAIM, *Fresh*. See FRESH.

CLAIM, *Writ*. See QUIT.

CLAIR-OBSCURE, or CHIARO-SCURO, in *Painting*, the art of distributing to advantage the lights and shadows of a piece, both with regard to the eafing of the eye, and heightening the effect of the whole composition.

Thus when a painter gives his figures a strong relievo, loosens them from the ground, and sets them free from each other, by the management of his lights and shadows, he is said to understand the *clair-obscure*.

The *clair-obscure* makes one of the great divisions, or branches, of painting; the whole of a picture being resolvable into light and shadow. It was first invented in Italy by Hugo da Carpi, in the sixteenth century.

The doctrine of the *clair-obscure* will come under the following rules. Light may either be considered with regard to itself, to its effects, the place wherein it is diffused, or its use. For the 1st, light is either *natural*, or *artificial*.

Natural, either comes immediately from the sun, which is brisk, and its colour various, according to the time of the day; or is that of a clear air, through which light is spread, and whose colour is a little bluish; or of a cloudy air, which is darker, yet represents objects in their genuine colours with more ease to the eye.

Artificial light proceeds from fire, or flame, and tinges the object with its own colour, but the light it projects is very narrow and confined.

For the 2d, the effects of light are either *principal*, as when the rays fall perpendicularly on the top of a body, without any interruption; or glancing, as when it slides along bodies; or *secondary*, which is for things at a distance.

3. For the place, it is either the open champaign, which makes objects appear with great softness; or an inclosed place, where the brightness is more vivid, its diminution more hasty, and its extremes more abrupt.

4. For the use, or application of the light of the sun is always to be supposed without, and over-against the picture, which may heighten the foremost figures; the intermediates themselves never appearing, in regard the best colours cannot expreſs them. The chief figure is to meet on the chief group, and as much as poſſible on the chief figure of the ſubject. The light is to be purſued over the great parts, without being croſſed, or interrupted with little ſhadows. The full force of the principal light is to be only in one part of the piece; taking care never to make two contrary lights. Not to be ſcrupulouſly confined to one univerſal light; but to ſuppoſe other acceſſory ones, as the opening of the clouds, &c. to looſen ſome things, and produce other agreeable effects. Laſtly, the light to be different, according to the quality of the things whence it proceeds, and the nature of the ſubjects which receive it.

As for ſhadows, they are diſtinguiſhed, 1°, Into thoſe formed on the bodies themſelves, by their proper relievos: 2°, Thoſe made by adjacent bodies: 3°, Thoſe that make part of an whole: and 4°, The different effects according to the difference of places. For the firſt, ſince the different effects of lights only appear by ſhadows, their degrees muſt be well managed. The place which admits no light, and where the colours are loſt, muſt be darker than any part that has relievo, and diſpoſed in the front. The reflex, or return of the light, brings with it a colour borrowed from the ſubject that reflects it, and ſhuts off as a greater or leſs angle, according to the poſition of the reflecting body with regard to the illuminated one: hence, its effects muſt be different in colour, and in force; according to the diſpoſition of bodies. Deſcendings, which admit not of any light, or reflex, muſt never meet on the relievo of any member of any great obſcured party; but in the cavities or joints of bodies, the folds of draperies, &c. And to find occaſions for introducing great ſhadows to ſerve for the repoſe of the light, and the looſening of things; inſtead of many little ſhadows, which have a mean effect.

For the 2d, the ſhadows made by bodies, are either in plain and ſmooth places, or on the earth; wherein they are deeper than the bodies that occaſion them, as receiving leſs reflex light; yet ſtill diminiſh as they depart farther from their cauſe; or they are on the neighbouring bodies, where they are to follow the form of the ſaid bodies, according to their magnitude and poſition, with regard to the light.

For the 3d, in ſhadows that have parts, the painter muſt oblerve to take his light in a ſhadowed place, the tint, or luſtre of the light parts, and, on the contrary, for the ſhadow in the lightened part, the tint or luſtre in the ſhadow: to make an agreeable aſſemblage of colour, ſhadow, and reflexin the ſhadowed part; but without interrupting the great maſſes of ſhadow: to avoid forming little things in the ſhadow, as not being perceived, unleſs cloſely looked at; and to work, as it were, in the general, and at one light; never to ſet the ſtrong ſhadows againſt the lights, without ſoftening the harſh contraſt by the help of ſome intermediate colour: tho' the maſs of light be placed either before or behind that of the ſhadow, yet make it to be diſpoſed, as to illumine the principal part of the ſubject.

For the 4th, the effects of ſhadows are different, as the place is either wide and ſpacious; as in thoſe coming immediately from the ſun, which are very ſenſible, and their extremes pretty abrupt: from the ſcreene air, which are fainter and more ſweet: from the dark air which appear more diffuſed, and almoſt imperceptible: and thoſe from an artificial light, which makes the ſhadows deep, and their edges very abrupt: or as it is more narrow and confined, where the lights coming from the ſame place make the ſhadow more ſtrong, and the reflex leſs ſenſible.

CLAIR-OBSCURE, CHIARO-SCURO and OBSCURO, is alſo uſed for a deſign conſiſting only of two colours; ordinarily black and white, ſometimes black and yellow.

Or, it is a deſign only waſhed with one colour; the ſhadows being of a duſky brown colour, and the lights heightened up with white.

The word is alſo applied to prints of two colours, taken off at twice; whereof there are volumes in the cabinets of the curious in prints.

The word *clair-obſcure*, is compounded of two others. *Clair* is uſed among the French for thoſe parts of a painting which reflect the moſt light; and comprehends not only the lights themſelves, but alſo thoſe colours that are luminous. By *obſcure*, is meant not only all the ſhades, but alſo all the colours that are dark.

CLARD, in *Ornithology*, a name given by the people of Lancaſhire, and ſome other places, to the BARNACLE, a ſmall ſpecies of wild gooſe.

CLAMATOR, in *Antiquity*, was uſed to ſignify a domeſtic officer, whoſe buſineſs was to call the gueſts to dinner.

CLANEA *admittenda in itinere per attornatum*, is a writ whereby the king commands the juſtices in eyre to admit a perſon's *claim* by an attorney, who being employed in the king's ſervice, cannot come in perſon.

CLAMOR, or CLAMOUR *de Hare*, a popular term in the French

French laws, importing a complaint, or cry, whereby any one implores the assistance of justice against the oppression of another.

CLAMOR, *sm.*, in *Medicine*, an intenseness of the voice, a loud outcry, a *clamor*. This is sometimes the cause of a rupture of the vessels, and sometimes of a disorder, like an inflammation about the membranes of the fauces and muscles; which may be compared to that ulcerous and inflammatory lassitude, which affects the hands, legs, and loins, after excessive hard labour: the spirituous and humid particles being exhausted, and the fibres and membranes dried and contracted. A *clamor* is sometimes also a sort of remedy, and prescribed as such in order to rouse persons out of a lipothymy, or syncope.

CLAMOR *bellicus*, in *Antiquity*. See SHOUT.

CLAMPS, in *Gunnery*. See CAP-*squares*.

CLAMPS, in *Ship-building*, are thick planks in a ship's side, used to sustain the ends of the BEAMS. They include the whole inner range of the side circle under each deck, from the item to the fashion-piece of the stern. Those of the lower and second decks should be half the thickness of the corresponding timbers in that part, and as broad as they can be procured: until they should be so disposed as not to be pierced by the ports.

CLAMPS, in a *Ship*, are also pieces of timber applied to a mast, or yard, to strengthen it, and prevent the wood from burlting.

CLASP, also, denotes a little piece of wood, in form of a wheel; used instead of a pully in a mortise.

CLAMP, in like wise the term for a pile of bricks built up for burning.

CLAMP-*nails*, are such nails as are used to fasten on *clamps*, in building and repairing of ships.

CLAMPING, in *Joinery*, &c. When a piece of boards is fitted with the grain, to the end of another piece of board cross the grain; the first board is said to be *clamped*.

Thus the ends of large old tables were commonly *clamped*, to preserve them from warping.

CLAMPONNIER, or CLAPONNIER, in the *Manege*, a long-jointed horse; that is, one whose patterns are long, slender, and over-pliant.

The word is obsolete, and is properly applicable only to the ox kind: for *la claponniere* in French, is in them what the pastern is in a horse.

CLANCULARII, a sect of Anabaptists, who denied the necessity of making an open profession of the faith; and taught that a private one would be sufficient.

These were also called *Horziani*, and *Gardenses*, from the places they chose to assemble in, instead of churches.

CLANDESTINA, in *Botany*. See LATHRÆA.

CLANDESTINE, any thing done secretly and without the knowlege of some of the parties interested in it; or without the proper solemnities.

The word comes from the preposition *clam*, of *apud*, *circum*, *from*; or *latium*, *fortum*, *theft*.

Thus, a marriage is said to be *clandestine*, when performed without the publication of banns, the consent of parents, or the knowlege of the ordinary. The council of Trent, and the French ordonnances, annul all *clandestine* marriages. See MARRIAGE.

CLANGULA, in *Ornithology*. See DUCK.

CLAP, in *Medicine*, the first stage, or state, of the venereal disease, called also a GONORRHŒA.

Dr. Cockburn, and others after him, will have the *clap* to consist in an ulceration of the mouths of the glands of the *urethra* in men, and of the glandlar *carunculæ* in women; occasioned by the insinuation of an acrimonious, purulent matter, contracted from an infected person *in actu coitus*.

From these glands, ulcers or gleets a sharp corrosive matter, accompanied with heat of urine, chordee, &c. which makes what is usually termed the first stage of the distemper.

A *clap* appears sometimes sooner, and other times later, though generally in about three or four days after the infection is received; and discovers itself by the running, &c. of the *penis*, with inflammation of the *glans*, or nut of the yard.

The heat, or burning, which such persons feel in making water, is a consequence of this exoriation of the *urethra*; the salts contained in the urine pricking and irritating the vicious *fibrillæ* of the *urethra*, thus divested of its natural membrane.

If the person be affected with a *gleet*, or *paraphimosis*; if the running be of a thin consistence, a yellow or green colour, and in great quantity, and the testicles swelled; it is usually termed a *gonorrhœa virulenta*; and the *clap* supposed to be in its second stage.

Some authors think, that in this degree, or stage, the infection has reached the mass of blood, and the *system* is *venereal*: others infist, that these symptoms may be accounted for, from the running, or ulcer, being more corrosive; and by that means irritating and inflaming the adjacent parts.

The cure of a *clap* consists in proper evacuations, as universal purgatives, refrigerant emulsions, *decoctum lenitivum* emetics, and bathe, proper temperature, &c. to which some add, decoctions of the *lignum vitæ*, &c. as to externals, they are generally comprehended under the form of fomentations, cataplasms, liniments, and lotions.

Late authors, and especially Dr. Cockburn, have insisted on the cure of a *clap* by a particular injection, without the use of any other medicine. This has given a handle to quacks, who, by affecting to do the same by their injections, generally check the running, and occasion a confirmed pox.

Turbith mineral, calomel, &c. given in small doses, and continued for some time, so as to take effect by way of alteratives, have been lately much commended as to success. Mercurial unguents, used in small quantities, so as not to raise a salivation, are said to cure all the stages of the venereal disease: this practice is used at Montpelier.

CLAP-*board*, a board cut, in order to make casks or vessels.

CLAP-*net*, in *Birding*, a sort of net contrived for the taking of larks with the looking-glass, by the method called daring, or dering. The nets are spread over an even piece of ground, and the larks are invited into the place by other larks fastened down, and by a looking-glass composed of five pieces, and fixed in a frame, so that it is turned round very swiftly, backwards and forwards, by a cord pulled by a person at a considerable distance behind a hedge. See DARING.

CLAR, or CLARE, in *Metallurgy*, bone ashes perfectly calcined, and finely powdered, kept purposely for the covering the insides of CUPELS.

CLARAMONT *powder*, the name of a medicinal powder very famous in Venice, and some other places, for its virtues in stoping hemorrhages of all kinds, and in the cure of malignant fevers. It has its name from the person who first found out its virtues and who has written a book expressly about it. It is a white earth found near Baira, not far from Palermo, and is thence called also by some writers, *terra de Baira*.

CLARE, *Nuns of St.* were founded at Assise in Italy, about the year 1212. These nuns observed the rule of St. Francis, and wore habits of the same colour with those of the Franciscan Friars: and hence were called *Minoresses*; and their *house*, without Aldgate, the *Minories*, where they were settled when first brought over into England, about the year 1293. They had only three houses besides this.

CLARENCIEUX, the second king at arms; thus called from the duke of Clarence, to whom he first belonged.

Lionel, third son of Edward III. having by his wife the heiress of Clare in the county of Thomond, was hereupon created duke of Clarence: which dukedom afterwards escheating to Edward IV. he made this herald, who properly belonged to the duke, a king at arms, naming him *Clarenceux* in French, and *Clarentius* in Latin.

His office is to marshal, and dispose of, the funerals of all the lower nobility; as baronets, knights, esquires, and gentlemen on the South side of Trent: whence he is also called *Surroy*, or *Southroy*, in contradistinction to NORROY.

CLARENDON, *Constitutions of*, in *Antiquity*, a charter or code of laws established by the parliament at *Clarendon*, in Wiltshire, A. D. 1164, fifteen articles of which related particularly to ecclesiastical matters, and were designed by king Henry II. to check the power of the pope and his clergy, and to limit the total exemptions which they claimed from the secular jurisdiction. They were vehemently opposed by Becket; and ten of them were condemned by pope Alexander III. and by no means.

CLARET, or CLARET, *vin rouge*, a name which the French give to such of their red wines as are not of a deep or high colour. See WINE.

The word is a diminutive of *clear*, *bright*, *transparent*.

There are various accounts in the Phil. Trans. of attempts to improve the operation of VARNISH by injecting the *siccative* after the lymph is drawn off with *clarets* and other astringents. Phil. vol. abr. part ii. N° 65. an. 1756.

CLARET, *Claretum*, in the *ancient Pharmacy*, was a kind of wine sweetened with sugar, and impregnated with aromatics; sometimes also called *Hippocras*, or *vinum Hippocraticum*; because supposed to have been first prescribed by Hippocrates.

It has its name *claret*, from its being clarified by percolation through a flannel bag, called *manica Hippocratis*.

CLARIAS, or CLARIAS *Silurus*, in *Ichthyology*, the name of a fish of the *glanis* kind, common in the Nile, and brought

brought to market at Memphis, and in many other parts of Egypt, but of an insipid taste, and eaten only by the poorer sort of people. The tail is broad and forked, and has externally two horny appendages of a round figure, and a hand's breadth in length, in which it differs from all other fishes.

CLARICORD, or MANICORD, a musical instrument, in form of a spinet.

It has forty-nine or fifty keys, and seventy strings, which bear on five bridges; the first whereof is the highest, the rest diminishing in proportion. Some of the strings are in unison; their number being greater than that of the stops.

There are several little mortises for pulling the jacks, armed with little brass hooks, which stop and raise the chords in lieu of the feather used in virginals and spinets. But what distinguishes it most, is, that the strings are covered with pieces of cloth, which render the sound the sweeter; and deaden it so as that it cannot be heard to any considerable distance.

Hence some call it the *dumb spinet*; whence it comes to be particularly in use among the nuns, who learn to play, and are unwilling to disturb the silence of the dormitory.

The *clarichord* is more ancient than either the spinet or harpsichord; as is observed by Scaliger, who, however, only gives it thirty-five strings.

CLARIFICATION, in *Chymistry*, the act of clearing, or fining of liquors from their grosser parts.

Clarification is performed by decantation, ebullition, defumation, and colature, or filtration.

The term is chiefly applied to juices, decoctions, and syrups, which are *clarified* by filtration, or by passing them through a strainer, after having been beat up into a froth with the whites of eggs; the viscous parts of the eggs, entangling the thick gross particles of the liquor, retain them in the strainer. Sometimes the mixture is boiled; by which means the eggs entangle the grosser parts, and carry them up to the top in a tough scum, which is either taken off with a spoon, or separated by a flannel bag, as before, called *Hippocrates' sleeve*. Another method is, by letting the liquor stand in a convenient vessel, till the grosser particles settle.

In distilled waters, &c. which have a milky hue, or are turbid, this is generally effected with fine sugar, mixed with a small quantity of alum; which will bear down the oily parts, and leave the rest clear.

Many liquors are *clarified* by passing them through a thick brown paper; among others, hippocras, hydromel, &c.

The ancients *clarified* their wines by pouring them from off the lees, into another barrel, through a tin strainer. Fine and delicate wines are usually *clarified* with ichthyocolla, or fish-glue: the thicker wines with omelette, or whites of eggs diluted in water; sometimes by pouring them through a heap of little chips.

It is an error to suppose, that either isinglass, or omelette, can be prejudicial to the health; since both the one and the other fall down with the lees, without producing any ill effect: though Neumann makes a doubt concerning the wholesomeness of wines thus *clarified*; especially if they are drank too soon. That which makes wines unwholsome is not the *clarifying* by these innocent means, but the mixtures and sophistications of the vintners, to make them brisk, and bring them to life again after the frets which is done with *aqua vitæ*, spices, pigeons dung, &c.

Bay salt is *clarified* with ox's blood.

Sugar is *clarified* with the whites of eggs, and sugar beat together; and with ox's blood and other materials. See SUGAR.

For MALT *liquors*, particularly beer, there are various methods of clearing; the best is by casting into it fixed nitre: some add the quintessence of malt and wine; whites of eggs made into balls with a little flour and isinglass: oil, and quintessence of barley, have the same effect. It is exceedingly cleared and strengthened, by adding to it, during the time of its fermentation, some ardent spirit.

CLARIGATIO, in *Roman Antiquity*, a ceremony that always preceded a formal declaration of war. It was performed in this manner: a first four heralds, crowned with vervain, were sent to demand satisfaction for the injuries done the Roman state. These heralds, taking the gods to witness that their demands were just, one of them, with a clear voice, demanded restitution within a limited time, commonly thirty-three days; which being expired, without any restitution made, then the *pater patratus*, or prince of the heralds, proceeded to the enemies frontiers, and declared war.

CLARIGATIO is also used for apprehending a man, and holding him to bail. The Greeks called this action ANDROLEPSIA.

CLARIGATION, in the *Law of Nations*, denotes a solid clear call, or summons made to an enemy, to demand satisfaction for some injury received; in defect whereof, recourse will be had to reprisals.

Clarigatione amounts to much the same with what the Greeks call ἀφορμὴ ἐγκλημάτων. Though Naudæus for the word in a somewhat different manner. "Reprisals," says he, "signify the same as *pirationes Budæo aut clarigationes* " *Hermolao*; for as to the Greek word *androlepsia*, it is " equivalent to the Latin *prehensio bonorum*."

CLARINO, in the *Italian Music*, signifies a TRUMPET; thus, *a due clarini*, added to any composition, denotes that it was made for two trumpets. See CORNET.

CLARION, a kind of trumpet, whose tube is narrower, and its tone acuter and shriller than the common trumpet.

Menage derives the word from the Italian *clarino*, of the Latin *clarus*, by reason of the clearness of its sound.

Nicod says, the *clarion*, as now used among the Moors, and the Portuguese, who borrowed it from the Moors, served anciently for a treble to several trumpets, which sounded tenor and bass. He adds, that it was only used among the cavalry and the marines.

CLARION, in *Heraldry*, is a bearing represented in *Tab. Heraldry, fig.* 30.—He bears ruby, three *clarions* topaz; being the arms of the earl of Bath, by the name of Granville.

Guillim takes these *clarions* to be a kind of old-fashioned trumpets; but others rather think, they represent the rudder of a ship; and others a reft for a lance.

CLARISSIMI, among the Romans, a title of honour belonging to the third rank of nobility under the emperors. See SPECTABILES.

CLARK-*goose*, in *Natural History*, a species of wild goose found in Zealand. Phil. Trans. N° 473. sect. 8.

CLARO *obscuro*. See CLAIR *obscure*.

CLARY, *Sclarea*, in *Botany*; Tourn. *Linnæus* has joined the genus and the next to the SALVIA. Its characters are these: the flower has a tubulous empalement, which widens at the top, and has five acute points at the brim; it is of the lip kind, with one petal, having a crooked tube which enlarges at the chaps, where it is divided into two lips; the upper lip erect and arched, the under lip cut into three segments; it has two stamina, which are situated under the upper lip, terminated by oblong erect summits; and a four pointed germen, supporting a forked style longer than the upper lip, crowned by a bifid stigma: the germen afterwards becomes four roundish seeds, which ripen in the empalement.

There are fifteen species, natives of different places. The first sort grows natural in Syria, but has been long cultivated in the European gardens, both for the kitchen and shops; it is a biennial plant, which perishes after it has borne seeds. The lower leaves of this are large, rough, wrinkled, oblong, and heart-shaped; and are sawed on the edges.

It is propagated by seeds, which should be sown in the spring; and when fit to remove, may be planted in an open spot of ground in rows, two feet asunder. In the winter and spring following, the leaves, which are the only part used, will be in perfection, and in the summer will run up to flower; and after ripening their seeds, will decay; so that young plants should be annually raised for use.

Clary is accounted to be of a warm and drying nature. Infused in wine, it comforts a cold windy stomach; it is particularly commended to strengthen the kidneys, to relieve a *flux alvi*, and invigorate a cold relaxed womb.

CLARY-*water*, is composed of brandy, sugar, clary-flowers, and cinnamon, with a little *ambergris* dissolved in it. It helps digestion, and is cardiac. This water is rendered either purgative or emetic, by adding resin of jalap and scammony, or *crocus metallorum*. Some make *clary-water* of brandy, juice of cherries, straw berries, and gooseberries, sugar, cloves, white pepper, and coriander seeds; infused, sugared, and strained.

CLARY, *wild*, *Horminum*, in *Botany*; Tourn. Inst. R. H. 178. Its characters are these: the empalement of the flower is permanent, of one leaf, having two lips, the upper ending in three acute points, the under in two; the flower has one petal, divided into two lips, the upper concave, and incurved with a slight indenture at the point, the lower broader, and more indented; it hath two short stamina, situated in the tube of the flower; and in the bottom of the tube are four roundish germina, which become four seeds lodged in the empalement.

There are five species, one of which is sometimes called OCULUS *Christi*.

The English name of this genus of plants is *clary*; but it is an indeterminate one, because it is also used as the name for the *sclarea*, a different genus of plants, though

by many authors confounded with the others under the name *lanuginum*.

Hieracium has been much celebrated as a cardiac, but is now less used than formerly. The dried herb, given in infusion or decoction, is good in the *fluor albus*, but should be given with other medicines. It is also commended in colics, flatulencies, and hysteric complaints; also as an antispasmodic, and in epilepsies.

CLASMIUM, in *Natural History*, the name of a genus of fossils of the *gypsum*: the characters of which are, that they are of a soft texture, and of a dull and opake look, being composed, like all the other gypsums, of irregularly arranged flat particles.

The word is derived from *κλασμα*, *a fragment*, or *small particle*, from the flaky small particles of which these bodies are composed. Of this genus there is only one known species; this is of a tolerably regular and even structure, though very coarse and harsh to the touch. It is common in Italy, and is greatly esteemed there: we have of it also in some parts of Derbyshire; but with us it is not particularly regarded, but burnt among the rest. It neither gives nor wash fleet, nor ferments with *aqua fortis*; but calcines readily in the fire, and affords a very valuable plaister of Paris.

CLASP-*nails*. See NAILS.

CLASPERS, in *Botany*, are tendrils, threads, or ligaments of a middle nature between those of a root, and trunk; whereby shrubs, and other lesser plants, take hold of trees, or other things near them, for their support, &c.

The wisdom of the Creator is very conspicuous, in this provision for some species of plants, which need it; as ivy, vines, bryony, &c.

The contrivance is various in various subjects. Malpighi observes, that the *claspers* of ivy are roundish, and covered with hair: and what is very remarkable, they yield a glutinous terebinthine humour, by means whereof they adhere closely to stones, &c. Nature, he adds, uses no less artifice in the vine *Canadensis*.

Claspers serve sometimes for support only: as those of the vine, bryony, &c. whose branches being long, slender, and brittle, would be weighed down by their own load, and that of their fruit, but for these *claspers*, which, by a natural spire, or circumvolution, catch hold of any adjacent body.

Claspers sometimes also serve for a supply of juice; as in the trunk locus of ivy, which being a tall plant, and of a compact substance, the sap would not be sufficiently furnished to the upper sprouts, without this expedient.

Claspers also sometimes serve for stabilment, as those of cucumbers; for propagation, as those of camomile; and for shade, stabilment, and propagation all together, as those of strawberries.

CLASS, *Classis*, a distribution of persons, or things, ranged according to their merit, value, or nature. See RANK, &c.

The word comes from *classis*, derived by some from the Greek *καλειν*, *convocare*, a *class* being nothing but a multitude assembled apart.

CLASS, in *Botany*, is defined by Linnæus to be an agreement of several genera in the parts of fructification, according to the principles of nature distinguished by art; and he has divided the whole body of vegetables into twenty-four *classes*. See FRUCTIFICATION.

CLASS is particularly used for a distinction among scholars; who are distributed into several *classes* or forms, according to their capacities and attainments.

Quintilian uses the word *classis* in this sense, in the first book of his Institutions.

CLASSIC, CLASSICAL, a term chiefly applied to authors read in the *classes* at schools, and who are in great authority there. In this sense Aquinas, and the Master of the Sentences, are *classic* authors in the school-divinity; Aristotle, in philosophy; Cicero and Virgil, in the humanities. Aulus Gellius ranks among *classic* authors, Cicero, Cæsar, Sallust, Virgil, Horace, &c.

The term *classic* seems properly applicable only to authors who lived in the time of the Roman republic, and the Augustan age, when the Latin was in its perfection.

It appears to have taken its rise hence, that an estimate of every person's estate being appointed by Servius Tullius, he divided the Roman people into six bands, which he called *classes*. The estate of those of the first *classis* was not to be under two hundred pounds; and those, by way of eminence, were called, *classici*, *classics*.

Hence, also, authors of the first rank came to be called *classici*; till the rest are said to be *infra classem*.

The first *classis*, again, was subdivided into centuries; making fourscore centuries of footmen, and eighteen of horsemen.

Each *classis* consisted, one half of the younger sort, who were to make war abroad; and the other of old men, who staid at home for the defence of the city.

CRITICAL *learning* may be understood to signify such an acquaintance with the best Latin and Greek writers, as shall enable the reader to perceive and admire the peculiar beauty of their compositions, and to adopt their diction and sentiment. The principal *classic* Greek authors are, Homer, Hesiod, Plato, Demosthenes, Æschines, Xenophon, Plutarch, Isocrates, Epictetus, Lucian, Sophocles, Euripides, Longinus, Theocritus, Anacreon, Pindar, Aristophanes, &c. The chief Latin writers are, Cicero, Livy, Cæsar, Sallust, Virgil, Horace, Terence, Plautus, Juvenal, Ovid, Pliny, Valerius Paterculus, Tacitus, &c.

CLATHRI, in *Antiquity*, bars of iron, or wood, used in securing doors and windows.

There was a goddess that presided over *clathri*, called *Clathria*.

CLATHRUS, in *Botany*, a name given by Micheli, and continued by Linnæus, to a genus of *fungi*, in the class of *cryptogamia*, the characters of which are these: they are always of a roundish figure, and have a reticulated and hollowed body, as if full of windows with ramifications every where annexed.

CLATHRUS is also the name of a species of TURBO in the *order of testacea*, belonging to the class of worms.

CLAIRE, in *Heraldry*, a term borrowed from the French, to express such lines as are sometimes found in the old paintings, and engravings of arms. These lines are of an irregular kind, and not reducible to any other proper lines of heraldry, as the engrailed, indented, embattled, or the like.

CLAVARIA, in *Botany*, the name given by Vaillant, and continued by Linnæus, to a genus of *fungi*, in the class of *cryptogamia*; the characters of which are, that they grow perpendicularly, and have a simple and uniform surface; these have been called also by the same Vaillant, under some small varieties in the species, *coralloides* and by Tournefort, *coralloides*. Dillenius has called them *fungoides*.

CLAVARIUM, in *Antiquity*, an allowance which the Roman soldiers had for furnishing nails to secure their shoes with. They raised frequent mutinies, demanding largesses of the emperors under this pretence.

CLAVATA *vestimenta*, in *Antiquity*, habits adorned with purple *clavi*, which were either broad or narrow. See CLAVUS.

CLAUDENDA *aria*. See CURIA.

CLAUDENS *pectoralis*, in *Anatomy*, a name given by Spigelius, and some others, to one of the muscles of the face, called by Albinus and Winslow, *musculus orbicularis palpebrarum*, and by others, *sphincter palpebrarum*.

CLAUDICATION. See LAMENESS.

CLAVELLATI *cineres*. See POT-*ashes*.

CLAVES *insulæ*, a term used in the Isle of Man, where all antiquious and weighty causes are referred to twelve persons, whom they call *claves insulæ*, i. e. *the keys of the island*.

CLAVICULÆ, *collar-bones*, in *Anatomy*, two small bones situate at the basis of the neck, and top of the breast. *See Tab. Anatomy, (Osteol.) fig. 3. n. 3. 3.*

They are about half a foot long, of the thickness of a finger, and a little bent at each end, and that different ways, sometimes like the letter *S*; and are thus called, as being the keys, *claves*, of the *thorax*.

Their inner substance is spongy, whence they are brittle, easily broken, and easily coalescing again. They are joined to the *acromium* of the *scapula per syndesmosin*; and on the fore-part, *per synchondrosin*; and on the fore-part, *per arthrodiam*, to a *sinus* on each side of the upper part of the *sternum*.

Their use is to fix the *scapulæ* with the *sternum*, and the arms, and to prevent them from slipping too forward upon the *thorax*.

The two *claviculæ* are situated transversely, and a little obliquely, opposite to each other, about the superior and anterior part of the *thorax*, between the *scapulæ* and the *sternum*. Each *clavicula* resembles in some measure an Italic *S*, being a long bone irregularly cylindric, bent forwards near the *sternum*, and backwards near the *scapula*, as if it were made up of two arches joined endwise in opposite directions, that which lies on the fore-part of the breast being the largest. The *claviculæ* are each divided into a body, or middle part, and two extremities, one anterior, inferior, and internal, which may be termed the pectoral or sternal extremity; the other superior, posterior, and external, which may be named the humeral or scapular extremity. The pectoral extremity is the thickest, and is of a triangular figure, especially near the end, where it is a little enlarged, and shews a cartilaginous surface, with three angles, of which the lowest is the most prominent, and is turned a little toward the cavity of the *thorax*; near these angles there are several muscular and ligamentary impressions, one of which near the inferior angle, is sometimes raised like a tubercle. The humeral extremity is flat and broad, and two sides may be considered in it, one superior, the

other

other inferior; as likewise two edges, one anterior, the other posterior; and a small articular surface.

The upper side has several inequalities, and in the lower there is a kind of oblong, rough, oblique, tuberosity. The posterior ridge is convex, thick, and uneven, being that of the small arch of the *clavicle*; the anterior edge is concave, thin, and smooth, every where except near the great arch, where it has a rough impression. The articular surface terminates this extremity, being cartilaginous, turned obliquely forward, and of an oval figure, like that of the *acromion*, with which it is articulated. The body or middle portion, which, together with the pectoral extremity, forms the great curvature of the *clavicle*, is not so thick as the extremities; it is a little flatted both on the upper and lower sides, and therefore two edges may likewise be distinguished in it; the upper side is pretty even, the lower something rougher, and a little depressed by a superficial channel. The edges are rounded, the anterior being convex, the posterior concave; the inner substance of the extremities is cellular, the rest is more solid, consisting of very thick sides, with a narrow cavity more or less filled with reticular bony filaments. Winslow.

Mr. Weitbrecht has described and delineated a ligament which had not been observed by anatomical writers, stretched from the posterior part of the anterior extremity of each *clavicle*, behind the *sternum*, to the same part of the other *clavicle*, which makes the articulation of the *sternum* and *clavicles* stronger. See Comment. Acad. Petrop. tom. iv. p. 155.

CLAVICLE, *fracture of the.* The *clavicle* is extremely subject to be fractured, both from its transverse position, and from its smallness. Whether it happens to be broken near the *humerus*, or near the *sternum*, its end that is next the *humerus* always descends lower than the other, from the weight of the arm which was before sustained by the *clavicle* and head of the *sternum*; and notwithstanding that part of it next the *sternum* remains immoveable by the descent of its other end, it can scarce happen but they will in some degree collapse over one another.

The reduction of a fractured *clavicle* is not very difficult, especially when the fracture is transverse; nor is it usual for the *humerus*, with the fragment of the *clavicle*, to be so far distorted as not to be easily reduced by the fingers. The difficulty, however, is much greater to keep the bone in its place when the fracture has been reduced; and that most of all when the bone has been broken obliquely. For this there are two reasons; for the circular bandages, with which the bones of the arms, and other extremities are usually held very firm, cannot be applied here, because of the form and disorder of the part; and then the weight of the depending arm soon pulls to pieces what the surgeon has been replacing.

This fracture is to be reduced in the following manner: the patient must be placed on a low seat, and an assistant is to thrust his knee against the middle of the patient's back, between his two shoulders; then laying hold of the heads of both the patient's arms with his hands, he must pull them gently and gradually backwards, by which means the *clavicles* will be properly extended: while this is doing, the surgeon must stand before, and endeavour to replace the bone with both his hands, ordering the assistant to hold the bone in that position; he is then to apply a narrow and thick compress, so as to fill up the cavities above and below the *clavicle*; upon these he is to lay two or more narrow compresses made in the form of an X; over all these he is to apply a piece of paste-board, accommodated to the shoulders and neck, and first steeped in spirits of wine, or oxycrate; then he must place a ball under the arm, or else bind it several times with a thick roller, to prevent the *humerus* from subsiding; and lastly, the whole is to be properly bound up, and the arm suspended by a sash or sling hung across the shoulder, about the neck. The plasters that have been used to be employed on this occasion, have, of later years, been found to be wholly useless.

Whenever there are any loose splinters of the bone that are entirely separated, which, though they should not wound, or hurt the flesh, yet will obstruct the meeting of the *clavicle*, it seems altogether requisite to open the skin, and remove them before the reduction of the bone, treating the wound as usual; but if these should be any splinters which still adhere to the bone, and prick the adjacent parts, and impede the reduction, they must be also either taken off with forceps, or else forced back into their places, by which they may be again united to the bone. But to divide the parts, and remove the fragments requires great caution, lest some of the large subclavian veins or arteries be wounded in the operation, and thereby a fatal hæmorrhage be produced. Heister, Surg. p. 120.

CLAVICLE, *luxated.* The *clavicles* are but seldom displaced, by reason of their strong ligaments: but they may be dislocated, however, either from the top of the *sternum*, or *processus acromion* of the *scapula*, to which they are naturally connected. This may be occasioned either by a fall or blow, or by lifting some great weight. With regard to the cure, the sooner assistance is had, the more easily may the reduction of the *clavicle* be performed; but loss of time in this case is of the utmost consequence; inveterate luxations of the *clavicle* being found incurable.

The *clavicles* may be dislocated in two manners from the *sternum*, either internally toward the *larynx*, or externally upon the breast. When the first case happens, a cavity may be generally perceived upon the part affected, and the *trachea*, with the carotid *vessels*, and arteries, and nerves, and the *œsophagus*, which are all together, will be very much disturbed or compressed. On the contrary, when it is luxated forward upon the breast, it shews itself by a preternatural tumor, instead of a cavity, in that place.

The *clavicles*, when luxated, are to be replaced by the patient's being set in a low seat, and an assistant's thrusting his knee against the middle of his back, between his shoulders, and laying hold of both his arms, and pulling them gently backwards. By this means the *clavicles* will be extended, and are in that state easily replaced. When this is done, it must be carefully regarded to remove the injuries of the neck. If any kind of luxation requires an accurate retention by bandage, it must certainly be this of the *clavicle*, especially when the luxation has happened some time before the reduction: for, beside that the *clavicles* have scarce any muscles to support them, their ligaments are usually so much stretched and weakened in this case, that they are in no wise sufficient to sustain the weight of the arms. Such luxations of the *clavicles* as happen near the *processus acromion*, are generally much more difficult to discover, and have been too often mistaken, even by surgeons, for luxations of the *humerus*. Whenever this luxation happens, the superior part of the *scapula* sticks up: but in the place, when the *clavicles* are separated from the acromion process, a cavity may be observed: much acute pains also arise from this luxation, and the arm can by no means be lifted up. If therefore the luxated *clavicle*, in this case, is not timely reduced, it is no wonder that the use of the arm is entirely lost afterwards. A strict bandage continued about the part for forty days, to make the dislocated bones again coalesce, will be found of great service in these cases, and, indeed, is the principal part of the cure. The bones may be replaced by the before advised manner of extension, but nothing can keep them so but a proper and accurately applied bandage. Heist. Surg. p. 158.

CLAVICYMBALUM, in *Antiquity*, a musical instrument with thirty strings, in a perpendicular situation.

Modern writers apply the name to our harpsichorde.

CLAVIS, a Latin word, sometimes used in English writers for a key.

CLAUSE, an article, or particular stipulation in a contract; a change or condition in a testament, &c.

We say, *a derogatory clause, penal clause, saving clause, subsidiary clause*, &c.

CLAUSE *extremum diem.* See DIEM.

CLAUSTRAL *prior.* See PRIOR.

CLAUSUM *fregit*, an action of trespass; thus called, because the writ demands the person summoned to answer to *quare clausum fregit*, of the plaintiff, why he committed such a trespass?

CLAVUM *Veneris*, in *Botany*, a name given by some authors to the *water-LILY*, or *nymphæa*.

CLAVUS, in *Antiquity*, a band, or fillet of purple, worn on the breast of the Roman senators and knights, more or less broad, according to the dignity of the person; from the proportions of which arose the difference of *tunica* ANGUSTICLAVIA, and LATICLAVIA. See TUNICA.

This ornament, according to some, was called *clavus*, *nail*, as being studded with little round plates of gold, or silver, like the heads of nails. Castellus maintains, that the *clavus* consisted of a kind of purple flowers, sewed upon the stuff.

CLAVUS *annalis*, in *Antiquity*. So rude and illiterate were the Romans towards the rise of their state, that the driving or fixing a nail was the only method they had of keeping a register of time; for which reason it was called *clavus annalis*. There was an ancient law, ordaining the chief prætor to fix a nail every year on the ides of September; it was driven into the right side of the temple of Jupiter Opt. Max. towards Minerva's temple.

This custom of keeping an account of time, by means of fixing nails, was not peculiar to the Romans, for the Etrurians likewise used to drive nails into the temple of their goddess Nortia with the same view. Vide Liv. lib. vii. cap. 3.

CLAVUS, in *Medicine*, a name physicians give to a shooting pain in the head, commonly situate a little above the eyes, viz. on the *sinus frontalis*; and supposed to resemble the boring of the head through with an augre; whence the name. In some it is only in one, and in others in both sides.

It is generally allowed to be a species of an ague, or an intermitting fever; its periods of coming or going being usually regular or stated. In some it is quotidian, in others tertian.

The cure consists in giving an emetic a little before the fit, and after; confirming it with a proper quantity of the cortex, &c. as in intermitting fevers: though bleeding and diaphoretics sometimes effect a cure without other assistance.

A pain like to this, on the top of the head, sometimes attacks hysterical persons; which by Dr. Sydenham is termed *clavus hystericus*.

CLAVUS *hystericus*, in *Medicine*, denotes a peculiar species of head-ach, more frequently attacking women than men, and with them usually owing its origin to a suppression of the menstrual discharges. In some cases, the pain is less violent, and only attends people during the three or four first days of the menstrual discharge. In others, the pain is more violent, and almost continual; and when to the common causes of it there is added a venereal taint, which is no uncommon case, it becomes then the most terrible of all pains in the head.

Signs of it. These are a piercing pain about the forehead or temples, resembling that of a nail driven into the head: this pain sometimes also extends itself over the whole head: with this there generally is a sensation of pain about the sagittal future in particular, and a remarkable coldness there: often there is an inflation and redness of the face, with a noise and ringing in the ears. To these there are not unfrequently added a slight fever, a chilliness of the extremities, a remarkable lassitude, and want of appetite, with frequent eructations and nauseas, and a costiveness of the bowels. It generally returns about the time of the menses; or in cases where it is continual, it rages with more than ordinary violence at that time. Among the women, those are most subject to it who live sedentary lives, and feed high, and who are naturally passionate, and of a hasty temper.

Causes of it. Among the natural causes of this terrible pain, the most powerful are, an excretion of blood towards the head, and a stoppage of the menses, and of the discharges by the haemorrhoidal veins, by injudicious treatment.

Prognostics from it. Nothing gives physicians greater trouble, or more exposes the insufficiency of the art of healing, than the head-achs to which women are subject. The manner of life of the patient is, however, more in fault in these obstinate cases, than either the nature of the disease, or the skill of the prescriber: high living, and idleness have too many charms, to be quitted easily by those who can enjoy them; and, therefore, while the cause always subsists, the cure can be only palliative or temporary, the disorder always returning after a time: yet it is certain by experience, that the most terrible and inveterate disorders of this kind may be removed so as not to return, by the use of proper medicines, and a thorough change in the diet and manner of life of the patient.

Method of cure. The first care in this respect is to keep the bowels lax, for they are almost always naturally costive in this disease: emollient clysters are the most proper means of doing this; and where purges are required beside, they must always be of the most gentle and least vellicating kind. After these, the violent emotions of the blood are to be quieted by powders of nitre, antimony diaphoretic, crab's eyes, and cinnabar; and if there be a spissitude in it, the neutral and diuretic salts are to be given, in a scruple at a time, every day. Tartarum vitriolatum alone, given in this manner, frequently has a very great effect. If it be found necessary, besides this, a gentle opiate may be sometimes given, such as a small dose of the thebaic pill: and externally, spirit of wine and camphor is not a little serviceable. By way of prevention, it is extremely proper to bleed at spring and autumn every year: and above all things, to keep regular in regard to the menstrual discharges. Gentle purges are to be given at times, and necessary exercise above all things to be advised; and this should always be the more insisted upon, the more adverse the patients are to it, and the more they love to indulge in a sedentary course. Junker Consp. Med.

CLAVUS is also used in *Medicine*, for a callus formed on the toes; popularly called a *corn*.

Clavi arise from a too great compression of the *cutis*; which by this means hardens, and forms itself into a knot. See CALLUS.

The cure is by first softening them, as with *emplast. de ranis cum mercurio*, or with *gallan. crocat.* with *sal ammoniac*; and then pulling them up. A piece of raw beef, applied in manner of a plaster, and frequently shifted, is often found to dissipate them in a little time. Whether these are removed by the knife, or by application of emollient, caustic, or corroding medicines, great caution should be used to avoid injuring any of the subjacent tendons.

After corns are cut away, Harris says the *diachylon simplex* will prevent their growing again; as also will the *gallonum collum Abyssinic.* and also that soft wax which is used by the lawyers. But above all a clean linen rag bound about the toe, after the callus is cut away; this was much recommended by king Charles II.

CLAWS, among *Zoologists*, denote the sharp-pointed nails with which the feet of certain quadrupeds and birds are furnished.

Eft's CLAWS. See ELK.

CLAWS is also used for a close or small measure of land.

CLAWING, or CLAWING-*off*, in *Sea-Language*, signifies the act of *beating* or turning to windward from a lee-shore, so as to escape the danger of shipwreck.

CLAY, *Argilla*, in *Natural History*, a soft viscous earth, found in various places, and used for various purposes of several kinds and properties.

Dr. Lister, in the Philosophical Transactions, gives us a table of twenty-two several *clays* found in the several counties of England; five whereof he calls

Pure, i. e. such as are soft, like butter, to the teeth, with little or no grittiness in them; viz. 1. FULLER's-*earth*, which he distinguishes by its colour into yellowish, brown, and white. 2. BOLUS. 3. Pale yellow *clay*. 4. Cow-shot *clay*. 5. Dark blue *clay*, or MARLE. The other seventeen

Impure; wherein eight are harsh and dusty when dry; as, 1. Certa, chalk, or milk-white *clay*. 2. Potters pale yellow *clay*. 3. Blue potters *clay*. 4. Blue *clay*, wherein is found the asbrotes. 5. Yellow *clay*. 6. Fine red *clay*. 7. Soft chalky blue *clay*. 8. Soft chalky red *clay*. Three are stony when dry; viz. 1. A red stony *clay*. 2. A blue stony *clay*. 3. A white stony *clay*.

Three are mixed with sand, or pebbles; viz. 1. A yellow loam. 2. A red sandy *clay*. 3. A second species of the same kind.

Lastly, three are mixed with flat or thin sand, glittering with mica; viz. 1. Crouch white *clay*. 2. Grey or bluish tobacco-pipe *clay*. 3. A red *clay*. But this is a very unartful disposition.

Dr. Hill has distinguished them by their colours into white, yellow, brown, blue, green, red, and black *clays*; and enumerated several particular sorts of *clay* under each of these heads. Mr. Mendez da Costa also, in his History of Fossils, distributes them according to their colour into black, white, ash and grey, red, yellow, brown, blue, green *clays*; and then subdivides each class into *clays* which are not acted upon by acids, and alkaline *clays*.

The distinguishing characters of earths principally used in the potter's trade are these: they are firmly coherent, weighty, and compact; stiff, viscid, and ductile to a great degree while moist; smooth to the touch, and unctuous, not easily breaking between the fingers, nor readily diffusible in water, and when mixed in it not readily subsiding from it. It hardens by fire into a kind of stony substance. It is not known that any kind of earth shrinks so much as *clay*, and hence the purity of *clay* may be judged from the degree of its contraction. Lewis's Commercium. Phil. Techn. p. 259.

Such as are curious to know more of this subject may be fully gratified by consulting M. Maquer's Mem. on *clays*, in the Mem. of the A. D. S. an. 1762.

CLAY-*lands*. See SOIL.

CLAYES, in *Fortification*, are wattles made with flakes, interwoven with osiers, &c. to cover lodgments.

CLAYING *of land*. See MANURING.

CLAYTONIA, in *Botany*, a genus of the *pentandria monogynia* class. The character are: the flower hath a two-leaved oval empalement, with a transverse base: it hath five oval indented petals, and five recurved stamina, shorter than the petals, and terminated by oblong summits. In the centre is situated an oval germen, supporting a single style, crowned by a trifid stigma. The germen becomes a roundish capsule with three cells, opening with three elastic valves, and filled with round seeds. This is a native of Virginia, and we have but one species in our English gardens.

CLEAR, in *Building*, is sometimes used among the workmen for the inside work of a house, &c.

CLEARING *of Liquors*. See CLARIFICATION.

CLEATS, in *Ship-building*, are pieces of wood of different shapes, used occasionally to fasten ropes upon, in a ship: some have one arm, some two, and others have no arms

but

but are hollowed in the middle, and nailed to the deck or the sides of the ship.

CLEAVERS, CLIVERS, or GOOSE-*grass*, *aparine*, in *Botany*, the name of a genus of plants, the characters of which are these: the flower consists of one leaf, and is bell-fashioned, very wide, open at the mouth, and divided into several segments; the cup becomes a fruit, which is dry, covered with a very thin skin, and composed of two round bodies, which contain an umbilicated seed. The leaves of this plant are rough and hairy, and stand in rundles round the stalk.

The species of *cleavers* enumerated by Mr. Tournefort, are eleven.

The *cleavers* are known from the madders, by their having a dry fruit; and from crosswort, by having five or more leaves at a joint: and finally, from galium, or ladies bed-straw, by the leaves being rough or hairy. However, Linnæus has classed the goose-grass with smooth seed under GALIUM, and the low trailing goose-grass with a blue flower under *valantia*. It is very common on banks under hedges.

The vulgar have an opinion of this plant as an antiscorbutic, and eat it in spring with nettle-tops and the rest of that tribe, to sweeten their blood. It stands recommended by many authors as a remedy for the king's evil; and others have ascribed a very powerful diuretic virtue to it; but these have in general ordered a very bad preparation of it for these purposes, the distilled simple water; doubtless a good decoction must be greatly preferable. We have the assurance of Dr. Palmer, from his own knowledge, that it is an excellent remedy in a *gonorrhœa simplex*.

CLECHE, or CLECHY, in *Heraldry*, is explained by Guillim as an ordinary open to the light, or pierced through with another inner one of the same figure; v. gr. when a cross appears as if charged with another cross of the same colour with the field; or as if the field appeared through the apertures thereof.

The word is French, supposed to be formed of *clef*, *key*; the ends of the cross being thought to bear some resemblance to the bowls of the ancient keys.

But Colombiere, and some other writers, will have this piercing to be only a circumstance of the cross *clechè*, and call it by the name *vuidé*, voided. The thing that denominates it *clechè*, is its spreading from the centre towards the extremities, which are very wide, and end in an angle in the middle; as in the figure represented *Tab. Herald. fig.* 37.

CLEDGE, a name given by miners to the upper part of the stratum of fuller's-earth. See FULLER's-*earth*.

CLEDONISM, CLEDONISMUS, a kind of divination, in use among the ancients.

The word is formed from κληδων, which signifies two things, *rumor*, a report, and *avis*, a bird: in the first sense, *cledonism* should denote a kind of divination drawn from words occasionally uttered.—Cicero observes, that the Pythagoreans made observation not only of the words of the gods, but of those of men; and accordingly believed the pronouncing of certain words, v. g. *secundum*, at a meal, very unhappy.—Thus, instead of *prison*, they used the word *domicilium*; and to avoid *erinnyes*, furies, said *eumenides*.

In the second sense, CLEDONISM should seem a divination drawn from birds; the same with ornithomantia.

CLEF, or CLIFF, in *Music*, a mark at the beginning of the lines of a song, which shews the tone, or key, in which the piece is to begin. Or, it is a letter marked on any line, which explains and gives the name to all the rest.

Anciently, every line had a letter marked for a *clef*; now a letter on one line suffices; since by this all the rest are known; reckoning up and down, in the order of the letters.

It is called the *clef*, q. d. *key*, because hereby we know the names of all the other lines and spaces; and consequently the quantity of every degree, or interval.

But because every note in the octave is called a *key*, though in another sense, this letter marked is called in a particular manner the *signed clef*; because being written on any line, it not only signs and marks that one, but it also explains all the rest.

By *clef*, therefore, for distinction-sake, we mean that letter signed on a line, which explains the rest; and by *key*, the principal note of a song, in which the melody closes.

There are three of these *signed clefs*, *c*, *f*, *g*. The *clef* of the highest part in a song, called *treble*, or *alt*, is *g* set on the second line counting upwards. The *clef* of the *bass*, or the lowest part, is *f* on the fourth line upwards: for all the other mean parts, the *clef* is *c*, sometimes on one, sometimes on another line. Indeed, some that are really mean parts, are sometimes set with the *g clef*.

It must, however, be observed, that the ordinary signatures of *clefs* bear little resemblance to those letters. Mr. Malcolm thinks it would be well if we used the letters themselves. Kepler takes great pains to shew, that the common signatures are only corruptions of the letters they represent. See their figures among the other CHARACTERS *of Music*.

The *clefs* are always taken fifths to one another: that is the *clef f* is lowest, *c* a fifth above it, and *g* a fifth above *c*.

When the place of the *clef* is changed, which is not frequent in the *mean clef*, it is with design to make the system comprehend as many notes of the song as possible, and so to have the fewer notes above or below it. If then there be many lines above the *clef*, and few below it, this purpose is answered by placing the *clef* in the first or second line: if there be many notes below the *clef*, it is placed lower in the system. In effect, according to the relation of the other notes to the *clef* note, the particular system is taken differently in the scale, the *clef* line making one in all the variety.

But still, in whatever line of the particular system any *clef* is found, it must be understood to belong to the same of the general system, and to be the same individual note or found in the scale. By this constant relation of *clefs*, we learn how to compare the several particular systems of the several parts; and know how they communicate in the scale, i. e. which lines are unison, and which not: for it is not to be supposed, that each part has certain bounds, within which another must never come. Some notes of the treble, v. gr. may be lower than some of the mean parts, or even of the bass. To put together therefore into one system all the parts of a composition written separately, the notes of each part must be placed at the same distances above and below the proper *clef*, as they stand in the separate system; and because all the notes that are consonant (or heard together) must stand perpendicularly over each other, that the notes belonging to each part may be distinctly known, they may be made with such differences as shall not confound, or alter their significations with respect to time, but only shew, that they belong to this or that part. Thus we shall see how the parts change and pass through one another; and which, in every note, is highest, lowest, or unison. The use of particular *signed clefs* then, is an improvement with respect to the parts of any composition; for unless some one key in the particular systems were distinguished from the rest, and referred invariably to one place in the scale, the relations could not be distinctly marked.

It must here be observed, that for the performance of any single piece, the *clef* only serves for explaining the intervals in the lines and spaces. So that we need not regard what part of any greater system it is; but the first note may be taken as high or low as we please. For as the proper use of the scale is not to limit the absolute degree of tone; so the proper use of the *signed clef* is not to limit the pitch, at which the first note of any part is to be taken; but to determine the tune of the rest, with relation to the first; and considering all the parts together, to determine the relation of their several notes by the relations of their *clefs* in the scale: thus, their pitch of tune being determined in a certain note of one part; the other notes of that part are determined by the constant relations of the letters of the scale, and the notes of the other parts by the relations of their *clefs*.

In effect, for performing any single part, the *clef* note may be taken in an octave, i. e. at any note of the same name; provided we do not go too high, or too low, for finding the rest of the notes of a song. But in a concert of several parts, all the *clefs* must be taken, not only in the relations, but also in the places of the system above mentioned; that every part may be comprehended in it. The difference of *clefs* in particular systems makes the practice of music much more difficult and perplexed, than it would otherwise be; both with respect to instruments, and to the voice. This occasioned Mr. Salmon to propose a method of reducing all music to one *clef*; whereby the same writing of any piece of music should equally serve to direct the voice, and all instruments; which he calls an *universal character*.

The natural and artificial note expressed by the same letter, as *e* and *e* ♯, are both set on the same line or space. When there is no character of flat or sharp, at the beginning with the *clef*, all the notes are natural: and if in any particular place the artificial note be required, it is signified by the sign of a flat or sharp, set on the line a space before that note.

If a sharp or flat be set at the beginning in any line or space with the *clef*, all the notes on that line or space are artificial ones; i. e. are to be taken a semitone higher or lower than they would be without such sign. And

the ſame affects all their octaves above and below, though they be not marked ſo. In the courſe of the ſong, if the natural note be ſometimes required, it is ſignified by this character ♮.

The marking of the ſyſtem thus by flats and ſharps, Mr. Malcolm calls the *ſignature of the clefs*.

CLEFT, in *Graffing*. See ENGRAFTING.

CLEFTS, or CRACKS, in the heels of horſes, are occaſioned by hard labour, unwholeſome food, want of exerciſe, and waſhing them when hot. They are cured by cutting off the hair, and anointing with the oil of hempſeed, or linſeed, and keeping them clean.

CLEIDION, in *Antiquity*, the ſame with *clavicula*. See CLAVICULÆ.

CLEIDOMASTOIDEUS, in *Anatomy*, a name given by Albinus to a muſcle, called by others ſimply MASTOIDÆUS, and by Euſtachius *ſeptimus caput moventium*.

CLEMA, in *Antiquity*, a ſpecies of vine, a twig of which was the enſign of a centurion's office.

CLEMATIS, in *Botany*. See VIRGIN's *bower*.

CLEMENT, *Conſtitutions of*. See *Apoſtolical* CONSTITUTIONS.

CLEMENT, *Recognitions of*. See RECOGNITIONS.

CLEMENTINA, a ſpurious work attributed to Clement.

CLEMENTINE, a term uſed among the Auguſtins, who apply it to a perſon, who, after having been nine years a ſuperior, ceaſes to be ſo, and becomes a private monk, under the command of a ſuperior.

The word has its riſe hence, that pope Clement, by a bull, prohibited any ſuperior among the Auguſtins from continuing above nine years in his office.

CLEMENTINES, in the *Canon Law*, are the conſtitutions of pope Clement V. and the CANONS of the council of Vienne.

CLENCH-*nails*. See NAILS.

CLEOME, in *Botany*, a name given by ſome to the ſea-holly, or eringo. Ger. Emac. Ind. 2.

CLEOME, *Anapeſtrum* of Tournefort, is a genus of the *tetradynamia ſiliquoſa* claſs. The characters are; the flower hath a four-leaved empalement, which ſpreads open; it hath four petals, which incline upward, and ſpread open; the lower being leſs than the other; in the bottom there are three mellous glands, which are roundiſh, and ſeparated by the empalement; it hath ſix or more ſtamina, which are incurved, having riſing ſummits fixed to their ſide; it hath a ſingle ſtyle, ſupporting an oblong germen, which is of the ſame length with the ſtamina, and crowned by a thick ſtigma; the germen becomes a long cylindrical pod, having one cell opening with two valves, and filled with round ſeeds.

CLEPSYDRA, a kind of water-clock, or an hour-glaſs ſerving to meaſure time by the fall of a certain quantity of water.

The word comes from κλεπτω, *conceal*, and ὑδωρ, *aqua*, *water*.

There have likewiſe been *clepſydræ* made with mercury.

The Egyptians, by this machine, meaſured the courſe of the ſun. Tycho Brahe, in modern days, made uſe of it to meaſure the motion of the ſtars, &c. and Dudley uſed the ſame contrivance in making all his maritime obſervations.

The uſe of *clepſydræ* is very ancient: they were probably invented in Egypt under the Ptolemies; though ſome authors aſcribe the invention of them to the Greeks, and others to the Romans. Pliny informs us, that Scipio Naſica, about one hundred and fifty years before Chriſt, gave the firſt hint for the conſtruction of them; and Pancirollus has particularly deſcribed it. According to his account, the *clepſydra* was a veſſel made of glaſs, with a ſmall hole in the bottom of it edged with gold: in the upper part of this veſſel a line was drawn, and marked with the twelve hours: the veſſel was filled with water, and a cork with a pin fixed in it floated on the ſurface, and pointed to the firſt hour; and as the water ſunk in the veſſel, by iſſuing out of the ſmall hole, the pin indicated the other hours in proportion to its decreaſe. Their uſe was chiefly in the winter; ſun-dials ſerved in the ſummer. They had two great defects; the one, that the water ran out with a greater or leſs facility, as the air was more or leſs denſe: the other, that the water ran out more readily at the beginning, than towards the concluſion.

M. Amontons has invented a *clepſydra* free from both theſe inconveniencies, and which is ſaid to have the three grand advantages of ſerving the ordinary purpoſe of clocks; of ſerving in navigation for the diſcovery of the longitude; and of meaſuring the motion of the arteries.

CLEPSYDRA, *conſtruction of a*. To divide any cylindric veſſel into parts to be emptied in each diviſion of time; the time wherein the whole, and that wherein any part is to be evacuated, being given.

Suppoſe, v. gr. a cylindric veſſel, whoſe charge of water flows out in twelve hours, were required to be divided into parts to be evacuated each hour. 1. As the part of time 1 is to the whole time 12, ſo is the ſame time 12 to a fourth proportional, 144. 2. Divide the altitude of the veſſel into 144 equal parts: here, the upper diviſion will fall to the laſt hour; the three next above to the laſt but one; the five next to the tenth hour, &c. Laſtly, the twenty-three laſt to the firſt hour.

For, ſince the times increaſe in the ſeries of the natural numbers, 1, 2, 3, 4, 5, &c. and the altitudes, if the numeration be in retrograde order from the twelfth hour, increaſe in the ſeries of the unequal numbers, 1, 3, 5, 7, 9, &c. the altitudes computed from the twelfth hour, will be as the ſquares of the times 1, 4, 9, 16, 25, &c. Therefore the ſquare of the whole time 144, comprehends all the parts of the altitude of the veſſel to be evacuated. But a third proportional to 1 and 12, is the ſquare of 12; and conſequently it is the number of equal parts into which the altitude is to be divided, to be diſtributed according to the ſeries of the unequal numbers, through the equal intervals of hours. Since, in lieu of parts of the ſame veſſel, other leſs veſſels equal thereto may be ſubſtituted; the altitude of a veſſel emptied in a given ſpace of time being given, the altitude of another veſſel to be emptied in a given time may be found; viz. by making the altitudes as the ſquares of the times.

Hence we ſee the method of conſtructing the *clepſydræ* uſed by the ancients.

The honourable Mr. Charles Hamilton has deſcribed a curious *clepſydra* of a new conſtruction. An open canal *r s*, (ſee *Tab. Hydraul. fig.* 1.) ſupplied with a conſtant and equal ſtream by the typhon *d*, has at each end *f*, *f*, open pipes of exactly equal bores, which deliver the water that runs along the canal *r*, alternately into the veſſel *g* 1, *g* 2, in ſuch a quantity as to raiſe the water from the mouth of the tantalus *t* exactly in an hour. The canal *r s* is equally poiſed by the two pipes *f* 1, *f* 2, upon a centre *r*; the ends of the canal *r s* are raiſed alternately, as the cups *n n* are depreſſed, to which they are connected by lines running over the pullies *l*, *l*. The cups *n n*, are fixed at each end of the balance *m*, *m*, which moves up and down upon its centre *v*: *n* 1, *n* 2, are the edges of two wheels or pullies, moving different ways alternately, and fitted to the cylinder *s* by oblique teeth both in the cavity of the wheel and upon the cylinder, which, when the wheel *n* moves one way, that is, in the direction of the minute-hand, meet the teeth of the cylinder and carry the cylinder with it; and when *n* moves the contrary way, ſlip over thoſe of the cylinder, the teeth not meeting, but receding from each other. One or other of theſe wheels *n n* continually moves *s* in the ſame direction, with an equable and uninterrupted motion. A fine chain goes twice round each wheel, having at one end a weight *x*, always out of water, which equiponderates with *y* at the other end, when kept floating on the ſurface of the water in the veſſel *g*, which *y* muſt always be; the two cups *n*, *n*, one at each end of the balance keep it in equilibrio, till one of them is forced down by the weight and impulſe of the water, which it receives from the tantalus *t i*: each of theſe cups *n*, *n*, has likewiſe a tantalus of its own *b b*, which empties it after the water has done running from *r*, and leaves the two cups again in equilibrio: *g* is a drain to carry off the water. The diſh-plate, &c. needs no deſcription. The motion of the *clepſydra* is reflected thus: as the end of the canal *r*, fixed to the pipe *f* 1, is, in the figure, the loweſt, all the water ſupplied by the ſyphon runs through the pipe *f* 1, into the veſſel *g* 1, till it runs over the top of the tantalus *t* 1; when it immediately runs out at *t* into the cup *n*, at the end of the balance *m*, and forces it down; the balance moving on its centre *v*. When one ſide of *m* is brought down, the ſtring which connects it to *f* 1, running over the pulley *l*, raiſes the end *f* 1 of the canal *r*, which turns upon its centre *r*, higher than *f* 2; conſequently, all the water which runs through the ſyphon *d* paſſes through *f* 2 into *g* 2, till the ſame operation is performed in that veſſel, and ſo on alternately. As the height the water riſes in *g* in an hour, viz. from *i* to *t*, is equal to the circumference of *n*, the float *y* riſing through that height along with the water, lets the weight *x* act upon the pulley *n*, which carries with it the cylinder *s*; and this, making a revolution, cauſes the index *p* to deſcribe an hour on the dial-plate. This revolution is performed by the pulley *n* 1: the next is performed by *n* 2, whilſt *n* 1 goes back, as the water in *g* 1 runs out through the tantalus; for *y* muſt follow the water, as its weight increaſes out of it. The axis *s* always keeps moving the ſame way; the index *p* deſcribes the minutes; each tantalus muſt be wider than the ſyphon, that the veſſels *g g* may be emptied as low as *i*, before the water returns to them. See drawings of this inſtrument in different poſitions, with

a deſcription of it in the Phil. Tranſ. vol. xliv. art. xiv. p. 171.

CLEPSYDRA is alſo uſed for an HOUR-*glaſs* of ſand.

CLEPSYDRA is alſo applied to a chemical veſſel perforated in the ſame manner.

CLERGY, CLERUS, the aſſembly or body of clerks, or eccleſiaſtics; in contradiſtinction to the LAITY. See CLERK.

In the Romiſh church there are two kinds of *clergy*: the one *regular*, comprehending all the religious of both ſexes: the other *ſecular*, comprehending all the eccleſiaſtics that do not make the monaſtic vows.

Among the reformed, there are none but ſecular *clergy*. The Roman *clergy* forms a monarchical ſtate, under the pope, as its ſupreme head.

The *clergy* in the firſt century were diſtinguiſhed by the title of PRESBYTERS or BISHOPS; and ſome maintain that they were of equal rank and authority. But towards the cloſe of the ſecond century, a notion prevailing, that the miniſters of the Chriſtian church ſucceeded to the character, rights, and privileges of the Jewiſh prieſthood, this produced a ſubordination of rank among them. The biſhops aſſumed a rank and character ſimilar to thoſe of the Jewiſh high-prieſt, the preſbyters repreſented the prieſts, and the deacons the levites. This diſtinction was ſtill farther promoted towards the end of the third century, and a new ſet of eccleſiaſtical officers was eſtabliſhed, ſuch as ſub-deacons, acolythi, door-keepers, readers, exorciſts, &c. The powers of the *clergy* were conſiderably extended under the patronage of Conſtantine the Great, about the cloſe of the fourth century.

The *clergy* was anciently divided into three orders; viz. prieſts, deacons, and inferior CLERKS; and each order had its chief: the arch-prieſt was the head of the firſt order, the arch-deacon of the ſecond, and the dean of the third.

Under the name of *clergy*, were alſo formerly compriſed all the officers of juſtice; as being ſuppoſed to be men of letters.

Though the *clergy* formerly claimed an exemption from all ſecular juriſdiction, yet Matt. Paris tells us, William the Conqueror ſubjected the biſhops and abbeys who held *per baroniam*, and who, till then, had been exempt from all ſecular ſervice; and ordered they ſhould be no longer free from mortuary ſervices. To this purpoſe he preſcribed arbitrarily what number of ſoldiers every abbey and biſhoprick ſhould provide, to ſerve him and his ſucceſſors in war, and laid up the regiſters of eccleſiaſtical ſervitude in his treaſury.

But, in effect, the *clergy* were not exempt from all ſecular ſervice till then; as being bound by the laws of king Edgar to obey the ſecular magiſtrate in ſome things; viz. upon an expedition to the wars, and in contributing to the building and repairing of bridges, &c. See TRINODA *neceſſitas*.

The privileges of the Engliſh *clergy*, by the ancient ſtatutes, are very conſiderable: their goods are to pay no toll in fairs or markets; they are exempt from all others, but their own; from the king's carriages, poſts, &c. from appearing at the ſheriffs tourns or frank-pledges; and are not to be fined or amerced, according to their ſpiritual, but their temporal means.

A *clergyman* acknowledging a ſtatute, his body is not to be impriſoned: if he be convicted of a crime, for which the benefit of *clergy* is allowed, he ſhall not be burnt in the hand. See *Benefit of* CLERGY.

The *clergy*, by common law, are not to be burdened in the general charges with the laity; nor to be troubled or incumbered, unleſs expreſly named, and charged by the ſtatute; for general words do not affect them. Thus, if a hundred be fined for a robbery, the miniſter ſhall not contribute; though the words are, *gentes demorantes*: neither are they aſſeſſed to the highway, to the watch, &c. But theſe privileges are in a great meaſure loſt; the *clergy* being included under general words in later ſtatutes: ſo that they are liable to all public charges impoſed by act of parliament, where they are not particularly excepted. They are not now required to bear temporal offices, as thoſe of ſheriff, conſtable, &c. nor to ſerve on juries, nor to appear at tourns and leets, nor to ſerve perſonally in wars. Their bodies are not to be taken on ſtatutes merchant or ſtaple, &c. nor are they liable to an arreſt by *capias*; but a writ ſhould be addreſſed to the biſhop, compelling them to appear: nevertheleſs, when execution is obtained, a ſequeſtration of the profits of their benefices may be had. *Clergymen* are not liable to be arreſted in the church or church-yard, while attending on divine ſervice; and he that beats a *clergyman*, may be obliged to do penance in the ſpiritual court. See BATTERY.

The revenues of the *clergy* were anciently more conſiderable than at preſent: Ethelwolph, in 855, gave them the tythe of all goods, and the tenth of all the lands in England; free from all ſecular ſervices, taxes, &c.

The charter whereby this was given them, was confirmed by ſeveral of his ſucceſſors; Edmund, Edgar, Ethelred, Alfred, and William the Conqueror; the laſt of whom, finding the biſhoprickes ſo rich, erected them all into baronies; each barony containing thirteen knights fees, at leaſt. But ſince the Reformation, the biſhoprickes are much impaired. See BISHOP.

The revenues of the inferior *clergy*, in the general, are ſmall; a third part of the beſt benefices being ancient, by the pope's grant, appropriated to monaſteries; upon the diſſolution whereof they became lay-fees.

Indeed, an addition was made, 2 Anne, the whole revenue of FIRST-FRUITS and tenths being then granted, to raiſe a fund for the augmentation of the maintenance of the poor *clergy*; purſuant to which, a corporation was formed, by the name of the governors of the bounty of queen Anne, for the augmentation of the maintenance of the poor *clergy*; to whom the ſaid revenues were conveyed in truſt, &c. See AUGMENTATION.

CLERGY, *articles of the*. See ARTICLE.

CLERGY, *protors of the*. See PROCTORS.

CLERGY, *Privilegium Clericale*, or *Benefit of Clergy*, denotes an ancient privilege of the church, conſiſting in this, that places conſecrated to religious duties were exempted from criminal arreſts, whence proceeded SANCTUARIES; and that the perſons of *clergymen* were exempted from criminal proceſs before the ſecular judges in particular caſes. This, at firſt, was an indulgence granted by the civil government, but it was afterwards claimed as an inherent, *indefeaſible*, and *jure divino* right: and the *clergy* endeavoured to extend the exemption not only to almoſt all kinds of crimes, but to a variety of perſons, beſides thoſe who were properly of their own order. In England, though this privilege was allowed in ſome capital caſes, it was not univerſally admitted. The method of granting it was ſettled in the reign of Henry VI. which required, that the priſoner ſhould firſt be arraigned, and then claim his *benefit of clergy*, by way of *declinatory* plea, or, after conviction, by way of arreſt of judgment; which latter mode is moſt uſually practiſed. This privilege was originally confined to thoſe who had the *habitum & tonſuram clericalem*: but in proceſs of time every one was accounted a clerk, and admitted to this *benefit*, who could read; ſo that, after the invention of printing, and the diſſemination of learning, this became a very comprehenſive teſt, including laymen as well as divines; and, therefore, the ſtat. 4 Henry VII. cap. 13. diſtinguiſhes between lay-ſcholars, and clerks in holy orders; and directs, that the former ſhould not claim this privilege more than once, and, in order to their being afterwards known, that they ſhould be burnt with a hot iron in the brawn of the *left* thumb. This diſtinction was abolished by 28 Hen. VIII. cap. 4. and 32 Hen. VIII. cap. 3. but was virtually reſtored by 1 Ed. VI. cap. 12. in conſequence of which ſtatute peers of the realm, and lords of parliament, were entitled to an equal privilege with the *clergy*, for the firſt offence, though they could not read, and for all offences *clergyable* to commoners, and ſome others therein ſpecified. When thoſe, admitted to the privilege of their *clergy*, were thus diſcharged from the ſentence of the law in the king's courts, they were delivered over to the ordinary for *canonical* PURGATION. But by ſtat. 18 Eliz. caps. 7. all ſuch perſons, inſtead of being committed to the ordinary, are delivered out of priſon, provided the judge does not think fit to continue them in goal for a limited time, not exceeding a year.

Some alterations were made in the law reſpecting this privilege, by 21 Jac. I cap. 26. and by 3 and 4 W. and M. cap. 9. and 4 and 5 W. and M. cap. 24. in conſequence of which all women, all peers, and all commoners who could read, were diſcharged in *clergyable* felonies; abſolutely, if clerks in orders; and for the firſt offence, upon burning in the hand, if lay; all, however, except peers, liable to impriſonment, as before mentioned; and thoſe who could not read, if under the degree of peerage, were hanged. By 5 Anne, cap. 6. the *benefit of clergy* was indiſcriminately granted to all who had a *right* to aſk it, without the condition of reading.

Again, by 4 Geo. I. cap. 11. and 6. Geo. I. cap. 23. it is enacted, that where any perſons ſhall be convicted of larceny, either grand or petit, and ſhall be entitled to the *benefit of clergy*, or liable only to the penalties of branding or whipping, the court in their diſcretion may direct ſuch offenders, inſtead of burning or whipping, to be tranſported to America for ſeven years; and if they return within that time, it ſhall be felony *without benefit of clergy*.

It appears, from the above account, that the perſons to whom this privilege now extends, are clerks in orders, without

without branding or transportation; lords of parliament and peers of the realm, for the first offence; and all commoners, not in orders, whether male or female, *for clergiable* felonies, upon being burnt in the hand, or imprisoned at the discretion of the judge; and in case of larceny, on being transported for seven years, or suffering the punishment more lately substituted in the room of transportation.

This privilege is allowed only in petit treason and felonies; though not in all felonies, as lying in wait on the highway, destroying and ravaging the country, and ARSON. Petit treason, and other acts of felony, besides these, are excluded by particular acts of parliament; the operation of which restores the law to the same rigour of capital punishment in the first offence, which it exerted before the privilege was allowed, and which it still exerts on a second offence in almost all kinds of felonies, unless committed by clerks in actual orders. By the statute law, declared in *stat.* 28 Hen. VIII. cap. 15. the *benefit of clergy* is not allowed in any case whatever.

Those who are entitled to claim this privilege, are for ever discharged of all felonies, committed before conviction, within its extent; and restored to all capacities and credits, and the possession of their lands, as if they had never been convicted. But by conviction they forfeit all their goods to the king, which are not afterwards restored, and are subject to all the disabilities of felons, till they have received either the judgment of the law or a pardon. Blackft. Com. vol. iv. p. 368, &c.

CLERICAL *Crown*. See CROWN.

CLERICAL *Title*. See TITLE.

CLERICI *non eligentur in officio*. See QUOD *Clerici*.

Non-residentia pro CLERICIS *Regis*. See NON *residentia*.

CLERICO *admittendo*, a writ directed to the bishop, for the admitting a clerk to a benefice upon a *ne admittas* tried, and found for the party who procured the writ.

CLERICO *capto per statutum mercatorum*, is a writ for the delivery of a clerk out of prison, who is imprisoned upon the breach of statute-merchant.

CLERICO *convicto commisso gaolæ in defectu ordinarii deliberandi*, is a writ for the delivery of a clerk to his ordinary, that was formerly convicted of felony; by reason his ordinary did not challenge him according to the privilege of clerks.

CLERICO *infra sacros ordines constituto non eligendo in officium*, is a writ directed to the bailiffs, &c. that have thrust a bailiwick or beadleship upon one in holy orders; charging them to release him.

CLERK, CLERICUS, a word formerly used to signify a learned man, or man of letters.

The word comes from κληρος, used for *clergy*, but more properly signifying *lot*, or *heritage*, because the lot and portion of *clerks* or ecclesiastics is to serve God. Accordingly, *clerus* was at first used to signify those who had a particular attachment to the service of God. The origin of the expression is derived from the Old Testament, where the tribe of Levi is called the *lot*, *heritage*, κληρος; and God is reciprocally called their portion; because the tribe was consecrated to the service of God, and lived on the offerings made to God, without any other settled provision, as the rest had.

Thus, Paſquier obſerves, the officers of the counts (*comites*) were anciently created under the title of *clerks of accompts*; and ſecretaries of ſtate were called *clerks of the ſecrets*. So, *Clericus domini regis*, in the time of Edward I. was rendered in Engliſh, the *king's ſecretary*, or *clerk of his council*.

The term was applied indifferently to all who made any profeſſion of learning; or who knew how to manage the pen: though, originally, it was appropriated to eccleſiaſtics.

As the nobility and gentry were uſually brought up to the exerciſe of arms; there were none but the clergy left to cultivate the ſciences: hence, as the clergy alone made any profeſſion of letters, a very learned man came to be called a *great clerk*, and a ſtupid ignorant man, a *bad clerk*.

Romland, in his old language, uſes the word feminively, *clergeſſe*, for a learned woman. "*Mais trop plus eſt a "ornondre une ſime clergeſſe.*"

CLERK (in general) is uſed for all thoſe of the eccleſiaſtical ſtate, who are in holy orders, of any degree, or kind; from the *ſexton*, to the prelate.

Yet, in its utmoſt latitude, the word *clerk* alſo includes CHANTORS, ACOLYTHI, EXORCISTÆ, and OSTIARII. The canons excommunicate all thoſe who lay hands on a *clerk*. A council held in Africa prohibited the appointing any *clerk* to be a tutor, guardian, or curator, by teſtament. The council of Elvira enjoins continence on all *clerks*, biſhops, prieſts, or deacons, on pain of being ſtripped of their clericature.

CLERK, *cephalus*, in the ſixth century, was a name given to thoſe *clerks* who ſeparated from the biſhop, and thoſe not to live any longer in community with him; in contradiſtinction to

CLERKS *canonic*, who continued to live with the biſhop, according to the canons.

CLERK, in the way of trade and buſineſs, is one who exerciſes any function with the pen.

CLERK is alſo a title given to ſeveral officers of this kind in the royal palace, the courts of juſtice, revenue, army, navy, &c. The principal of theſe are as follow.

CLERK *of the Acts*, is an officer of the navy, who receives and enters the commiſſions and warrants of the lord admiral; and regiſters the acts and ordinances of the commiſſioners of the navy.

CLERK *of Affidavits*, in the court of chancery, an officer who files all affidavits made uſe of in court.

CLERK *of Aſſize*, is he that writeth all things judicially done by the juſtices of aſſize, in their circuits.

CLERK *of the Bails*, an officer belonging to the court of king's bench. Stat. 22 and 23 Car. II. He files the bail-pieces taken in that court, and attends for that purpoſe.

CLERK *of the Check*. See CHECK.

CLERK *of the Cloſet*, is a divine, otherwiſe called *confeſſor to his majeſty*; whoſe office is to attend at the king's right hand during divine ſervice, to reſolve all doubts concerning ſpiritual matters, to wait on the king in his private oratory, &c.

CLERK *of the Crown*, or *Crown-Office*, in the king's bench court, an officer whoſe buſineſs is to read, frame, and record all indictments againſt traitors, felons, and other offenders there, arraigned upon any public crime.

CLERK *of the Crown*, in chancery, is an officer, who, by himſelf, or deputy, is continually to attend the lord-chancellor, or lord-keeper, for ſpecial matters of ſtate, by commiſſion, or the like, either immediately from his majeſty, or by order of his council; as well ordinary as extraordinary. All general pardons, upon grants of them at the king's coronation, or in parliament; the writs of parliament, with the names of the knights, citizens, and burgeſſes, are alſo returned into his office: beſides which, he has the making of ſpecial pardons, and writs of execution upon bonds of ſtatute ſtaple forfeited.

CLERK *of the Declarations*, an officer in the court of king's bench that files all declarations in cauſes there depending, after they are engroſſed.

CLERK *of the Delivories*, is an officer in the Tower, who takes indentures for all ſtores iſſued thence.

CLERK *of the Errors*, in the court of common pleas, tranſcribes, and certifies into the king's bench, the tenor of the records of the cauſe, or action, upon which the writ of error, made by the curitor, is brought there, to be determined.

CLERK *of the Errors*, in the king's bench, tranſcribes and certifies the records of ſuch cauſes in that court into the exchequer; if the cauſe or action, is by bill.

CLERK *of the Errors*, in the exchequer, tranſcribes the records certified thither out of the king's bench; and prepares them for judgment in the court of exchequer, to be given by the juſtices of the common-pleas, and barons, there.

CLERK *of the Eſſoins*, in the court of common pleas, keeps the eſſoin-roll, or enters eſſoins. He alſo provides parchment, cuts it into rolls, marks the number on them; delivers out all the rolls to every officer, and receives them again when written. See ESSOIN.

CLERK *of the Eſtreats*, belongs to the exchequer, and every term, receives the eſtreats out of the lord-treaſurer's remembrancer's office, and writeth them out to be levied for the king. He alſo maketh ſchedules of ſuch ſums eſtreated as are to be diſcharged. See ESTREAT.

CLERKS *of the Green-Cloth*. See GREEN-CLOTH.

CLERK *of the Hanaper*, or *Hanaper*, is an officer in chancery, whoſe buſineſs is to receive all money due to the king for the ſeals of charters, patents, commiſſions, and writs: as alſo fees due to the officers for enrolling and examining the ſame. He is obliged to attend on the lord-chancellor, or lord-keeper, daily, in term-time; and at all times of ſealing.

CLERK *Comptroller of the King's Houſe*, an officer of the court, who has place and ſeat in the compting-houſe; with authority to allow or diſallow the charges and demands of purſuivants, and meſſengers of the green-cloth, purveyors, &c. He has alſo the overſight of all defaults and miſcarriages of inferior officers; and ſits in the compting-houſe with the ſuperior officers, viz. the lord-ſteward, treaſurer, comptroller, and cofferer, for correcting and reſtoring things out of order.

CLERK *of the Inrollments of Fines and Recoveries*, in the court of common pleas, is an officer under the three elder judges

of that court, and removeable at their pleasure, who inrolls all fines and recoveries, and returns writs of entry, &c. See INROLLMENT.

CLERK *of the Juries*, or *curata scritti*, is an officer belonging to the court of common-pleas, who makes out the writs called *habeas corpus*, and *distringas*, for the appearance of jurors, either in court, or at the adiits; after the panel is returned upon the *venire facias*. See JURY.

CLERK *of the markets*, is an officer of the king's house, whose duty is to take charge of the king's measures, and to keep standards of them, that is, examples of all the measures that ought to be used through the land.

CLERK *Marshal* of the king's house, seems to be an officer who attends the marshal in his court, and records all his proceedings. See MARSHAL. CLERK *martial*, under the master of the horse. See AVERON.

CLERK *of the Nichils*, or *Nihils*, is an officer in the exchequer, who makes a roll of all such sums as are *nichiled* by the sheriffs upon their estreats of green wax; and delivers the same into the lord-treasurer's remembrancer's office, to have execution done upon them for the king. See NIHILS.

CLERK *of the Ordnance*, is an officer in the Tower, who registers all orders relating to the king's ordnance. See ORDNANCE.

CLERK *of the Outlawries*, is an officer belonging to the court of common pleas; being a deputy to the king's attorney-general, for making out the writs of *capias ad exigendum*, after outlawry: and the king's attorney's name is to every one of these writs.

CLERK *of the Paper-Office*, is an officer of the king's bench, who makes up the paper-books of special pleadings and demurrers in that court.

CLERK *of the Papers*, an officer in the court of common-pleas, who keeps the papers of the warden of the Fleet, enters commitments and discharges of prisoners, delivers out days-rules, &c.

CLERK *of the Parcels*, an officer of the exchequer. See PARCEL-*Makers*.

CLERK *of a parish*. See PARISH *clerk*.

CLERK *of the Parliament*, is an officer who records all things done in parliament, and engrosses them fairly into parchment rolls, for the better preservation of them to posterity. Of these there are two: one of the house of lords, and the other of the house of commons.

CLERK *of the Patents*, or letters patent under the great seal. See PATENT.

CLERK *of the Peace*, is an officer belonging to the session of the peace, whose duty is to the session to read the indictments, to inrol the acts, and draw the process; to inrol proclamations of rates for servants wages; to inrol the allowance of approvers; to keep the counter part of the indentures of armour, &c. Also to certify in the king's bench transcripts of indictments, outlawries, attainders, and convictions, had before the justices of the peace within the time limited by statute. He is appointed by the *custos rotulorum* of the county, and liable to be discharged for misdemeanor by the justices of peace in quarter sessions.

CLERK *of the Pells*, belongs to the exchequer: his business is, to enter the tellers bill into a parchment roll, called *pells receipt-roll*; and also to make another roll of payment, called *pells issues*, wherein he sets down by what warrant the money was paid. 22 and 23 Car. II.

CLERK *of the Petty Bag*, is an officer in chancery, whereof there are three: the master of the rolls being their chief. Their office is to record the return of all inquisitions out of every county, all liveries granted in the court of wards, all other les mains; to make all patents of customers, gaugers, comptrollers, and salmagers; con. d'elires for the creations of bishops; summonses of the nobility, clergy, and burgesses, of parliament; commissions directed to the knights and others, of every shire, for raising of subsidies; writs for nomination of collectors for the fifteenths; and all transcripts upon any office, bill, or other writs; and to receive the money due to the king for the same. See PETTY-*Bag*.

CLERK *of the Pipe*, belongs to the exchequer. See PIPE-*Office*.

CLERK *of the Privy*, is an officer in the exchequer, in whose office the officers of the court, upon special priviledge belonging to them, ought to be, and be sued, upon any action.

CLERKS *of the privy Seal*, are four officers who attend the lord-keeper of the privy-seal, or, if there be none such, the principal secretary of state; and write, or make out, all things sent by warrant from the signet to the privy-seal, and to be passed to the great seal: as also to make out privy-seals upon any special occasion of the king's affairs; as for loan of money or the like.

CLERK *of the pleas*, in *Chancery*, an officer who searches for, and copies records, causes, &c.

CLERK *of the Rolls*, in the court of king's bench, an officer who draws up and enters all the *rules* and orders made in court, and gives rules of course in divers cases.

CLERK *of the sewers*, is an officer belonging to the commissioners of the sewers, who writes down all things they do by virtue of their commission, and the authority given them by 23 El. cap. 9.

CLERK *of a Ship*, is an officer appointed to take care that nothing be squandered, or spent needlessly.

He is obliged to keep a register, or journal containing an exact inventory of every thing in the lading of the vessel; as the rigging, apparel, arms, provision, munition, merchandizes; as also the names of the passengers, if there be any; the freight agreed on; a list of the crew, their age, quality, wages, the bargains, purchases, sales, or exchanges the ship makes from its departure; the consumption of provision; and, in short, every thing relating to the expence of the voyage. He also registers the contributings of the captain, pilot, &c. He also does the office of a register in all criminal processes; and of a notary, to make and keep the wills of those who die in the voyage; takes inventories of their effects, &c. The *clerk* is not allowed to quit the vessel during the voyage, on forfeiture of all his wages, &c. In small vessels, the master, or pilot does the office of *clerk*.

CLERK *of the Signet*, is an officer continually attending on the king's principal secretary; who has custody of the privy-signet, as well for sealing the king's private letters, as for such grants as pass his majesty's hands by bills signed. Of these there are four, who attend in their turn, and have their diet at the secretary's table.

CLERK *of the king's Silver*, is an officer belonging to the common pleas; to whom every fine is brought, after it hath been with the *custos brevium*; and by whom the effect of the writ of covenants is entered into a paper-book; and according to that note, all the fines of that term are also recorded in the rolls of the court. See QUEEN *Gold*.

CLERK *of the Supersedeas*, is an officer in the court of common pleas, who makes out writs of *supersedeas* (upon the defendants appearing to the exigent on outlawry) whereby the sheriff is forbid to return the exigent.

CLERK *of the Treasury*, an officer of the common pleas, who has charge of the records of the *nisi prius*, the fees due for all searches, and the certifying of all records into the king's bench when a writ of error is brought. He also makes out all writs of *supersedeas de non molestando*, which are granted for the defendants while the writ of error is depending; and all exemplifications of records, being in the treasury.

CLERK *of the king's great Wardrobe*, keeps an account of the inventory, in writing, of all things belonging to the king's wardrobe. See WARDROBE.

CLERK *of the Warrants*, is an officer belonging to the court of common-pleas, who enters all warrants of attorney for plaintiff and defendant; and inrols all deeds of indentures of bargain and sale, which are acknowledged in the court, or before any judges out of the court; and it is his office to estreat into the exchequer all issues, fines, and amerciaments, which grow due to the king in that court, for which he has a standing fee or allowance.

CLERKS, *misprision of*. See MISPRISION.

CLERK *riding*. See RIDING.

CLERKS *sir*. See SIR.

CLERKS, *Apostolic*, in *Ecclesiastical History*. See JESUITS.

CLERKS, *Regular*, a general denomination, comprehending several distinct religious orders, and assumed to denote a reformation attempted to be introduced among them. See THEATINS and FATHERS.

CLERKS, *Regular, of the company of Jesus*. See JESUITS.

CLERKS, *Regular, of St. Maturin*. See FATHERS *of Samaritans*.

CLERKS, *Regular, of St. Paul*. See BARNABITES.

CLERMONT *Manuscript*, is a copy of St. Paul's Epistles, found in the monastery of Clermont in France, and used by Beza, together with the Cambridge MS. in preparing his edition of the New Testament. This copy is in the octavo form, and is written on fine vellum in Greek and Latin, with some mutilations. Beza supposes that it is of equal antiquity with the Cambridge copy; but both were probably written by a Latin scribe in a later period than he alleges to them. The various readings of this MS. were communicated to archbishop Usher, and they are preserved by Walton. The MS. itself was in the possession of Morinus; and after his death deposited among the MS. copies of the Royal Library at Paris, N° 2245. See the references under CAMBRIDGE *MS.*

CLERODENDRUM, in *Botany*, the name of a genus of plants of the *didynamia angiospermia* class, the characters of which are these: the calyx is bell-shaped, and divided into five segments; the tube of the corolla is slender and long,

long, and its limb divided into five equal segments; the stamina are very long, and the fruit is a single-seeded berry.

CLEROMANCY, a kind of divination performed by the throwing of dice, or little bones: and observing the points, or marks, turned up.

The word comes from κληρος, *lot*, and μαντια, *divination*.

At Buru, a city of Achaia, was a temple, and a celebrated oracle of Hercules; where such as consulted the oracle, after praying to the idol, threw four dice, the points whereof being well scanned by the priest, he was supposed to draw an answer from them.

Something of this kind seems to have been practised with regard to Jonah. See Jonah, i. 7.

CLEROTI, among the Athenians, a kind of public arbitrators. See Diætetæ.

CLETHRA, in *Botany*, Gronov. Fl. Virg. 43. a genus of the *decandria monogynia* class. Its characters are these: the flower hath five oblong petals, and ten stamina, which are as long as the petals: in the centre is situated a roundish germen, which afterward becomes a roundish capsule enclosed by the empalement, having three cells, which are full of angular seeds. We know but one species of this genus of shrubs, which is a native of Virginia and Carolina.

It is hardy enough to bear the open air of England; and is one of the most beautiful shrubs at its flowering season. It thrives best in moist land, and in a sheltered situation.

CLETHRITES *lapis*, a name given by the ancients to such pieces of fossile wood as shewed a grain resembling that of the wood of the alder.

CLEW *of the sail of a ship*, is the lower corner of it which reaches down to that earing where the tackles and sheets are fastened; so that when a sail is made goring, or sloping by degrees, the is said to have a *great clew*: and a ship is said to have a great *clew*, when the has a very long yard, and so has much canvas in her sails.

CLEW-*garnet*, in *Ship-building*, a rope fastened to the *clew* of the sail, and from thence running in a block seized to the middle of the main and four-yard. Its use is to hale up the *clew* of the sail close to the middle of the yard, in order to its being furled.

CLEW-*line* is the same to the top-sails, top-gallant-sails, and sprit-sails, that the *clew-garnet* is to the main-sail and fore-sail, and has the very same use. In a gust of wind, when a top-sail is to be taken in, they first hale home the lee *clew-line*, and by that means the sail is taken in much easier.

CLINOMANCY, from κλινη, a *bed*, and μαντια, *divination*, a species of divination performed by means of keys. See Dactyliomancy.

CLIENT, CLIENS, among the Romans, a citizen who put himself under the protection of some great man, who in that relation was called his patron, *patronus*.

The patron assisted his *client* with his protection, interest, and estate; and the *client* gave his vote for his patron, when he sought any office for himself, or his friends. *Clients* owed respect to their patrons, as their reciprocally owed them their protection.

This right of patronage was appointed by Romulus, to unite the rich and poor together, in such manner as that one might live without contempt, and the other without envy. But the condition of a *client*, in course of time, became little else but a moderate kind of slavery.

By degrees, the custom extended itself beyond Rome; and not only families, but cities, and entire provinces, even out of Italy, followed the example. Thus Sicily *v. gr.* put itself under the clientela, or protection of Marcellus.

Lazius and Budæus refer the origin of fiefs, and tenures, to the patrons and *clients* of ancient Rome: but the difference is pretty considerable between the relation of vassals and their lords, and that of *clients* and their patrons. See Vassal.

The *clients*, beside the respect they bore their patrons, and the vote they gave them, were obliged to assist them in all affairs; and even to pay their ransom, if they should be taken prisoners in war, in case they were not able to do it of themselves.

CLIENT, is now used for a party in a law-suit who has turned over his cause into the hands of a counsellor, or solicitor.

CLIFFORTIA, in *Botany*, a genus of the *dioecia polyandria* class. Its characters are these: it hath male and female flowers in different plants; the male flowers have a spreading empalement, composed of three small oval concave leaves, but no petals, with a great number of hairy stamina. The female flowers have a permanent empalement, composed of three leaves sitting upon the germen; these have no petals; but the oblong germen, which is situated below the empalement, supports two long, slender, feathered styles. The germen afterward becomes an oblong taper capsule, with two cells, crowned by the empalement, including one narrow taper seed. There are three species, natives of the Cape of Good Hope.

CLIFT, in the *Sclavonic*, a deficiency in the new, soft, and tough horn-part that grows in a horse's foot, upon the heel-gall.

It is also called *chint*, *crust*, or *chap*; and by the French *crudure*. See Chap.

CLIFTS, in timber. See Timber.

CLIMACIDES, among the Greeks, were women servants who assisted their *mistresses* to get on horseback, by serving as steps for them to ascend by.

CLIMACTERIC, *Annus* CLIMACTERICUS, a critical year, or period in a man's age, wherein according to astrologers, there is some very notable alteration to happen in the body; and a person is exposed to great danger of death.

The word comes from κλιμακτηρ, or κλιμακτηρικος, of κλιμαξ, κλιμακος, *ladder*, q. d. *by steps*, or *ladder*.

The first *climacteric* is, according to some, the seventh year of a man's life; the rest are multiples of the first, as 14. 21. 49. 56. 63. and 84. which two last are called the *grand climacterics*, and the dangers here are supposed more imminent.

The opinion has a great deal of antiquity on its side. Aulus Gellius says, it was borrowed from the Chaldeans; who might probably receive it from Pythagoras, whose philosophy turned much on numbers; and who imagined an extraordinary virtue in the number 7.

Marc. Firmus gives the foundation of the opinion: he tells us, there is a year assigned for each planet to rule over the body of man, each in his turn: now Saturn being the most malefic ent planet of all, every seventh year, which falls to his lot, becomes very dangerous; especially those of 63 and 84, when the person is already advanced in years.

Some hold, according to this doctrine, every seventh year an established *climacteric*; but others only allow the title to those produced by the multiplication of the climacterical space by an odd number, 3. 5. 7. 9. &c. Others observe every ninth year as a *climacteric*.

Bovellus has a volume under the title of Annus Climactericus, describing the loss he sustained in the burning of his observatory, &c. which it seems happened in his first *grand climacteric*.

Suetonius says, Augustus congratulated his nephew upon his having passed his first *grand climacteric*, whereof he was very apprehensive.

Some pretend that the *climacteric* years are also fatal to political bodies; which perhaps may be granted, when it is proved that they are so to natural ones.

Authors on this subject, are Plato, Cicero, Macrobius, Aulus Gellius, among the ancients; Argol, Magirus, and Salmasius among the moderns. And St. Augustine, St. Ambrose, Beda, and Boetius, countenance the opinion.

CLIMATARCH, Κλιματαρχης, were governors of provinces to the Greek emperors.

CLIMATE, Clima, or Clime, in *Geography*, a part of the surface of the earth, bounded by two circles parallel to the equator, and of such a breadth, as that the longest day in the parallel near the pole, exceeds the longest day in that next the equator by some certain space; viz. half an hour.

The word comes from κλινω, *inclinavi*, an *inclination*; because the difference of *climates* arises from the different inclination or obliquity of the sphere.

Climate, *the beginning of the*, is the parallel circle where in the day is the shortest.

Climate, *the end of the*, is that wherein the day is the longest. The *climates* therefore are reckoned from the equator to the pole; and are so many bands, or zones, terminated by lines parallel to the equator: though, in strictness, there are several *climates* in the breadth of one zone.

Each *climate* only differs from its contiguous ones, in that the longest day in summus is longer or shorter by half an hour in the one place than in the other.

As the *climates* commence from the equator, the first *climate*, as its beginning, has its longest day precisely twelve hours long; at its end, twelve hours and an half: the second, which begins where the first ends, viz. at twelve hours and a half, ends at thirteen hours; and so of the rest, as far as the polar circles, where those which the geographers call *horo-climata* terminate, and *mesobiani* commence.

As an *horo-climate* is a space comprised between two parallels of the equator, in the first of which the longest day exceeds that in the latter by half an hour; so the *mesobi-climate* is a space terminated between two circles

parallel

parallel to the polar circles, whose longeſt day is longer or ſhorter than that of its contiguous one by a month, or thirty days.

The ancients, who confined the *climates* to what they imagined the habitable parts of the earth, only allowed of ſeven. The middle of the firſt they made to paſs through Meroe; the ſecond through Sienna; the third through Alexandria; the fourth through Rhodes; the fifth through Rome; the ſixth through Pontus; and the ſeventh through the mouth of the Boryſthenes. To theſe were added two other *climates*; the eighth paſſing through the Riphæan mountains, and the ninth through Tanais. The moderns, who have ſailed farther toward the poles, make thirty *climates* on each ſide; and in regard the obliquity of the ſphere makes a little difference in the length of the longeſt day; inſtead of half an hour, ſome of them only make the difference of *climates* a quarter.

In uſing the *climates*, there ordinarily is no regard had to the refraction.

Vulgarly, the term *climate* is beſtowed on any country or region differing from another, either in reſpect of the ſeaſons, the quality of the ſoil, or even the manners of the inhabitants; without any regard to the length of the longeſt day.

Monteſquieu, in his Spirit of Laws, examines the influence of different *climates* on the manners, characters, and laws of nations. See vol. i. book xiv. xv. xvi. xvii.

Abulfeda, an Arabic author, diſtinguiſhes the firſt kind of *climates* by the term *real climates*; and the latter by that of *apparent climates*.

Varenius gives us a table of thirty *climates*; but without any regard to the refraction. Riccioles furniſhes a more accurate one, wherein the refractions are allowed for: an abſtract of which follows.

A Table of CLIMATES.

Middle of Clim.	Longeſt Day	Lat.	Cli-mates	Longeſt Day	Lat.	Middle of Clim.	Lat.	N. Lat. Cont. Day	N. Lat. Cont. Night	S. Lat. Cont. Day	S. Lat. Cont. Night
I	12h 30′	18	VIII	16h 0′	48° 15	XV	66° 53	31° 27	30° 28		
II	13 0	15 36	IX	17 0	53 46	XVI	69 38	62 58	60 59

VII	15 30	44 22	XIV	24 0	65 54						

CLIMATE *for plants*. See TEMPERATURE.

CLIMAX, or *gradation*, in *Rhetoric*, a figure, whereby the diſcourſe aſcends, as it were, by degrees. Such is that of Cicero to Catiline: *Nihil agis, nihil moliris, nihil cogitas, quod ego non audiam, quod etiam non videam, planeque ſentiam: thou doſt nothing, meditateſt nothing, thinkeſt nothing, but I hear it, nay ſee it, and perfectly underſtand it.* Thus the ſame Cicero to Atticus: *Si dormio, expergiſcores; ſi ſtas, ingredere; ſi ingrederis, curre; ſi curris, advola.* See ANTICLIMAX.

CLIMBER, in *Botany*. See VIRGIN'S *Bower*.

CLIMIA of the Arabs. See KLIMIA.

CLIMING *Fumitory*, in *Botany*. See FUMITORY, and Phil. Tranſ. vol. xlix. part ii. p. 842.

CLINCH *of a cable*, is that part of it which is bent about the ring of the anchor, and then ſeized or made faſt.

CLINCH-*bolts*, in a ſhip, are ſuch as are *clinched* with a riveting hammer at thoſe ends which come through.

CLINCHER-*work*, in *Sea-Language*, the diſpoſition of the planks in the ſide of any veſſel, by which the lower edge of every plank overlays the next under it, like the ſlates on the top of a houſe.

CLINCHING, in *Sea-Language*, a kind of ſlight caulking uſed about the ports, on a proſpect of foul weather: it is done by driving a little oakum into their ſeams, that the water may not come in at them.

CLINIC, CLINICUS, a term applied by ſome church hiſtorians to thoſe among the ancients, who received baptiſm on their death-bed.

The word CLINIC is formed from κλινη, a *bed*.

It was the doctrine of many of the fathers, that baptiſm abſolutely waſhed away all previous ſins, and that there was no atonement for ſins committed after baptiſm. On this account, many deferred that ſacrament till they were arrived at the laſt ſtage of life, and were pretty ſafe from the danger of ſinning any more; and ſuch were called *clinici*.

Novatian, in the third century, made a doubt whether ſo no *clinics* were truly baptized, in regard the ceremony was only performed by aſperſion, inſtead of immerſion: he conſulted St. Chryſoſtom on the point, who replied to him, that the ſacrament does not waſh away ſin after the manner of a corporal bath; and ſhews from ſcripture that aſperſion is ſufficient. See BAPTISM.

CLINIC is alſo uſed, in *Antiquity*, for a patient or perſon merely ſick, even without keeping his bed; as appears from the life of Charlemagne, in Canſius.

CLINICUS is alſo uſed for a phyſician: becauſe phyſicians are much converſant about the beds of the ſick.

They were, however, principally the phyſicians of emperors that were called by this title.

CLINIC is now ſeldom uſed but for a quack; or rather for an empirical nurſe, who pretends to have learned the art of curing diſeaſes by attending on the ſick.

CLINICAL, *medicine*, was particularly uſed for the method of viſiting, and treating ſick perſons in bed, for the more exact diſcovery of all the ſymptoms of their diſeaſes.

Le Clerc obſerves, that Eſculapius was the firſt who exerciſed the *clinic medicine*.

CLINKARD, among *Britiſh Miners*. See BATES.

CLINOIDES, in *Anatomy*, an epithet given to the four ſmall proceſſes of the os SPHENOIDES, one of the bones of the cranium; ſo called, by Dubois, from their reſembling the feet of a bed.

The word is formed of the Greek κλινη, a *bed*, and ειδος, *form*; either from the reſemblance which the three bones bear to the feet of the bed; or from the cavity they form, which reſembles a bed itſelf.

Theſe together form a little cavity, from its ſhape called *ſella turcica*, or *equina*; wherein is placed the pituitary gland.

CLINOPODIUM, in *Botany*, *Field Baſil*, a genus of the *didynamia gymnoſpermia* claſs. Its characters are theſe: the flower is of the *labiated* kind, with a ſhort tube enlarging to the mouth: the upper lip is erect, and indented at the top; the under lip is trifid, the middle ſegment being broad and indented. It hath four ſtamina under the upper lip, two of which are ſhorter than the other: in the centre is ſituated the quadripartite germen, which afterward becomes four oval ſeeds, that lie in the empalement. There are ſix ſpecies.

The firſt ſort grows naturally by the ſides of hedges in moſt parts of England.

CLIO, one of the MUSES. In the portraits of Apollo and the Muſes, dug out of Herculaneum, Clio appears ſeated, and her head is crowned with laurels. In her left hand ſhe holds an open volume, in which ſhe is reading. On the outſide is written KLEIH ICTOPIAN, *Clio the Hiſtorian*; though it ſhould rather be tranſlated *Clio immortal Hiſtory*. At her feet are ſix other rolls, or antique volumes, incloſed in a cylindrical caſe. Burney's Hiſt. of Muſic, vol. i. p. 204.

CLIO, in *Zoology*, the name of a genus of worms, belonging to the order of *molluſca*: the body of which is oblong, and formed for ſwimming, and furniſhed with two oppoſite *alæ* of a membranaceous ſtructure. They are found in the ocean.

CLIPEUS, in *Natural Hiſtory*, the name of a claſs of the *echinodermata*, which are very depreſſed and flat, and in ſome meaſure reſemble a ſhield. Of this claſs there are only two known ſpecies.

The firſt is the diſcoid echinites of Plot, and the ſecond that of Langius, which has a little higher top.

CLIPPING *the coin*. See COIN.

CLITONES, the eldeſt, and all the ſons of kings. This word is often met with in our antient authors.

CLITORIA, in *Botany*, a genus of the *diadelphia decandria* claſs. Its characters are theſe: the flower is of the *papilionaceous* kind, having a large ſpreading ſtandard, which is erect; the two wings are oblong, and ſhorter than the ſtandard; the keel is ſhorter than the wings, and is hooked; it hath ten ſtamina, nine of which are joined, and one ſtands ſeparate; in the centre is ſituated an oblong germen, which afterward becomes a long, narrow, compreſſed pod, with one cell, opening with two valves, inclining ſeveral kidney-ſhaped ſeeds. There are four ſpecies.

CLITORIDIS *muſculus*, a name given by Verheyen to the muſcle of the female *pudendum*, uſually called *erector clitoridis*. This is the only muſcle that is proper to this part;

part; the other, called the *inferior clitoridis* being properly a *sphincter vaginæ*, or, as Albinus calls it, *constrictor cunni*.

CLITORIS, in *Anatomy*, a long round body in the forepart of the vulva, or natural parts of a woman, where the *nymphæ* form an angle with each other; being one of the organs of generation in that sex. See *Tab. Anat. (Splanch.) fig. 9. lit. e. f. fig. 12. lit. m. fig. 13. lit. a.* Its figure represents that of a glans or acorn: ordinarily it is pretty small, but in some women thick, and long. In many respects it represents the penis of a man; whence some call it *mentula*, or *penis muliebris*, the woman's yard.

In effect, it is composed of the same parts; it has, like it, two cavernous or spongious bodies; and a glans at the extremity, covered with a præputium, but it is not pierced through like the penis.

This is thought by some to have been first discovered by modern anatomists; but Dr. Tronchin quotes several ancient authors who knew the *clitoris*, and proves that Bonaciolus mentioned it before Columbus or Fallopius.

It has two muscles which erect it in coition; on which occasion it swells and grows hard. Some anatomists pretend too, that it has two *musculi ejaculatores*. See *Tab. Anat. (Splanch.) fig. 13. lit. f. f.*

Its sensation is exquisite; and it is found the chief seat of pleasure; so that some call it *sedes Veneris*. And hence it is said, some women are apt to abuse it. See POLLUTION.

The extremity of this part is sometimes cut off; as in circumcision, where it advances out too far. It is sometimes so large and preponderant, that it bears a full resemblance to the virile member; whence the persons, in whom it is so found frequently pass for hermaphrodites.

The spongious bodies of the *clitoris* arise distinctly from the lower parts of the *ischia*; and approaching one another unite, and form the body of the *clitoris*. Before their union they are called the *crura clitoridis*, and are twice as long as the body of the *clitoris*.

Its muscles arise from the protuberance of the ischium, and are inserted into its spongious bodies. It has veins and arteries from the hæmorrhoidal vessels, and pudenda; and nerves from the intercostals.

CLIVERS, in *Botany*. See CLEAVERS.

CLOACA, among the *Ancients*, was a subterraneous aqueduct, or common-sewer, for the reception and discharge of the filth of a city, or house.

The word is formed from κλύζω, *I wash away*.

Tarquinius Priscus is said to have been the first who contrived *cloacæ* in ancient Rome; to which end, a canal was first dug through the mountains whereon the city stood, and divided into three branches, called the *great cloaca*.

The care and inspection of the *cloacæ* belonged to the censors, till the time of Augustus, who appointed *curatores cloacarum* on purpose. The Romans had also their *Cloacina*, or goddess, who presided over the *cloacæ*.

CLOACA, in *Comparative Anatomy*, imports that canal in birds, through which the egg descends from the ovary in its exit. In this it is remarkable, that the part which is next the ovary is jagged, like the *morsus diaboli*, and fastens itself to the abdomen without any attachment to the ovary: hence anatomists have been somewhat puzzled to comprehend by what means the egg falls into the ovary. See EGG.

CLOATHS, or CLOTHES. See HABIT.

CLOCK, a kind of movement, or machine, serving to measure, and strike time.

The usual chronometers are watches and *clocks*: the former, in strictness, are such as shew the parts of time; the latter, such as publish it by striking: though the name watch is ordinarily appropriated to pocket *clocks*; and that of *clocks* to larger machines, whether they strike or no.

The parts common to both kinds of movements, see under the article MOVEMENT. Those peculiar to watches and *clocks*, see under WATCH-WORK, and CLOCK-WORK.

The invention of *clocks* with wheels, is referred to Pacificus, archdeacon of Verona, who lived in the time of Lotharius, in the ninth century, son of Lewis the Debonnair; on the credit of an epitaph quoted by Ughelli, and borrowed by him from Panvinius. Others ascribe the invention to Boethius, about the year 510.

They were at first called *nocturnal dials*; to distinguish them from sun-dials, which shewed the hour by the sun's shadow.

Dr. Derham makes *clock-work* of a much older standing; and ranks Archimedes's sphere, mentioned by Claudian, and that of Posidonius, mentioned by Cicero, among machines of this kind; not that either their form or use was the same with those of ours; but that they had their motion from some hidden weights, or springs, with wheels, or pullies, or some such *clock-work* principle. Thus he understands the *ipsiusque turris famulus spiritus ignis*; & *vivam cœli motibus urget aquam*.

But be this as it will, it is certain the art of making such as are now in use, was either first invented or at least retrieved, in Germany, about two hundred years ago.

Clock-makers were first introduced into England in 1 when Edward III. granted a license for three artists come over from Delft in Holland, and practise their occupation in this country.

The *water-clocks*, or *clepsydræ*, and sun-dials, have both a much better claim to antiquity.

The French annals mention one of the former kind, sent by Aaron king of Persia to Charlemagne, about the year 807, which seemed to bear some resemblance to the modern *clocks*: it was of brass, and shewed the hours by twelve little balls of the same metal, which fell at the end of each hour, and in falling struck a bell, and made it sound. There were also figures of twelve cavaliers, which at the end of each hour came forth at certain apertures, or windows, in the side of the *clock*, and shut them again, &c.

Among the modern *clocks*, the most eminent for their furniture, and the variety of their motions and figures, are those of Strasburgh, and of Lyons. In the first, a cock claps his wings, and proclaims the hour; the angel opens a door and salutes the Virgin; and the Holy Spirit descends on her, &c. In the second two horsemen encounter, and beat the hour on each other; a door opens, and there appears on the theatre the Virgin with Jesus Christ in her arms; the magi, with their retinue, marching in order, and presenting their gifts; two trumpeters sounding all the while to proclaim the procession.

The invention of PENDULUM *clocks* is owing to the happy industry of the last age: the honour of it is disputed between Huygens and Galileo. The former, who has a volume on the subject, declares it was first put in practice in the year 1657, and the description thereof printed in 1658. Becher, De Nova Temporis dimetiendi Theoria, anno 1680, contends for Galileo; and relates, though at second-hand, the whole history of the invention: adding that one Treffler, *clock-maker* to the father of the then grand-duke of Tuscany, made the first pendulum *clock* at Florence, by direction of Galileo Galilei; a pattern of which was brought into Holland.

The academy del Cimento say expressly, that the application of the pendulum to the movement of a *clock* was first proposed by Galileo, and first put in practice by his son Vincenzo Galilei, in 1649.

But the inventor who he will, it is certain the invention never flourished till it came into Huygens's hands, who insists on it, that if ever Galileo thought of such a thing, he never brought it to any degree of perfection.

The first pendulum clock made in England, was in the year, 1662, by Mr. Fromantil, a Dutchman.

Pendulum CLOCK, *Pocket* CLOCK, and *Repeating* CLOCK. See WATCH, and PENDULUM *clock*.

CLOCK-WORK, is that part of the movement which strikes the hour, &c. on a bell. See *Tab. Horology, fig. 2.*

The wheels it consists of are the great or first wheel H; which is moved by the weight or spring at the barrel G: in eight or thirty-hour *clocks*, this has usually pins, and is called the *pin-wheel*; in eight-day pieces, the second wheel I is commonly the pin-wheel, or striking-wheel, which is moved by the former. Next the striking-wheel, is the detent-wheel, or hoop-wheel, K, having a hoop almost round it, wherein is a vacancy at which the *detent* locks. The next is the third, or fourth wheel, according to its distance from the first, called the *running-wheel* L. The last is the flying quarter Q, with a fly, or fan to gather air, and to bridle the rapidity of the *clock*'s motion. To these must be added the pinion of report, which drives round the locking-wheel, called also the *count-wheel*; ordinarily with eleven notches in it, unequally distant, to make the *clock* strike the hours. See WHEEL.

Beside the wheels, to the *clock* part belongs the *pulley*, or *rack*, a kind of wheel with twelve large *tangs*, running concentrical to the dial-wheel, and serving to lift up the detent every hour, and make the *clock* strike: the detents, or flops, which being lifted up, and let fall, lock and unlock the *clock* in striking: the hammer, as S, which strikes the bell R: the hammer-tails, as T, by which the striking-pins draw back the hammers: *latches*, whereby the work is kept up and unlocked: and lifting-pieces as P, which lift up and unlock the detents.

For the mechanism of the several parts of a *clock* that serve to move the hands, and shew the time, see WATCH-*work*.

CLOCK-*work, theory and calculation of*. The method of calculating the numbers of a piece of *clock-work* having

something in it very entertaining, and at the same time very easy and useful, we shall give the readers the rules relating thereto: referring, for the general rules that obtain in the calculation of all movements of watch as well as *clock-work*, to the article MOVEMENT; and, for the particular rules of watch-work, to the article WATCH-*work*.

For the strict calculation itself, it bears that affinity to the calculation of watch-work, that, to avoid repetitions, we shall refer to that head: what *clock-work* has peculiar to itself will be conceived from what follows.

CLOCK, *rules for calculating the striking part of a.* First then, observe, that regard here needs only be had to the counting-wheel, striking-wheel, and detent-wheel, which move round in this proportion: the count-wheel commonly goes round once in 12 or 24 hours: the detent-wheel moves round every stroke the *clock* strikes, or sometimes but once in two strokes; wherefore, it follows, that,

Secondly, As many pins as are in the pin-wheel, so many turns hath the detent-wheel in one turn of the pin-wheel; or, which is the same, the pins of the pin-wheel are the quotients of that wheel divided by the pinion of the detent-wheel. But if the detent-wheel move but once round in two strokes of the *clock*, then the said quotient is but half the number of pins.

Thirdly, As many turns of the pin-wheel as are required to perform the strokes of 12 hours (which are 78), so many turns must the pinion of report have, to turn round the count-wheel once: or thus, the quotient of 78, divided by the number of striking-pins, shall be the quotient for the pinion of report and the count-wheel; and this is in case the pinion of report be fixed to the arbor of the pin-wheel, which is commonly done.

An example will make all plain: the locking-wheel being 48, the pinion of report 8, the pin-wheel

8) 48 (6.
48

the striking-pins are 13, and to of the rest. Note also, that 78 divided by 13 gives

6) 78 (13. 6, the quotient of the pinion of report. As
6) 60 (10 for the warning-wheel, and fly-wheel, it
6) 48 (8. matters little what numbers they have; their use being only to bridle the rapidity of the motion of the other wheels.

The following rules will be of good service in this calculation.

1. *To find how many strokes a clock strikes in one turn of the fuse, or barrel.* As the turns of the great wheel, or fusee, are to the days of the *clock's* continuance; so is the number of strokes in 24 hours, viz. 156, to the strokes of one turn of the fusee.

2. *To find how many days a clock will go.* As the strokes in 24 hours are to those in one turn of the fusee; so are the turns of the fusee to the days of the *clock's* going.

3. *To find the number of turns of the fusee, or barrel.* As the strokes in one turn of the fusee are to those of 24 hours; so is the *clock's* continuance to the turns of the fusee, or great wheel.

4. *To find the number of leaves in the pinion of report on the axis of the great wheel.* As the number of strokes in the *clock's* continuance is to the turns of the fusee; so are the strokes in 12 hours, viz. 78, to the quotient of the pinion of report fixed on the arbor of the great wheel.

5. *To find the strokes in the clock's continuance.* As 12 is to 78, so are the hours of the *clock's* continuance to the number of strokes in that time.

By 8 & 9 and 10 W. III. cap. 28. § 2. no person shall export, or endeavour to export, out of this kingdom, any outward or inward box-case or dial-plate, of gold, silver, brass, or other metal, for clock or watch, without the movement in or with every such box, *&c.* made up fit for use, with the maker's name engraven thereon; nor shall any person make up any clock or watch, without putting their name and place of abode or freedom, and no other name or place, on every clock or watch; on penalty of forfeiting every such box, case, and dial-plate, clock and watch, not made up and engraven as aforesaid; and 50*l.* one moiety to the king, the other to those that shall sue for the same.

The ingenious Dr. Franklin has contrived a *clock* to shew the hours, minutes, and seconds, with only three wheels and two pinions in the whole movement. The dial-plate (*fig.* 8. *Tab.* II. *Horology*) has the hours engraven upon it in spiral spaces along two diameters of a circle containing four times 60 minutes. The index A goes round in four hours, and counts the minutes from any hour by which it has passed to the next following hour. The time, therefore, in the position of the index shewn in the figure is either 32 minutes past XII. III. or VIII. and so in every other quarter of the circle, it points to the number of minutes after the hours which the index last left in motion. The small hand B, in the arch at top, goes round once in a minute, and shews the seconds. The wheel-work of this *clock* may be seen in (*fig.* 9.) A is the first or great wheel, containing an hundred and sixty teeth, and going round in four hours with the index A in *fig.* 8. let down by a hole on its axis. This wheel turns a pinion B of ten leaves, which therefore goes round in a quarter of an hour: on the axis of this pinion is the wheel C of an hundred and twenty teeth, which goes round in the same time, and turns a pinion D, of eight leaves, round in a minute, with the second-hand B of *fig.* 8. fixed on its axis, and also the common wheel E of thirty teeth, for moving a pendulum (by pallets) that vibrates seconds, as in a common *clock*. This *clock* is wound up by a line going over a pulley on the axis of the great wheel, like a common thirty-hour clock. Many of these admirably simple machines have been contrived, which measure time exceedingly well. It is subject, however, to the inconvenience of requiring frequent winding by drawing up the weight; and likewise to some uncertainty as to the particular hour shewn by the index A. Mr. Ferguson has proposed to remedy these inconveniences by the following contrivance. In the dial-plate of his *clock* (*fig.* 10.) there is an opening *a b c d*, below the centre, through which appears part of a flat plate, on which the 12 hours with their divisions into quarters, are engraved: this plate turns round in twelve hours, and the index A points out the true hour, &c. B is the minute-hand which goes round the large circle of 60 minutes, whilst the plate *a b c d* shifts its place one hour under the fixed index A. There is another opening *e f g h*, through which the seconds are seen on a flat moveable ring at the extremity of a sector-dc, is engraved on the face of the dial-plate A, in *fig.* 11, is the great wheel of this *clock*, containing an hundred and twenty teeth, and turning round in twelve hours. The axis of this wheel bears the plate of hours, which may be moved by a pin pulling through small holes drilled in the plate, without affecting their wheel-work. The great wheel A turns a pinion B of ten leaves round in an hour, and carries the minute-hand B on its axis round the dial-plate in the same time: on this axis is a wheel C of an hundred and twenty teeth, turning round a pinion D of six leaves in three minutes; on the axis of which there is a wheel E of ninety teeth, that keeps a pendulum in motion, vibrating seconds by pallets, as in a common *clock*, when the pendulum-wheel has only thirty teeth, and goes round in a minute. In order to shew the seconds by this *clock*, a thin plate must be divided into three times sixty, or an hundred and eighty equal parts, and numbered 10, 20, 30, 40, 50, 60, three times successively; and fixed on the same axis with the wheel of ninety teeth, so as to turn round near the back of the dial-plate; and these divisions will shew the seconds through the opening *e f g h*, *fig.* 10. This *clock* will go a week without winding, and always shew the precise hour; but this *clock*, as Mr. Ferguson exhaustively acknowledges, has two disadvantages of which Dr. Franklin's *clock* is free. When the minute-hand B is adjusted, the hour-plate must also be set right by means of a pin; and the fallness of the teeth in the pendulum-wheel will cause the pendulum-ball to describe but small arcs in its vibrations; and therefore the momentum of the ball will be less, and the times of the vibrations will be more affected by any unequal impulse of the pendulum-wheel on the pallets. Besides, the weight of the flat ring on which the seconds are engraved will load the pivots of the axis of the pendulum-wheel with a great deal of friction, which ought by all possible means to be avoided. To remedy this inconvenience, the fecond plate might be omitted.

A CLOCK shewing the apparent diurnal motions of the fun and moon, the age and phases of the moon, with the time of her coming to the meridian, and the times of high and low water; by having only two wheels and a pinion added to the common movement, was contrived by Mr. Ferguson, and is described in his Select Exercises. The dial-plate of this *clock*, (fee *Tab.* II. *Horology*, *fig.* 12.) contains all the twenty-four hours of the day and night. S is the fun, which ferves as an hour index, by going round the dial-plate in twenty-four hours; and M is the moon, which goes round in twenty-four hours, fifty minutes and a half, the time of her going round in the heavens from one meridian to the fame meridian again. The fun is fixed to a circular plate, (fee *fig.* 13.) and carried round by the motion of that plate, on which the twenty-four hours are engraven; and within them is a circle divided into twenty-nine and a half equal parts for the days of the moon's age, reckoning from new moon to new moon; and each day ſtands directly under the time, in the twenty-four hour circle, of the moon's coming to the meridian; the XII. under the fun ſtanding for noon, and the oppoſite XII. for midnight. The moon, M, is fixed

to another circular plate (*fig.* 12.) of the same diameter with that which carries the fun, part of which may be seen through the opening, over which the fmall wires *a* and *b* paſs in the moon-plate. The wire *a* ſhews the moon's age and time of her coming to the meridian, and *b* ſhews the time of high-water for that day, in the fun-plate. The diſtance of theſe wires anſwers to the difference of time between the moon's coming to the meridian and high-water at the place for which the *clock* is made. At London their difference is two hours and a half. Above the moon-plate there is a fixed plate N, ſupported by a wire A, fixed to it at one end and fixed at right angles into the dial-plate at the midnight XII. This plate may repreſent the earth, and the dot L London, or the place to which the *clock* is adapted. Around this plate there is an elliptic ſhade on the moon-plate, the higheſt points of which are marked *high-water*, and the loweſt *low-water*. As this plate turns round below the plate N, theſe points come ſucceſſively even with L, and ſtand over it at the times when it is high or low water at the given place: which times are pointed by the ſun, S, on the dial-plate; and the plate H, above XII. at noon riſes or falls with the tide.

As the ſun, S, goes round the dial-plate in twenty-four hours, and the moon, M, in twenty-four hours fifty minutes and a half, it is plain that the moon makes only twenty-eight revolutions and a half, whilſt the ſun makes twenty-nine and a half: ſo that it will be twenty-nine days and a half from conjunction to conjunction. And thus the wire *a* ſhifts over one day of the moon's age on the ſun-plate in twenty-four hours.

The phaſes of the moon for every day of her age may be ſeen through a round hole *m* in the moon-plate: thus, at conjunction or new-moon the whole ſpace ſeen through *m* is black; at oppoſition or full-moon, this ſpace is white: at either quadrature half black and half white; and at every poſition, the white part reſembles the viſible part of the moon for every day of her age. The black-ſhaded ſpace *N f F i*, (*fig.* 13.) on the ſun-plate ſerves for theſe appearances. N repreſents the new-moon, F the full-moon, and *f* her firſt quarter, and *i* her laſt quarter, &c.

The wheel-work and tide-work of this *clock* are repreſented in *fig.* 14. A and B are two wheels of equal diameters: A has fifty-ſeven teeth, with an hollow axis that paſſes through the dial of the *clock*, and carries the ſun-plate with the ſun S. B has fifty-nine teeth, with a ſolid ſpindle for its axis, which turns within the hollow axis of A, and carries the moon-plate with the moon M: both wheels are turned round by a pinion C of nineteen leaves, and this pinion is turned round by the common *clock* work in eight hours; and as nineteen is the third part of fifty-ſeven, the wheel A will go round in twenty-four hours; and the wheel B in twenty-four hours fifty minutes and a half: fifty-ſeven being to twenty-four as fifty-nine to twenty-four hours fifty minutes and a half very nearly. On the back of the wheel B is fixed an elliptical ring D, which, in its revolution, raiſes and lets down a lever EF, whoſe centre of motion is ou a pin at F; and this, by the upright bar G, raiſes and lets down the tide-plate H, twice in the time of the moon's revolving from the meridian to the meridian again: this plate moves between four rollers R, R, R, R.

A *clock* of this kind was adapted by Mr. Ferguſon to the movement of an old watch: the great wheel of a watch goes round in four hours; on the axis of this he fixed a wheel of twenty teeth, to turn a wheel of forty teeth on the axis of the pinion C; by which means that pinion was turned round in eight hours, the wheel A in twenty-four, and the wheel B in twenty-four hours fifty minutes and a half.

See alſo a deſcription and drawing of an *aſtronomical* CLOCK, ſhewing the apparent daily motions of the ſun, moon, and ſtars, with the times of their riſing, ſouthing and ſetting, the places of the ſun and moon in the ecliptic, and the age and phaſes of the moon for every day of the year, in Ferguſon's Select Exercites, p. 19.

To this article of *clock*-work we ſhall ſubjoin a brief account of two curious contrivances; the one for giving motion to the parts of a *clock* by making it to deſcend along an inclined plane, is the invention of Mr. Maurice Wheeler; and the *clock* itſelf may be ſeen in Don Saltero's coffee-houſe at Cheſſea. D E (*ſee Tab. Horology, fig.* 5.) is the inclined plane on which the *clock* A B C deſcends: this conſiſts externally of a hoop about an inch broad, and two ſides or plates ſtanding out beyond the hoop about one-eighth of an inch all round, with indented edges, that the *clock* may not ſlide, but turn round whilſt it moves down. One of theſe plates is inſcribed with the twenty-four hours, which paſs ſucceſſively under the index L P, *fig.* 6, which is always in a poſition perpendicular to the horizon, and ſhews the hour on the top of the machine: for this reaſon the lower part of the index, or H L is heavieſt, that it may preponderate the other H P, and always keep perpendulous, with its point to the vertical hour, as the movement goes on. Inſtead of this index, [illegible] fixed for ornament on the axis *f*, which, [illegible] ed finger, performs the office of an index, and deſcribe the internal part or mechaniſm of the [illegible] L E T Q be the external circumference of the [illegible] *f*, *f*, the frame-plate, on which is placed [illegible] wheel-work, 1, 2, 3, 4, which is much the [illegible] as in other *clocks*, and is governed by a balance and regulator, as in them. But there is no need of a ſpring and fuſee in this *clock*; their effects being otherwiſe anſwered, as we ſhall ſee. In this machine the great wheel 1 is placed in the centre, or upon the axis of the movement, and the other wheels and parts towards one ſide, which would therefore prove a bias to the body of the *clock*, and cauſe it to move, even on an horizontal plane, for ſome ſhort diſtance; this makes it neceſſary to fix a thin plate of lead at C, on the oppoſite part of the hoop, to reſtore the equilibrium of the movement. This being done, the machine will abide at reſt in any poſition on the horizontal plane H H; but if that plane be changed into the inclined plane D E, it will touch it in the point D; but it cannot reſt there, becauſe the centre of gravity at M acting in the direction M I, and the point I having nothing to ſupport it, muſt continually deſcend, and carry the body down the plane. But now if any weight P be fixed on the other ſide of the machine, ſuch as ſhall remove the centre of gravity from M to the point V in the line L D which paſſes through the point D, it will then reſt upon the inclined plane, as in the caſe of the *rolling* CYLINDER. If this weight P be ſuppoſed not fixed, but ſuſpended at the end of an arm, or vectis, which arm or lever is at the ſame time faſtened to a central wheel 1, moving on the axis M of the machine, which wheel by its teeth ſhall communicate with the train of wheels, &c. on the other ſide, and the power of the weight be juſt equal to the friction or reſiſtance of the train, it will remain motionleſs as it did before when it was fixed. And, conſequently, the *clock* alſo will be at reſt on the inclined plane. But, ſuppoſing the power of the weight P to be ſuperior to the reſiſtance of the train, it will then put it into motion, and of courſe the *clock* likewiſe; which will then commence a motion down the plane: while the weight P, its vectis P M, and the wheel 1, all conſtantly retain the ſame poſition which they have at firſt, when the *clock* begins to move. Hence it is eaſy to underſtand, that the weight P may have ſuch an intrinſic gravity, as ſhall cauſe it to act upon the train with any required force, ſo as to produce a motion in the machine of any required velocity; ſuch, for inſtance, as ſhall carry it once round in twenty-four hours: then, if the diameters of the plates A B C be four inches, it will deſcribe the length of their circumference, viz. 12.56 inches in one natural day; and, therefore, if the plane be of a ſufficient breadth, ſuch a *clock* may go ſeveral days, and would furniſh a perpetual motion, if the plane were infinitely extended.

Let S D be drawn through M perpendicular to the inclined plane in the point D; alſo let L D be perpendicular to the horizontal line H H, paſſing through D; then is the angle H D E = L D S = D M I; whence it follows that the greater the angle of the plane's elevation is, the greater will be the arch D T, and, conſequently, the farther will the common centre of gravity be removed from M; therefore the power of P will be augmented, and of courſe the motion of the whole machine accelerated. Thus it appears, that by duly adjuſting the intrinſic weight of P, at firſt to produce a motion ſhewing the mean time as near as poſſible, the time may be afterwards corrected, or the *clock* made to go faſter or ſlower by raiſing or depreſſing the plane, by means of the ſcrew at S. The angle to which the plane is firſt raiſed is about ten degrees. The marquis of Worceſter is alſo ſaid to have contrived a watch that moved on a declivity. See farther Phil. Tranſ. abr. vol. i. p. 468, &c. or N° 161.

The other contrivance is that of M. de Gennes for making a *clock* aſcend on an inclined plane. To this end let A B D (*fig.* 7.) be the machine on the inclined plane E D E, and let it be kept at reſt upon it, or in equilibrio by the weight P at the end of the lever P M. The circular area C F is one end of a ſpring barrel in the middle of the movement, in which is included a ſpring as in a common watch. To this end of the barrel the arm or lever P M is fixed upon the centre M; and thus, when the clock is wound up, the ſpring moves the barrel, and therefore the lever and weight P in the ſituation P M. In doing this, the centre of gravity is conſtantly removed farther from the centre of the machine, and therefore,

it must determine the *clock* to move upwards, which it will continue to do as long as the spring is unbending itself; and thus the weight and its lever PM will preserve the situation they first have, and do the office of a chain and fusee. Phil. Trans. N° 140. or Abr. vol. i. p. 497. By means of the following table, clocks and watches may be so regulated as to measure true equal time.

Days.	H. M.S.

The ſtars make 366 revolutions from any point of the compaſs to the ſame point again in 365 days and one minute: and therefore, they gain a 365th of a revolution every 24 hours of mean ſolar time, near enough for regulating any clock or watch.

This acceleration is at the rate of 3 min. 55 ſec. 53 thirds, 50 fourths in 24 hours; or, in the neareſt round numbers, 3 minutes, 56 ſeconds, by which quantity of time, every ſtar comes round ſooner than it did on the day before.

Therefore, if you mark the preciſe moment ſhown by a clock or watch when any ſtar vaniſhes behind a chimney, or any other object, as ſeen through a ſmall hole in a thin plate of metal, fixed in a window-ſhutter; and do this for ſeveral nights ſucceſſively (as ſuppoſe twenty) if, at the end of that time, the ſtar vaniſhes as much ſooner than it did the firſt night, by the clock, as anſwers to the time denoted in the table for ſo many days, the clock goes true: otherwiſe not. If the difference between the clock and ſtar be leſs than the table ſhews, the clock goes too faſt; if greater, it goes too ſlow; and muſt be regulated accordingly, by letting down or raiſing up the ball of the pendulum, by little and little, by turning the ſcrew-nut under the ball, till you find it keeps true equal time.

Thus, ſuppoſing the ſtar ſhould diſappear behind a chimney, any night when it is XII. by the clock; and that, on the 20th night afterward, the ſame ſtar ſhould diſappear when the time is 41 minutes 22 ſeconds paſt X. by the clock; which being ſubtracted from 12 hours, 0 min. 0 ſec. leaves remaining 1 hour, 18 minutes, 38 ſeconds for the time the ſtar is then faſter than the *clock*: look in the table, and againſt 20, in the left hand column, you will find the acceleration of the ſtar to be 1 hour, 18 min. 38 ſec. agreeing exactly with what the difference ought to be between the *clock* and ſtar: which ſhews that the *clock* meaſures true equal time, and agrees with the mean ſolar time, as it ought to do.

To add chimes to a piece of CLOCK-*work*. See CHIMES.

CLOCK, *balance of a*. See BALANCE.

CLOCK-*makers, company of*. See COMPANY.

CLOCK-*makers compaſſes*. See COMPASSES.

CLOERE, a priſon or dungeon; it is conjectured from Britiſh original: the dungeon or inner priſon of Wallingford caſtle, temp. H. II. was called *Cloero-brien*, i. e. *carcer Britonis*, &c.

CLOG. See RUNIC *ſtaffs*.

CLOISTER, CLAUSTRUM, an habitation ſurrounded with walls, and inhabited by canons, or religious.

In a more general ſenſe *Cloiſter* is uſed for a monaſtery of religious of either ſex.

In a more reſtrained ſenſe *cloiſter* is uſed for the principal part of a regular monaſtery, conſiſting of a ſquare built around; ordinarily, between the church, the chapter-houſe, and refectory; and over which is the dormitory. See DORMITORY, &c.

The *cloiſters* ſerved for ſeveral purpoſes in the ancient monaſteries. Petrus Bleſenſis obſerves, that it was here the monks held their lectures; the lecture of morality at the north-ſide, next the church; the ſchool on the weſt, and the chapter on the eaſt; ſpiritual meditation, &c. being referred for the church.

Du-Cange concludes, that all theſe different exerciſes were performed in the cloiſter itſelf; but by miſtake. The church, the chapter-houſe, and the ſchool, were not parts of the *cloiſter*, but buildings adjoining to it.

Lanfranc obſerves, that the proper uſe of the *cloiſter* was for the monks to meet in, and converſe together, at certain hours of the day.

The form of the *cloiſter* was ſquare; and it had its name *clauſtrum* from *claudo, I ſhut or cloſe*, as being incloſed on its four ſides with buildings.

Hence, in architecture, a building is ſaid to be in form of a *cloiſter*, when there are buildings in each of the four ſides of the court.

CLOISTERED *monks*. See MONK.

CLONARIUM, in *Botany*, that ſmall pedicle which ſupports every ſeparate flower, or fruit in a cluſter, as every grape in a bunch, every berry in a corymbus of ivy, &c.

CLOSE, in *Heraldry*. When any bird, addicted to flight, is drawn in a coat of arms, in a ſtanding poſture; with its wings cloſe down about it, and not either flying or diſplayed, they blazon it by the word *cloſe*.

In which ſenſe *cloſe* ſtands oppoſed to VOLANT.

Cloſe is not applied to the peacock, dunghill-cock, &c. becauſe that is their ordinary poſture.

The term *cloſe* is likewiſe uſed for the barnacles, or bits of a bridle, when not extended, as they are uſually borne.

It is alſo applied to the bearing a helmet, with the vizor down: a barnacle *cloſe*, helmet *cloſe*, &c.

CLOSE, in *Muſic*. See CADENCE.

CLOSE, *breath of*, in *Law*, a ſpecies of treſpaſs, denoting every unwarrantable entry on another's ſoil, which the law ſuppoſes to be *incloſed*, either by a viſible fence, or an inviſible boundary.

CLOSE *rolls*, and CLOSE *writs*, in *Law*, charters, or letters of the king, containing grants of lands, &c. ſealed with his great ſeal, and directed to particular perſons, and the particular purpoſes, not being proper for the public inſpection, are *cloſed* up and ſealed on the outſide, and are therefore called *writs cloſe, litteræ cloſuræ*, and they are recorded in the *cloſe rolls*. See LETTERS, and PATENT.

CLOSE *field*. See FIELD.

CLOSE *fights*, aboard a ſhip, are bulk-heads put up fore and aft in the ſhip, for the men to ſtand behind in a cloſe engagement, and fire on the enemy; or, if the ſhips be boarded, to ſcour the decks.

CLOSE *fire*. See FIRE, and REVERBERATION.

CLOSE-*hauled*, in *Sea-Language*, denotes the arrangement or trim of a *ſhip's* ſails when the endeavours to proceed in the neareſt direction poſſible to that point of the compaſs from which the wind blows. The keel of larger ſhips makes an angle of about ſix points with the line of the wind; but ſloops and ſmaller veſſels fail almoſt a point nearer. All veſſels, when *cloſe-hauled*, make nearly a point of lee-way, and this angle increaſes with the increaſe of wind and ſea. The ſails, in this diſpoſition of them, are all extended ſideways on the ſhip; and the term *cloſe-hauled* is then applied to it, becauſe her tacks are drawn cloſe down to her windward ſide, the ſheets hauled cloſe aft, and all the bow-lines are drawn to their utmoſt extenſion, in order to keep the ſails ſteady.

CLOSE *quarters*, in *Sea-Language*, denote ſtrong beams of wood extended along a merchant-ſhip in ſeveral places: as they are a place of retreat, when the ſhip is boarded by an adverſary, they are fitted with ſmall loop-holes, through which the ſhip's crew may fire ſmall arms to defend themſelves and annoy the enemy. They are likewiſe furniſhed with powder-cheſts, filled with powder, old nails, &c. which may be fired upon the boarders.

CLOSE *pound*. See POUND.

CLOSET, in *Heraldry*, ſignifies the half of a BAR.

CLOSET, *clerk of the*. See CLERK.

CLOSH, in our *Old Cuſtoms*, an unlawful game, forbidden by ſtat. 14 Edw. IV. c. 3. & 33 Hen. VIII. c. 9. It is ſaid to have been the ſame with our *nine-pins*, and is called *cloſh-cayls*, by the 33d Hen. VIII.

CLOT-*bird*, in *Ornithology*, a name by which the common OENANTHE is called in many parts of England.

CLOTH, in *Commerce*, in its general ſenſe, includes all kinds of ſtuffs woven or manufactured on the loom, whether their threads be of wool, hemp, or flax.

CLOTH is more peculiarly applied to a web, or tiſſue of woollen threads, interwoven; whereof ſome called the *warp*, are extended lengthwiſe, from one end of the piece to the other; the reſt, called the *woof*, are diſpoſed acroſs the firſt, or breadthwiſe of the piece.

Cloths are woven on the looms as well as linens, druggets, ſerges, camblets, &c. They are of various qualities, fine, coarſe, ſtrong, &c. ſome are made of wool, and this of different colours; the wool being dyed and dreſſed, is firſt ſpun, then wove: others are wrought white, deſtined to be dyed in ſcarlet, black, blue, green, yellow, &c. Their breadths and lengths are various, according to the places where they are manufactured.

The goodneſs of CLOTH conſiſts, 1. In the wool's being fine, and being well dreſſed. 2. In its being ſpun equably: always obſerving, however, that the thread of the warp be finer, and better twiſted, than that of the woof. 3. In the *cloth's* being well wrought and beaten on the loom, ſo as to be every where equally cloſe and compact. 4. In the wool's not being finer and better at one end of the piece than in the reſt. 5. In the liſts being ſufficiently ſtrong, and of the ſame length with the ſtuff; and that they conſiſt of good matter, as wool, hair, or oſtrich feathers, or the hair of Daniſh dogs; which

which laſt is the beſt. 6. In the *cloth*, being well cleared of the knots, and other imperfections. 7. In its being well ſcoured with good fullers-earth, then fulled with the beſt white ſoap, and waſhed out in clear water. See FULLING. 8. In the hair or knap's being well drawn out with the TEAZLE, or thiſtle, on the pole, without being too much opened. 9. In its being ſhorn cloſe, yet without laying the ground or thread bare. See SHEARING. 10. In its being well dyed. 11. In its not being ſtretched, or pulled farther than is neceſſary to ſet it ſquare, and bring it to its juſt length and breadth. See TENTER. 12. In its only being preſſed cold; hot-preſſing being hurtful to *cloth*.

Manufacturing of white CLOTHS *for dying*. The beſt wools for the purpoſe are thoſe of England and Spain; eſpecially thoſe of Lincolnſhire, and Segovia.

To uſe them to the beſt advantage; when taken out of the bales, they muſt be ſcoured, by putting them in a liquor ſomewhat more than lukewarm, compoſed of three parts of fair water, and one of urine. After the wool has continued long enough in the liquor to diſſolve and looſen the greaſe, it is taken out, drained, and waſhed in a running water: it is known to be well ſcoured, when it feels dry to the touch, and has no ſmell but the natural ſmell of the ſheep.

In this ſtate it is hung out to dry in the ſhade; the heat of the ſun being apt to make it harſh, and untractable.

When dry, it is beat with rods on hurdles of wood, or on ropes, to clear out the duſt and groſſer filth: the more it is thus beat and cleaned, the more ſoft it becomes, and the better it ſpins. After beating, it is well picked, to clear the reſt of the filth, that had eſcaped the rods.

It is now in a ſtate to be oiled, and carded on large iron cards, placed ſlopе. The beſt oil for the purpoſe is oil of olives; one fifth of which, at leaſt, ſhould be uſed for the wool deſtined for the woof, and a ninth for that of the warp.

It is now given out to the ſpinners; who firſt card it on the knee, with ſmall fine cards; then ſpin it on the wheel: obſerving to make the thread of the warp ſmaller, by one-third, than that of the woof, and much cloſer twiſted: in order to this, the latter muſt be ſpun with the hand, or ſtring open, and the former with it cruſſed. The thread being thus ſpun, reeled, and made into ſkeins; that deſtined for the woof is wound on ſpools, i. e. on little tubes, or pieces of paper, or ruſhes, ſo diſpoſed as that they may be eaſily put in the eye of the ſhuttle. That for the warp is wound on a kind of rockets, or large wooden bobbins, to diſpoſe it for warping.

When warped, it is ſtiffened with ſize; whereof, that made of ſhreds of parchment is the beſt; and coarſe yarn, uſed in herſeys, is ſtiffened by ſteeping it for a few hours in chalk-water; and, when dry, is given to the weavers, who mount it on the loom.

The warp being on the loom, the weavers, who are two to each loom, one on each ſide, tread at the ſame time, alternately, on the ſame treadle; i. e. now on the right leaf, and now on the left, which raiſes and lowers the threads of the warp equally; between which they throw, tranſverſe, the ſhuttle from the one to the other. And each time that the ſhuttle is thrown, and ſo a thread of the woof inſerted within the warp, they ſtrike it cloſe jointly with the ſame frame, wherein is faſtened the comb, or reed, between whoſe teeth the threads of the warp are paſſed; repeating the ſtroke as often as is neceſſary; in ſome *cloths* no leſs than twelve or thirteen times, viz. ſix with the warp open, and ſeven ſhut.

It may be obſerved, that the more the threads of the woof are ſtruck againſt each other, the cloſer the *cloth* is: and hence it becomes enabled to ſuſtain the violence of the fulling-mill, as well as of the tearing, or fulling-thiſtle, without fretting, or opening. The weavers having continued their work till the whole warp is filled with woof, the *cloth* is finiſhed: it is taken off the loom by unrolling it from the beam whereon it had been rolled in proportion as it was woven; and is now given to be cleared of the knots, ends of thread, ſtraws, and other filth; which is done with little iron nippers: and this operation is called *burling*.

In this condition it is carried to the fullery, to be ſcoured with urine, or a kind of potters clay well cleaned and ſteeped in water, put along with the *cloth* in the trough, wherein it is fulled. See FULLING.

The *cloth* being again cleared from the earth, or urine, by waſhing it in water, is returned to the former hands, to have the leſſer filth, ſmall ſtraws, and almoſt imperceptible knots, taken off as before: it is likewiſe ſtone-drawn. See STONE-*drawing*. Then it is returned to the fuller, to be beat and fulled with hot water, wherein five or ſix pounds of ſoap have been diſſolved. The ſoap moſt eſteemed is the white, eſpecially that of Genoa.

After fulling an hour and a half, it is taken out to be ſmoothed, i. e. to be pulled by the liſts lengthways, to take out the wrinkles and creaſes occaſioned by the fall of the mallets, or peſtles, falling on the *cloth*, when in the troughs: which is often done by racking or tenting the *cloth*. See TENTER.

The ſmoothing is repeated every two hours, till the fulling be finiſhed, and the *cloth* brought to its proper breadth: after which, it is waſhed in clear water, to purge it of the ſoap, and given, all wet, to the carders, to raiſe the hair, or knap, on the right ſide, with the thiſtle, or teaſel; wherewith they give it two rubs, or courſes; the firſt againſt the grain, the ſecond with the grain: which operation is called ROUGHING it.

The *cloth* being dried after this operation, the cloth-worker takes it, and gives it its firſt cut, or SHEARING. This done, the carders reſume it, and after wetting it, give as many more rubs, or courſes, with the teaſle, as the quality of the ſtuff requires: always obſerving to begin againſt the hair, and to end with it; and to begin with a ſmoother thiſtle, proceeding ſtill to a ſharper and ſharper, as far as the ſixth degree.

After this, the *cloth* being dried, is returned to the cloth-worker, who ſheers it a ſecond time, and returns it to the carder; who wetting it again, gives it as many courſes as he thinks fit, dries it, and gives it back again to the cloth-worker; who after ſheering it the third and laſt time, returns it to the carders, who repeat their operation as before, till the hair, or knap, be well raiſed on the ſurface of the *cloth*, from one end of the piece to the other.

It muſt be obſerved, that it is indiſpenſably neceſſary the *cloth* be wet, while in the carders hands; in order to which, it is ſprinkled from time to time with water.

The knap being finiſhed, and the *cloth* dried, the cloth-worker gives it as many cuts as he thinks requiſite for the perfection of the ſtuff. It muſt alſo be obſerved, that all the ſheerings muſt be on the right ſide, except the two laſt, which muſt be on the other; and that the *cloth* cannot be too dry for ſheering.

The *cloth* thus woven, ſcoured, knapped, and ſhorn, and ſometimes *watered*, or FRIZED, is ſent to the dyer. When dyed, it is waſhed in fair water, and the cloth-worker takes it again, wet as it is, lays the hair, or knap, with a bruſh on the table, and hangs it on the tenters; where it is ſtretched both in length and breadth, enough to ſmooth it, ſet it ſquare, and bring it to its proper dimenſions, without draining it too much; obſerving to bruſh it afreſh, the way of the hair, while yet a little moiſt on the tenter.

When quite dry, the *cloth* is taken off from the tenter, and bruſhed again on the table, to finiſh the laying of the knap: it is then folded, and laid cold under a preſs, to make it perfectly ſmooth and even, and to give it a little gloſs.

The gloſs is given by laying a leaf of vellum, or cap-paper, to each plait of the piece; and over the whole a ſquare plank of wood: on which, by means of a lever, the ſcrew of a preſs is brought down, with the degree of force judged neceſſary, with regard to the quality of the *cloth*. In France, none but ſcarlets, greens, blues, &c. receive this laſt preparation; blacks being judged better without it.

Laſtly, the *cloth* being taken out of the preſs, and the papers removed, it is in a condition for ſale, or uſe. See the whole proceſs of manufacturing ſheep's wool into *cloth*, deſcribed by ſir W. Petty, in Birch's Hiſt. of the Royal Society, vol. i. p. 555, &c.

For the manufacture of mixt CLOTHS, or thoſe wherein the wools are firſt dyed, then mixed, ſpun, and woven of the colours intended; the proceſs, except in what relates to the colour, is moſtly the ſame with that juſt ſpoken of.

The method of adjuſting the mixture, is by firſt making a felt, or lock, of the colours of the intended *cloth*, as a ſpecimen: the wool of each colour is weighed, and when the ſpecimen is to the manufacturer's mind, he mixes, for uſe, a quantity in the ſame proportion: eſtimating each grain of the ſpecimen at twenty pounds weight of the ſame wool in the *cloth* to be made.

Thus, if he would mix three colours, viz. coffee-colour, feuille-morte, and pale-blue, the firſt to be the prevailing colour, he weighs a quantity of each; for inſtance, 70 grains of the firſt, 35 of the ſecond, and 20 of the third: then multiplies each by 20 pounds of wool; and thus takes 1400 pounds for the coffee wool; 700 pounds for the feuille-mort, and 400 for the pale-blue.

The wools of the ſpecimen, thus weighed, are mixed, oiled, carded, moiſtened with clear water, rubbed with black ſoap, and in this ſtate wrought a long time in the hands; till they be reduced into a piece of felt like that uſed by hatters.

It is then rinsed in water, to purge out the oil and soap, and when dry, the hair, or knap, is carded out with the teazle; then shorn carefully, till the ground appear, and the several colours be discoverable.

Lastly, wetting it a little, and pressing it, he examines it well; and if he be not contented with it, makes another felt; if he be, he proceeds to mix his wools: when mixed, it is beat on hurdles, cleaned, oiled, carded, spun, woven, &c. as in white *cloth*.

For the laws relating to the woollen manufactory, see stat. 3 and 4 Edw. III. cap. 2. 3 and 4 Edw. IV. cap. 6. 17 Edw. IV. *cap.* 1. 5 and 6 Edw. VI. cap. 6. 4 and 5 Ph. and M. cap. 5. 39 Eliz. cap. 20. 1 Jac. I. cap. 8. 7 Jac. I. cap. 7. 21 Jac. I. cap. 18. 12 Car. II. cap. 22. 1 Anne. 7 Anne, cap. 13. 10 Anne. cap. 16. 1 Geo. I. cap. 15. 11 Geo. I. 12 Geo. I. 13 Geo. I. 11 Geo. II. 14 Geo. II.

CLOTH, *Sear*. See SEAR-*Cloth*.

CLOUD, in *Physiology*, a collection of condensed VAPOUR, suspended in the atmosphere.

A *cloud* is a congeries of watery particles, or vesiculæ raised from the waters, or watery parts of the earth, by the solar, or subterraneous, or electrical *fire*; which at their first rise from our globe, are too minute, and too much separated by their mutual repulsion, to be perceived; but as they mount, meeting with a greater degree of cold, losing their electricity, or by any other process which nature employs for this purpose, are condensed and rendered opaque, by the reunion of their parts; so as to reflect light, and become visible. For the manner wherein vapours are raised into *clouds*, see EVAPORATION.

These vapours, however raised, being specifically lighter than air, mount in it, till having reached such a region of the atmosphere as is of the same specific gravity with themselves, they will be suspended, till the watery vesicles, which were at first too thin to be perceived, being now condensed by the cold of the superior regions; and consequently the parts set closer together; their density is first augmented so as to render them opaque enough to reflect the sun's light, and become visible; and their specific gravity increased, so as to make them descend: in the former state they are called *clouds*; and in the latter, when they arrive at us, *rain*.

Clouds, beside their use when they descend in showers, are of service, while suspended in the atmosphere; as they help to mitigate the excessive heat of the torrid zone, and screen it from the beams of the sun, especially when in his zenith.

From the observable motions of the *clouds* it appears, that there are different currents in the air at the same time, and in the same quarter, under one another. Phil. Trans. N° 454. p. 537.

For the colour of the *clouds*, see COLOURS. For the electricity of the *clouds*, see ATMOSPHERE, CONDUCTORS, ELECTRICITY, EVAPORATION, &c.

CLOUDS, *Magellanic*. See MAGELLANIC *Clouds*.

CLOUDBERRY. See CHAMÆMORUS.

CLOVE-*Tree*, CARYOPHYLLUS, in *Botany*, a genus of the *polyandria monogynia* class. Its characters are these: it hath a double empalement; the flower is of one leaf, cut into four obtuse parts, upon which the germen is situated: the fruit hath another empalement, which is small, and slightly divided into four parts, which are permanent. The flower hath four blunt petals, and hath many stamina. The germen is situated under the flower, which afterwards becomes a soft berry with two cells, each containing a kidney-shaped seed. There are five species.

The fruit is somewhat in form of a nail; whence the term *clove*, from the French *clou*, *nail*.

The *clove-tree* was anciently very common in the Moluccо islands; where all the European nations, who traffic in spices to the *Indies*, furnished themselves with what quantity of *cloves* they required. At present there are scarce any found but in the island of Ternate: the Dutch, in order to render themselves masters of that merchandize, having dug up the *clove-trees* of the Moluccos, and transplanted them to Ternate; so that there are none now to be had but through their hands.

The tree is very large, its bark resembles that of the olive-tree, and its leaves those of the laurel: its fruit falling, takes root, and thus it multiplies itself without any culture. It is said, it will not allow any other herb, or tree, to grow near it; its excessive heat drawing to it all the humidity of the soil.

When the *cloves* first begins to appear, it is of a greenish-white colour; as it ripens, it grows brown. Nor is there any preparation necessary in order to render it such as it comes to us, but to dry it in the sun; whatever some authors talk of first steeping it in sea-water, to preserve it from worms.

In the inside of a *clove* are found a style and stamina, with their apices; and towards the larger end, there shoot out from the four angles, four little points like a flat; in the middle of which is a round ball, of a lighter colour than the rest, composed of four small scales or leaves, which seem to be the unexpanded petals of the flower. *Cloves* must be chosen dry, brittle, harsh to the touch, well grown, of a dusky-reddish colour, a rough aromatic taste, an agreeable smell, and, if possible, with the stalk on. This spice acquires weight by imbibing water, which it will do at some considerable distance. The Dutch, who trade in *cloves*, make a considerable advantage by knowing this secret. They sell them always by weight; and when a bag of *cloves* is ordered, they hang it several hours before they send it in, at about two feet distance over a vessel of water. They carefully watch the time when the *cloves* have imbibed the proper quantity, that the fraud may pass undiscovered. This will add many pounds to the weight, which the unwary purchaser pays for on the spot. This is often practised in the spice islands and sometimes in Europe: but the degree of moisture must be more carefully watched in the former place; for there a bag of *cloves* will in one night's time attract so much water, that it may be pressed out of them by squeezing them with the hand.

Cloves are the hottest and most acrid of aromatic substances, and their properties are, to warm and dry, to correct a foetid breath, to sharpen the sight, dissipate films in the eyes, fortify the stomach and liver, and stop vomiting. They are used in apoplexies, palsies, lethargies, and other diseases of the brain.

Such of the fruit as escape the gatherers grow and swell on the tree, and become full of a gum; these are sometimes used in medicine, and are called *mother of cloves*.

There is also an oil drawn from *cloves* by distillation, moderately pungent; which, when new, is of a pale-yellow colour, but reddens as it grows old: it is used in medicine as a sovereign remedy for the tooth-ach, and in compositions with the same view as the fruit. It is also much used among the perfumers.

No plant, nor any part of any plant contains so large a proportion of essential oil as *cloves*; and this oil is heavier than water. From sixteen ounces of *cloves* Neumann obtained, by distillation, two ounces and two drams; and Hoffman obtained from the same quantity an ounce and a half. The pungency of *cloves* is owing to a combination of resin with essential oil.

The oil of *cloves* met with in the shops, and obtained from the Dutch, is highly acrimonious; but this is not the genuine distilled oil of *cloves*. It probably derives its acrimony and high colour from a mixture of the resinous part of the *clove*. Dr. Lewis, in his Mat. Med. observes, that the common oil, as being the most pungent, is best adapted for external purposes, and the genuine oil for those of an internal aromatic.

The natives call the *clove-tree* *chawpoo*, the Persians and Arabs *karunfel*, and the Turks *kaniefour*. They make several preparations both of the flowers, and the fruit.

CLOVE-CINNAMON. See CINNAMON.

CLOVE-WATER, is prepared of brandy, and cloves bruised therein and distilled.

CLOVE, in *Commerce*, is used for the two-and-thirtieth part of a weigh of cheese, i. e. eight pounds. 9 Hen. VI. cap. 8. See WEIGH.

CLOVE-*gilly-flowers*, a species of caryophyllus, greatly recommended as cordials, and given in disorders of the head, palpitations of the heart, and in nervous complaints of all kinds. See PINK.

CLOVE-*tongue*, a name used by some English writers, for the common black hellebore, the root of which is used in medicine.

CLOVER *grass*. See TREFOIL.

CLOUGH, or *draught*, in *Commerce*, an allowance of two pounds in every hundred weight for the turn of the scale; that the commodity may hold out weight when sold out by retail.

CLOUT-NAILS. See NAIL.

CLOUTS, in *Gunnery*, are thin plates of iron nailed on that part of the axle-tree of a gun-carriage, which comes through the nave, and through which the linspin goes.

CLOWN'S *wound wort*, in *Botany*. See IRON-*wort*.

CLOYED. The seamen, when any thing is put into the touch-hole of a great gun, so that they cannot with a priming-iron make way for the powder to be put in to

prime it, fay *the touch-hole is clayed*: wherefore when guns are nailed, &c. they fay they are *clayed*.

CLUB-*antenna*, in *Natural Hiſtory*, a name given by naturaliſts to ſuch of the horns or *antennæ* of butterflies as repreſent a *club*, being larger at the extremities than at the origin.

CLUNY, or CLUGNI, a celebrated abbey of Benedictine monks, in a city of that name in France; being the head, or chief of a congregation denominated from them. It is ſituated in the Maſſonnois, in the province of Burgundy, on the river Rhone; and was founded by William duke of Berry and Aquitain; or, as others ſay, by the abbot Berno, ſupported by that duke, in the year 910: but owed its diſtinguiſhed reputation to Odo, who was created abbot of *Cluny* in 927.

This order of monks was brought into England, by William earl of Warren, ſon-in-law to William the Conqueror who built a houſe for them at Lewes, in Suſſex, about the year 1077. There were twenty-ſeven priories and cells of this order in England, which were governed by foreigners, afterwards made denizens.

CLUE *of a ſail*, &c. See CLEW.

CLUPEA, in the *Artificial Syſtem*, the name of a fiſh, the characters of which are theſe: it is one of the order of the *malacopterygii*, or ſoft-finned kind; and in the Linnæan ſyſtem, of the *abdominales*, under which are claſſed eleven different ſpecies. The branchioſtege membrane contains on each ſide eight bones. The belly is very acute, or, as it were, ſerrated, from the ſingular ſituation of the ſcales; and the back-fin is placed ſomewhat nearer to the ſnout than to the tail.

There are four ſpecies of this genus, enumerated by Artedi; of which the firſt is our common *herring*; the ſecond, the *ſprat*; the third, the *ſhad*; and the fourth, the *anchovy*. See *Tab.* IV. of *Fiſhes*, N° 39.

CLUSIA, in *Botany*, the *baſtard-tree*, a genus of the *polygamia monœcia* claſs. Its characters are theſe: the flower hath five large roundiſh concave ſpreading petals: in the bottom is ſituated a globular nectarium, including the germen, which is pervious at the top. It hath a great number of ſingle ſtamina: the oblong oval germen is terminated by a plain ſtar-like ſtigma, with ſix obtuſe indentures, which afterward becomes an oval capſule, with ſix furrows and ſix cells, opening with ſix valves, which ſpread in form of a ſtar, including many angular ſeeds fixed to a column, ſurrounded with pulp. There are two ſpecies, natives of the ſouthern parts of America.

CLUSTER-*pulſe*. See POLYPE.

CLUTIA, in *Botany*, a genus of the *dioecia pentandria* claſs, and deriving its name from *Clute*, a curious botaniſt. Its characters are theſe: it is male and female in different plants: the male flowers have five heart-ſhaped petals, which are ſhorter than the empalement, and ſpread open; they have five exterior nectariums, which are ſituated in a circle at the bottom of the petals, and five interior, which are ſituated within the other; they have five ſtamina ſituated in the middle of the ſtyle: the female flowers have petals like thoſe of the male; theſe have five double exterior nectariums, but no interior: they have a roundiſh germen which afterward becomes a globular capſule, with ſix furrows and three cells, each containing a ſingle ſeed. There are four ſpecies.

CLYDON, from κλυδω, *I cauſe to fluctuate*, in *Medical Writers*, is uſed for the fluctuation of food taken into the ſtomach, ariſing from the laxity or weakneſs of its fibres; and of the abdominal muſcles.

CLYMENUM, in *Botany*, the name of a genus of plants, the characters of which are in all reſpects the ſame with thoſe of the ſaltwyas; only in this plant there grow but two leaves on each rib, whereas on the *cynocrambe* there are ſeveral pairs: the rib finally terminating in a clavicle or tendril. Tournefort enumerates three ſpecies. Inſt. p. 396.

CLYPEOLA, in *Botany*, *treacle-muſtard*; a genus of the *tetradynamia ſiliculoſa* claſs. Its characters are theſe: the flower hath four oblong entire petals, placed in form of a croſs, and ſix ſtamina, two of which ſtanding oppoſite, are ſhorter than the other; in the centre is ſituated a roundiſh compreſſed germen, which afterwards becomes an orbicular pod, compreſſed, erect, and indented at the top, with the longitudinal ſiſſure, opening in two cells, containing round compreſſed ſeeds. There are four ſpecies, natives of the ſouthern parts of Europe.

CLYPEUS, or CLYPEUM, *Buckler*; a piece of defenſive armour, which the ancients uſed to carry upon the arm, to ſecure them from the blows of their enemies.

The figure of it was either round, oval, or ſexangular; in the middle was a boſs of iron, or of ſome other metal, with a ſharp point. See SHIELD.

CLYSSUS, a chemical production, conſiſting of the moſt efficacious principles of any body, extracted, purified and then remixed.

A *cloſſus* is when the ſeveral ſpecies, or ingredients of a body are prepared and purified ſeparately, and then combined again. Thus, ſalt, ſulphur, oil, ſpirit, and mercury, reaſſembled into one body, by long digeſtion, &c. make a *cloſſus*.

CLYSSUS *of Antimony*, denotes the vapours reſulting from the detonation of nitre with *antimony*.

CLYSSUS *of Nitre*, ſignifies the vapours ariſing from the detonation of *nitre* with charcoal.

CLYSSUS *of Sulphur*, denotes an acid liquor obtained by the detonation of *ſulphur* with nitre, and is ſimilar to that of antimony. Particular virtues were formerly aſcribed to theſe liquors, of which they are now found to be deſtitute.

The rapidity and violence with which NITRE detonates, in certain circumſtances, may occaſion a violent exploſion, and the rupture of the veſſels. To prevent ſuch accidents, and the diſagreeable conſequences of them, the inflammable matter ſhould not be very intimately mixed with the nitre, the DETONATION of which is proportionably ſtronger and quicker as the mixture is more exact and entire; a ſmall quantity only of the mixture ſhould be detonated at a time, and no addition ſhould be made till the detonation of the firſt ſmall quantity be altogether finiſhed.

There is alſo a *cloſſus* of vitriol, which is a ſpirit drawn by diſtillation from vitriol diſſolved in vinegar. This is uſed by phyſicians in various diſeaſes, and to extract the tinctures of ſeveral vegetables.

CLYSSUS is alſo uſed among ſome authors for a kind of *ſapa*, or extract, made with eight parts of the juice of a plant, and one of ſugar, ſeethed together into the conſiſtence of honey.

CLYSTER, in *Medicine*, a liquid remedy, or injection, introduced into the inteſtines by the fundament; in order to refreſh them, looſen the belly, moiſten and ſoften the feces, diſſipate wind, &c.

The word comes from κλυζω, *lavo, abluo, I waſh*. *Cloſters* are ſometimes made of bran-water and milk, but more uſually of decoctions of certain herbs; to which are added honey, brown ſugar, and ſometimes lenitive electary; and other drugs. *Cloſters* are emollient, carminative, lenitive, aſtringent, laxative, anodyne, uterine, antiſeptic, nouriſhing, &c.

In Holland, England, and Germany, *cloſters* are given by means of a pipe of ivory faſtened to a bladder, the patient being made to lie on one ſide, and to retain the liquor as long as he is able. The French, and ſome other nations, uſe a ſort of ſyringe, holding a pint, or more for this purpoſe; and this is evidently the better method, as, by this means, liquors are not only more quickly, but more forcibly thrown into the inteſtines, and are made to paſs further than by the Engliſh method. Some alſo uſe a leather pipe of half an ell long, which is faſtened to the ſyringe, and to the pipe introduced into the anus, and by this means the patient can give himſelf the *cloſter*.

Great care muſt be taken in adminiſtering *cloſters*, that the liquor be neither too hot nor too cold, but only tepid, or moderately warm, both extremes being capable of doing great injury to the boweſs.

Cloſters are properly uſed, 1. Where a coſtive ſtate is to be removed, and the body rendered ſoluble. 2. For alleviating the pains ariſing from the colic, ſtone, dyſentery, violent hæmorrhoids, and other diſorders of the abdomen. 3. For making revulſions from the head in apoplexies, lethargies, deliriums, and other diſorders of that part. 4. In difficult labours, whether the fœtus be dead or alive, eſpecially if the mother be coſtive, as alſo for expelling the ſecundines, when they adhere too firmly to the womb, or remain longer behind than they ought. 5. *Cloſters* are able to nouriſh perſons, who, from their power of deglutition being impaired, muſt otherwiſe periſh of hunger; and for this purpoſe nouriſhing liquors muſt be uſed, ſuch as broths, and the like, to which a little wine may be added, if the nature of the caſe will allow it.

A very remarkable *cloſter*, which ſeems to have been invented by the Engliſh, and, from us, propagated to other nations, is the ſmoak of tobacco. When all other *cloſters* have proved ineffectual for rendering the body ſoluble, in the iliac paſſion, and ſome other caſes, the end has ſometimes been obtained by injecting a large quantity of the ſmoak of tobacco, by means of a proper inſtrument. There are ſeveral kinds of inſtruments invented for this purpoſe, and deſcribed by Bartholine, Valentini, and others. The general method of making them is this: a box is provided capable of holding about half an ounce of tobacco; this has two pipes, the one made of ivory, to be introduced into the anus, the other reſembles the mouth-piece of ſome muſical inſtruments, and, by means of blowing into this, the ſmoak of the lighted tobacco in the box is driven forcibly up the anus: this is to be continued till the patient find a ſtrong ſtimulus to go to ſtool, and if once doing it does not produce

duce the effect, it is to be repeated till it succeeds. This is of prodigious service in obstinate incarcerated hernias of the scrotum. And Heister observes, that he always found it succeed so well, as never to reduce him to a necessity of having recourse to the knife. When tobacco alone will not answer the purpose, other more stimulating ingredients may be added to it in the box; and this acrid smoke so contracts the diameters of the intestines, that the prolapsed ones are much more easily drawn back into the abdomen, than they otherwise could be. See FUMIGATOR.

Clysters of the liquid kind are prepared of different ingredients, according to the intentions proposed to be answered, and as, in practice, those intentions are principally four, to alter and change, to evacuate, to corroborate, and to mitigate pain; so *clysters* are accordingly contrived to soften the indurated faeces, to correct the acrid, acid, and saline recrements, to evacuate the contents of the large intestines, and to corroborate the weak and languid fibres of the intestines in general, and so strengthen their peristaltic motion; or lastly, to mitigate the spasms of their contracted coats, and relax their constricted fibres.

When *clysters* are intended to lubricate and soften the dry and indurated faeces, or to obtund acrid, saline, corrosive, and acrid humours, in the large intestines, they are to be prepared with the emollient ingredients, such as broths, milk, decoctions of emollient herbs, as marshmallows, and the like, with manna, oil, and the like assistances; and, as all these ingredients have a power of relaxing spasms, as well as of softening the faeces, *clysters* of this kind are extremely beneficial in all spasmodic disorders, fevers, pains, and cases where the patient is costive, whether it be from spasms of the intestines, or from induration of the faeces.

When the intention is at once to evacuate the intestines, and to carry off stagnant humours, then salts, added to the decoctions, admirably answer the end. Glauber's salt, Epsom salt, and sal gem, are all useful for these purposes: in some cases also sal ammoniac; and experience shews, that half an ounce of one of these salts, in a *clyster*, will do more toward evacuating the contents of the bowels than four ounces of any of the common purging electaries. Corroborating *clysters* are to be prepared of the four greater hot seeds, bay and juniper-berries, the carminative oils, &c. and in violent disorders of the head, such as apoplexies, palsies, lethargies, and the like, rue, marjoram, thyme, rosemary, and lavender flowers, are conveniently added to *clysters*; as are mugwort, pennyroyal, feverfew, and the like. When there is any disorder of the womb, or suppression of the menses, the *clysters* of the sedative kind are principally to be composed of oil, or the like fatty ingredients, and such as consist purely of oil alone, are found often to do wonders, in allaying the most violent pains.

CLYSTERS, *nourishing*, are those applied with design to nourish persons who cannot take in any aliment at the mouth. Hildanus tells us, that Aubery, a physician, fed a woman of quality 6 weeks with *clysters* composed of capons flesh, and other fowls, boiled to a pulp, with yolks of eggs, applied twice a day. It is difficult, however, to conceive how *clysters* should nourish; and the case is briskly controverted in the Memoirs of the French Royal Academy, between M. Littre, who maintains the negative, and M. Lemery.

The arguments used by the first are, that the materials of the *clyster*, for want of the ordinary passage, want the preparation necessary to be converted into nourishment; and beside that, are not of the road for getting into the blood: for in the first of the large intestines, called the *cæcum*, is a valve called *valvula Bauhini*, to oppose the passage of any food into the small intestines: and there are no lacteal veins in the large intestines, but abundance in the small ones. But the lacteals are the only canals that can carry the chyle into its receptacle, and the chyle is the only substance that can nourish.

To this M. Lemery objects, that very great anatomists have found lacteals in the large intestines, though but in small numbers: but though there were none, adds he, the meseraic veins are indisputably distributed to these intestines; and may easily be supposed to pump up the most subtil part of a broth, and carry it into the blood. M. Mery has passed a liquor immediately from the large intestines into these veins: besides, the animal machine is so porous throughout, that nature seems to have intended an extraordinary way of conveying fluids into the blood, to be ready on extraordinary occasions.

This notion will appear incontestible, if M. Morin's theory of the passage of the urine be admitted.

Herodotus says, the Egyptians were the first who invented *clysters*; or rather who applied them to use. Galen and Pliny add, that they took the hint from a bird of their country, called *ibis*, which they frequently observed to make this kind of injection with its beak, and afterwards to discharge itself several times. Others say, that the *ecchis*, or stork, first taught men the application of *clysters*.

CLYSTERS, *Uterine*, are injections into the uterus, or womb.

CLYSTERS, *Catholicon for*. See CATHOLICON.

CNEMODACTYLÆUS, in *Anatomy*, a muscle, otherwise called *extensor tertii internodii digitorum*. See EXTENSOR *tertii internodii*, &c.

CNEORUM, in *Botany*, *widow-wail*; a genus of the *triandria monogynia* class. Its characters are these: the flower hath three narrow oblong petals, and three stamina which are shorter than the petals. In the centre is situated an obtuse three-cornered germen, which afterwards becomes a globular dry berry with three lobes, having three cells, each containing one round seed. We have but one species.

CNICUS, in *Botany*, *Blessed Thistle*; a genus of the *syngenesia polygamia æqualis* class. Its characters are these: the empalement of the flower is scaly; the flower is composed of several hermaphrodite florets, which are uniform; these are funnel-shaped, and cut at the top into five equal segments, having five short hairy stamina; in the centre is situated a short germen crowned with down, which afterward becomes a single seed crowned with down, and shut up in the empalement. There are four species.

The first sort is the *carduus*, which is used in medicine; this is an annual plant, which perishes soon after the seeds are ripe. It grows naturally in Spain, and in the islands of the Archipelago, but is cultivated in gardens in England to supply the market. This plant, which is the *centaurea benedicta* of Linnæus, is so well known as to require no description. See *Blessed* THISTLE.

COA, in *Natural History*, the name given by Plumier to a genus of plants, called by Linnæus HIPPOCRATEA.

COACERVATUM *vacuum*. See VACUUM.

COACH, a vehicle for commodious travelling, suspended on leathers, &c. and moved on wheels.

In England, and throughout Europe, the *coaches* are drawn by horses, except in Spain, where they use mules. In a part of the East, especially the dominions of the great mogul, their *coaches* are drawn by oxen. In Denmark they sometimes yoke rein-deer in their *coaches*; though this is rather for curiosity than use.

The *coachman* is ordinarily placed on a seat raised before the body of the *coach*. But the Spanish policy has displaced him in that country by a royal ordinance; on occasion of the duke d'Olivarez, who found that a very important secret whereon he had consulted in his *coach*, had been overheard, and revealed by his coachman: since that time, the place of the Spanish coachman is the same with that of the French flage-coachman, and our postilion, viz. on the first horse on the left.

The invention of *coaches* is owing to the French; yet they are not of any great antiquity even in France; scarce reaching earlier than the reign of Francis I.

Their use, at their first rise, was only for the country: and authors observe, as a thing very singular, that there were at first no more than two *coaches* in Paris; the one that of the queen, and the other that of Diana, natural daughter of Henry II. The first courtier who had one, was Jean de Laval de Bois Dauphin, whose enormous bulk disabled him from travelling on horseback.

Coaches were first introduced into England in 1580, by Fitz-Allen, earl of Arundel, and they were in general use by the nobility and gentry at London about the year 1605. Anderson's Hist. Com. vol. 1. p. 421. 469.

Coaches have had the fate of all other inventions to be brought by steps and degrees to their perfection; at present they seem to want nothing, either with regard to ease, or magnificence.

Louis XIV. of France made several sumptuary laws for restraining the excessive richness of *coaches*, prohibiting the use of gold, silver, &c. therein; but they have had the fate to be neglected.

Coaches may be divided into two kinds: those that have iron bows, or necks, and those that have not; both the one and the other have two principal parts, the body, and the train, or carriage. See CRANE-*neck*, and PERCH. The *body* is that part where the passengers are disposed; and the *carriage* is that which sustains the body, and to which the wheels are fastened, that give motion to the whole machine.

Coaches are distinguished, with regard to their structure, into *coaches*, properly so called, *chariots*, *calashes*, and *berlins*. With regard to the circumstances of their use, &c. we distinguish *stage-coaches*, *hackney-coaches*, &c.

Chariot, or *Half-*COACH, is a kind of *coach* that has only a seat behind; with a stool, or stool, before. When these are very gay, richly garnished, and have five glasses, they are called CALASHES. The duty on every *coach*, chariot, &c. with four wheels, kept by any person for his own use, or to let out to hire, is 6*l.* yearly, and for every chaise, &c. with two wheels, 4*os.* yearly. And a farther sum of 20*s.* if the chaise, &c. is kept by any person for his own use,

ute. 20 G. II. cap. 10. 16 Geo. III. cap. 34. 21 Geo. III. cap. 68.

Hackney-Coaches, thofe expofed to hire, in the ſtreets of London, and ſome other great cities, at rates fixed by authority.

Theſe firſt began to ply in the ſtreets of London, or rather waited at inns, in 1625, and were only twenty in number: but they were ſo much increaſed in 1635, that king Charles iſſued an order of council for reſtraining them. In 1637 he allowed fifty *hackney-coaches*, each of whom might keep twelve horſes. In 1653 their number was limited to two hundred, and in 1654 extended to three hundred. In 1661 four hundred were iſſued at 5*l.* annually for each. In 1694 ſeven hundred were allowed, and taxed by the 5 and 6 W. and M. at 4*l.* per annum each. See 20 Geo. II. cap. 10.

Thoſe in London are under the direction of five commiſſioners, who take cognizance of all cauſes and diſputes ariſing thereupon.

By 9 Anne, cap. 23. eight hundred hackney-*coaches* were allowed in London and Weſtminſter; but by 11 Geo. III. cap. 24. the number is increaſed to one thouſand; which are to be licenced by commiſſioners, and pay a duty of 5*s.* a week, and alſo by 24 Geo. III. cap. 27. the ſame additional duty, for each licence to the crown: and if any perſon drive a hackney-*coach* without licence, he ſhall forfeit 5*l.* And coachmen uſing abuſive language, or demanding more than their fare, are liable to a penalty not exceeding 20*s.*

The ſtat. 1 Geo. I. ſtat. 2. cap. 57. ordains, that where coachmen refuſe to go at, or exact more for their hire than is limited by the act, they ſhall forfeit not exceeding 3*l.* nor under 10*s.* and the commiſſioners have power to determine it. The fare of hackney-coachmen in London, or within ten miles thereof, is by 24 Geo. III. cap. 27. 1*s.* 6*d.* per day, allowing twelve hours to the day, and for every hour exceeding twelve 1*s.* 6*d.*; and by the hour, not above 1*l.* 6*d.* for the firſt, and 1*s.* for every hour after, and none are obliged to pay above 1*l.* for the uſe of any hackney-*coach* for any diſtance, not mentioned in the act, which is not above one mile and four furlongs; nor above 1*s.* 6*d.* for any diſtance not exceeding two miles, and ſo increaſing 6*d.* for every half mile. Hackney-coachmen are compellable to go any where within the diſtance of ten miles from London, or Weſtminſter.

7 Geo. III. cap. 46. 12 Geo. III. cap. 49.

Coachmen are to have numbers on their *coaches*, on tin plates, or ſhall forfeit 5*l.* and refuſing any perſon to take the numbers of their *coaches*, or giving a wrong number, incurs the forfeiture of a ſum not exceeding 40*s.* None but licenſed *coaches* ſhall ply at funerals for hire, under the penalty of 5*l.* Drivers of hackney-*coaches* are to give way to perſons of quality, and gentlemen's *coaches*, on the penalty of 10*s.* By 11 Geo. III. cap. 28. every hackney-*coach* is to be provided with cheque-ſtrings; and every coachman plying without them, incurs a penalty of 5*s.* On Sundays there were formerly only 3 hundred and ſeventy-five *coaches* to ply, which were to be appointed by the commiſſioners; but their number is now unlimited.

COACHES, *Stage*, are thoſe appointed for the conveyance of travellers from one city or town to another; and theſe pay an annual tax of 5*l.* 16 G. III. c. 34. See POST *horſes*.

COACH, in *Sea Language*, denotes a chamber or apartment near the ſtern, in a ſhip of war.

COADJUTOR, *Fellow Helper*, is properly uſed for a prelate joined to another, to aſſiſt him in the diſcharge of the functions of his prelature; and even, in virtue thereof, to ſucceed him.

The *coadjutor* has the ſame privileges with the biſhop himſelf. *Coadjutors* were formerly appointed by kings, for archbiſhops and biſhops grown old, or abſent, and not able to ſuperintend their dioceſes. But the right of appointing *coadjutors*, in Romiſh countries, is now reſerved to the pope alone.

Coadjutors are alſo called biſhops *in partibus infidelium*; becauſe it is neceſſary the *coadjutor* of a biſhop ſhould be a biſhop himſelf; without which, he cannot diſcharge the office. See SUFFRAGAN.

The uſe of *coadjutors* in the church is borrowed from the Roman empire. Symmachus ſpeaks of aſſiſtants, or *coadjutors*, given to magiſtrates; and calls them *adjutores publici officii*.

The popes, formerly, made a ſhameful abuſe of the *coadjutorſhip*: ſome they granted to children, and young people, with this clauſe, *dum ingreſſus fuerit: till they ſhall be capable of entering upon the adminiſtration of the office.* Others they granted to perſons not in orders, with this clauſe, *dum accedat*: and others to perſons at a great diſtance, with this clauſe, *dum egrediatur*: but the council of Trent has ſhown the pope's hands, by adding abundance of reſtrictions to the article of *coadjutors*.

In nunneries they have *coadjutreſſes*, who are religious, nominated to ſucceed the ABBESS, under pretence of aiding her in the diſcharge of her office.

COADUNATÆ, in *Botany*, an order of plants in the *fragmenta methodi naturalis* of Linnæus.

COAGMENTATION, is uſed, among *Chemiſts*, for the act of melting down a matter, by caſting in certain powders, and afterwards reducing the whole into a concrete, or ſolid.

COAGULABLE *lymph of the blood*. See LYMPH.

COAGULATION, in *Chemiſtry*, denotes certain operations, in which fluid bodies become ſolid; as for example the CRYSTALLIZATION *of ſalts*. In a general ſenſe, it ſignifies the condenſing, or thickening of a fluid matter, without its loſing any of the ſenſible parts which conſtituted its fluidity; as we frequently ſee in blood, milk, &c.

We diſtinguiſh between that kind of thickening which is effected by the evaporation of the fluid parts of a body, as in clay, which condenſes in the ſun, properly called *hardening*; and that effected without any loſs of its ſubſtance, called *coagulating*. Thus we ſay, that cold *coagulates* blood, &c.

There is one general term, viz. *concretion*, which includes *coagulation*, condenſation, and hardening.

By injecting an acid into the vein of an animal, the blood coagulates; which ſtops its circulation, and brings immediate death. Several poiſons have their effect by inducing a *coagulation*.

COAGULATION is performed by ſix different agents in the general operations in chemiſtry, and by each of theſe in ſeveral ways.

1. It is performed with water, by congealing, cryſtallizing, and precipitating; as in the *mercurius vitæ*, and ſome other ſuch preparations.

2. With oil, which, by the force of fire, unites to itſelf ſulphur, ſalts, and metals.

3. With alcohol, upon the ſpirit of ſal ammoniac, the white of eggs, the ſerum of the blood, &c.

4. With acid and alkali, growing ſolid together, as in the *tartarum vitriolatum*.

5. With fixed alkali, as in milk. *And*, 6. With acid ſalts, as in milk, ſerum, and whites of eggs.

COAGULUM, the *coagulum* of the Latins, the πυτια, and the *caſeus* of the Greeks, are the ſame with what in Engliſh we call RUNNET.

COAGULUM, in *Chemiſtry*, denotes curdled concretions formed by the mixture of two liquors; ſuch as the precipitate of ſilver in the formation of LUNA *cornea*, &c.

COAGULUM *alumineuſum, alum curd*, a form of medicine, preſcribed long ſince by Riverius, and now taken into the London diſpenſatory. It is ordered to be made by putting whites of eggs into a pewter or earthen veſſel, and ſtirring them about with a large lump of alum till they are coagulated.

COAK denotes a ſort of foſſil *coals* that have undergone a ſimilar operation to that of charring; whereby they are deprived of their phlegm, acid, and the greateſt part of their oil; and are therefore uſed in furnaces for ſmelting iron ore, and for drying malt.

COAL, a black, ſulphureous, inflammable matter, dug out of the earth; ſerving in many countries as the common fuel. This we ſometimes call *pit-coal*, *foſſil-coal*, *earth-coal*, and *mineral coal*, to diſtinguiſh it from that kind made in imitation hereof, by half burning the branches and roots of trees; properly called *charcoal*, and *wood-coal*: in places, whither *coal* is brought by ſea, it is called *ſea-coal*. *Coal* is one of the cloſs of opake inflammable foſſils, and is diſtinguiſhed from the reſt by being of a gloſſy hue, ſoft, friable, not fuſible, but eaſily inflammable, and leaving, after burning, a large reſiduum of whitiſh aſhes. It ſeems to conſiſt of petrol intimately mixed with a ſmall proportion of earth, moſtly argillaceous, ſeldom calcareous, and often with pyrites.

We have three ſpecies of this foſſil in common uſe for our fuel in different parts of the kingdom. 1. A hard duſky black *coal*. This is in common uſe with us, under the name of *Scotch coal* (though that name is not reſtrained to this ſpecies alone, but the following is alſo ſometimes known among the dealers by the ſame appellation): this is uſually of a rough and duſty ſurface, and is leſs gloſſy, when freſh broken, than any other *coal*. It burns briſkly, and turns wholly to aſhes, not leaving any cinders. There is a vaſt deal of this dug about Lymington in Hampſhire, whence it is often called by the dealers *Lymington coal*. 2. A hard gloſſy coal. This is ſometimes ſold in London with the former, under the name of *Scotch coal*, but it is more determinately known in many parts of the kingdom by the name of *Iriſh coal*. It is diſtinguiſhed from the others by its great hardneſs, and gloſſy black, where freſh broken, and is much eſteemed for burning with leſs ſmoke than any other kind; and in ſome parts of this kingdom, and generally in Wales, they uſe it to make malt. 3. The third is our common *coal*, too well known to need any deſcription, but diſtinguiſhed from all the others by its friatery friable ſtructure, and its great gloſs when freſh broken. It is common in moſt countries of Europe; though the Engliſh *coal* is of moſt repute, even in foreign countries;

notwithstanding some pretend that of the Foſſe in Auvergne not to be inferior to it.

The common *pit-coal* contains a large quantity of ſal ammoniac. The mouths of our ſubterranean fires in the *coal* countries all afford it, and it is even found in brick-kilns, where nothing but coal is burnt with the clay. It may appear ſtrange indeed to ſome, that this black ſubſtance ſhould yield ſo white and fine a ſalt; but chemiſts know that all volatile ſalts whatever may be freed from their factor and intenſe colour, by tranſmuting them into a ſal ammoniac, by the mediation of an acid, as the ſpirit of ſalt, vitriol, or alum; after ſublimation with which, they become white, ſweet, and pure. The reaſon of this change is, that though the ſalts always carry over ſome of the fœtid oil with them in a ſtate of volatility, yet being thus in a manner fixed, the fœtid oil muſt by force of fire riſe firſt, leaving the ſubſequent ſal ammoniac without ſmell: though it is ſtill a doubt, whether the ſalt be the better or the worſe for this labour. Phil. Tranſ. N° 130. The goodneſs of *coal* is found by its being as free as poſſible from ſulphur, in its heating iron well, and by its burning a long time in the ſmith's forge. The Engliſh *coal* has this property peculiar to it, that it never lights ſo perfectly, as when water is thrown on it.

The commerce of *coal* is very conſiderable in England; great quantities are exported to France, &c. by way of Rouen. The meaſure whereby it is ſold is the chaldron, containing thirty-ſix buſhels, or a little more than twenty-eight hundred weight: allowing a chaldron, Newcaſtle meaſure, to be fifty-three hundred weight, and eight Newcaſtle chaldrons to be equal to fifteen London chaldrons. However the weight of a chaldron of *coals* has been variouſly eſtimated. It appears that the mean quantity of *coal*, annually imported into London, deduced from an eſtimate of ten years, viz. from 1770 to 1779, is 658,853 chaldrons, or about 722,396 tons.

Anderſon, in his Hiſtory of Commerce, fixes the introduction of Newcaſtle *coal* into London at ſo early a period as the year 1305.

In the Memoirs of the French Royal Academy, we have an account of two experiments on the common *pit-coal*, made by M. Des Landes while in England, and which he thinks have eſcaped the Engliſh Philoſophers.

1ſt, Pounding ſome *coal*, and putting half an ounce of it in a phial of water, the mixture became quite black: but leaving it expoſed to the air in a window, during a cold winter night, in the morning it was found frozen, and turned to a reddiſh colour. The reaſon of the change muſt be, that the froſt had diſengaged the ſulphurs of the *coal*; though one would little expect ſuch an effect from it.

2dly, From an infuſion of cinders in brandy, mixed with iron filings, ariſes a black tincture, which brightens in proportion as it is heated: when arrived at the heat of boiling, the colour becomes perfectly fine and laſt, and gives a dye to cloth, which no workman can imitate.

The ſtrata, or veins of *coals* in *coal-pits*, are numerous, and their order, quality, &c. are very different in different places. In thoſe at Dudley, in Staffordſhire, the ſtrata, below the turf, are two or three clays, a grey ſtone, and a hard grey rock: then they are expreſſed in the Philoſophical Tranſactions, to be, 1. *coal*, called *bomb-coal*; 2. *ſlipper-coal*, leſs black, and ſhining than the former; 3. *ſplin-coal*, more black and ſhining; 4. *ſtone-coal*, much like *canal-coal*.

Theſe ſtrata have between each of them a bat, or bed, of a peculiar ſort of matter, about the thickneſs of a crown piece. Below theſe are divers metalline ſtrata; as a black ſubſtance, called the *dun-row bat*; a grey iron ore, called the *dun-row iron-ſtone*; a bluiſh bat, called *white-row*; a blackiſh iron ore, called *white-row grains*; or *iron-ſtone*; a grey iron ore, called *mid-row grains*; a black foſſil ſubſtance, called the *gublin-bat*; a black iron ore, called *gublin iron-ſtone*; a dark grey iron ore, called *rubble iron-ſtone*; and laſtly the *table-bat*.

Then, 5. comes a coarſe ſort of *coal*, called *foot-coal*; a black brittle bat; 6. the *heathen-coal*; 7. a ſubſtance like coarſe *coal*; though called a *bat*, becauſe it does not burn well; and 8. *bench-coal*.

COAL, *Bovey*, ſo called from Bovey Heath in Devonſhire, where it is found. Dr. Mills, whoſe paper of remarks upon it is publiſhed in the Philoſophical Tranſactions, vol. li. part ii. N° 83. anno 1760, thinks it is the ſame with the foſſil wood, or as the miners call it, the *foſſile wood*, deſcribed by Hoffman, ibid. vol. xlix. p. 506. ib. N° 85.

COAL, *Canal*. See AMPELITES.

COAL-*bulls*, balls made of *coal* and clay, or ſlack, for firing. Theſe balls are made with $\frac{1}{3}$ of clay, without ſand or gravel, and $\frac{2}{3}$ of *coal-duſt*, or CULM, well mixed, and formed either into round balls or into bricks. This *coal-duſt* being the refuſe of the mine, makes this ſort of firing cheap. See Phil. Tranſ. N° 460. ſect. 3.

COAL-*mines*.—Wilfully ſetting *coal-mines* on fire, is by ſtatute felony, without benefit of clergy. 10 G. II. c. 32. § 6.

COAL-*pot*. See SOOT.

COAL-*ſpirit*. *Coals* diſtilled in a retort not only afford a phlegm, and black oil, but a ſpirit, which is apt to force the lute and break the glaſſes, and will catch fire at the flame of a candle. We are told that bladders may be filled with this ſpirit, or inflammable AIR, which may be kept a conſiderable time. If the bladder be pierced with a pin, and ſqueezed near the flame of a candle, the ſpirit will take fire, and afford an amuſing ſpectacle. See Phil. Tranſ. N° 452. ſect. 5. See DAMPS.

Small-COAL is a ſort of CHARCOAL, prepared from the ſpray, and bruſh-wood, ſtripped off from the branches of coppice-wood, ſometimes bound in bavins for that purpoſe, and ſometimes prepared without binding.

The wood they diſpoſe on a level floor, and ſetting a portion of it on fire, they throw on more and more, as faſt as it kindles; whence ariſes a ſudden blaze, till all be burnt that was near the place. As ſoon as all the wood is thrown on, they caſt water on the heap from a large diſh or ſcoop; and thus keep piling the heap of glowing *coals*, which ſtops the fury of the fire, while, with a rake, they ſpread it open, and turn it with ſhovels till no more fire appears. When cold, the *coals* are put up into ſacks for uſe.

COALESCENCE, the union or growing together of two bodies before ſeparate. It is principally applied to ſome bones in the body, which are ſeparate during infancy, but afterwards grow together; or to ſome morbid union of parts, which ſhould naturally be diſtinct from each other. Thus there is a *coaleſcence* of the ſides of the vagina, anus, and nares; of the eye-lids, fingers, toes, and many other parts.

COALITION, the re-union, or growing together of parts before ſeparated. See CONGLUTINATION, &c.

COAMINGS, in *Ship-Building*, are thoſe planks, or that *frame*, forming a border round the hatches, which raiſe them up higher than the reſt of the deck. Loop-holes for muſkets to ſhoot out at, are often made in the *coamings*, in order to clear the deck of the enemy when the ſhip is boarded.

COANE, among the Greeks, a name given to a peculiar ſpecies of *tuba* or *turis*, which was always found in a tubular form. It has its name from κωνη, a word uſed to expreſs a ſort of cylindric tube, into which the melted braſs was received from the furnace, and in which it was ſuffered to cool. In cooling, it always depoſited a ſort of recrement on the ſides of the veſſel or tube, and this was the *turis* called *coane*.

COAST, a ſea-ſhore, or the country adjoining to the edge of the SEA.

COAST-*Mary*, or COST-*Mary*, in *Botany*. See TANEY.

COASTING, that ſort of navigation, wherein the places ſailed to and from, are not far diſtant; ſo that a ſhip may fail in ſight of the land, or within ſounding, between them.

Such are the voyages on the *Narrow*, or Britiſh ſeas, between *England*, Holland, and France; alſo thoſe about the Britiſh ſeas, and in the Mediterranean, &c.

For the performance hereof, there is only required good knowledge of the land, of the time and direction of the tide, of the reigning winds, of the roads and havens, the uſe of the compaſs, and of the lead, or ſounding-line.

COASTING *Pilot*. See PILOT.

COASTING, in *Agriculture*, &c. denotes the tranſplanting of a tree, and placing it in the ſame ſituation, with reſpect to eaſt, weſt, north, &c. as it ſtood before.

COAT, in *Anatomy*. See TUNICA and EYE.

COAT *of arms*, in *Heraldry*, a cloak, or habit, worn by the ancient knights over their arms, both in war, and at tournaments; and ſtill borne by the heralds at arms.

It was a kind of ſurcoat, reaching only as low as the navel; open at the ſides, with ſhort ſleeves; ſometimes furred with ermines and vair; whereon were applied the armories of the knight, embroidered in gold and ſilver, and enamelled with beaten tin, coloured black, green, red, and blue: whence the rule, never to apply colour on colour, nor metal on metal.

The *coats of arms* were frequently open, and diverſified with bands and fillets of ſeveral colours, alternately placed, as we ſtill ſee cloths ſcarletted, watered, &c. hence they were alſo called *dividas*, or *diviſes*, as being divided or compoſed of ſeveral pieces, ſewed together; whence the words *feſſe*, *pale*, *chevron*, *bend*, *croſs*, *ſaltier*, *lozenge*, &c. which have ſince become honourable pieces, or ordinaries of the ſhield. See each in its place, BEND, CROSS, FESSE, &c.

Coats of arms, and *banners*, were never allowed to be worn by any but knights, and ancient nobles. They were not introduced into SEALS, nor indeed to any other uſe, till about the reign of Richard I. who brought them from the croiſade in the Holy Land, where they were firſt invented and painted on the ſhields of the knights, to diſtinguiſh the variety of perſons from every nation,

who, when completely clad in steel, could not otherwise be known. Blackst. Com. vol. ii. p. 396.

COAT *of Mail, jargon de mail*, a kind of armour made in form of a shirt, consisting of iron rings wove together net-wise. See MAIL.

COAT, in a *Ship*, a piece of tarred canvas put about that part of the masts, or bowsprit, which joins to the deck, or lies over the head of a ship. They are also put about the pumps at the decks, that no water may go down there; and they are also used at the rudder's head.

COAT likewise denotes the materials with which the ship's sides and masts are varnished, to preserve them, as tar, &c.

COAT, in *Zoology*. See RACKOON.

COATING, in *Chemistry*. See LORICATION.

COATING, in *Electricity*, denotes a covering of sheet-lead, tin-foil, or any other conducting substance, applied to the Leyden phial, or to any electric body, and serving to accumulate the electricity, to increase the force of the CHARGE, and to facilitate the operation of *discharging*. The first person who discovered the use of *coating* in electrical experiments, was Dr. Bevis: it was first applied to the Leyden phial, but has been since extended to a great variety of other electrical substances. When glass plates, or *jars*, sufficiently wide at the neck, are to be *coated*, the best method is to *coat* them with tin-foil on both sides, which may be fixed on the glass with varnish, gum-water, bees-wax, &c. but if the internal *coating* cannot be conveniently introduced, brass filings may be used, and stuck to the surface of the glass with gum-water, or beet-wax, &c. However, care should be taken that the opposite *coatings* do not come too near to each other: that of glass jars should be kept at the distance of, at least, two inches from the top. Glass phials may be *coated* with silver, by burning it into the very substance of the glass, so that nothing can remove it without injuring the glass, together with the metal. Glass, thus *coated* and burnished, exhibits an elegant appearance, has no inequalities in its surface, and is capable of being charged as highly and readily, as when *coated* with tin-foil. Glasses of this kind will discharge spontaneously, and are apt to burst by the explosion. Phil. Trans. vol. lxvii. part i. p. 108.

Electric substances, which are easily melted, such as resin, sealing-wax, &c. may be easily *coated* by pouring them on a circular plate of tin-foil, placed on a marble table, and two inches less in diameter than the electric plates proposed; and then pressing them with a pane of glass, or any thing else with a smooth surface, to the requited dimensions. When this is done, let another piece of tin-foil, of equal size with the former, be applied to the upper surface, by pressing it gently with a hot iron. Electric substances in a fluid state may be *coated* by fixing a piece of tin-foil to the bottom of an earthen dish, reaching within an inch of the sides, and by introducing, through a hole in the bottom, a slender wire, so as to communicate with the tin-foil; then pour the fluid electric into the dish; and let a brass plate of the same dimensions with the tin-foil be suspended from a glass arm, or from the prime conductor, and touch the surface of the electric. A plate of air may also be *coated*, by means of two smooth circular boards, about three or four feet in diameter: let one side of each of these boards be *coated* with tin-foil, which should be pulled down, and burnished, and turned over the edge of the boards. Then insulate the boards in an horizontal position, and with their *coated* sides turned towards each other, and so disposed, that they may be easily moved to or from each other. If these boards are placed at the distance of about an inch asunder, they may be used exactly as the *coatings* of a pane of glass. It will be shewn that the electric matter does not reside in the *coating* of a charged electric under the article LEYDEN *Phial*.

COB *nut*. See HAZLE.

COBALT, in *Natural History*, a dense, compact and ponderous mineral, very bright and shining, and much resembling some of the antimonial ores. Its specific gravity is about 7,700; and its fusibility nearly as that of copper.

It is sometimes found of a deep, dusky, bluish black, very heavy and hard, and a granulated structure, looking like a piece of pure iron, when fresh broken. At other times, it is more compact and heavy, of a very even texture, and not granulated, or composed of any separate molecule, but resembling a dusky mass of melted lead, not an ore.

The inner part, when fresh cut or broken, is in some ores found much more beautiful than in either of these states, being of a fine bright silvery grey, and of a beautiful and evenly striated structure; the striæ all running great lengths, but being all variously inflected and undulated, and in some parts broken. These are the more usual appearances of *cobalt* in its ore: but beside these, it is subject to an alteration in the bowels of the earth, by means of subterraneous fires and sulphur, which reduce it to a body which cannot be supposed at first sight the same with *cobalt*, though it proves to be exactly the same substance on a chemical analysis.

In these states, instead of the lead-like appearance of the common kind, it is of a fine florid red colour, though sometimes debased by accidental mixtures to a grey, black, or yellow, either wholly, or in part; and in this state it has two subordinate distinctions, as it appears sometimes in form of a compact mass of an uniform texture, and sometimes in a striated and beautifully rigid mass, resembling the fibræ. The three first states of *cobalt* are commonly called *cobalt ore*, without any distinction; but the first of these red kinds is called by the Germans *kupfer nickel*, and the latter or striated one, the flower of *cobalt*. It contains arsenic or ratsbane, and a fixed earth, which on fusion with fluids and pot-ash, or any other alkali salt, yields that fine blue glass which we call smalt, and which our painters and washer-women use under the names of smalt and powder-blue. It is dug about Sneeberg and Annaberg, and in some parts of Bohemia. It is always found below, not mixt with the ores of metals, and is very rich in the arsenic in some places, and but poor in others: all our arsenic is made from it. The miners are directed where the veins of *cobalt* lie, by a sort of soil which they call therefore the flower of *cobalt*: it is a very elegant substance, of a fine blooming red colour, and a radiated structure; sometimes of a paler red and in form of powder.

Cobalt is found in Germany, Saxony, Bohemia, England, and Scotland, and probably in other parts of Europe: and that it is in the eastern parts of Asia, appears from the colouring on old oriental porcelain. Ours is but a poor kind, but it is met with in considerable plenty on Mendip-hills, and at Gifennep in Cornwall. The German *cobalt* generally contains a large quantity of bismuth, and the Bohemian of silver.

The world is obliged to Kunckel for the history of the several arsenics, *zaffer*, and smalt, which are all the produce of *cobalt*. See ARSENIC, &c.

Cobalt, when exposed for a considerable time by itself in a heap to the sun and rain, yields an efflorescence of a rose or peach-blossom colour, called by the miners the flower of *cobalt*, and very much resembling the native flowers of *cobalt* described before, but less beautiful: this efflorescence, when properly treated, affords a very fine red colour for the painter's use, and a little green vitriol. Spirit of nitre dissolves the *cobalt* with a violent effervescence; four times the quantity of the acid is sufficient to dissolve some *cobalt*, but other ores require six times or more; this is owing to the purity or impurity of the ore. The solution is of an uncertain colour, according to the other matters contained in the *cobalt*; when it contains vitriol it is blue, when it contains copper, as is often the case, but particularly in that kind called, by the miners, *copper nickle*, which has an appearance of copperon the surface, the solution is then green; it is also sometimes green from the purest ores to appearance. This green colour resembles very much that of salt of steel well purified, but it still seems to have some share of copper in it.

Oil of vitriol, and spirit of sea-salt, act on *cobalt*, but do not properly dissolve it: they may rather be said to erode it, and particularly the acid of vitriol, which turns it into a white powder, to that spirit of nitre seems the proper simple solvent of it. Phil. Trans. N° 396. p. 199.

The *cobalt* is roasted in a reverberatory furnace, and the flowers which it yields in great abundance, are collected in long wooden funnels, which supply the place of chimnies, on the inside of which it sticks in form of soot, and from this soot, or flower, are made all the several sorts of arsenic or ratsbane. If this is only resublimed, or but barely melted in a covered vessel, the substance which we call white arsenic, or common ratsbane, is produced. If a tenth part of sulphur be mixed with them, and they are sublimed together, the product is our yellow arsenic; and the red arsenic is made by adding to the flowers only one fifth of sulphur, and a little copper dug.

When the flowers, or soot of *cobalt*, are all discharged, the remaining matter is powdered very fine, and being mixed with three times the weight of common flints in powder, and wetted with water, the whole concretes into a solid mass, and is what is called ZAFFER.

Two parts of this being fused with three parts of common salt, and one part pot-ash, the whole becomes a beautiful blue substance, called SMALT.

As sprinkling the powder of the calx of flints and *cobalt*, for making them into *zaffer*, gives them a pretty firm coalescence, and even the hardness of a common stone, persons who were unacquainted with the process, have taken *zaffer* for a native mineral.

COBALT is also used by some to express that suffocative vapour or damp in mines, which often proves fatal to the miners. It is common among the Germans, to say on this occasion, that the *cobalt* rose and choaked them. See DAMP.

COBBAN, in *Botany*, a small tree like a peach-tree, which grows in Sumatra, called *Perfica affinis in Taprobana*, C. B. *Arbor Getruth, five cobban*, J. B. It bears a small leaf, like that of the tree which produces the *filiqua catharticæ*, with short branches, and a yellowish or saffron-coloured bark. The fruit is thick and round like a tennis-ball, inclosing a nut as big as a filbert, which contains a very bitter kernel, tasting like the root of angelica.

The fruit is very proper to quench thirst: but the kernel, however bitter, is far superior in virtue. The inhabitants of Sumatra, where the tree grows, extract an oil from the kernel, which is very efficacious in pains of the liver and spleen, taken inwardly, or used by way of unction; and is also a sovereign remedy in the pain of the gout, to which the inhabitants of that island are very subject.

From the same tree distils a gum, which is very serviceable in the before mentioned disorders, if it be dissolved with a moderate quantity of oil, and applied to the affected parts by way of cataplasm.

COBBING, in *Sea Language*, a punishment inflicted at sea on those who quit their station during the night-watch. It consists of a number of strokes on the breech with a flat piece of wood called the *cobbing-board*.

COBELLA, in *Zoology*. See COLUBER and SERPENT.

COBITIS, in *Ichthyology*, the name of a small fresh-water fish, commonly called in English the *loach*. It very much resembles our common gudgeon, both in figure and colour, but it is much smaller, about two inches being its usual length, and three, or a little more, the utmost that it ever arrives at. Its body is soft and slippery; its tail flat and broad, and it has either extremely minute scales, or none at all. It is of a brown colour, spotted all over with black specks, and it has three pair of beards, at its upper-jaw. It is caught in fresh water in many parts of the world, and is esteemed by many a very delicate fish, especially when very young and small.

Artedi enumerates three species of this fish. This is the fish called *mifgurn* and *fifgurn* at Nuremberg and Ratisbon. It has ten or more *cirri* in the mouth.

The word *cobitis* is truly Roman, and used by the best authors to express the same fish we now call by it; but its derivation is uncertain.

Linnæus makes this a genus of the *abdominales*, including five species.

COBITIS *aculeata*, called also *cobitis oxyrynchus*, a small fresh-water fish of the loach kind, but armed with two prickles on the coverings of each of its gills, by means of which it moves nimbly about among the stones. See DACTYLITHUS.

COBIUS, in *Ichthyology*, a name given by Aristotle, Ælian, Appian, and the other Greek writers, to the GOBIUS *marinus*, or sea-gudgeon of authors, distinguished by Artedi by the name of the blackish variegated gobius, with fourteen rays on the second fin of the back. It is called by the French, *gouderat*, or *boulerot*.

COBIUS *leucoterus*, in *Ichthyology*, a name given by Aristotle, Athenæus, and some other of the old Greek writers, to the fish called GOBIUS *albus* by later authors. It is a genuine species of the gobius, and is distinguished by Artedi by the name of the gobius with the ventral fin blue, and the rays of the anterior back-fin rising above the membrane. This is a sufficient distinction from all the other *cobii*.

COBLE, a boat used in the turbot fishery, twenty feet six inches long, and five feet broad. It is about one ton burthen, rowed with three pair of oars, and admirably constructed for encountering a mountainous sea.

COBOB, the name of a dish among the Moors. It is made of several pieces of mutton wrapt up in a cawl, and afterwards roasted in it; the poorer people, instead of the meat, use the heart, liver, and other parts of the entrails, and make a good dish, though not equal to the former. Phil. Transf. N° 251.

COBOOSE, *in Sea Language*, is derived from the Dutch *kambuis*, and denotes a sort of box, resembling a sentry-box, used to cover the chimneys of some merchant ships. It generally stands against the barricade, on the fore-part of the quarter-deck. It is called in the West Indies *cabre vuyo*.

COBRA, *de los cabeças*, in *Zoology*, the Portuguese name for an American species of serpent of the *amphisbæna* kind, whose bite is very fatal. It lives under ground, and feeds on ants. See IBIJARA.

COBRA *de coral*, in *Zoology*, the name of a species of serpent found in America, and called by the natives IBIBIBOCA; it is about two feet long, and has a great deal of a fine red in its variegations.

COBRA *de cipo*, in *Zoology*, the name given by the Portuguese in America, to a species of serpent more usually known by its Brasilian name BOITJAPO.

COBRAS *de capello*, in *Zoology*, the Portuguese name of a peculiar species of serpent, called by authors *serpens cornutus diadematus, seu conspicillo insignis*, and by us the *spectacle-snake*, from the strange resemblance on the back of his head and neck to a pair of spectacles. It grows to somewhat more than the size of our viper; its snout is long; its head flat or depressed; its bite is very terrible. It is thought by many that there is a stone in the back part of its head, which is a remedy for the bite; but the stones commonly sold with us under the name of *lapides cobræ de capello*, are well known to be all artificial compositions.

COBRE *de bord*, in *Zoology*, the name given by the Portuguese in America, to a species of serpent called by the natives, and, from them, by most authors, BOICI.

COBWEB. See WEB and SILK.

COCCEIRA, in *Botany*, a name by which some authors have called the coco-nut tree, the *palma nucifera Indica* of most writers.

COCCIFEROUS, in *Botany*, such plants or trees as bear berries. See BACCIFEROUS.

COCCINELLA, in *Zoology*, a genus of insects of the *coleoptera* order, the characters of which are these: the *antennæ* are elevated and truncated; and the *thorax*, with the exterior wings, which are marginated, constitute an hemispherical figure. Of this genus are several species, distinguished by the colour and spots of their wings; among which are comprehended our common *lady-cows*.

COCCO, the name of a plant in the West Indies, and in some of the islands of the South Sea, called also *Indian kale*.

COCCODES, in *Natural History*, a name given by Mercatus to those stones of the AMMITES kind, whose grains are very large.

COCCOLOBA, in *Botany*. See *Sea-side* GRAPE.

COCCOTHRAUSTES, in *Ornithology*, the name of a very remarkable bird, considerably larger than the chaffinch, very short-bodied, and large-beaked, whence it is called in English, the *grosse-beak* or *hawfinch*. Its head is very large in proportion to its body, and its great beak tapers from a very thick base to a sharp point, resembling the shape of a funnel. It is common in Germany, and lives there in the woods and mountains all summer; in winter it comes into the flat country. It is never seen in England, except in the winter months; it feeds on the kernels in the stones of fruits, as cherry-stones, and the like, and breaks these with great dexterity; it will also eat the seeds of many different plants. Ray.

COCCOTHRAUSTES *cristata*, in *Ornithology*, the name by which naturalists call the bird usually known among us by the name of the *Virginian nightingale*, it being truly a *coccothraustes*, though called by the improper name NIGHTINGALE. Ray.

COCCULUS *Indicus*, a poisonous narcotic berry, known mostly now to poachers, who have got a trick of intoxicating fish therewith, so as to take them out of the water with their hands; for which reason these berries are called *bacca piscatoriæ, fishery-berries*.

The good women use it with flaveacre, for destroying vermin in childrens heads. Brewers have used it also in their brewing; but this is expressly prohibited by act of parliament.

COCCUS, in the *Writings of the Ancients*, a name given by some authors to that fine shining red colour used to illuminate the capital letters in manuscripts, and more generally known by the name of *encaustum sacrum*, from its being used in ornamenting the manuscript bibles, and its resembling the fine red glow of the enamel of that colour.

COCCUS, in the *History of Insects*, the name of a very comprehensive genus of the *hemiptera* class, the trunk of which arises from their breast; the body is cetose behind; the wings only two, placed erect, and to be found only in the males.

This genus comprehends all the *progoll-insects* of Reaumur.

COCCUS, or COCOS, in *Botany*, the name of a genus of plants of the *palmæ* class, called in the Hortus Malabaricus, TEUGA. It produces male and female flowers on the same plant; the male flowers have the whole ear for their cup, which is divided into three segments; the corolla has three petals; the stamens are six single filaments, of the length of the flower; the apices are oblong and incumbent; the germen of the pistil is so small in these flowers as to be scarce visible; the style is short and thick, and is obscurely trifid, and the stigma is small; these flowers never produce any fruit, yet they are not simply male flowers, but a sort of hermaphrodite ones, the female organs of which are always abortive; the female flowers grow on the same spike with the male; the calyx is divided into five parts, but the segments are very small; the corolla has three petals; the germen of the pistil is of an oval figure, and terminates in a short-pointed style; the stigma is small, and it

is divided into three parts. The fruit is very large, and membranaceous; it is of a somewhat rounded figure, but with some obscure traces of a trigonal form; the seed is a very large nut of an oval form, pointed, trivalve, and obtusely trigonal, as the fruit is; it has three holes in the base, and the kernel is hollow.

The *coco-tree*, which the Malabarians call *tenga*, grows straight, without any branches, and ordinarily is thirty or forty feet high; its wood is too spongious to be used in carpentry. At the top it bears twelve leaves, ten feet long, and half a foot broad, used in the covering of houses, making mats, &c. Above the leaves grows a large excrescence, in form of a cabbage, excellent to eat; but the taking this off is mortal to the tree. Between the leaves and the top arise several shoots, of the thickness of the arm; which, when cut, distil a white sweet, agreeable liquor, serving as a wine, and intoxicating: it becomes acid, if kept a few hours; and at the end of twenty-four hours is converted into a strong vinegar; but it may be prepared into brandy. While this liquor distils, the tree yields no fruit; but when the suckers are let grow, it puts forth a large cluster or branch, wherein the *coco-nuts* are fastened, to the number of ten or twelve.

While they are yet new, and the bark tender, they yield each about half a pint of clear cooling water, which in a little time becomes firm a white soft pulp, and at length condenses, and assumes the taste of the nut.

The tree yields fruit thrice a year, and those sometimes as big as a man's head. Many travellers aver, from the first, and the many useful products of this tree, that from a single *coco*-tree, and its fruit, a ship might be built, equipped, and loaden with merchandize and provision.

The *cocos* of the Antilles are not so large as those of the East Indies, Africa, and Arabia: the trees seldom exceed twenty-five feet in height; and the fruits are in proportion: these are used among us.

In the kingdom of Siam, the *coco* fruit, dried, and emptied of its pulp, serves as measures, both for things liquid and dry.

As these shells are not all of the same capacity, but are some larger, others less, their content is first measured with cauris, those little Maldives shells, which serve as small money in several states of the Indies. Some *cocos* contain a thousand cauris, others five hundred, &c.

The shell is likewise much used by the miners, carvers, &c. in divers works.

COCCUS *Maldivia*, the Maldivia nut, in the *Materia Medica*, the name of the fruit of the *palma Maldivensis* of Johnston, an oval-figured fruit, of a sweet taste, and famous for its virtues in nervous disorders. See Coll. Acad. P. Etr. tom. iii. p. 525.

COCCUS *Polonicus*, an insect which may properly enough be called the *cochineal* of the northern part of the world. As the cochineal loves only the hot climates, this creature affects only the cold ones. It is collected for the use of dyers, but the crops of it are much smaller, more difficultly made, and the drug itself greatly inferior to the true cochineal. It is commonly known by the name of *coccus Polonicus*, or the scarlet grain of Poland. Poland is indeed the place where it is gathered in greatest abundance, but it is not the only one; it is found in many other of the northern countries, and may very possibly be produced in some of the more temperate ones, where it is not known, as it is very much hid by nature from the eyes of common observers.

This kermes of Poland, if it may be so called, is found affixed to the root of a small plant, and usually to the same plant, which has been thence called the *polygonum coccifera*. Authors have informed us of the same berry, as it is often called, also growing at the roots of the mouse-ear, rupture-wort, pimpernel, and pellitory of the wall, and that it is in no other than dry sandy places, that it is found at the roots of these plants. Breynius, in 1732, printed at Dantzick a very curious account of this production, which proves it incontestibly to be an animal, and gives us many reasons for knowing it to be of the progallinsect class. There is a particular account of this insect in the Philosophical Transactions, vol. liv. N° 15. and vol. lvi. N° 20. See Cochineal.

COCCYGÆUS *anterior*, a muscle fixed, by a broad insertion, in the anterior portion of the small transverse ligament at the upper part of the *foramen ovale* of the *os innominatum*; from thence it runs between this great ligament and the *musculus obturator internus*, with which it is often confounded by anatomists, and contracting in breadth, it is inserted in the lower part of the *os coccygis*.

COCCYGÆUS *posterior*, a muscle fixed to the inner, or concave edge of the two first *vertebræ* of the *os sacrum*, to the inner and lower edge of the *ligamentum sacro-sciaticum*, and to the spine of the *os ischium*; from thence, contracting in breadth, it is inserted in the inside of the *os coccygis*, above the anterior.

COCCYGIS *Os*, in *Anatomy*, a bone joined to the extremity of the *os sacrum*; composed of three or four bones, whereof the lower is still less than the upper, till the last ends in a small cartilage. See *Tab. Anat. (Offeal.) fig. 7. n. 21.*

It resembles a little tail turned inwards; or rather, as some imagine, the beak of a cuckow; whence the name.

Its use is to sustain the straight gut: it yields to the pressure of the fœtus in women in travail; and midwives use to thrust it backwards; but sometimes too violently, which is the occasion of great pain, and several bad effects.

The *os coccygis* may be thrust inwards by a violent fall or blow, and it is often pushed outward in hard births. When this happens, it is usually attended with violent pain and inflammation about the lower part of the spine; abscesses are formed in the *intestinum rectum*, and the fæces are constipated, or suppressed. The replacing this bone is not very difficult, if an able surgeon is applied to in time. If it be thrust outwards, it must be depressed into its right place by the thumb; after which compresses dipt in warm wine, or spirits of wine, are to be applied to the part; these are to be made broad above, and narrow below, that they may fill up the *posterior sinus* of the *nates*; and these may be conveniently held on by the T bandage.

When the *os coccygis* happens to be luxated inwards, the fore-finger is to have its nail cut close, and being dipt in oil, it is to be introduced up the anus, and must be thrust in as far as possible, that it may the more readily drive out the depressed bone: the other fingers, being placed externally, are to conduct the bone into its right posture.

When the bone is replaced, the patient must rest some time upon a bed; and when he sits up, it must be in a chair with a hole in its bottom, lest the affected part should otherwise be compressed or disturbed.

COCCYGIS *ossis musculi*. These are small, thin, radiated muscles, lying on the inner, or concave side of the *os sacrum*, and neighbouring parts of the *pelvis*. They are four in number, two on each side, one placed more forward, the other more backward; for which reason the first may be termed *coccygæus anterior*, five *ischio coccygæus* and the other *coccygæus posterior*, five *sacro coccygæus*.

COCCYGRIA, in *Botany*. See Sumach.

COCCYX, in *Anatomy*. See Coccygis *Os*.

COCCYX, in *Ichthyology*, a name given by Aristotle, and the other old Greek writers, to the fish called *cuculus*, and lyra by other authors. It is a species of the trigla, distinguished by Artedi by the name of the trigla all over red, with a bifid snout, and the coverings of the gills striated.

COCETUM, among the *Ancients*, a kind of drink made of honey and poppies.

COCHIA, in *Medicine*, the name of officinal pills, which are distinguished into the greater and less: the former is a composition of hiera picra, troches of Alhandal turpeth, diagrydium, the syrup of buckthorn, taken from Rhades, but seldom used in the present practice. The latter is compounded of equal quantities of bright aloes, the purest scammony, and the pulp of colocynt, made into a mass with syrup of buckthorn. Two drams of the distilled oil of cloves are added to an ounce of each of the former ingredients. These pills are prescribed to discuss viscidities, watry humours, and flatulencies.

COCHINEAL, or Cochenel, a drug used by the dyers, &c. for giving red colours, especially crimson and scarlets, and for making carmine; and likewise in medicine as a cardiac, cordial, sudorific, alexipharmic, and febrifuge.

It is brought from the West Indies; but authors have been divided as to its nature; some taking it to be a kind of worm, and others for the berry of a tree. F. Plumier, a celebrated botanist, has maintained the former opinion, and Pomet very absurdly the latter. That author is very wide of the truth in the description he has given of *cochineal*.

The *cochineal*, in the state in which it is brought to us, is in small bodies of an irregular figure, usually convex, and rigid and furrowed on one side, and concave on the other. The colour of the best is a purplish grey, powdered over with a sort of white dust. All that the world knew of it for a long time was, that it was gathered from certain plants in Mexico, and therefore it was naturally supposed to be a seed.

In the year 1692, father Plumier gave Pomet, the French author of a History of Drugs, an account of its being an animal: this, however, was disregarded; but Messrs. Hartsoeker, De La Hire, and Geoffroy, afterwards evidently

dently proved it to be one; and after this there were printed the depositions, in form, of a number of persons upon the spot, who all declare it to be a viviparous animal, and that it passes a great part of its life fixed to the vegetable body on which it feeds, and that it was a creature subject to no change, nor ever appearing in any other state. These and many other qualities found in the *cochineal*, all analogous to those of the class of *pregall-insects*, give great room to believe that it is truly and properly an insect of this class.

There are two kinds of *cochineal*, the finer called *mestique*, the other termed the wild *cochineal*. The first is gathered from such plants of the opuntia as are prepared and managed properly on purpose for the production of the animal; the other is found wild on the wild plant, and is much inferior to the *mestique* in value.

Dampier tells us there are two sorts; one an insect, and the other a seed; and gives a precise description of each kind.

The COCHINEAL *worm, Cochi*, otherwise called the *pregall-insect*, is an insect engendered in a fruit resembling a pear: the plant which bears it is five or six feet high. At the top of the fruit grows a red flower, which, when mature, falls on the fruit; and that opening discovers a cleft two or three inches in diameter. The fruit then appears full of little red insects, having wings of superfine swallows, and which would continue and die, and rot there, if not taken out.

The Indians, therefore, spreading a cloth under the tree, shake it with poles, till the insects are forced to quit their lodging, and fly about the tree; which they cannot do many moments, but tumble down dead into the cloth; where they are left till they be entirely dry: when the insect dies, it is red; when it is fallen, black; and when first dried, it is greyish; though it afterwards changes colour. Dampier's Voyages. See *Tab. Nat. Hist. fig.* 24.

The figure of this insect is oval, and its utmost size is that of a small pea. It has six legs armed with claws, two eyes, and a trunk by which it sucks its nourishment. The ants, and many other little animals, are very fond of eating the *cochineal*; and it is with great difficulty that the Indians defend the young brood from those devourers.

After the Indians have gathered the *cochineal* they kill it, otherwise they would lose a great part of their harvest; for the parent race would live some days after their being taken from the plant, and would produce their young which would be nimble enough to run away in great numbers. Some to kill the creatures plunge them in hot water, and afterwards dry them in the sun; others kill them by a proper degree of heat, and others again by smoke.

The accounts from the place, where the *cochineal* is produced, furnish all these particulars; but to decide the long disputed point, whether they are of the animal or vegetable kingdom, we have the means in our own hands, even in this part of the world. We need only moisten and soak in water, or in vinegar, a number of *cochineals* till they are swelled and distended, to know that every one is the more or less perfect body of an insect; the most imperfect and mutilated specimens always shew the rings of the body, and from observing others it will be easy to find the number and disposition of the legs; parts, or even whole ones, being left on several, and often complete pairs. In this way the legs, antennæ, and proboscis may be discovered.

If a full grown *cochineal* be soaked a considerable time in water or vinegar, and afterwards gently pressed, there will frequently be protruded from its hinder part a number of smooth oblong bodies, which might be easily mistaken for eggs; but a good microscope will shew in these the traces of the legs and other lineaments sufficient to prove it to be a true embryo fœtus. The eggs exhibit a vivid crimson hue.

It is easy to see in some the head, and sometimes a tubercle on each side of it, which may very naturally be supposed the eyes, or else the roots of the *antennæ* or horns. The first pair of legs are thus found to be very near the head of the animal, and placed exactly as in all the gall-insect and *pregall-insect* class; a little above these one may distinguish also the remainder of the trunk situated exactly as in the gall-insects and *pregall-insects*; the anus is also easily distinguished.

As the manner of the fecundation of the gall-insects was so long unknown in Europe, it is no wonder that that of the *cochineal* should not be very early discovered in Mexico: but we have an account among Mr. Ruysch's pieces, from whence almost all the true history of this animal is had, that at the season of the *cochineals* becoming big, there is seen continually among them a small butterfly, which is bred upon the same plants, and by means of which she *cochineals* conceive. This is sufficiently analogous to the manner of the gall insect class, that there is no room to doubt the fact; and it is a further great proof, how little truth was before to the guesses concerning the class of animals this belonged to. Reaumur's Hist. of Insects, tom. iv.

The female *cochineal* has been long known, and is well described by Reaumur, Dr. Brown, and Linnæus; but neither of them had ever seen the male; and therefore the history of this valuable insect has been very defective. Mr. Ellis, being informed that this insect bred in great abundance on the *cactus opuntia* of Linnæus, in South Carolina and Georgia, as well as on the *cactus coccinellifer* in Mexico and Jamaica, obtained from Dr. Garden some branches of the former, with the insects upon them. In examining several of these specimens, he, at last, discovered three or four minute dead flies with white wings; and having moistened them in spirit of wine, and observing them with a microscope, found, that they were of a bright red colour, which convinced him, that these were the true male insects. Dr. Garden, to whom this discovery was communicated, made several observations on the male species. This is very rarely found, so that he imagines there may be a hundred and fifty, or two hundred females, for one male. The male is much less than the female, more active, and better made; and the body of it is of a lighter red than that of the other. See a minute description of the male species, illustrated by microscopical drawings, in the Phil. Trans. vol. lii. part 1. art. 10.

The male fly of the Polish *cochineal* was also discovered by Dr. Wolfe of Warsaw. See Phil. Trans. vol. liv. p. 95. and vol. lvi. art. 20.

Cochineal has been supposed to possess several medicinal virtues, similar to those of the KERMES; but its principal use is as a colouring drug. When infused or boiled in water, it yields a crimson tincture, inclining to a purple. Fixed alkali renders the crimson deeper, but lessens its lustre. Volatile alkali heightens the colour, without diminution of lustre. The best method of applying volatile alkali for this purpose in dying, was found by M. Hellot to be, by dipping the cloth died with *cochineal* in a solution of sal ammoniac, and then throwing into the solution some portions by which the volatile alkali of the sal ammoniac is disengaged. By a small quantity of vitriolic acid the crimson decoction of *cochineal* is rendered purple; a greater quantity makes it flesh-coloured; and by adding more still, it becomes colourless. This colour is first changed to a yellow, and afterwards destroyed by nitrous acid. Solution of tin in aqua regis heightens the colour of this decoction to a scarlet, which is darker or brighter as the quantity is less or greater. Other metallic solutions have different effects. French dyers give fire to their scarlets, by the addition of turmeric; but this tinge does not penetrate the cloth, and soon perishes. Woollen cloth requires, for the scarlet dye, about one fifteenth its weight of *cochineal*, part of which is used with tartar, in the preparatory liquor, and the rest for finishing the dye, to each of which decoctions a proper quantity of the solution of tin is added. M. Hellot observes, that if *cochineal*, after the usual pulverization, be mixed with one fourth of its weight of pure dry crystals of tartar, and the mixture be levigated into an impalpable powder, the saving of *cochineal*, both for the crimson and scarlet dye, will be about one part in four, without any injury to the colour. The wild or sylvester *cochineal* is much inferior to the other: four parts of the former have no greater effect in dying than one of the latter; nor does it give equal beauty to the colour, especially the scarlet. Neumann's Works, with Dr. Lewis's additions, p. 506, &c. See DYEING.

Josselin, in his account of the products of New England, mentions a particular kind of sun-flower, called by some a species of *golden-rod*, the flakes of which are covered about the knots, in the summer months, with insects of the size of large fleas. These, preserved in a proper manner, yield a very elegant scarlet colour, and the author thinks might be made to supply the use of *cochineal*. There are whole plantations of the *cochineal* plant, or *tuna*, as the natives call it, about Guatimala, Chepe, and Guexaca, in the kingdom of Mexico. It is called renegrido, silpeada, &c. according to the manner of its preparation.

The COCHINEAL *grain*, or, as Dampier calls it, *silvester*, is a red berry, growing in America, found in a fruit resembling that of the *cochineal* plant, or *tuna*. The first shoot produces a yellow flower, then comes the fruit, which is long, and, when ripe, opens with a cleft of three or four inches. The fruit is full of kernels, or grains, which fall on the least agitation, and which the Indians take care to gather. Eight or ten of these fruits may yield about an ounce of grain. See *fig.* 14. 2.

This berry yields a dye almoſt as beautiful as that of the inſect; and a perſon may be eaſily deceived in them; though the other is much the moſt eſteemed. Dampier is miſtaken in ſuppoſing this laſt a ſeed. It is an animal of the ſame kind with the other.

COCHLEA, in *Anatomy*, the third part of the labyrinth, or inner cavity of the EAR.

The *cochlea* lies directly oppoſite to the ſemicircular canals, and is properly ſo called from the reſemblance it has to the ſhells that ſnails lie in; through its parietes a ſmall branch of the auditory nerve paſſes.

Its canal is divided by a ſeptum compoſed of two ſubſtances, one almoſt cartilaginous, the other membranous.

The two canals, that are divided by the ſeptum, are called *ſcalæ*: whereof the one, looking towards the tympanum, by the feneſtra rotunda, is called *ſcala tympani*; the other, having a communication with the veſtibulum, by the feneſtra ovalis, is called the *ſcala veſtibuli*: the firſt lies uppermoſt, and is the largeſt; the laſt lowermoſt, and is the leaſt.

The parts to be diſtinguiſhed in this in its true ſituation, are the *baſis*, the *apex*, the ſpiral *lamina*, the half ſeptum; by which its cavity is divided into two half canals, the ſpindle round which the *cochlea* turns; and laſtly, the orifices and union of the two ducts. The baſis is turned directly inward, toward the internal *foramen auditorium*; the apex outward, and the axis of the ſpindle is nearly horizontal; but in all of theſe allowance muſt be made for the obliquity of the *os petrum*, in which they lie. The baſis of the *cochlea* is gently hollowed, and towards the middle is perforated by ſeveral ſmall holes. The ſpindle is a kind of ſhort cone, with a very large baſis which is the middle of the baſis of the *cochlea*; through its whole length runs a double ſpiral groove, which, through a microſcope, ſhews a great number of pores. The *cochlea* makes about two turns and a half from the baſis to the apex, and the two ducts, being ſtrictly united together through their whole courſe, form an entire common ſeptum, which muſt not be confounded with the half ſeptum, or ſpiral lamina, as is often done. The firſt of theſe may be properly termed the common ſeptum, the other the particular, or half ſeptum: both of them are cloſely joined to the ſpindle, being thicker there than in any other place. The common ſeptum is complete, and ſeparates the turns entirely from one another, whereas the half ſeptum in the ſkeleton is only a ſpiral lamina, the breadth of which is terminated all round by a very thin border lying in the middle cavity of the *cochlea*. In a natural ſtate there is a membranous half ſeptum, which completes the partition between the two ducts. The two half canals turn jointly about the ſpindle, one being ſituated toward the baſis of the *cochlea*, the other toward the apex; for which reaſon, one of them may very well be termed the internal, the other the external; the uſual diviſion of them into the upper and lower flight not being agreeable to the natural ſtate, but liable to convey a falſe idea of it. The ſpiral volute of the *cochlea* begins at the lower part of the veſtibulum, runs from theſes forward to the top, then backward down to the bottom, afterwards upward and forward, and ſo on from the baſis, which is turned inward, to the apex, which is turned outward. It is eaſy hence to know to which ear a *cochlea* has belonged, when it is ſeen prepared. The two half canals communicate fully at the apex of the *cochlea*. Their ſeparate openings are toward the baſis, one of them being immediately into the lower part of the veſtibulum, the other into the feneſtra rotunda. Theſe two openings are ſeparated by a particular turning. Winſlow's Anat. p. 51.

COCHLEA, in *Conchyology*, the name of a very large family of ſea ſhell-fiſh, which are divided by authors into three diſtinct genera, from the figure of their mouths, ſome of which are circular, ſome ſemicircular, ſome oval. Theſe are expreſſed by the generical names *cochleæ lunares*, *cochleæ ſemilunares*, and *cochleæ ore depreſſo*. The two former genera are under LUNARIS *cochlea*, and SEMILUNARIS *cochlea*.

The characters of the third are theſe: it has an univalve ſhell of a broad figure, with a conoide baſe and an elevated ſummit, or ſometimes a plane and depreſſed one. It is umbilicated, and of a pearly colour within, and has a mouth of an oval figure, ſometimes furniſhed with teeth, ſometimes without any. The conic figure of theſe ſhells uſually diſtinguiſhes them at firſt ſight from all the other kinds.

Some of the ſpecies of this genus have their apex elevated to a conſiderable height, and forming ſeveral ſpiral turns. Theſe are properly called *ſabots* by the French, and *trochi* by the authors of other nations. Others have the apex leſs elevated, and are more of the common ſhape of ſnails. And finally, ſome of them have the apex quite depreſſed. This is enough to ſhew that in ſhells, in general, the elevation of the apex is no genuine character of a genus. Among the *trochi* there is one ſingle ſpecies which is umbilicated, the others are none of them ſo; and hence this forms a very grand diſtinction. Rondeletius obſerves that this genus of *cochleæ* was called *trochus*, from the reſemblance of ſome of the ſpecies to the ſhape of a boy's whipping-top.

From the figures of theſe ſeveral ſpecies of ſhells, it will be eaſily ſeen that the name *trochus*, according to the common derivation of the word, very badly expreſſes the ſeveral kinds, ſome of which are of that figure, and ſome no way approaching to it. They are much better expreſſed by the name *cochlea ore depreſſo*, which conveys an idea of an abſolute diſtinction, which takes place in them all, and in no other ſhells. See *Tab. of Shells*, N° 5, 6, 7, and *Tab.* III. *Fiſh*, *Cloſs* 3.

COCHLEA, in *Mechanics*, one of the five mechaniſal powers; otherwiſe called the SCREW.

It is thus denominated, from the reſemblance a ſcrew bears to the ſpiral ſhell of a ſnail, which the Latins call *cochlea*.

COCHLEARIA. See *Horſe*-RADISH, and SCURVY-*Graſs*.

COCK, *Gallus*, in *Ornithology*, the names of the males of gallinaceous birds; the diſtinguiſhing characters of which are, that the feet have each four toes, the front of the head has a comb, and the wattles are two, and are naked and flat. See GALLINACEOUS.

In the choice of a *dunghill-cock*, he ſhould be of a large body, very long from the head to the rump, thick in the girth, the neck long, looſe, and high; the comb, wattles, and throat large; the eyes round and large, and anſwerable to the colour of his plume or mane, as grey with grey, yellow with yellow, and ſo of the reſt; his beak ſhould be ſtrong and hooked; and his main or neck-feathers very long and gloſſy, covering his neck and ſhoulders: the legs ſhould be ſtraight, and of a long beam, with very large and long ſpurs, a little bending; the colour ſhould be black, yellow, or browniſh; the claws ſhould be long and ſtrong; the tail long, bending back, and covering the whole body; the wings very ſtrong; and the general colour ſhould be reddiſh. See FOWL.

COCK, *game*. In the choice of the *game*, or *fighting-cock*, four things are principally to be conſidered; theſe are the ſhape, colour, courage, and ſharpneſs of the heel. As to the ſhape, ſuch a one ſhould be choſen, as is neither too ſmall nor too large; the very large ones are always clumſy and unweildy, and the ſmall ones are ſlow and tedious in fighting, and are generally too weak to ſtand a very tight battle: another diſadvantage in theſe extremes is, that both are very difficult to be matched; the middle ſized one ought therefore ever to be preferred, as he is generally the moſt nimble and active with his ſtrength, and the matching him is eaſy. The head ought to be ſmall, the eyes large and brisk, and the beak ſtrong and hooked at the ſetting on; its colour ought alſo to anſwer to that of the principal or general colour of the feathers, whether that be yellow, reddiſh, or grey. The beam of his leg ought to be very ſtrong, and according to his plumage, either blue, grey, or yellow; and the ſpurs ought to be rough, long, and ſharp, a little bending, and pointing inward. The three colours eſteemed in the *game-cock* are grey, yellow, and red, with a black breaſt. The perfection of a *cock* is not, however, annexed abſolutely to theſe colours; for experience has ſhewn, that there are *cocks* of other colours which have proved excellent ones, but theſe are in general the beſt: the pied *cock* ſometimes turns out good, but the white and dun are ſeldom of any value.

If the neck of a *cock* be inveſted with a circle of a ſcarlet complexion, it is a ſign that he is ſtrong, vigorous, and has great courage; but, on the contrary, if it be pale and wan, it denotes him to be defective in theſe material particulars.

In order to prepare a *cock* for fighting, his mane is to be clipped off with a pair of ſhears cloſe to the fleſh, all the way down the neck, from the head to the ſhoulders; the feathers are alſo all to be clipped off cloſe to the rump, and the redder that appears the better condition the *cock* is in. The wings are to be ſpread by the length of the firſt riſing feather, and all the others are to be cut ſloping with ſharp points, that in riſing he may endanger the eyes of his adverſary. There muſt be no feathers left on the crown of the head, that the opponent can take hold of and his head ſhould be moiſtened with ſpittle; then the ſpurs being put on, he is to be turned into the pit to try his fortune.

The beſt ſeaſon for breeding the *game-cocks* is from the beginning of February to the middle or latter end of March; the neſt for the hen is to be made of ſweet and clean ſtraw, and ſhould be placed in ſome warm corner

out

out of the way of disturbance from other fowl; for this sort of interruption provokes this quarrelsome bird in such a manner as to endanger the eggs. That she may never have occasion to leave the nest, and cool her eggs, it will be proper to lay all sorts of food, that she is likely to approve of, before her, and to put clean water every day, not only for her to drink, but to wash and trim herself in; some ashes, sand, and gravel, should also be sifted on about the nest. The chickens are hatched in about three weeks, and the nest is to be carefully watched about this time, for there are always some of the chickens hatched before the others; these should be taken away as soon as out of the shell, and laid before the fire, or in some warm place, in wool, and as soon as the rest are hatched, these should be given back to the hen. They are not to be suffered to go abroad for the first fortnight, and the room they are kept in must be boarded, all other floors being too cold and too moist. At about a month old the chickens may be turned out into a walk of some fresh grass, that they may feed at liberty, and eat worms and other insects; but there must be no puddle of water near the place, for they are apt to get into such, and it occasions them a number of diseases. As soon as the comb and wattles appear on the *cocks*, they must be cut away, and the fore place anointed with fresh butter till it is well. The chickens may all be suffered to run together till they begin to peck one another, then the *cocks* are to be separated; each must have his particular walk, and the more free from disturbance this is, the better. The place of feeding them must either be a boarded floor, or a very soft and dry piece of ground. If the place be hard, as a stony pavement, or a pitched floor, the taking up their food will injure and blunt their beaks, so that they will never be able to hold fast afterwards. Any white corn is good for the young *game-cock* in his walk; and so is a white bread toast steeped in ale; at times this may be given him steeped in urine, which will serve to scour and cool him very well. There should never be more than three hens allowed to one *cock* in his walk; for if there are more he will consume his strength in the treading; and though his courage may not fail, yet he will never have the ability to go through a battle. Care is to be taken also as to his roosting place, that the perch be not too small in the gripe, and be so placed, that he may sit on it without straddling; if the perch be crooked it is also disadvantageous, for it will accustom the *cock* to such an uneven disposition of his feet, that he will be no good striker in the battle. The best method of contriving the roosting place is to have a row of short perches, about eight inches long, and the lowest ten inches from the ground, that he may ascend with the more ease; and when he is come to the roosting perch, be constrained to sit with his legs close together. A *cock* bred in this manner may be fought young; but the best method is not to hazard a battle till he is somewhat more than two years old.

Game-cocks are commonly brought to the state of their greatest strength and activity in about ten days, which Dr. Robinson calls their *athletic* WEIGHT; but they will scarce remain twenty-four hours in this condition; nay, some have been known to change for the worse in twelve hours.

COCK, *black*. See GROUSE.

COCK, *bloody-heeled*. See HEELER.

CUCK, *gor*. See GORCOCK.

COCK, *grubbing a*. See GRUBBING.

COCK, *high bearing*, is a term used with respect to fighting cocks; denoting one larger than the *cock* he fights.—A *high-bearing cock* is one over matched for height.

COCK, *Indian*. See CRAX.

COCK *of the mountain*, *Uragallus*, the name of a bird of the gallinaceous kind, being a species of the TETRAO. See *Tab.* III. *of Birds*, N° 25.

In shape it resembles the turkey, and approaches to it in size. Its legs are feathered down to the toes before and naked behind. It is common on the Alps, and in some parts of Italy, and is said to be found also in the mountainous parts of Scotland. Its flesh is very delicate.

COCK, *wood*. See WOOD-*cock*.

COCK-*boats*, small boats used in rivers, or near the shore, which are of no service at sea, because too tender, weak, and small.

COCK'S-*comb*, in *Botany*. See LOUSE-WORT, and AMARANTH.

COCK *of a dial*, the pin, style, or gnomon. See GNOMON.

COCK'S-*foot grass*. See GRASS.

COCK'S-*head*. See SAINTFOIN.

COCK-*paddle*, the Scotch name for the *lumpus*, a sea-fish, common on the English coasts, and called the lump-fish, or sea-owl.

COCK-*throppled*, a name given by dealers in horses to one whose wind-pipe is small, and bends like a bow when he bridles his head. See HORSE and HUNTER.

COCK-*water*, is a stream of water brought to a trough through a long pole, in order to wash out the sand of the TIN-*ore* into the launder, while it is brushing in the coffer of a stamping-mill.

COCK, in a watch or clock. See BALANCE.

COCKS, aboard a ship, are little square pieces of brass, with holes in them, and put into wooden barrels to keep them from splitting and galling by the pins of the blocks in which they move.

COCKATOON, a name usually given to the white MACAW, but more properly belonging to the whole MACAW-*tribe*.

COCKERINGS, an exaction, or tribute in Ireland, now reduced to chief-rents.

COCKET, or COCQUET, a SEAL belonging to the king's custom-house.

COCKET, or COCQUET, is a scroll of parchment, sealed and delivered by the officers of the custom-house to the merchants, upon entering their goods; *certifying* that the goods were customed. It likewise gives name to an office appointed for this purpose.

The same word is also used in the statute of bread and ale, 51 Hen. III. where there is mentioned *cocket-bread*, among several other kinds: it seems to have been hard sea-biscuit, which, perhaps, had then some *cocket*, *mark*, or *seal*; or else was so called from its being designed for the use of the cock-swains, or seamen.

COCKING *Cloth*, a device for the catching of pheasants. It consists of a piece of coarse canvas, about an ell square, dipped in a tan-pit to colour it; and kept stretched by two sticks, placed from corner to corner, diagonal-wise: a hole being left to peep through. The sportsman then being provided with a short gun, carries the cloth before him at arms-end; under cover of which he may approach his game as near as he pleases: when near enough he puts the noale of his gun through the hole, and shoots.

COCKLE, *Pellunculus*. See PECTEN.

COCKLE. See *Dwarf*-GRASS.

COCKLE-*stairs*. See STAIRS.

COCKPIT, a sort of theatre, whereon game-cocks fight their battles. The *cockpit* is usually a house, or bowl, covered over; they fight on the clod, or green sod; which is generally marked out round, and encompassed with seats, one above another.

The COCKPIT *Laws*, are principally these; when cocks are set, none are to be on the sod but the two setters. When the cocks are set beak to beak, in the middle of the clod, and there left by the setters, if the set cock does not strike in counting twenty, and six times ten, and twenty after all, the battle is lost; but if he does strike, the battle is to begin again, and they must count again. If any one offers a mark to a groat, or forty to one, and the wager be taken, the cock must be set, and they are to fight it out. Done, and done, is a sufficient bet, or wager, when the cocks are call on the clod.

COCKPIT, in a man of war, is a place on the lower floor or deck, abaft the main-capstan, lying between the platform, and the steward's room; where are subdivisions, or partitions, for the purser, the surgeon, and his mates. See *Tab. Ship, fig.* 2. *lit.* Z.

COCKROAD, a contrivance for taking of woodcocks. This bird lies close by day, under some hedge, or near the root of an old tree, to peck for worms under dry leaves, and will scarce stir out, unless disturbed; as not seeing his way so well in the morning: towards the evening he takes wing to seek for water, flying generally low: and when he finds any thoroughfare in a wood, he ventures through it.

To take them, therefore, they plant nets in such places; or, for want of such places ready to their hands, they cut roads through woods, thickets, groves, &c.

These roads they usually make thirty-five, or forty feet broad, perfectly straight and clear; and to two opposite trees they tie the net, which has a stone fastened to each corner. Then, having a hand or place to lie concealed in, at a proper distance, with a stake near the same, to fasten the lines of the net to: when they perceive the game flying up the road, they unwind the lines from off the stake; upon which, the stones drawing it down, the birds are entangled in the same.

COCKSWAIN, or COCKSON, an officer aboard a man of war, who hath the care of the boat, or sloop, and all things belonging to it. He is to be always ready with his boat's gang, or crew, and to mind the boats on all occasions. He sits in the stern of the boat, and steers; and hath a whistle to call and encourage his men.

COCOA, or more properly CACAO; the nut whose kernel yields the chocolate. See PALM-*tree*.

COCOI, in *Ornithology*, the name of a very beautiful bird of the

the Britiſh, of the heron-kind, of the bigneſs of the common ſtork: its fleſh is very well taſted.

COCOON. See SILK.

COCROTALEON, in *Natural Hiſtory*, a name given by the ancients to an animal generated between the hyæna and the lioneſs. This animal is deſcribed as having many of the qualities of the MANTICHORA; and it ſeems with ſome to be only another name for the ſame beaſt. It is called alſo LEUCROCOTTA, and *laucerdia*, and ſometimes ſimply *crocotta*, or *corocta*.

COCTION, a general name for all alterations made in bodies by the application of fire, or heat.

There are various ſpecies of *coction*; as MATURATION, FRICTION, ELIXATION, ASSATION, TORREFACTION, DITTION, DECOCTION, and CONCOCTION.

Various liquors are uſed, and different portions of time allotted for *coction*, according to the different intention of operators; or the particular natures of the ſubſtances to be boiled: ſo that nothing general can be determined with reſpect to this, the obſervation of which would be of general uſe to the operator: but we are to judge of the manner in which particular ſubſtances are to be boiled, from a knowledge of the reſpective natures of the bodies to be ſubjected to this operation.

This *coction* of the aliments in the ſtomach is their digeſtion or reduction to a ſort of emuſſion or chyle.

COD-*fiſh*, is the largeſt of the genus of the *aſelli*, called ASELLUS *maximus* by authors; and ſometimes, ASELLUS *tertius*, *five ſtriatus*. The characters by which this is diſtinguiſhed from other fiſhes of the ſame genus are theſe; its colour on the back and ſides is a duſky olive colour, variegated with yellow ſpots; its belly is white; its ſides have a long white line running their whole length, from the gills to the tail, which at the abdomen is curved, but elſewhere is ſtraight; its ſcales are very ſmall, and adhere ſtrongly to the ſkin; its eyes are large; at the angle of the lower jaw there hangs a ſingle beard, which is ſhort, ſeldom exceeding a finger's length: its tongue is broad; it has ſeveral rows of teeth, one of which is much longer than all the others. Among theſe there are ſome moveable teeth, as in the pike; and in the palate, near the orifice of the ſtomach, and near the gills, it has ſmall cluſters of teeth. It has three back-fins, two at the gills, and two at the breaſt, and two others behind the anus: and the tail is plain.

This fiſh according to its age, the places where is caught, or cured, and other accidents, has alſo ſeveral names given it. From the various places, it is called, the *Haberdeen*, from Aberdeen in Scotland; the *Green-fiſh*, from Greenland; the *North-ſea cod*, from the Northern ocean; and the *Iceland fiſh*, from Iceland. From other cauſes, it is called *ſtock-fiſh*, from the neceſſity of beating it with ſticks, before it is fit to be dreſſed: *barrelled-cod*, when cured, and put up in barrels; when young, a *codling*; and by the Dutch and Americans, *cabiaw*.

According to the Artedian ſyſtem, it is a ſpecies of GADUS; and it is diſtinguiſhed from the other ſpecies of that genus, by having beards at the mouth, the upper jaw longeſt, and the tail not forked.

The *laſt*, when freſh, produces good juice, and is nouriſhing; but when ſalted, and become too old, it is neither ſo well taſted, nor ſo eaſy of digeſtion. The pickle of *cod* is of a diſſolving drying nature, when outwardly applied; it is alſo uſed, among other things, in clyſters; for it is laxative, becauſe it contains much ſalt, irritates the inteſtinal glands, and forces liquor out of them.

COD-*fiſhery*. See *Cod*-FISHERY.

CODA, in *Italian Muſic*, literally ſignifies a *tail*; but is uſed often at the end of a canon, for two or three meaſures to cloſe with, after having repeated it ſeveral times. The *coda* ſerves only to end the piece, which, without it, might be carried on to infinity.

CODA *lunata*, in *Ornithology*, the name given by the Italian authors to the ſpecies of duck called by others the *anas cauduacuta*, and vulgarly known, in ſome parts of England, by the names of the CRACKER, or *ſea-phaſiana*. It differs from all other birds of the duck kind in the ſhape of its tail, which has two feathers longer than the reſt, and ending in a point. See *Pintail* DUCK.

CODAGA-*tree*, a name given to that otherwiſe called CONESSI, or *conefli*.

CODDAM-*apple*, in *Botany*, a name by which ſome authors have called the tree which produces the gamboge, the *gutta gamba* of the ſhops.

CODDY-*mallard*, in *Ornithology*, the Engliſh name of a common water fowl of the *larus*, or GULL kind, and diſtinguiſhed by the names of the *larus fuſcus*, or *larus Hyperboreus*.

CODE, CODEX, a collection of the laws and conſtitutions of the Roman emperors; made by order of Juſtinian.

The word comes from the Latin *codex*, *a paper-book*; ſo called *a caudicibus*, or *candicibus arborum*, *the trunks of trees*, the bark whereof, being ſtripped off, ſerved the ancients to write their books on.

The *Code* is comprifed in twelve books, and makes the ſecond part of the civil, or Roman law.

There were ſeveral other *Codes* before the time of Juſtinian; all of them collections, or abridgments, of the Roman laws. Gregorius and Hermogenes, two lawyers, made each a collection of this kind, called from their names, the *Gregorian Code*, and *Hermogenian Code*. The former included the conſtitutions of the emperors from Adrian, or, as ſome ſay, Auguſtus, to Diocletian and Maximian. The latter was compiled in the age of the Conſtantines, and comprifed all the imperial conſtitutions of Diocletian and Maximian, beſides thoſe of Claudius, Aurelian, Probus, Carus, and Cyprian, to the year 296 or 312. We have nothing remaining of theſe but a few fragments; the compilations themſelves falling to the ground, for want of authority to put them in execution.

Theodoſius the younger was the firſt emperor, who made a *Code*, which was comprifed in fifteen books, formed out of the conſtitutions of the emperors from Conſtantine the Great to his own time; abrogating all other laws not included in it: and this is what we call the Theodoſian *Code*; which was publiſhed in the year 438, and received and obſerved, till annulled by the *Code* of Juſtinian.

The Theodoſian *Code* has been a long time loſt in the Weſt: Cujas took a great deal of pains to retrieve it, and to publiſh it in a better condition than ever. Gothofred has given us a comment on the Theodoſian *Code*; a work which coſt him thirty years.

In 506, Alarick king of the Goths made a new collection of the Roman laws, taken from the three former *Codes*; the Gregorian, Hermogenian, and Theodoſian, which he likewiſe publiſhed under the title of the Theodoſian *Code*. The *Code* of Alarick continued a long time in force; and was all the Roman law received into France.

This *Code* of Alarick is ſometimes called the *Code* of Anian, becauſe compiled by Anian, who was chancellor to Alarick.

Laſtly, the emperor Juſtinian, finding the authority of the Roman law exceedingly weakened in the Weſt, upon the decline of the empire, made a general collection of the whole Roman juriſprudence. The management hereof he committed to his chancellor Trebonianus; who choſe out the moſt excellent conſtitutions of the emperors, from Adrian to his own time; and publiſhed his work in 529, under the title of the New *Code*.

But becauſe Juſtinian had made ſeveral new deciſions, which made ſome alteration in the ancient juriſprudence, he retrenched ſome of the conſtitutions inſerted by Trebonianus, and added his own in their place: on which account he publiſhed a new edition of the *Code* in 534, and abrogated the former. See CIVIL *Law*.

There have been various other later *Codes*, particularly of the ancient Gothic, and of the French kings; as the *Code* of Frederic, the *Code* Michaux, *Code* Louis, *Code* Novo, *Code* Henry, *Code* Marchand, *Code des Eaux*, *Code* Noire, *&c.*

Code *of honour*, *Codex canonum*. See CANON.

CODEX, in *Antiquity*, a kind of puniſhment by means of a clog, or block of wood, to which ſlaves, who had offended, were tied faſt, and obliged to drag it along with them; and ſometimes they ſat on it cloſely bound.

CODIA, *Codia*, in *Botany*, is uſed for the top or head of any plant; but, by way of eminence, for that of the white poppy: whence the ſyrup made therewith is called *diacodium*.

CODICIL, a ſchedule, or ſupplement to a will, or other writing.

It is uſed as an addition to a teſtament, when any thing is omitted which the teſtator would add, explain, alter, or retract; and is of the ſame nature as a teſtament, except that it is without an heir, or executor.

So that a *codicil*, is a leſs ſolemn will, of one that dies either teſtate or inteſtate, without the appointment of an heir: teſtate, when he that hath made his *codicil* hath either before or afterwards made his teſtament, on which that *codicil* depends, or to which it refers: inteſtate, when one leaves behind him only a *codicil* without a teſtament, wherein he gives legacies only to be paid by the heir at law, and not by any heir inſtituted by will or teſtament.

A *codicil*, as well as a will, may be either *written*, or *nuncupative*. Some authors call a teſtament, a *great will*, and a *codicil* a *little one*.

But there is this farther difference between a *codicil* and a teſtament, that a *codicil* cannot contain the inſtitution of an heir; and that in a *teſtat.* a man is not obliged to obſerve

observe strictly all the formalities prescribed by law for solemn testaments.

In customary countries, testaments, properly speaking, are no more than *codicils*; because custom itself names the heir, and does not allow of testamentary substitutes. *Codicils* were first brought into use in the time of Augustus, by L. Lentulus: they were originally intended to follow the testament; which was, as it were, their basis. In process of time, *codicils* came to have their effect, even though made before the testament; provided there was nothing in the testament contrary to the *codicil*. People were also allowed to make *codicils* without testaments.

Raymond Lully has a book which he calls The *Codicil*, wherein he pretends to have left his readers the secret of the philosopher's stone; provided they do but understand it.

CODLIN-*tree*. See APPLE-*tree*.

CODON, in *Antiquity*, a cymbal, or rather a little brass-bell, resembling the head of a poppy. They were fastened to the trappings and bridles of horses.

CODON, is also used to signify the orifice of a trumpet.

COECUM, in *Anatomy*, the *blind gut*; the first of the thick intestines; so called, because made like a sack, having but one aperture, which serves it for both entrance and exit. It is situate on the right side, below the kidney; and in length is about the breadth of three or four fingers. In children new-born, and in quadrupeds, it is found full of excrements; but in adults, &c. it frequently disappears, or hangs like a worm.

Its use in adults is very obscure; in a *fœtus*, or infant newly born, it appears to serve as a receptacle of the *fœces* during such time as the animal does not discharge by stool. See APPENDIX.

Dr. Gibbon imagines it may likewise serve in such animals as have it large, as dogs, coneys, rats, &c. for a kind of second ventricle, or bag, wherein the prepared aliment may be retained, while a richer and more nutritious juice is drawn from it.

Others will have it contain a ferment: and others, the flatus of the intestines: others fancy it may separate a humour, by some glands placed in it to harden the excrements as they pass through the colon.

Dr. Lister assigns the use of the *cæcum* to be, to keep the excrements which pass into the cavity (as most of those of sound animals, he thinks, do), till they are sufficiently drained, baked, and hardened, to receive the figure to be given them by the colon and rectum. He adds, to confirm this, that wherever there are regularly figured excrements of the first kind, there is a capacious *cæcum*, and *vice versâ*. That supposed is true that some animals, which are naturally loose, have either no *cæcum* at all, or very little; as the *lupus*, *echinus terrestris*, *gulo*, &c. The intention of nature, in thus providing for the figuration of the excrements, he takes to be, first, to prevent diarrhœas; secondly, to make the creature abide hunger the better, (thus it is, that fowls in winter, rest with full intestines); and, lastly, to heighten the digestion and fermentation in the stomach and small guts.

Dr. Musgrave gives us an account, in the Philosophical Transactions, of the *cæcum* of a dog being cut out, without any prejudice to the animal. M. Giles gives us another, of the *cæcum* of a lady being distended so as to form a tumor, that held almost three chopines of a thin greyish, and almost liquid substance, whereof she died. And Mr. Knowles, a third, of a boy's *cæcum* being vastly extended, and stuffed with cherry-stones, which likewise proved mortal.

Some say, the name *cæcum* is mistaken; not allowing this to be the *cæcum* of the ancients, which they imagine to be the thick globous part of the colon, immediately appended to the ileum; and therefore gives this part the name of *appendicula vermiformis*.

CO-EFFICIENTS, in *Algebra*, are numbers, or given quantities, prefixed to letters, or unknown quantities, into which they are supposed to be multiplied; and therefore, with such letters, or with the quantities represented by them, make the rectangle or product, *ex-sistent per-aduction*, whence the name.

Thus, in $3a$, or $b\times$, or Cx^3; 3 is the *co-efficient* of $3a$: b, of bx: and C, of Cx^3. If a letter have no number prefixed, it is always supposed to have unit for the *co-efficient*. Thus, a, or $1a$, import as much as $1a$, or $1b$. The *co-efficient*, in a quadratic equation, is according to its sign, either the sum, or the difference of the two roots.

In any equation of a higher nature, the *co-efficient* of the second term is always the aggregate of all the roots retaining their proper signs; so that if all the negatives be equal to all the affirmatives, the second term will vanish; and when the second term is thus wanting, it is a sign that the quantities under contrary signs were thus equal.

The *re-sistent* of the third term is the aggregate of all the rectangles arising by the multiplication of every two of the roots, how many ways soever those combinations of roots can be had; as three times in a cubic, six in a biquadratic equation, &c.

The *co-efficient* of the fourth term is the aggregate of all the solids made by the continual multiplication of every three of the roots, how often soever such a ternary can be had; as there may be four in a biquadratic, five in an equation of five dimensions, &c. And thus it will go on infinitely.

CO-EFFICIENTS *of the same order*, in *Algebra*, is a term sometimes used for the *co-efficients* prefixed to the same unknown quantities, in different equations.

Thus, in the equations $\left\{\begin{array}{l} ax+fy+gz=m \\ dx+ey+fz=n \\ gx+fy+cz=p \end{array}\right\}$ the *co-efficients* a, d, g, are of the same order, being the *co-efficients* of x: also e, f, b, are of the same order, being the *co-efficients* of y, &c. The *co-efficients* also that affect no unknown quantity, are said to be of the same order.

CO-EFFICIENTS, *opposite*, such as are taken each from a different equation, and from a different order of *co-efficients*. Thus in the foregoing equations, a, e, b, and d, b, f, as also d, e, b, are *opposite co-efficients*.

COEHORN. See MORTAR.

COELESTIAL, in a general sense, denotes any thing belonging to the *cœlum* or the heavens. Thus

COELESTIAL *observations* are observations of the phenomena of the heavenly bodies, made with a proper apparatus of astronomical instruments, in order to determine their places, motions, phases, &c.

The instruments chiefly used in *cœlestial* observations are the astronomical QUADRANT, MICROMETER, and TELESCOPE.

Observations in the day-time are easy: because the cross hairs in the focus of the object-glass of the telescope are then distinctly perceivable; in the night, those cross hairs are to be illumined to make them visible.

This illumination is either performed by a candle, placed obliquely near them, so that the smoke doth not intercept the rays; or, where this is inconvenient, by making an aperture in the tube of the telescope, near the focus of the object-glass, through which a candle is applied to illumine the cross hairs.

M. De la Hire has made an improvement on the first method, which renders it of very good use: and it is by covering that end of the tube next to the object-glass with a piece of gauze, or fine white silken crape. For, in such case a link placed at a good distance from the tube, so enlightens the gauze, as to render the cross hairs very perceivable.

Observations of the sun are not to be made without placing a glass, smoaked in the flame of a lamp or candle, between the telescope and the eye; to take off from its lustre, which would otherwise damage the eye, were not a good part of its beams intercepted.

Note, when any of the heavenly bodies are observed through a telescope of only two glasses, they appear inverted.

Cœlestial observations are chiefly of two kinds; the one, when the objects are in the MERIDIAN; the other when they are in VERTICAL circles.

COELESTIAL *globe*. See GLOBE.

COELIA, κοιλια, or κοιλον. This has many different significations; first, it imports a cavity in any part of the body, or in any of the viscera: secondly, it implies the same as *uterus*. The κοιλια, with the addition of κατω, that is, κοιλια κατω, in the lower belly, or intestinal tube.

COELIAC *artery*, the first artery detached from the descending trunk of the aorta into the abdomen.

It divides into two branches, the one on the right side, the other on the left; of which the first gives the *gastrica dextra*, which goes to the stomach; the *cystica*, which goes to the gall-bladder; the *epiploica dextra* to the *omentum*; the *intestinalis* to the *duodenum*, and to a part of the *jejunum*; and the *gastro-epiploica* to the stomach, to the *omentum*, and some branches to the liver, which enter the *capsula communis*, to accompany the branches of the *vena portæ*.

The left branch of the *cœliaca* gives the *gastrica dextra*, which is also spread upon the stomach; the *epiploica sinistra*, which goes to the *omentum*; and the *splenica* to the substance of the spleen. See each branch described in its place.

CŒLIAC *passion*, is a sort of diarrhœa, or flux of the belly; wherein the aliment comes away either crude or chylified, in lieu of excrements.

Dr. Friend recommends, for this disorder, such medicines as gently stimulate the intestinal tube, and deterge the obstructed glands; such as light and frequent purges and gentle vomits of ipecacuanha.

Authors frequently confound the *coeliac passion* with the *lientery*; but they are different.

There is also COELIAC *diuretics*, called *cœliaca urinalis*, wherein the chyle passes off along with, or instead of urine. See DIABETES.

COELIAC *vein*, is that which runs through the *intestinum rectum*. See RECTUM.

COELICOLOR, in *Natural History*, a name given by some to the OPAL.

COELOMA, in *Surgery*, a hollow and round ulcer, in the horny tunic of the eye.

COELUM. See HEAVEN.

COELUM is also used by some anatomists for the cavity of the eye towards the angles, or *canthi*. See EYE, CANTHUS, &c.

COELUS, in *Mythology*, one of the heathen deities, the same with the Greek *Uranus*.

COEMETERIUM. See CEMETRY.

COEMPTIONALES, among the Romans, an appellation given to old slaves, which were sold in a lot with others, because they could not be sold alone.

COENA *domini, bull*. See BULL.

COENOBITE, a religious, who lives in a convent or in community, under a certain rule; in opposition to ANACHORET, or HERMIT, who lives in solitude.

The word comes from *koinos*, *communis*, and *bios*, *vita*, *life*. Cassian makes this difference between a *convent* and a *monastery*, that the latter may be applied to the residence of a single religious, or recluse; whereas the *convent* implies *conventus*, or numbers of religious living in common.

Fleury speaks of three kinds of monks in Egypt; *anachoreti*, who live in solitude; *cœnobiti*, who continue to live in community; and *sarabaites*, who are a kind of monks errant, that stroll from place to place.

He refers the institution of *cœnobites* to the times of the apostles, and makes it a kind of imitation of the ordinary lives of the faithful at Jerusalem. Though St. Pachomius is ordinarily owned the institutor of the *cœnobite* life; as being the first who gave a rule to any community.

COENOBIUM, the state of living in a society, or community where all things are in common. Pythagoras is thought to be the author, or first institutor of this kind of life, his disciples, though some hundreds in number, being obliged all to give up their private estates, in order to be annexed to the joint stock of the whole. The Essenians among the Jews and Platonists, are said to have lived in the same manner. Many of the Christians also have thought this the most perfect kind of society, as being that in which Christ and his apostles chose to live. See CENOBITE.

COENOTAPH. See CENOTAPH.

CO-EQUALITY, a term expressing the relation of EQUALITY between two things.

The retainers to St. Athanasius's doctrine of the Trinity hold the Son and Holy Spirit *co-equal* with the Father. The Arians, &c. deny the *co-equality*. See TRINITY, and ARIAN.

COERULEUM *montanum*, signifies *mountain-blue*, which is called by some authors, CHRYSOCOLLA; it is a blue ORE *of copper*.

CŒRULEUM *minerum*. See ARMENIAN *stone*.

COES, among *miners*, are little hooles, which the miners make over their mines to lay ore in.

CO-ETERNITY is used, among *Divines*, to denote the ETERNITY of one being equal to that of another.

The orthodox hold the second and third persons in the Trinity *co-eternal* with the first.

COEUR, in *Heraldry*.—*Party-en* CŒUR, signifies a short line of partition in pale, in the centre of the escutcheon, which extends but a little way, much short of top and bottom; being met by other lines, which forms an irregular partition of the escutcheon, as represented in *Tab. Heraldr. fig.* 43.

CO-EXISTENCE, a term of relation, denoting two or more things to exist together at the same time, &c. See EXISTENCE.

COFFEE, in *Natural History*, a seed, or berry, brought from Arabia Felix; used for making a potable liquor of the same name.

That from the Levant is most esteemed, being greener, heavier, and appearing riper and plumper, than that from Mocha; which is larger, lighter, and whiter.

For *coffee-berries*, some substitute peas, beans, rye, and barley, which roasted, yield an oily matter, resembling in flavour, but less agreeable, as well as much less strong, than *coffee*.

COFFEE also denotes a kind of drink prepared from these berries: very familiar in Europe for more than a hundred years, and among the Turks for two hundred and fifty. The original is not well known: some ascribe it to the prior of a monastery, who, being informed by a goat-herd, that his cattle, sometimes browsing on the tree, would wake and capes all night, became curious to prove its virtues; accordingly, he first tried it on his monks, to prevent their sleeping at matins. Others, from Schebaeddin, refer the invention of *coffee* to the Persians; from whom, they say, it was learned in the fifteenth century by Gemaleddin, mufti of Aden, a city near the mouth of the Red Sea; who, having tried its virtues himself, and found that it dissipated the fumes which oppressed the head, inspired joy, opened the bowels, and prevented sleep, without being incommoded by it; recommended it first to his dervises, with whom he used to spend the night in prayer.

Their example brought *coffee* into vogue at Aden; the professors of the law for study, artizans to work, travellers to walk in the night, in fine, every body at Aden, drank *coffee*. Hence it passed to Mecca, where first the devotees, then the rest of the people, took it. From Arabia Felix it passed to Cairo.

In 1511, Khaire Beg prohibited it, from a persuasion that it inebriated, and that it inclined to things forbidden. But Selem Canfou immediately after took off the prohibition, and *coffee* advanced from Egypt to Syria and Constantinople.

The dervises declaimed against it from the Alcoran, which declares that coal is one of the number of things created by God for food. Accordingly, the mufti ordered the *coffee*-houses to be shut up; but his successor declaring *coffee* not to be coal, they were opened again. During the war in Candia, the assemblies of newsmongers making too free with state-affairs, the grand vizier Coprili suppressed the *coffee*-houses at Constantinople; which suppression, though still in force, does not prevent the public use of the liquor there. The first the traveller was the first who brought it into France; and a Greek servant called Pasqua, brought into England by Mr. Dan. Edwards, a Turkey Merchant, in 1652, to make his *coffee*, first set up the profession of *coffee-man*, and introduced the drink among us: though some say Dr. Harvey had used it before. The first mention of it in our statute-books is in the year 1660, when a duty of four pence was laid on every gallon of *coffee* made and sold; and in 1675, king Charles issued a proclamation to shut up the *coffee*-houses, because they were seminaries of sedition. The French first conveyed some plants to Martinico in 1727, whence it probably spread to the neighbouring islands.

The word *coffee* is originally Arabic: the Turks pronounce it *cahuah*, and the Arabs *cahuah*; which some authors maintain to be a general name for any thing that takes away the appetite; others, for any thing that promotes appetite; and others again, for any thing that gives strength and vigour.

The Mahometans, it is observed, distinguish three kinds of *cahuah*: the first is wine, or any liquor that inebriates: the second is made of the pods that contain the *coffee*-berry; this they call the *sultanes coffee*, from their having first introduced it, on account of its heating less than the berry, as well as its keeping the bowels open; the third is that made with the berry itself, which alone is used in Europe, the pods being found improper for transportation. Some Europeans, who imported the pods called them the *flower of the coffee-tree*.

The deep brown colour of the liquor occasioned its being first called *sherp of the Indian mulberry*; under which specious name it first gained ground in Europe.

The preparation of *coffee* consists in roasting, or giving it a just degree of torrefaction, on an earthen or metalline plate, till it hath acquired a brownish hue, equally deep on all sides: it is then ground in a mill, as much of it as serves the present occasion. A proper quantity of water is next boiled, and the ground *coffee* put in it. After it has just boiled, it is taken from the fire; and the decoction having stood a-while to settle, and fine, they pour, or decant it into dishes.

The custom is to drink *coffee* as hot as possible, with sugar; though the Turks do not trouble themselves to take off its bitterness with any sugar: their grandees add to each dish a drop of essence of ambergris: others boil it with a couple of cloves; others, a little anise-seed; others, cacoutich, or the grain of the cardamomum minus.—*Coffee* is one of the necessaries with which the Turks are obliged to furnish their wives.

The ordinary method of roasting *coffee* among us, is in a tin cylindrical box, full of holes; through the middle whereof runs a spit: under this is a semicircular hearth, wherein is a large charcoal fire: by help of a jack, the spit turns round, and so roasts the berries; being now and then taken up to be shaken. When the oil rises, and is become of a dark brown colour, it is emptied into two receivers, made with large hoops, whose bottoms are iron plates, into which these fall: there the *coffee* is shaken, and left till almost cold; and if it look bright and oily, it is a sign it is well done.

Coffin

Coffee is taken with very different, nay, frequently with directly opposite intentions; some use it to prevent sleep, others to promote digestion, &c. Its more real virtues, owned by the physicians, consist in this; that being an excellent stitic, it carries off fumes and blemishes of the head, arising from too much moisture, dissipates meagrims, and assists the astringency of the stomach; whence its use, after a debauch of strong liquors; and hence also its use in promoting watchings, bracing the fibres, and rendering them too tense for the relaxation required in sleep. It likewise promotes circulation, but that best with people of a pretty corpulent habit; being found hurtful in those who are thin, lean, dry, and of a bilious temperament; as it dries up the nerves, and inclines them to tremors: it is said to be prejudicial likewise to those who digest too fast; where the circulation is too quick, or where there is a spitting of blood arising from the mouth of any of the veins and arteries being too open, or the blood too thin and sharp.

Mr. Boyle mentions an instance of a person to whom *coffee* always proved emetic; and that much drinking of it produced the palsy. It is also known to be purgative to others.

The oily matter that separates from the *coffee*, and appears on its surface when roasted; and its particular smell, which distinguishes it from peas, beans, rye, &c. which some substitute in lieu of *coffee*, are to be the real indications of its effects. If considered with regard to the oil drawn by the retort, this, as well as that, contains volatile principles, both saline and sulphureous.

It is to the dissolution of its salts, and the mixture of its sulphurs in the blood, that its chief faculty of promoting watchfulness is to be attributed: hence also its property of promoting digestion, of precipitating foods, of preventing eructations, and of correcting acrimonies of the stomach, when taken after meals.

Hence also that fermentation of the blood, serviceable to corpulent people: hence also its diuretic virtue. By experience it is found of service to drink a glass of water before *coffee*, to render it laxative; and to mix it with milk or cream, to extinguish its sulphurs, embarrass its saline principles, and to render it nourishing.

S. Paulli, a Danish physician, maintains, that it enervates men, and renders them incapable of generation: and it is certain the Turks attribute the same effects to it; and from the immoderate use hereof, account for that dulness of intellect found in their provinces, formerly the best peopled. But this opinion is refuted by Du Four. M. Malebranche gave the Royal Academy of Sciences an account of a person cured of an apoplexy, by means of several glysters of *coffee*. It has proved of service in the case of an ASTHMA. From some experiments recited by Dr. Percival in vol. II. of his Essays Med. and Exp. it appears, that *coffee* is slightly astringent and antiseptic; that it restrains fermentation; and has a powerful sedative action on the nervous system.

For the laws relating to this commodity, see 6 and 7 W. III. c. 7. 3 and 4 Ann. c. 4. 10 Ann. c. 26. 5 Geo. I. c. 11. 10 Geo. I. c. 10. 11 Geo. I. c. 30. 5 Geo. II. c. 24. 15 Geo. II. c. 11. 5 Geo. III. c. 45. 19 Geo. III. c. 56.

The duty on *coffee* paid on importation is three pence a pound, besides an inland duty to be charged on the maker or seller of 2*s.* 6*d.* a pound, excepting for *coffee* grown in America, which pays only 1*s.* 6*d.* a pound.

No person is allowed to sell or retail *coffee* without a license, under the penalty of 5*l.* a month; and no person shall mix any materials to increase the weight, under a penalty of 100*l.* Every dealer in *coffee*, &c. is to have his house marked, *dealer in coffee*, &c. under a penalty of 20*l.* See TEA.

COFFEE-*tree*, *Coffea*, in *Botany*, a genus of the *pentandria monogynia* class. Its characters are these: the flower hath one petal, which is funnel-shaped, having a narrow cylindrical tube, and is plain at the top, where it is indented in five parts; it hath five stamina, which are fastened to the tube; the roundish germen afterwards becomes an oval berry, containing two hemispherical seeds, plain on one side, and convex on the other. We have but one species, which is supposed to be a native of Arabia Felix, where it was first cultivated for use; and to this day it is the country from whence the best *coffee* is brought to Europe. It is a low tree in the native country of its growth, where it seldom rises more than sixteen or eighteen feet high.

The great fault of the American *coffee* is the want of flavour, or having a disagreeable one; though the berries are much larger than those imported from Arabia. It is the constant practice of the planters to gather the fruit while it is red; at which time the berries are larger, and of greater weight than those which are permitted to ripen perfectly on the tree, which is not until they are turned black: whereas in Arabia they always shake the berries from the trees, spreading cloths under them to receive them; and take only such as readily fall each time.

As the *coffee-tree* is an ever-green, it makes a beautiful appearance at every season in the stoves: but particularly when it is in flower, and also when the berries are red, which is generally in the winter, so that they continue a long time in that state: these is scarce any plant therefore which deserves a place in the stoves more than this.

It is propagated by the berries, which must be sown soon after they are gathered from the tree; for if they are kept out of the ground any time, they will not grow.

COFFER, a large square box about three feet long, and one and a half broad, used for breaking in pieces an ore in a stamping-mill.

COFFER, *Coffa*, in *Architecture*, a square depression, or sinking, in each interval between the mouldings of the Corinthian cornice; ordinarily filled up with a rose, sometimes with a pomegranate, or other enrichment.

These sinkings, called also *panels*, are of different figures in the compartiments of vaults and soffits.

COFFER, in *Fortification*, denotes a hollow lodgment, athwart a dry moat, from six to seven feet deep, and from fifteen to eighteen feet broad: the upper part made of pieces of timber raised two feet above the level of the moat; which little elevation has hurdles laden with earth, for its covering; and serves as a parapet, with embrasures.

The *coffer* is nearly the same with the caponiere, excepting that this last is sometimes made beyond the counterscarp on the glacis, and the *coffer* always in the moat, taking up its whole breadth, which the caponiere does not.

It differs from the traverse, and gallery, in that these latter are made by the besiegers, and the *coffer* by the besieged.

The besieged generally make use of *coffers* to repulse the besiegers, when they endeavour to pass the ditch. To save themselves from the fire of their *coffers*, the besiegers throw up the earth on that side towards the *coffer*.

COFFER-*dam*, in French *Batardeaux*, in *Building*, denote inclosures formed for laying the foundation of piers, and for other works in water, in order to prevent the ambient water from interrupting the workmen.

These inclosures are sometimes single, sometimes double, with clay rammed between them: sometimes they are made with piles driven close by one another; sometimes the piles are notched or dove-tailed into one another; but the most usual method is to drive piles with grooves in them, at the distance of five or six feet from each other, and then boards are let down between them. See BRIDGE.

COFFERER *of the King's Household*, a principal officer in the court, next under the comptroller; who, in the compting-house, and elsewhere at other times, has a special charge and overlight of other officers of the house, for their good demeanour and carriage in their offices: to all whom he pays their wages. See HOUSEHOLD.

COFFIN, in a general sense, a wooden box or trunk, into which the bodies of dead persons are put, in order for burial.

COFFIN, in the *Manege*, the whole hoof of a horse's foot, above the coronet; including the *coffin*-bone, the sole, and the frush.

COFFIN-*bone*, is a small spongy bone, enclosed in the midst of the hoof, and possessing the whole form of the foot.

COFFIN-*joint*, is that where the lesser pastern joins the foot. A strain in this joint occasions a stiffness, which can only be removed by blistering and firing.

COFFIN, in the *Manufactures of China*. See CALLIATTE.

COGGESHALL'S *Sliding Rule*, an instrument used in gauging, so called from its inventor. See the description and use under SLIDING-RULE.

COGGLE, or COG, a small fishing-boat upon the coasts of Yorkshire; and *cogs* (*cogones*) are a kind of little ships or vessels used in the rivers Ouse and Humber. Stat. 23 H. VIII. c. 18. *Prætaxatis cogonibus, galeis, & aliis navibus, &c.* Mat. Paris, ann. 1066. And hence the cogmen, boatmen, and seamen, who after shipwreck or loss by sea, travelled and wandered about to defraud the people by begging and stealing; until they were restrained by divers good laws.

COGITATION, the act or operation of thinking. See THINKING.

COGNATION, in the *Civil Law*, the bond of relation between all the descendants of the same stock, both males and females; by which it is distinguished from *agnation*, which only comprehends the descendants of the male sex.

In France, for the succession to the crown they follow *agnation*; in England, Spain, &c. *cognation*; women coming

coming to the succession, according to the degree of proximity, in default of males, or their descendants from branch to branch.

In the *Roman Law*, the words *cognatio* and *cognati* are also taken in a more limited sense; *cognatio* signifying only the bond of relation between the descendants from the same stock by women; and *cognati* those between whom there was such a bond of relation subsisting.

COGNIOL, in *Ichthyology*, a name given by some to the fish more usually called *coius*, a kind of mackrel, differing from the common kind in nothing but that it is much smaller.

COGNISEE, or COGNIZEE, in *Law*, is the person to whom a fine of lands, &c. is acknowledged.

COGNISOR, or COGNIZOR, is he that passeth, or acknowledgeth a fine of lands and tenements to another. See COGNIZANCE.

COGNITIVE, is sometimes applied to that faculty or power of the human mind, by which we know any thing, or are enabled to distinguish truth from falsity.

Latin writers use the term *facultas cognoscitiva* in the same sense.

Hobbes has made use of the term *cognitive* power, for the power of knowing, or conceiving, in contradistinction to motive power, or appetite.

COGNITIONES *mittendi*, in *Law*, a writ to any of the king's justices of the common pleas, who has the power of taking a fine, and who, having taken a fine, defers to certify it, commanding him to certify the same.

COGNIZANCE, or COGNISANCE, in *Heraldry*. See CREST.

COGNIZANCE, or COGNISANCE, in *Law*, is the acknowledgment of a fine; or the confession of a thing done.

In which sense we say, *cognizans iuris, a chief that cognizes*.

COGNIZANCE is also used for the power, or jurisdiction.

Thus, *cognizance of pleas*, denotes an ability to call a plea out of another court, which no one but the king can do, unless he can shew a particular charter for it. Thus, if a scholar or other privileged person of the universities of Oxford or Cambridge, is impleaded in the courts of Westminster, for any cause of action, except a question of freehold; in such a case the chancellor or vice-chancellor, by charter confirmed by statute, may put in a claim or *cognizance*; which, if made in time, and accompanied with due proof, of the facts alledged, is allowed by the courts.

COGNIZANCE is sometimes used also for an audience, or hearing of a matter judicially. In which sense we say, *to take cognizance, &c.*

COGNIZANCE, again, is used for a badge on a waterman's or serjeeman's sleeve, which is commonly the giver's cost, whereby he is discerned to belong to this or that nobleman, or gentleman.

COGNOVIT *actionem*, in *Law*, is where a defendant acknowledges or confesses the plaintiff's cause against him to be just and true; and after issue, suffers judgment to be entered against him without trial. But most frequently the defendant confesses one part of the complaint, and traverses or denies the rest.

COGS, See COGGLE.

COGWARE is said to be a sort of course cloths, made in divers parts of England, of which mention is made in 15 H. 6. c. 12.

COHABITATION, implies a concubinage, copulation, or carnal knowledge, between two persons. It is rarely used except in a criminal sense.

COHEIR, a person who shares an inheritance or estate with another heir.

COHERENCE, a school-term, applied to propositions, discourses, &c. which have a CONNEXION, or dependance, on one another.

COHESION, or COHAESION, in *Physics*, the action whereby the particles, or primary corpuscles, whereof natural bodies consist, are connected, or bound together, so as to form particles; and those again kept together, so as to form sensible masses, or bodies.

The cause of this *cohesion*, or *mean materia*, has extremely perplexed the philosophers of all ages. In all the systems of physics, matter is supposed originally to be in minute, indivisible atoms.

How and by what principle these several and distinct corpuscles should come first joined and combined into little systems; and how they should come to persevere in that state of union; is a point of the most difficulty, and even of the most importance, of any in physics.

The opinion, maintained by many, is that so strenuously defended by J. Bernoulli, De Gravitate Ætheris; who accounts for the *cohesion* of the parts of matter, from the uniform pressure of the atmosphere: confirming this doctrine from the known experiment of two polished marble planes, which cohere very strongly in the open air; but easily drop asunder in an exhausted receiver.

However, if two plates of this kind be smeared with oil, to fill up the pores in their surfaces, and prevent the lodgment of air, and one of them be gently rubbed upon the other, they will adhere so strongly, when superficial even in an exhausted receiver, that the weight of the lower plate will not be able to separate it from the upper one. But though this scheme might serve tolerably well to explain the *cohesion* of compositions, or greater collections of matter, yet it falls short of accounting for that first *cohesion* of the atoms, or primitive corpuscles, whereof the corpuscles of hard bodies are composed.

Sir Isaac Newton delivers his doctrine of *cohesion* thus: "the particles of all hard homogeneous bodies, which "touch one another, *cohere* with a great force; to account for which, some philosophers have recourse to a "kind of hooked atoms, which, in effect, is nothing "else but to beg the thing in question. Others imagine, "that the particles of bodies are connected by rest, i. e. "in effect, by nothing at all; and others by conspiring "motions, i. e. by a relative rest among themselves. "For myself, it rather appears to me, that the particles "of bodies *cohere* by an attractive force, whereby they "tend mutually toward each other; which force, in "the very point of contact, is very great; at little di- "stances is less; and at a little farther distance is quite "insensible."

It is not certain in what proportion this force increases or decreases. Defaguliers conjectures, from some phenomena, that it decreases in a biquadratic ratio of the increased distance, so that at twice the distance it acts sixteen times more weakly, &c.

"Now, if compound bodies be so hard, as by experience we find some of them to be, and yet have a "great many hidden pores within them, and consist of "parts only laid together; no doubt those simple parti- "cles which have no pores within them, and which "were never divided into parts, must be vastly harder. "For such hard particles gathered into a mass, cannot "possibly touch in more than a few points; and there- "fore much less force is required to sever them than "to break a solid particle, whose parts touch through- "out all their surfaces, without any intermediate pores "or interstices. But how such hard particles, only laid "together, and touching only in a few points, should "come to *cohere* so firmly as in fact we find they do, is "inconceivable; unless there be some cause, whereby "they are attracted and pressed together.

"Now the smallest particles of matter may *cohere* by "the strongest attractions, and constitute larger, whose "attracting force is feebler: and, again, many of these "larger particles *cohering*, may constitute others still "larger, whose attractive force is still weaker; and so "on for several successions, till the progression end in "the highest particle, on which the operations in che- "mistry, and the colours of natural bodies, do depend; "and which, by *cohering*, compose bodies of a sensible "magnitude."

The different degrees of *cohesion* constitute bodies of different forms and properties. Thus, the same great author observes, the particles of fluids, which do not *cohere* too strongly, and are small enough to render them susceptible of tender agitations which keep liquors in a fluor, are most easily separated and rarefied into vapour, and make what the chemists call *volatile bodies*; being rarefied with an easy heat, and again condensed with a moderate cold.

Those whose particles are grosser, and so are less susceptible of agitation, or *cohere* by a stronger attraction, are not separable without a greater degree of heat; and some of them not without fermentation: and these make what the chemists call *fixt bodies*.

Air, in its fixed state, possesses the interstices of solid substances, and probably serves as a bond of union to their constituent parts; for when these parts are separated, the air is discharged, and recovers its elasticity. See AIR, *fixed*.

This kind of attraction is evinced by a variety of familiar experiments; as, by the union of two contiguous drops of mercury; by the mutual access of two pieces of cork, floating near each other in a bason of water; by the adhesion of two leaden balls, whose surfaces are scraped and joined together with a gentle twist, which is to considerable, that, if the surfaces are about a quarter of an inch in diameter, they will not be separated by a weight of 100 lb; by the ascent of oil or water between two glass planes, so as to form the hyperbolic curve, when they are made to touch on one side, and kept separate at a small distance on the *other*—see ASCENT; by the depression of mercury, and by the rise of water in CAPILLARY *tubes*, and on the sides of glass vessels; and also *linings*, *sponges*, and all porous substances. And where this *cohesive* attraction ends, a power of REPULSION begins. Professor Muschenbroeck has made many experiments

in

in order to determine the force of *cohæsion* in a great variety of different subjects. The adhesion of polished planes, about two inches in diameter, heated in boiling water, and besmeared with grease, required the following weights to separate them.

	Cold grease.	Hot grease.
Planes of Glass,	130lb.	300lb.
Brass,	150	800
Copper,	200	850
Marble,	225	600
Silver,	150	250
Iron,	300	950

But when the planes were made to adhere by other sorts of matter, the results were as in the following table:

With Water,	12 ounces.
Oil,	18
Venice turpentine,	24
Rosin,	850lb.
Tallow candle,	800
Pitch,	1400

In estimating the *absolute cohæsion* of bodies, he applied weights to separate them according to their length: his pieces of wood were of a long square figure, each side of which was .126 of an inch, and they were broken asunder by the following weights:

Wood of Linden tree,	1000lb.
Alder,	1000
Fir,	600
Oak,	1150
Elm,	950
Beech,	1350
Ash,	1250

He also tried wires of metal one tenth of a Rhinland inch in diameter: the metals and weights were as follow:

Of Copper	290lb.
Yellow brass,	360
Gold,	500
Silver,	370
Iron,	450
Tin,	40½
Lead,	29½

He then tried the *relative cohæsion*, or the force with which bodies resist an action applied to them in a direction perpendicular to their length. For this purpose he put pieces of wood by one end into a square hole of a metal plate, and hung weights towards the other end sufficient to break them at the hole; the weights and distances from the hole are exhibited in the following table:

	Distance.	Weights.
Fir,	9 inches,	40 ounces.
Oak,	8½	48
Elm,	9	44
Pine,	9½	36½
Alder,	9½	48
Beech,	7	56½

See Introductio ad Cohærentiam Corporum firmorum apud Physicæ Exper. & Geom. Dissertationes, p. 431, &c. and Introductio ad Philos. Nat. 4to. ed. 1702. tom. i. cap. 21.

COHOBATION, in *Chemistry*, a repeated distillation of the same matter, with the liquor drawn from it; that liquor being again and again returned upon the matter left at the bottom.

Cohobation is a kind of circulation, only differing from it in this, that the liquor is drawn off in *cohobation*, as in common distillation; and thrown back again; whereas in CIRCULATION it rises and falls in the same vessel, without ever being carried out.

The intention of *cohobation* is to dissolve the body, or to produce some change upon it. The operation is now neglected; but the ancient chemists practised it with great patience and zeal. To make it easier, and to prevent the great trouble of changing or moving the vessels, a particular kind of alembic is contrived, very convenient for the purpose, which is called a PELICAN.

COHORS *equitata*, in old inscriptions, has perplexed several antiquarians, who have been taught to consider the *cohorts* as appropriated to the foot service, as the *ala* and *turmæ* were to the horse. Mr. Horsley, in particular, imagines, the *cohors prima Claudia equitata*, which he had met with, was intended to intimate that this *cohort* had been promoted from the horse service; but when, by another inscription, he was led to consider that corps as consisting of a thousand horse, his difficulty is increased to that degree, that he knows not what to affirm upon it. But the learned Dr. Taylor thinks there is an easy solution of this difficulty.

The auxiliary, or provincial *cohorts*, were either entirely, or purely foot, like the the legionary or ordinary *cohorts*; or else they had a mixture of both kinds of militia, as appears from Gruter, DCXXIV. 5. This latter sort, as they could not properly be ranked under either denomination of horse, or foot, being made up of both, seem to have appropriated to themselves the distinguishing title of *cohortes equitatæ*, corps of infantry with a mixture of horse. And of this term we find frequent mention in inscriptions.

Hyginus also, *de* Castrametatione, gives us a full and decisive proof of this denomination, and of the manner of which such COHORTS consisted. Their troops consisted of a thousand men, part horse, and part foot, and were hence called *milliariæ*. The proportion of the horse to the foot was 240 to 760. His words are: *Hodie cohors equitata milliaria peditum octo partes, equitum tres habet; quidam decimas equitum quadraginta, centum decem.* Vide Phil. Trans. N° 480. sect 3.

COHORS *milliaria*. *See* above COHORS *equitata*.

COHORT, COHORS, in *Roman Antiquity*, a body of infantry, consisting of five or six hundred men; answering in most respects to our BATTALION.

The *cohort* was divided into three *manipules*, or companies; the manipuls into two centuries; and the century into an hundred men.

The first centurion in the first *cohort* was called *primipilus*; and had the charge of the eagle, or standard of the legion.—A legion consisted of ten *cohorts*.

When the army was ranged in order of battle, the *cohorts* were disposed in the following manner: the first *cohort* took up the right of the first line, as the companies of grenadiers do in our regiments; the rest follow'd in their natural order; so that the third was in the centre of the first line of the legion, and the fifth on the left; the second between the first and third; and the fourth between the third and fifth. The five remaining *cohorts* formed a second line in their natural order; thus the sixth was behind the first, and so of the rest.

The first, third, and fifth *cohorts*, were esteemed the best; at least it appears so from the post they took up, which were looked on by the Romans as the most important.

Marius is by some said to have been the first who divided the Roman forces into *cohorts*: which opinion seems confirmed by Festus; *Non enim in usu Latii fuerunt cohortium fit mentio, neque dubito, quin fecerint ea C. Marius primum cohortes ejus instituens.* But yet this is a great mistake, for the *cohorts* are often mentioned in Livy, and particularly, lib. xxvii. c. 13. *Marcellus—cohortibus quæ forma antiquata hordium dari solet, quingentos numero pedites, quos quisque ex suis manipulis fuerunt delectos, ejusdem virtutis defensuri.* This happened A. U. C. 543, and consequently several years before Marius was born.

COHORTS were distinguished, according to their appointment and office, into *auxiliary*, which were sent by allies; *equitatæ*, see above; *peditatæ*, which consisted of foot-soldiers only; *prætorian*, which was formed of the best soldiers, and served to guard the *prætor* or general. This *cohort* was instituted by Publius Posthumus, the dictator. Augustus likewise formed a *cohort*, under this appellation, consisting of nine thousand men; which was afterwards increased by Septimius Severus. There were also the *cohorts urbanæ*, a kind of militia, which guarded the streets of Rome; the *cohorts vigilum*, instituted by Augustus, which served on occasion of fires; and the *cohorts urbanæ*, established by Augustus, to guard the city.

COHUAGIUM, a tribute paid by those who meet promiscuously in a market, or fair; *cohus* signifying a promiscuous multitude of men in a fair, or market, probably from the French *cohue*.

COIF, the badge of a serjeant at law; who is hence also called SERJEANT *of the coif*.

The *coif* is of lawn, and is worn on the head, under the cap, when they are created, and ever after.

The use of the *coif* was to cover the *tonsura clericalis*, or clerical crown; because the crown of the head was originall clole shaved, and only a border of hair left around the lower part, which gave it the appearance of a crown. See TONSURE, &c.

COIL, on board a ship. See CABLE.

COILON, in *Antiquity*. See CAVEA.

COIN, *Mattier*, in the manufacture of money, medals, and counters, is a piece of steel well tempered, four or five inches deep, square at bottom, and round at top; whereon are engraved, dent-wise, with punchions, and other instruments, the several figures, marks, &c. to be struck on the moneys, &c. See COINING.

For the manner of engraving COINS, *See* ENGRAVING *in steel.*

COIN is more generally used for a piece of metal converted into money, by the imprinting of certain marks or figures thereon.

Coin may be defined, a species of money, ſtruck either with a hammer or mill.

Hence, *coin* differs from money, as the ſpecies does from the genus. Money is any matter, whether metal, wood, leather, glaſs, horn, paper, fruits, ſhells, or kernels, which have courſe as a medium in commerce.

Coins are a particular branch of moneys, viz. ſuch as are made of metal, gold, ſilver, or copper, and ſtruck according to a certain proceſs, called *coinage*.

It is obſerved, under the article MONEY, that the preciſe epocha of the invention of money is not known; it is too ancient for our annals; and if we might argue from the neceſſity and obviouſneſs of the thing, it muſt be nearly coeval with the world.

Whether *coins* be of equal antiquity, may admit of ſome doubt; eſpecially as moſt of the ancient writers are ſo frequent and expreſs in their mention of leathern moneys, paper moneys, wooden moneys, &c. Some however, notwithſtanding all this, are of opinion, that the firſt moneys were of metal: the reaſon they give, are the firmneſs, neatneſs, cleanlineſs, durableneſs, and univerſality of metals; which, however, do rather conclude, that they ought to have been ſo, than they actually were ſo.

In effect, the very commodities themſelves were the firſt moneys, i. e. they were current for one another by way of exchange; and it was the difficulty of cutting, or dividing certain commodities, and the impoſſibility of doing it without great loſs, that firſt put men on the expedient of a general medium.

Indeed, thus much may be ſaid in behalf of *coins*, that, in this view, it was natural for men to have their firſt recourſe to metals as being almoſt the only things whoſe goodneſs, and as it were integrity, is not diminiſhed by partition; beſides the advantages above expreſſed, and the conveniencies of melting, and returning them again into a maſs of any ſize or weight.

It was probably, then, this property of metals which firſt accuſtomed people, who trafficked together, to account them in lieu of quantities of other merchandizes in their exchanges; and at length to ſubſtitute them wholly in their ſtead; and thus aroſe money: as it was their other property to preſerve any mark or impreſſion a long time, which confirmed them in their right; and thus was the firſt riſe of *coins*.

In the firſt ages, each perſon cut his metal into pieces of different ſizes and forms, according to the quantity to be given for any merchandize, or according to the demand of the ſeller, or the quantity ſtipulated between them: to this end, they went to market, loaden with metal, in proportion to the purchaſe to be made, and furniſhed with inſtruments for proportioning it, and with ſcales for dealing it out, according as occaſion required.

By degrees it was found more commodious to have pieces ready weighed; and as there were different weights required, according to the value of the different wares, all thoſe of the ſame weight began to be diſtinguiſhed with the ſame mark, or figure: thus were *coins* carried one ſtep farther.

At length, the growing commerce of money beginning to be diſturbed with frauds, both in the weights and the matter, the public authority interpoſed; and hence aroſe the firſt ſtamps, or impreſſions, of money: to which ſucceeded the names of the moneyers; and at length the effigy of the prince, the date, legend, and other precautions to prevent the alterations of the ſpecies: and thus were *coins* completed.

On the foot wherron money now ſtands, it is divided into *real*, or *effective* money; and *imaginary* money, or money of *account*.

COINS, *modern, or ſpecies current in Europe, Aſia, Africa, and America.*—All the current ſpecies in the four quarters of the earth, at this day, are either made of metals, or they are ſhells, and fruits.

The metals are, gold, ſilver, copper, tin, and lead; to which may be added billon, a mixture of ſilver and copper in a certain proportion.

In Europe none are uſed beſide gold, ſilver, copper, and billon: in ſome parts of the Eaſt-Indies they likewiſe uſe tin and lead: as to ſhells and fruits, they are the ſmall money of ſeveral nations in Aſia, Africa, and America.

COINS, *Britiſh.*—In England, the current ſpecies of gold are, the guinea, half-guinea, jacobus, laureat, angel, and roſe-noble; the four laſt of which are now ſeldom met with, having been moſt of them converted into guineas, chiefly during the reigns of Charles II. and James II.

The ſilver *coins* are, the crown, half-crown, ſhilling, and ſixpence; the copper *coins* are, the half-penny, and farthing.

Value and proportion of the Engliſh COINS.

Farthing.						
2	Half-penny.					
48	24	Shilling.				
120	60	24	Half-crown.			
240	120	48	24	Crown.		
960	480	192	96	4	Pound Accompt.	
1008	504	201	84	4 1/5	1	Guinea or piece.

The Jacobus,	21	10	5	1
The Carolus, or Laureat,	23	11	5	1

It was made treaſon to counterfeit the *coin* of this realm, or to import counterfeit money, with intent to utter it, knowing it to be falſe, by 25 Edw. III. ſtat. 5. c. 2.

Counterfeiting foreign *coin*, current in this realm, is made treaſon by 1 Mary, ſeſſ. 2. c. 6.

Clipping, waſhing, filing the proper *coin* of this realm, or of any other realm current within this realm by proclamation, for lucre or gain, is made treaſon by 5 Eliz. c. 11.

Impairing, diminiſhing, falſifying the proper *coin* of this realm, is made treaſon by 18 Eliz. c. 1.

Making, mending, or aſſiſting in ſo doing; buying, ſelling, or having in poſſeſſion, inſtruments proper only for the coinage of money; and marking *coin* on the edges, by perſons not employed in the mint; are made treaſon by ſtat. 8 and 9 W. III. c. 26. ſect. 3. which is made perpetual by 7 Ann. c. 25.

Colouring, gilding, caſing, or waſhing any *coin*, reſembling the current gold *coin* of the realm, is treaſon, by ſtat. 8 and 9 W. III. c. 26. ſect. 4. 15 and 16 Geo. II. c. 28.

Lord Hale makes a query whether counterfeiting copper coin be not treaſon within the ſtatute of 25 Edw. III.?

Clippings or filings of the *coin*, bought or ſold, or knowingly found in the cuſtody of any perſon other than the officers of the mint, are forfeited, with 500*l.* half to the king, and half to the informer. 6 and 7 W. III. c. 19. ſect. 4. And the offender ſhall be branded in the cheek with the letter R.

Selling of blanched copper, or any compoſitions of metals or minerals, in imitation of ſtandard gold, is made felony by 8 and 9 W. III. c. 26. ſect. 6. 9.

Receiving or paying any diminiſhed or counterfeit money, under value, is made felony by 8 and 9 W. III. c. 26. ſect. 6. 9. 15 and 16 Geo. II. c. 28.

In Scotland, by the articles of the Union, it is appointed, that all the *coins* be reduced to the Engliſh, and the ſame accompts obſerved throughout. Till then the Scots had their pounds, ſhillings, and pence, as in England; but their pound was but twenty pence Engliſh, and the others were in proportion: accordingly, their mark was 13*s.* Scotch, current in England at 13*s.* 4*d.* their noble in proportion.

Beſide theſe, they had their Turnoter pence, and half-pence; their penny, one twelfth of that of England; beſides baſe money of achſons, babees, and placks: the bodle, one ſixth of the penny, one fourth of the achſon, one third of the baber, and one half of the placks.

In ſome parts of Scotland and the Iſle of Man, the penny is ſix ſeventhe of the Engliſh penny, the ſhilling or Manks equal to 10*d.* 2, and the Engliſh ſhilling equal in value to 14*d.* and the pound or Manks equal to 17*s.* 1*d.* 7.

In Ireland, the *coins* are as in England; viz. ſhillings, pence, &c. with this difference, that their ſhilling, or harper, is but equal to 11 3/13*d.* ſterling; or a ſhilling Engliſh is equal to twenty-ſix halfpence: whence their pound is only 18*s.* 5*d.* 3 of Engliſh money.

COINS, *French.*—The only gold *coin* now current in France is, the lewidore, or louis d'or; with the half, and the double louis. Till the year 1700, they had gold lys, and ecus, or crowns; but they are now no more.

The ſilver *coins* are, the greater ecu, or crown of ſix livres, the ecu of three livres, the piece of livre four ſols, and pieces of twelve ſols, and of ſix.

The billon *coins* are, of three kinds, each called *ſols*; ſome of twenty-four deniers, others of eighteen, and others of twelve; beſides the old half-ſol of nine deniers. To theſe may be added the deniers current in the Lionnois, Provence, Dauphiné, and other parts.

Laſtly, the copper *coin* is the liard, equal to three deniers; the double liard equal to 6*s.* and the ſou lav of twelve deniers.

Value and proportion of the French COINS.

Denier, equal to $\frac{1}{12}$ of a penny sterling.

100,	a piſtole,	0	16	9

COINS, *Perſian.*—Theſe are either ſilver, or copper; gold they have none. Of the firſt kind are, the halfi, mamoudi, ſhahee, and biſti; of the ſecond, the kabeſqui, and half-kabeſqui: the tela, or cheraſia, indeed, is gold; but it is leſs a money than a medal, though it has ſome courſe in commerce.

Coa	= 1/4 Engliſh penny.	l.	s.	d.
4,	a biſti,	0	0	1½
10,	ſhahee,	0	0	4
20,	mamoody,	0	0	8
25,	latin,	0	0	10
4 ſhahees,	an abaſhee,	0	1	4
5 abaſhees,	an ort,	0	6	8
12,	a bovello,	0	16	0
50,	a tomand or TOMAN of acc.	3	6	8

Some relations make the biſti a *coin* worth about one penny half-penny; but others only a term of account, ſignifying ten demars, or one thouſandth part of toman. See TOMAN.

Kabeſqui, or cabeſqui, equals five twelfths of a penny ſterling. Tela, or cheraſia, is uſually ſtruck at the acceſſion of a new king, and at the beginning of a new year; its weight and worth various.

COINS, *Chineſe.*—Throughout the Kingdom of China and Tonquin, there are not properly any *coins* ſtruck: inſtead of theſe, they cut their gold and ſilver into little pieces of different weights. Thoſe of gold, the Dutch, from their figure, which reſembles a boat, call *goldbars*: thoſe of ſilver, the natives call *leans*; the Portugueſe, *taels*. Their ſmall money is of copper: ten of theſe pieces make their ſhilling; and ten of thoſe their crown, or leam. Beſide theſe, they have a ſmall money of lead, mixed with the ſcum of copper, having holes in the middle to ſtring them on for the eaſe of numbering: this ſpecies is called *caſh*, *ca*, and *piſis*; and the ſtring, which uſually holds two hundred, is called *ſanta*. They are ſo very brittle, that they never fall without breaking into a great number of pieces; and if left all night in ſalt water, they ſtick ſo cloſe together, that they cannot be ſeparated.

There are two kinds of *goldbars*; great, and ſmall. Goldbar, an ingot, which, at 3*l.* 2*s.* per ounce, uſually amounts to 101*l.* 5*s.* ſterling. Other goldbars only weigh half as much; their value is in proportion.

A cazz,	= ¼ English penny.			
10,	a candereen.	*l.*	*s.*	*d.*
10 candereens,	a mace,	0	0	8
35,	a rupee,	0	2	6
2 rupees,	a dollar,	0	4	6
30 candereens,	a rix-dollar,	0	4	4½
7 maces,	an ecu,	0	5	0
2 rupees,	a crown,	0	5	0
10 maces,	a tael of acc.	0	6	8

COINS *of Japan.*—The Japonese strike coupants, both of gold and silver; and copper pieces with holes in the middle, like those of China; six hundred of these make the tael, or tale. Their other moneys, or quasi-moneys, are ingots, which they cut, like the Chinese, of different weights, chiefly three; the largest of the weight of six rials, viz. forty-eight taels, the tael equivalent to seventy-five Dutch stivers. The second equal to six taels and an half; and the third to ⅛ of a rial, or one tael ⅜.

Besides these they have a small silver money, in form of round beans, of no determinate weight, but usually weighed by mases; the common payment being by ten mases, which make one tael

	(Sterling.)	*l.*	*s.*	*d.*
Coupant of gold, weighing one ounce six drachms; its figure is a long oval, the longest diameter about four inches, and the shortest half an inch.		6	12	6
Other coupants of gold, near ½ of the former amounting to about,		3	4	2
Coupant of silver, current at	-	0	4	6

Other *coins* are as follow:

Piti,	= ¼ English penny.	*l.*	*s.*	*d.*
20,	a mace,	0	0	4
15 maces,	an ounce silver,	0	4	10½
20 maces,	a tale,	0	6	8
30 maces,	an ingot,	0	9	8½
13 ounces silver,	an ounce gold,	3	3	0
2 ounces gold,	a Japanese,	6	6	0
2 Japanefes,	a double,	12	12	0
21 ounces gold,	a cattee of account	66	3	0

COINS *of Siam*, viz. of *Pegu*, *Malacca*, *Sumatra*, *Java*, *Borneo*, &c. In the dominions of Siam are ftruck gold pieces five or six grains heavier than the half piftole of Spain; but thefe are rather pieces of curiofity, than ufe in commerce. Their filver *coin* is the tical, or baat; the diminutions whereof are the mayon, or feling, foang, and fompaye. Thefe pieces are all ftrangely ftruck: in form they refemble nuts, a little flatted at the extremities; and are fome of them cloven like horfe-fhoes; on two of the fides there are fome Siamefe letters. Their copper-money, called bia, is round and thick: beneath this is the cauris, or cork.

Cori,	= 1/320 Eng. penny.			
800,	a fettee,	*l.*	*s.*	*d.*
125 fettees,	a fataleer,	0	0	7½

8 fatcleers,	a crown,	0	5	0

COINS *of the coafts and iflands of the Indies.*—The principal, and thofe moft generally current, are pagodas, rupees, larins, fanos, or famons, and coupans, each whereof are ftruck both of gold and filver.

Befide thefe general *coins*, there are alfo particular ones, viz. at Goa, S. Thomas's of gold.—Along the Perfian Gulf, about Mecca, and throughout Arabia, the larin; along the coafts of Malabar, and at Goa, the parado and xeraphin of filver.—At Bantam, the fardos; at Malabar, the tare; at Siam, the tayl, and its diminution the mayam, foang, fompaye, and demi-foang: all of filver.—At Surat, Agra, and the reft of Indoftan, the pocha, or pefla, and doudou, all of copper.—The bafarucos and chedas, of tin. See laft and following articles.

COINS, *Mogul.*—In the dominions of the Great Mogul, are rupees, mamoudas, and pechas: the firft both of gold and filver; the fecond of filver alone; and the third of copper.

There are others ftruck by the princes tributary to him, and the powers bordering on him; but thefe are fcarce current beyond their refpective territories: particularly a fmall filver *coin* ftruck by the king of Matoucha, whofe territories lie to the north of Agra, of the value of the pecha of Mogul, but half as heavy again.—The rajah of Parta-jalamoula, to the north of Patua, likewife ftrikes fome little pieces, both of filver and copper, of fmall value.—The rajah of Ogden, who commands between Brampour, Serounge, and Amadabath, a fmall filver *coin*, equal to fix pence ftirling; and another of copper, equal to an halfpenny ftirling.—The king of Cheita and Pera, a tin money called chuda.—The king of Achem, little ftight gold pieces, worth about fifteen pence ftirling.—And tin pieces, eight of which are equal to the Engliſh penny, current in the iſles of Sumatra.—The gold *coin* of the king of Macaſſer and Celebes, is taken by the Dutch for a florin.—The king of Camboyas ſtrikes only pieces of ſilver and copper: his gold, wherein he abounds, is negotiated by weight.—The king of Java and Bantam, in the ſame iſland, and thoſe of the Molucca iſlands, ſtrike only copper *coins*: they allow foreign ſilver pieces to be current in their territories, but they coin nege.

For all the Spaniſh, Portugueſe, Dutch and Daniſh dominions in the Weſt Indies, or on the American continent, ſee the *coins* of the reſpective nations: but it muſt be obſerved, that the value of the CURRENCY alters according to the plenty or ſcarcity of *coins* imported. See Univerſal Table of *Coins*, annexed to Guthrie's Geography.

To the number of current coins which have diſtinct names to ſpecify them, may be added many more, both in Europe and Aſia, only denominated and known from their value: ſuch as thoſe called ſimply *pieces*, with the addition of their price; as in Spain, the piece of eight rials; in England, the piece of twenty-one ſhillings, or guinea; in France, the piece of four francs; pieces of ten ſols, or ſhillings; pieces of four ſols; pieces of two ſols; or of ſix franks, of 30, 15, 6, 4, &c. deniers, or pence. See PIECE.

COINS, *Shells current for.*—Theſe ſerve in many places for money; and are brought from the Maldives, and called in the Indies *cowries*: on the coaſts of Africa they change their names, and are called *bouges*.

In America they take a third name, viz. *porcellains*. Indeed theſe laſt do not come from the Maldives; there being ſhells found in the Weſt Indies much like thoſe of the Eaſt.

In the kingdom of Congo there is another kind of ſhells, called *zimbi*; though ſome will have them the ſame with the cowries. Cowries, cori, or bouges, are white ſhells, current particularly in the ſtates of the Great Mogul; ſixty-five are uſually reckoned equivalent to the done, a ſmall copper *coin*, worth about a halfpenny ſterling; which brings each cowry to 1/130 of a penny ſterling.

Porcelains are nearly on the ſame footing with the cowries. See PORCELAIN.

Zimbis are current, particularly in the kingdoms of Angola and Congo. Two thouſand zimbis make what the negroes call a *macuta*, or *macoute*; which is no real money, whereof there is none in this part of Africa, but only a manner of reckoning: thus, two Flemiſh knives they eſteem a macoute; a copper baſon, two pounds weight, and twelve inches diameter, three macoutes: a fuſee ten, &c.

COINS, *Fruits current for.*—There are kinds of fruits current for *coins*; two in America, particularly among the Mexicans; which are the cacao and maiſe: the other in the Eaſt Indies, viz. almonds; brought thither from Lar, and growing in the deſarts of Arabia.

Of the cacao, fifteen are eſteemed equivalent to a Spaniſh rial, or ſeven pence ſterling. See CACAO.

Maiſe has ceaſed to be a common money ſince the diſcovery of America by the Europeans.

Almonds are chiefly uſed where the cauris are not current. As the year proves more or leſs favourable to the fruit, the value of the money is higher or lower: in a common year, forty almonds are ſet againſt a peiche, or halfpenny ſterling; which brings each almond to 2/3 of a farthing.

COINS, *Ancient*, are thoſe chiefly which have been current among the Greeks, Jews, and Romans.

For Jewiſh COINS, *their Values and Proportion ſtand thus:*

			(Sterling.)	*l.*	*s.*	*d.*

Note, Of theſe the denarius, victoriatus, ſeſtertius, and ſometimes the as, were of ſilver, the reſt of braſs.

There were ſometimes alſo coined of braſs the triens, ſextans, uncia, ſextula, and dupondius.

	(Sterling.)	*l.*	*s.*	*d.*
The Roman gold *coin* was the aureus, which weighed generally double the denarius; the value of which, according to the firſt proportion of coinage, mentioned by Pliny, was,		1	4	3⅓
According to the proportion that obtains now amongſt us, worth,		1	0	9
According to the decuple proportion, mentioned by Livy and Julius Pollux, worth,		0	12	11
According to the proportion mentioned by Tacitus, and which afterwards obtained, whereby the aureus exchanged for 25 denarii, its value,		0	16	1

Theſe tables are formed on the ſuppoſition that ſilver is worth five ſhillings, and gold four pounds an ounce.

See Arbuthnot's Tables of Ancient Coins. See also on this subject an excellent paper by M. Raper, Esq. intitled an Enquiry into the Value of the Ancient Greek and Roman Money, in the Phil. Trans. vol. lxi. part ii. art. 48. p. 462. See DENARIUS and DRACHM.

COIN, in *Architecture*, a kind of dye, cut idogonal-wise, after the manner of the flight of a staircase; serving at bottom to support columns in a level; and at top to correct the inclination of an entablature, supporting a vault.

These *coins* have also the same effect with round balusters, which are not inclined according to any slight.

COIN is also used for a solid angle, compoſed of two ſurfaces inclined towards each other; whether that angle be exterior, as the *coin* of a wall, a tree, &c. or interior, as the *coin* of a chamber, or chimney: from the word *cuneus*, wedge. See QUOIN.

COIN, or QUOIN, in *Artillery*, a wedge of wood, ſerving to raiſe, or lower, the breech of a gun.

COINS, on board a man of war. See QUOINS.

COIN-*moulds*. See MOULDS.

Casting COINS, on board a ſhip, little ſhort pieces of wood, or billets, cut wedge-like, to lie betwixt the casks.

Standing COINS, on board a ſhip, billets, or pipe-ſtaves, to keep the casks from ſtirring or giving way.

Standing-coins are made of barrel boards, about four inches broad, and of a fit length to be driven in between the ends of a cask, about two or three hoops from the chine hoops, to keep the butts from jogging.

COINAGE, or COINING, the art, or act of making money.

Coining is performed either by the hammer or the mill. The firſt method is now little uſed in Europe, eſpecially in England, France, &c. though the only one known till the year 1553, when a new machine, or *coining* mill, invented by an engraver, one Antoine Borcher, was firſt tried in the French king's palace at Paris, for the coining of counters: though ſome attribute the invention of the mill to Varin, a famous engraver, who, in reality, was no more than an improver of it; and others to Aubry Olivier, who had only the inſpection of it.

The mill has met with various fate ſince its firſt invention; being now uſed, and again laid by, and the hammer reſumed: but it has at length got that footing, by the neatneſs and perfection of the ſpecies ſtruck with it, that there appears no great probability of its ever being again diſuſed. See MILL.

In either kind of *coining*, the pieces of metal are ſtamped, or ſtruck with a kind of punchions or dyes, wherein are engraven the prince's effigies, with the arms, legend, &c. The manner of preparing and cutting of which, ſee under ENGRAVING.

The firſt operations in *coining* are the mixing and melting of the metal. For the *firſt*, it is to be obſerved, that there are no ſpecies coined of pure gold or ſilver, but always a quantity of ALLOY of copper is mixed with them, or a mixture of ſilver and copper, for gold; becauſe ſilver alone would make the gold too pale, and copper too red: the reaſons are partly the ſcarcity of thoſe two metals, partly the neceſſity of making them harder by ſome foreign admixture; and partly to defray the expences of *coining*.

Now there are two kinds of alloying or miſcing. The proportioning of the alloy with the fine metal is eaſy in the firſt caſe; in the other it is more difficult. See ALLOY. Yet it is eaſily effected by the following method, taken from the anonymous author of the treatiſe at the end of that of Mr. Boiſard, viz.

Write down the ſeveral materials to be melted, their quality, weight, and fineneſs, in two diſtinct articles; the one containing thoſe above the ſtandard, the other thoſe under it: by caſting up the firſt, you ſhall have the exceſs; by the latter, the defect. Then comparing the two ſums, you will find, by ſubtraction, how much alloy muſt be added to bring the ſeveral matters to the fineneſs required.

For the melting, if the metal be gold, it is done in earthen crucibles: if ſilver or copper, in pots or crucibles of iron.

There are two kinds of furnaces proper for the melting of the metals; thoſe with only a draught of wind, and thoſe with bellows. See each explained under FURNACE.

When the gold and ſilver are in baſneo, i. e. are entirely melted, they are to be ſtirred and brewed together; the ſilver and copper with an iron ſtirrer, the gold with one of baked earth. In this ſtate they are pourèd into moulds or frames, for caſting them into long flat bars: the method of doing which is exactly the ſame with that uſed by the founders in ſand, both with regard to the frame, the manner of working the earth, and that of ranging the models or patterns.

The models are flat plates of copper, about fifteen inches long, and nearly of the thickneſs of the ſpecies to be ſtruck. In each mould are placed eight of theſe to make bars or plates, ten for half guineas, five for crowns, &c. and in proportion for copper; all the difference between caſting the bars of gold, and thoſe of the other metals, conſiſting in this: that the latter are taken out of the crucibles with ladles, and poured into the aperture of the mould; and that for gold, the pot or crucible is taken off the fire with a kind of tongs, and thence poured into the mould.

Thus far the proceſs is the ſame, in *coining* either with the mill, or the hammer: when the bars are taken out of the moulds, the difference commences; ſo that here the article of *coining* ſtrides into two branches.

COINING *by the Mill, or Milled Money*.—The bars or plates being taken out of the moulds, and ſcraped, and brushed, are paſſed ſeveral times through a mill, to flatten them farther, and bring them to the juſt thickneſs of the ſpecies to be coined; with this difference, however, that the plates of gold are heated again in a furnace, and quenched in water, before they undergo the *mill*; which ſoftens and renders them more ductile: whereas thoſe of ſilver paſs the mill juſt as they are, without any heating; and when afterwards they are heated, they are left to cool again of themſelves, without water.

The plates, whether gold, ſilver, or copper, thus reduced as near as poſſible to their thickneſs, are cut into round pieces, called *blanks* or *planchets*, near the ſize of the intended ſpecies, with a cutting inſtrument faſtened to the lower extremity of an arbor, whoſe upper end is formed into a ſcrew; which, being turned by an iron handle, turns the arbor, and lets the ſteel, well ſharpened, in form of a punch-cutter, fall on the plates; and thus is a piece punched out. See the cutting inſtrument repreſented in *Tab. Miſcellany, fig.* 2.

Theſe pieces are now given to be adjuſted, and brought by filing or raſping, to the weight of the ſtandard, whereby they are to be regulated: and what remains of the plate between the circles is melted again, under the denomination of *aſſel*.

The pieces are adjuſted in a fine balance; and thoſe which prove too light, are ſeparated from thoſe too heavy; the firſt to be melted again, and the ſecond to be filed down. For it may be obſerved that the mill through which the plates are paſſed, can never be ſo juſt, but there will be ſome inequality, whence will ariſe a difference in the blanks. And this inequality, indeed, may be owing to the quality of the matter as well as of the machine; ſome parts being more porous than others.

When the blanks are adjuſted, they are carried to the blanching, or whitening-houſe, i. e. the place where the gold blanks have their colour given them, and the ſilver ones are whitened; which is done by heating them in the furnace, and, when taken out and cooled, boiling them ſucceſſively in two copper veſſels, with water, common ſalt, and tartar; and, after that, ſcouring them well with ſand, and waſhing them with common water, drying them over a wood fire, in a copper ſieve, wherein they are put when taken out of the boilers.

The whitening, or BLANCHING, was formerly performed very differently from what it now is: and as the ancient method is ſtill in uſe among goldſmiths, and other workmen who uſe gold and ſilver, we have made a diſtinct article of it.

Formerly the planchets, as ſoon as blanched, were carried to the preſs, to be ſtruck, and receive their impreſſions; but now they are firſt marked with letters or graining, on the edges, to prevent the clipping and paring of the ſpecies, which is one of the ways wherein the ancient money uſed to be damaged. The machine uſed to mark the edges is very ſimple, yet ingenious; it conſiſts of two plates of ſteel, in form of rulers, about the thickneſs of a line, on which the legend or edging is engraven, half on the one, and half on the other. One of theſe plates is immoveable, being ſtrongly bound with ſcrews to a copper plate; and that again to a ſtrong board or table: the other is moveable, and rides on the copper plate by means of a handle, and a wheel, or pinion of iron, the teeth whereof catch in a kind of other teeth, on the ſurface of the ſliding plate. Now the planchet, being placed horizontally between theſe two plates, is carried along by the motion of the moveable one; ſo as by that time it has made half a turn, it is found marked all round. See *Fig.* 3.

This machine is ſo eaſy, that a ſingle man is able to mark twenty thouſand planchets in a day: Savary pretends it was invented by the ſieur Caſtagin engineer to the French king, and firſt uſed in 1685. But it is certain we had the art of lett'ring the edges in England long before that time; witneſs the crowns and half-crowns of Oliver Cromwell

Cromwell struck in 1658, which for beauty and perfection far exceed any French *essay* we have ever seen.

Laſtly, the planchets, being thus edged, are to be ſtamped, &c. their impreſſion is to be given them in a ſort of mill, or preſs, by the French called a *balancier*, invented towards the latter end of the ſixteenth century. See its figure in *Tab. Moſcellaneſ. fig. 3.*

Its chief parts are a beam, ſcrew, arbor, &c. all contained in the body of the machine, except the firſt, which is a long iron bar, with a heavy ball of lead at each end, and rings, to which are faſtened cords, which give it motion: this is placed horizontally over the body of the machine. In the middle of the beam is faſtened a ſcrew, which, by turning the beam, ſerves to preſs the arbor underneath it; to the lower extremity of which arbor, placed perpendicularly, is faſtened the dye, or matrice, of the reverſe, or arm ſide, in a kind of box, or caſe, wherein it is retained by ſcrews: and under this is a box, or caſe, containing the dye of the image ſide, firmly faſtened to the lower part of the engine, *fig.* 4. See MATRICE.

Now, when a planchet is to be ſtamped, it is laid on the image-matrice, upon which two men draw, each on his ſide, one of the ropes of the beam, and turn the ſcrew faſtened in it; which, by this motion, lowers the arbor to which the dye of the arms is faſtened: by which means the metal being in the middle, at once receives an impreſſion on each ſide, from either dye. As to the preſs formerly uſed, it has all the eſſential parts of a balancier, except the beam, which is here, as it were divided, and only drawn one way.

The blanks having now all their marks and impreſſion, both on the edges and faces, become money; but they have not currency till they have been weighed and examined.

For the COINING *of Medals*, the proceſs is the ſame, in effect with that of money: the principal difference conſiſts in this, that money, having but a ſmall relievo, receives its impreſſion at a ſingle ſtroke of the engine; whereas, for medals, the height of their relievo makes it neceſſary, that the ſtroke be repeated ſeveral times: to this end the piece is taken out from between the dyes, heated, and returned again; which proceſs, in medallions, and large medals, is ſometimes repeated fifteen or twenty times before the full impreſſion be given: care being taken, every time the planchet is removed, to take off the ſuperfluous metal ſtretched beyond the circumference, with a file.

Add to this, that medallions and medals of high relievo, on account of the difficulty of ſtamping them in the balancier, or preſs, are uſually firſt caſt or moulded in ſand, like other works of that kind, and are only put in the preſs to perfect them; becauſe the ſand does not leave them clean, ſmooth, and accurate enough. Medals, therefore, receive their form and impreſſion by degrees; money all at once.

The rule whereby they judge the metal to be ſufficiently ſtamped, is, when feeling it with the hand, it is found firm, and not to be ſhaken, as filling the dye equally every where.

COINING *with the hammer, or hammered money.*—In this method of making money, the bars or plates of gold, ſilver, or copper, being taken out of the moulds or frames, as above, are heated and ſtretched, by beating them on the anvil: when ſufficiently beaten, they are cut into pieces, which being again heated, flatted, and farther ſtretched with the hammer, are adjuſted by cutting off the angles with ſhears: thus, by cutting and rounding them, they are reduced to the weight of the ſtandard; and their roundneſs finiſhed with another hammer, which beats down all the points and angles ſtill remaining on the edges. In this manner they are brought to the ſize of the ſpecies to be coined.

In this ſtate the pieces become blanks or planchets, and are carried to the blanching-houſe; where they undergo the ſame preparation as the milled money already deſcribed, and are given to the miniſter to ſtamp them with the hammer.

For this laſt operation, which finiſhes the money, they uſe two punchions, or matrices; the one called the *pile*, and the other the *truſs*, or *quoin*; each engraven denewiſe; the pile bearing the arms, and the truſs the image, or croſs; both their legends, date, &c.

The pile, which is about eight inches high, has a kind of talon, or heel, in the middle, and ends in a point: which figure it had, for the ſake of being more eaſily ſunk, and more firmly faſtened to the block wherein the money is ſtruck.

The miniſter then laying the planchet horizontally on the pile, and covering it with the truſs, which he holds ſteadily in his left hand, gives ſeveral ſmart blows on the truſs with an iron mallet, held in the right; more or leſs, as the graving of the dyes is more or leſs deep. If after theſe firſt ſtrokes, the planchet be not ſufficiently ſtamped, it is returned again between the matrices, exactly in its former poſition, and the ſtrokes are repeated till the impreſſion be perfect.

Thus is the *coinage* finiſhed, and the planchets converted into money; which, after they have been examined as to their weight, become current.

COINAGE, *Engliſh.*—Since the inventionof milling money (the author whereof is not agreed on, nor even the country where it took its riſe, though the French lay claim to both) it has been imitated by ſeveralother nations; but by none with ſucceſs equal to that of the Engliſh, who carried it to the utmoſt perfection; both by the beauty of their graving, and by their inventing the impreſſions on the edges, that admirable expedient, for preventing the alteration of the ſpecies above mentioned.

Till the time of K. Charles II. the Engliſh money was generally ſtruck with the hammer, as that of other nations; and, in effect, it is but very lately, viz. in the reign of king William III. that the hammered ſpecies ceaſed to be current. Before they were put down, the Engliſh Money was in a woeful condition; having been filed and clipped by natives as well as foreigners, eſpecially the Dutch, ſo as to be ſcarce left of half the value: the reſtoring this diſtreſſed ſtate of the Engliſh money is looked upon as one of the glories of king William's reign; for which we are obliged, in good meaſure, to the happy conduct of the earl of Halifax.

The *coinage* of England is now performed wholly in the Tower of London; where there is a corporation for it, under the title of the *mint*.

Formerly there were here, as there are ſtill in other countries, what we call the rights of *ſeigneurage* and *braſſage*; but ſince the eighteenth year of king Charles II. there is nothing taken, either for the king or for the expences of *coining*; it having been ſettled by act of parliament, that all money ſhould be ſtruck at the public expence: ſo that weight is returned for weight, to all perſons who carry their gold and ſilver to the Tower.

There is a duty of ten ſhillings per ton on wine, beer, and brandy imported, called the *coinage* duty, granted for defraying the expence by ſtat. 18 Car. II. cap. 5. and continued and advanced by ſubſequent ſtatutes, 4 and 5 Anne, cap. 12. 1 Geo. I. cap. 43. 4 Geo. II. cap. 12. 3 Geo. III. cap. 16, &c.

The ſpecies coined in England are eſteemed contraband goods, and not to be exported; all foreign ſpecies are allowed by act of parliament, made in 1603, to be ſent out of the realm; as well gold and ſilver in bars, ingots, duſt, &c. Indeed, in the ſeſſion of parliament in 1718, endeavours were made to put a ſtop to this licence, which drains England of its richeſt metals; but in vain: the parliament having laid aſide the bill, without coming to any reſolution.

COINAGE *of Tea and Tools* is not under my diſcipline; each goldſmith, Jew, and even every private perſon, undertaking it at pleaſure: which renders their money exceedingly bad, and their commerce very unſafe.

COINAGE, *Moſcovite.*—The czar ſtrikes no money but ſilver, and that only in the cities of Moſcow, Novogrod, Twere, and Pleſcow: to which may be now added Peterſburg, the favourite city of her late czarian majeſty. The *coinage* of each of theſe cities is let out to farm, and makes part of the royal revenue.

COINAGE, *Perſian.*—All the money made in Perſia is ſtruck with the hammer; and the ſame may be underſtood of the reſt of Aſia and America, and the coaſts of Africa, and even Moſcovy; the invention of the mill not being yet gone out of Europe, nor even eſtabliſhed in every part of it. The king's duty, in Perſia, is ſeven and a half per cent. for all the monies coined; which are now reduced to ſilver and copper: there being no gold coined there, except a kind of medals at the acceſſion of a new ſophi.

COINAGE, *the Spaniſh*, is eſteemed one of the leaſt perfect in Europe: it is ſettled at Seville and Segovia, the only cities where gold and ſilver is ſtruck. It is true, there are brought from Mexico, Peru, and other provinces of the Spaniſh America, ſuch vaſt quantities of pieces of eight, and other ſpecies both of gold and ſilver, that, in this reſpect, it muſt be owned, there is no ſtate in the world where ſo much money is coined as in that of the king of Spain.

To take the repreſentation of a coin on paper, card, or paſteboard, ſee MEDAL.

CO-INDICATIONS, in *Medicine*, ſigns which do not indicate by themſelves alone, but together with other circumſtances, &c. help the phyſician to form a judgment.

COINING, in the *Tin-works*, is the marking the tin, when caſt into blocks, or ſlabs, with the figure of the lion rampant.

part. This is done by the king's officer. The king's custom is four shillings for every hundred weight.

COINUS, in *Natural History*, a name given by some writers to the gems of shells called PORCELLANA and *Concha veneris*.

COITION, the intercourse between male and female in the act of generation.

It is observed that frogs are forty days in the act of *coition*.

Bartholine, &c. relate that butterflies make an hundred and thirty vibrations of the wings in one act of *coition*.

COITION is also sometimes used for that mutual attraction, or tendency toward each other, which is found between iron and the magnet.

COJUMERO, in *Ichthyology*, a name given by some to the *manati*, or SEA-cow.

COIX, in *Botany*. See JOB'S *Tears*.

COKE, denotes pit-coal, or sea-coal, charred. It is prepared by burning them in ovens constructed for this purpose, and extinguishing the fire in the manner used for making CHARCOAL. See COAL.

COLAPTICE, the art of carving, or cutting, the resemblances and figures of natural things in stone. The term for the skill is *silvesis*.

COLARBASIANS, or COLORBASIANS, a sect of Christians in the second century; so called from their leader Colarbasus, a disciple of Valentinus; who, with Marcus, another disciple of the same master, maintained the whole plenitude, and perfection, of truth and religion, to be contained in the Greek alphabet; and that it was upon this account that Jesus Christ was called the *alpha* and *omega*. This sect was a branch of the VALENTINIANS. See also MARCOSIANS.

COLARIN, in *Architecture*. See HYPOTRACHELION and GORGERIN.

COLARIN is also used for the CINCTURE.

COLACISI, in *Natural History*, a name given by the people in the Philippine islands to a very small, but very beautiful species of the parrot, common in that part of the world, and called by others *rajà* and *gulo-fyà*.

COLATURE. See FILTRATION.

COLCHESTER-PLOUGH. See PLOUGH.

COLCHICUM, in *Botany*. See *Meadow* SAFFRON.

COLCHICUM, in *Medicine*. The general consent of authors condemns the root of the *colchicum* as a poison, on account of its acid and corroding quality; yet it is evident that the ancients esteemed it greatly: they called it *hiera-bulbus*. Some even gave it internally, in cases where it was necessary to make the patient vomit, it being esteemed a very good emetic: and others ordered its use externally, bruising it, and applying it to places where there were hard and violent pains.

Wedelius recommends it as an alexipharmic, and has written a treatise expressly on this subject. He frankly confesses to have taken his knowledge of its virtues from an obscure author, who, in a treatise of the plague, recommends it internally as a very beneficial medicine, and tells us that people were so well acquainted with its virtues, that they took it in considerable doses, and wore it about their necks, as a preservative against the infection. He found the virtues of this medicine were not confined to the pestilential and petechial fevers alone, but he gave it with the same success in the small-pox, the purple fever, and even the worst kind of the measles.

M. Stork of Vienna, discovered to the public the medicinal virtues of *colchicum*, and by experiments on himself ascertained it to be a most powerful diuretic, and a kind of miraculous remedy in the most deplorate dropsies. He digested an ounce of the solid root in a pound of vinegar for twenty-four hours, and then made an oxymel of this vinegar by mixing with it twice its quantity of honey: this medicine administered in doses of a tea spoonful, or a dram, promoted a copious discharge of urine. He also found, by many trials, that by giving a dram of it twice a day, and increasing the dose to an ounce or an ounce and a half in the day, it proved a very powerful diuretic, and of excellent service in hydropic and other serous disorders.

COLCOTHAR, in *Natural History, &c.* The Latin writers of the middle ages used *colcothar* as a name of vitriol in general, which is called by the Greeks *chalcanthum*.

Colcothar is originally an Arabic word, which does not signify the common vitriol, but the *chalcitis*. The word has been spelt *colchothar*, and from this the word *chalcitis* differs not very much. The Greeks of the middle ages followed the Arabians in the rule of the word *colcothar*, but added to it a termination proper to their language, and particularly to the custom of those times, which seemed not to express exactly the same thing, but a diminutive of it: they wrote it *colcotharion*, or *chalcitarion*. This they also called the *scebi*, *sechinion*, the *lodi cladion*, and to an hundred other instances. Avicenna uses the word *zeg* to express this substance, but then he is by no means determinate in it, but makes it include the *misy*, *sory*, and *melanteria*, as well as the *chalcitis*; but [illegible] gushing in another place the several kinds of [illegible] tells us, that one was the *chalcanth*, which [illegible] second the *chalcitis*, which was yellow; a [illegible] which was red. *Alzagiat* is a name also [illegible] express all these kinds; and this word the [illegible] generally render *atramenta*, inks. This is gen[illegible] posed to express their being all black substances, [illegible] not the case; but it properly signifies, that [illegible] are all vitriolic fossils: *atramentum* being a name of vitriol, as a substance used in the making of ink.

There are two kinds of *colcothar*, *natural* and *factitious*.

COLCOTHAR, *Natural*, otherwise called *chalcitis*, is a red vitriol, brought from Germany; formed from the common green vitriol, calcined naturally by some subterraneous fire.

COLCOTHAR, *Artificial*, is a substance which remains after martial vitriol has been calcined, and distilled for a long time by an intense fire; and by that means reduced to the redness of blood.

Mr. Le Fevre proposes an *easy* method of making *colcothar of vitriol*: he mixes two parts of filings of iron with one of sulphur, and a little water. After the acid of the sulphur has dissolved the iron, he exposes the paste to the air, and it changes into *colcothar*. See Mem. of the A. D. S. an. 1730. H. 32.

Colcothar of vitriol, after the action of the fire being calcified, or the metallic parts precipitated by the alkali, or by zinc, or any other of the imperfect metals, and sublimed with sal ammoniac, in either case an inflammable sulphur is prepared in the operation, and may be separated both from the sublimed flowers, and from the caput mortuum. This, and the sulphurous smell of spirit of vitriol, together with the sulphur produced by oil of vitriol and spirit of wine, prove abundantly what has been suspected by some, that vitriol contains sulphur as one of its principles, and a natural and necessary part of its composition. Phil. Trans. N° 103.

Colcothar, after calcination, retains some of its acid, and imbibes moisture from the air: but if it is washed in water, the remaining acid is discharged; it no longer attracts moisture, and becomes what they call the *sweet earth* of vitriol. Unwashed *colcothar* is an antiseptic, tonic, astringent and corrosive, and is therefore applied externally to all putrid, sanious, and fungous ulcers. See VITRIOL.

COLCUCULTIC, in *Ornithology*, the *American* name of a bird, of the partridge kind, described by Nieremberg. It is variegated with black, white and red, and is a very beautiful bird. Its colours are for the most part disposed not in spots, but in longitudinal lines on the back; but on the belly they are rather in form of small and short spots. Its legs and feet are blue. It is a well tasted bird.

COLD, is something devoid of HEAT, or which contains in it no particles of FIRE.

This definition is agreeable to the sentiments of most of the modern philosophers, who made cold a mere negative term; and suppose the thing to consist in a privation, or diminution of heat. Others define *cold*, much on the same principle, to be that state of the minute parts of a body, wherein they are more slowly and faintly agitated than those of the organs of feeling.—In which *cold*, *cold* is a mere term of relation: and hence the same body becomes liable to be perceived hot or *cold*, as its particles are in a greater or less degree of motion than those of the sensible organs.

Heat is supposed to consist in a particular motion of the parts of the hot body; and hence the nature of *cold*, which is its opposite, is easily deducible: for *cold*, we find, extinguishes, or rather abates heat, whence it seems to follow, that those bodies are *cold*, which check and restrain the motion of the particles wherein heat consists.

Now there are three kinds of bodies which may do this; viz. either those whose particles are perfectly at rest; or those whose particles are indeed agitated, but that less violently than those of the hot body to which they are applied: or, lastly, those whose particles have a motion proper for exciting the sensation of heat, but which move with a different determination; so as to remit and change the motion of the particles of the organ.

Hence there arise three different kinds of *cold*, or cold bodies: the first is, that cold common to all hard bodies, which consists in the rest of their parts. The second is that which arises from plunging any part of our body in water; which consists in this, that the parts of our pericardia, being more briskly agitated than those of the fluid, communicate part of their motion to it. The third, the *cold* felt in collecting even warm air with a fan, or in blowing hot breath out of their mouth, with the lips

lipo close shut; which consists in this, that the direct motion of the particles of air does, in some measure, change and retard the motion and determination of the parts of the body; and hence it is, that a *cold* body cannot cool another without heating itself. Hence also it is that the more parts of a slight body are at rest, the more must the particles of a warm body, applied to heat them, lose of their motion, and by consequence of their heat. Thus a marble having more quiescent parts than wood, which is full of pores and interstices, is felt colder than wood. Hence also we see why air, near marble and other dense bodies, feels somewhat colder than in other places.

On this principle, the two latter kinds of *cold* appear somewhat more than privations: the particles inducing the *cold* may be esteemed real frigorific corpuscles; and the coldness be deemed a real quality as well as horrefi.

These particles do not only check the agitation of those continually excited from the inner parts of the animal to the outer; but, having an elastic power, they bend and hang about the filaments of the body, pinch and squeeze them: and hence that acute pungent fenfation called *cold*.

That *cold* is more than a mere relation, or comparifon, is evident from its having real and positive effects; fuch as FREEZING, CONGELATION, CONDENSATION, RAREFACTION, BURSTING, &c.

Cold is the deftroyer of all vegetable life, when increafed to an exceffive degree; and it is difficult to fay how much increafe of it the hardier of them are, or are not able to bear. We find many of our garden plants and flowers, which feem to be very ftout and hardy, go off at a little increafe of *cold* beyond the ordinary ftandard. In the fevere winter in 1683, Mr. Roberts tells us, that the artichokes and cauliflowers all perifhed; and that the odoriferous fuffrutices, fuch as thyme, fage, lavender, cotton, and the like, were generally killed, very few efcaping, except fuch as had been planted the preceding year, and were therefore fo low as to have the advantage of a covering of fnow over them; which is the defence nature has given to the natives of the coldeft countries, and proves fuperior to any thing that can be invented by art for their preservation. In the corn-fields, fuch parts of them as had remained covered with fnow, had efcaped very well, the corn all looking freth and vigorous, after the melting of it in the fpring; but when the lands had lain fo expofed that the fnow had melted off, the crop was generally deftroyed, and the farmer obliged to ftow the place anew. Phil. Tranf. N° 169. See FROST.

Dr. Clarke takes *cold* to be owing to certain nitrous, and other faline particles, endued with particular figures proper to produce fuch effects. Hence, fal ammoniac, faltpetre, or falt of urine, and many other volatile and alkalizate falts, mixed with water, increafe its degree of *cold* very fenfibly. Hence alfo that popular obfervation that *cold* prevents corruption; which, however, muft not be admitted without an exception; fince, if a hard porous body have its interftices filled with water, and this be too much dilated by freezing, the including body will be burft, and thus it is, that *cold* proves deftructive to the parts of fome plants.

COLD, *Artificial*. See FREEZING, and THERMOMETER.

COLD, *Potential*. See POTENTIAL.

COLD *Baths*. See BATHS.

COLD *Fufion*. See FUSION.

COLD *Diamargariton*. See DIAMARGARITON.

COLD *Diatragacanth*. See DIATRAGACANTH.

COLD *Diftillations*. See DISTILLATIONS.

COLD, in *Medicine*, arifes from obftructed perfpiration, and is found to be productive of inflammatory diforders, as frozen limbs, gangrenes, coughs, pleurifies, peripneumonies, rheumatic pains, conſumptions, apoplexies, palfies, &c. which fee under their proper heads.

To remove a cold in the beginning, fmall and repeated bleedings are recommended, which likewife prove beneficial in coughs, and in the confirmed conſumption, even after purulent fpitting and hectic fymptoms have appeared. The quantity to be taken away at a time, may be from four to feven or eight ounces, once in eight or ten days; concerning which it is obfervable, that the patients do not find themfelves fo much relieved on the firft, as on the fecond or third night after bleeding.

What we commonly call catching *cold*, may be cured by lying much in bed; by drinking plentifully of warm fack whey, with a few drops of fpirits of hartfhorn in it, poffet-drink, water-gruel, or any other warm fmall liquor. In fhort it ought to be treated firft as a fmall fever, with gentle diaphoretics; and afterward, if any cough or fpitting fhould remain, by foftening the breaft with a little fugar-candy, and oil of fweet almonds, or a folution of gum ammoniac in barley-water; taking care to go abroad well clothed.

This is a much more eafy, natural, and effectual way, than the common practice by balfams, tinctures, pectorals &c. which ſerve only to fpoil the ſtomach, oppreſs the ſpirits, and hurt the conſtitution.

To prevent the catching of *cold*, the Jefuits bark is recommended in the Philofophical Tranfactions. Phil. Tranf. N° 478. p. 3.

COLD is alſo a diſeaſe to which horſes are ſubject; this is uſually occaſioned by want of regular exerciſe, by overheating them in riding, and ſuffering them to cool too faſt, or neglect of rubbing them down when they come in hot after journeys. The ſigns of a *cold* are a cough, heavineſs, watery eyes, kernels about the ears and under the jaws, gleets of the noſe, and rattles in breathing, &c. Bleedings, hot mathes of bran and water, and moderate exerciſe will, in moſt caſes, be an effectual remedy. To theſe may be added balls conſiſting of warm opening ingredients: Dr. Bracken preſcribes the following; take aniſeed, carraway ſeed, and grauier cardamoms, finely powdered, of each one ounce, two ounces of flower of brimſtone, one ounce and a half of turmeric in fine powder, two drams of ſaffron, two ounces of Spaniſh juice diſſolved in water, half an ounce of oil of aniſeed, one ounce and a half of liquorice powder, and a ſufficient quantity of wheat flour: let theſe ingredients be well beat in a mortar and made into a ſtiff paſte; and given in ſmall quantities about the ſize of a pullet's egg.

COLD *charge*, in *Farriery*, a medicine conſiſting of vinegar, bole, and the whites of eggs, mixed to the conſiſtence of a poultice, and ſpread over the injured part for the cure of ſtrains, &c.

COLD-*finch*, in *Ornithology*, the name of a bird of the *ornotix* kind, or nearly approaching to that genus, common about the Peak in Derbyſhire. Its belly is white; its breaſt of a yellowiſh brown, and its head and back of a brownith or greeniſh grey: the long feathers of its wings and tail are black, but with ſome variegation of white, toward the end; its beak is ſlender, ſtraight, and ſomewhat ridged or triangular; it feeds on worms and other inſects.

COLD *water*. See WATER.

COLDENIA, in *Botany*, a genus of the *tetrandria tetragynia* claſs. Its characters are theſe; it hath a funnel-ſhaped flower of one peral, ſpreading at the top, and obtuſe; and four ſtamina, which are inſerted in the tube of the petal. In the centre are inſerted four oval *germina*, each ſupporting a hairy ſtyle: the germina afterward become ſo many oval, compreſſed, rough fruits, terminated by four beaks, enclofed by the empalement. We know but one ſpecies of this genus, which is a native of India.

COLDSHIRE *Iron*, ſuch as is brittle when it is cold. See IRON.

COLE-*fiſh*, a name for a fiſh of the whiting-kind, called by authors *aſellus niger*, by Artedi and Linnæus reckoned a ſpecies of the GADUS, and in Cornwall, and ſome other parts of England, the *rawlin-pollack*. It is very common on the coaſts of Northumberland, Yorkſhire, and other northern counties of England, and is called the *cole-fiſh*, or coal-fiſh, from its blackneſs. It has ſomething of the taſte of the cod, but much inferior to it. This fiſh is ſalted and dried for ſale.

COLE-*mouſe*, in *Ornithology*, the name of a ſmall bird of the tit-mouſe kind, diſtinguiſhed from all the reſt by being the ſmalleſt of all the tit-mouſe kind, and having a white ſpot on the back part of its head. See TITMOUSE.

COLE-*pearch*, in *Ichthyology*, a name given to a ſmall fiſh, much eſteemed about Dantzick and other places for its delicate flavour. It is very like the common river pearch, but that it does not grow ſo large, and has a greater variety of colours, and its head is proportionably larger. Phil. Tranſ. N° 83.

COLE-*ſeed*, the ſeed of the napbew or napus, propagated in many parts of England to great advantage, for the oil expreſſed from the ſeeds. It is much ſowed in the moory land in fen countries; and the land is prepared for it by the method of BURN-*bating*, or DENSHING. The freſheſt mould is found beſt for it, or what the former has called a hufty ſoil, which is newly broken up, and has been long at reſt; but with plenty of manure, and deep frequent ploughing, it will grow in any ſoil. Indeed the land cannot be too mellow, nor too much pulverized for this plant.

It loves rich fat land, and ſucceeds very well on marſh and fen-lands, and particularly on ground newly recovered from the ſea. The ranker the land is for *cole-ſeed* the better. This ſeed is principally brought from Holland, though it is very good when taken from our own plants for growth as well as other uſes. The ſowing this ſeed is a very advantageous piece of huſbandry. The beſt ſeed is that which is largeſt, faireſt, and of the cleareſt colour. It is very apt to be mouldy, if not kept very dry. It is to be ſown in July, the land being previouſly

ploughed

ploughed and harrowed: the quantity of feed is half a peck allowed for an acre.

The plants are likewise hoed like turnips. The flugs and infects which infeft this plant are deſtroyed by a mixture of ſlaked lime and wood aſhes; ten buſhels of lime and fifteen of aſhes being allowed to an acre, and this alſo ſerves to forward the crop.

Some ſow it for the ſake of the ſeed; others by way of a winter food for the cattle in the months of January, February, and March, when other food is wanting. It will do very well in poor lands for this purpoſe; but the richer grounds only will make it rank enough for ſeed. If the winter be mild, it will after feeding grow again, and afford a ſecond winter's ſupply, and after cutting up the ſtumps, will ſhoot out young ſprouts, very ſweet, and in great abundance.

But Mr. Young obſerves, that turnips will anſwer the purpoſe much better; and he diſcourages the culture of it for food in April and May to ſucceed turnips, becauſe it produces only a ſmall quantity per acre: as he obſerves that if it is fed off with ſheep or cattle, and afterwards reſerved for ſeed, the crop is much damaged by it; and he adds, that the principal profit of the crop is the ſeed, which amounts to five times the value of food gained by it.

Mr. Miller, however, alledges that one acre of land, planted with *cole*, will produce nearly as much food as two acres of turnips; and there is this advantage attending the culture of this plant, that it will bear a ſevere froſt, and yield a conſtant ſupply of food, when the ground is ſo frozen, that the turnips cannot be taken up. But caution ſhould be uſed in feeding cattle with *this plant*. In the *ſen* countries they turn their ſheep to fatten upon the ſeed about Michaelmas; and it is obſerved that theſe will thrive more on this paſture in a month than they will on turnips in two.

In Flanders *cole-ſeed* is ſown and tranſplanted like cabbages: the land in which it is ſown is ploughed twice before winter; it is again ploughed in May, harrowed two or three times and rolled; and theſe operations are repeated in July; when the ſeed is ſcattered over it by the three fingers, the land is lightly harrowed and afterwards rolled. Twenty-four pounds of ſeed will ſow three acres, and yield plants ſufficient for twelve acres. The land for the plants, when the previous crop is removed, is twice ploughed; afterwards harrowed, and ploughed again with an open trench at ſmall intervals in September. In the beginning of October the plants are removed and placed in rows acroſs the furrows, at the diſtance of a foot, and about ſix inches diſtant from one another. The ground may be afterwards ſown with pulverized pigeon's dung, which is the beſt manure for theſe plants; allowing about thirty buſhels to an acre. The looſe earth in the trenches is then thrown among the plants in the rows; which is again repeated early in the ſpring. When it turns yellow, or about the beginning of July, it is reaped like corn, and after remaining three or four days ſtacked in the field, where it heats and yields a greater quantity of oil than it would have otherwiſe done, in September it is threſhed and dreſſed on a kind of floor in the field.

When it is kept for ſeed, it is to be reaped in the manner of wheat, as ſoon as one half of the ſeed looks brown: it is to be left a fortnight to dry on the ground, never turning it, for fear of ſhedding the ſeed; and when this time is over, it is to be gathered up in large ſheets, and carried to the barn for immediate threſhing; or it may be ſtrewed in the field on a large ſheet. Its common produce is five quarters of ſeed from an acre, and the value of this about five pounds.

Mr. Donellan, near Dublin, obtained a crop by the horſe-hoeing culture, of ſeventy-three tons ſix hundred weight on an Engliſh acre: but Mr. Young, by broadcaſt ſowing, and hand-hoeing, which he reckons the beſt method of cultivating this plant, obtained only five tons per acre.

The land, where this has grown, is very well prepared by it for wheat; though ſome ſow oats upon it, as what ſucceeds beſt of all after it. When the oil is preſſed out of the ſeeds, they uſe the remaining cakes in ſome places as firing: but in others they give them to their cows and other cattle in winter, when other food is ſcarce. They will very ſoon fatten thoſe deſigned for ſale: and the yellowneſs and rankneſs of the fat may eaſily be remedied, by feeding them on dry fodder a fortnight or three weeks before they are killed. In ſome places, they mix the powder of their cakes with water, and give it to their calves till they are three or four days old, inſtead of milk, and it does as well for them; till they are able to eat graſs or hay. It is a good method to burn the ſtubble on the *cole-ſeed* lands, for it is ſo ſtumpy that it is of no uſe to plow it in.

COLEOPTERA, in *Zoology*, an order of inſects, comprehending all thoſe with four wings; the external pair of which are hard, rigid, and opake, and form a kind of caſe for the interior pair; add to this, that the mouth conſiſts of two tranſverſe jaws.

Theſe animals are known in Engliſh by the general name of beetles; whereof authors have eſtabliſhed a great many genera, from the different figures of their *horns*, or horns, and other general diſtinctions; as the *ſcarabæus*, or beetle properly ſo called, the *cantharis*, *coccinella*, *chryſomela*, *dyſticus*, *tenebrio*, &c.

COLEWORTS, in *Gardening*, for the botanical character ſee BRASSICA. The common *colewort*, or Dorſetſhire kale, is now almoſt loſt near London; where the markets are uſually ſupplied with cabbage plants inſtead of them. Indeed, where farmers ſow *colewort* to feed their milch cattle in the ſpring, when there is a ſcarcity of *herbage*, the common *colewort* is to be preferred, as being ſo very hardy that no froſt will deſtroy it. The beſt method to cultivate this plant in the field, is, to ſow the ſeeds about the beginning of July, in moiſt weather, which will bring up the plants in about a fortnight. The quantity of ſeed for an acre of land is nine pounds. When the plants have got five or ſix leaves they ſhould be hoed, as is practiſed for turnips; but they ſhould be kept thicker than turnips, as being in greater danger of being deſtroyed by the fly: this work ſhould be performed in dry weather, that the weeds may be killed. About ſix weeks after, the plants ſhould have a ſecond hoeing, which if carefully performed will clean the ground, ſo that they will require no farther culture. In the ſpring they may be drawn up and carried out to feed the cattle, or theſe may be turned in to feed upon them as they ſtand; but the former method is to be preferred; for when the cattle are turned in among the plants, they will tread down and deſtroy more than they eat; eſpecially if they are not fenced off by hurdles. Miller.

COLIBERTS, *Coliberti*, in *Law*, were tenants in ſocage and particularly ſuch villeins as were manumitted, or made freemen. Domeſday.

But they had not an abſolute freedom; for though they were better than ſervants, yet they had ſuperior lords to whom they paid certain duties, and in that reſpect might be called ſervants, though they were of middle condition between freemen and ſervants. Du-Cange.

COLIBRI, in *Ornithology*, the name of a bird very remarkable for its beauty, its form, its manner of living, and its littleneſs. It ſucks its food from flowers, on which it ſeldom lights, but extracts the honey from their nectaria with its long, fine, delicate tongue. There are ſpecies of them which have all the colours of precious ſtones, and the moſt and moſt beautiful plumage imaginable. They fly with great rapidity, and are heard before they are ſeen, making a kind of humming noiſe, from which they are called HUMMING-*birds*.

COLIC, in *Medicine*, a ſevere gnawing pain, felt in the lower venter; ſo called, becauſe the ordinary ſeat of the diſorder was anciently ſuppoſed to be in the inteſtine colon.

Phyſicians uſually diſtinguiſh four kinds of *colic*; the *bilious*, *inflammatory*, *windy*, and *nephritic*.—The *bilious* colic has its riſe from certain ſharp, bilious, ſtimulating humours, which, being diffuſed through the inteſtines, vellicate their fibres, and occaſion a ſenſation of pain; though Willis takes the part here principally affected to be the meſentery.

Dr. Sydenham obſerves, that the *bilious colic* uſually attacks people about the beginning of ſummer; that it is generally attended with a vomiting of bilious green liquor; that the patient complains of exceſſive heat, great gripings, faintneſs, &c. and that if it be not ſoon relieved, it is apt to turn to the iliac paſſion.

Baglivi notes, that if the patient ſweat much, and be much enfeebled, the diſeaſe is apt to degenerate into a palſy. The cure, he ſays, depends on bleeding, gentle cathartics, and clyſters; and if it ariſe from a crapula, an emetic is to precede: after which, the cure is to be completed with proper anodynes.

COLIC, *inflammatory*, is the moſt dangerous, and ariſes from an inflammation of the ſtomach and inteſtines. See INFLAMMATION.

COLIC, *Windy*, is a vague pain, never ſtaying in any fixed place: being produced by windy vapours, which ſwell and diſtend the inteſtines they are incloſed in.

COLIC, *Nephritic*, is that felt particularly in the reins, whence it has its name.

It uſually has its riſe from ſome ſtone, or gravel detached from the kidneys, and fallen into the pelvis. The pareira brava is ſaid to be a ſpecific for *nephritic caſes*.

Some, particularly Sydenham, mention a *certain colic*, moſtly incident to hyſteric and hypochondriac perſons; but this appears only a ſpecies of the *windy colic*.

Persons subject to colics. These are diseases that attack both sexes, but in general women are more subject to them than men; and they are the more violent, and usually of longer duration in that sex than in the other. In women they usually appear gentle, and often trifling at first; but they gain strength by time, and often become convulsive. The persons of that sex, peculiarly subject to *colics*, are those of a sanguine temperament, and such as have had obstructions in the menses. Women in childbed are also very subject to flatulent *colics*, when the belly has not been properly bound round after delivery: in this case the *colics* not only are troublesome during the month of lying-in, but often become habitual, and do not leave them afterwards. In men, the middle-age is more subject to *colics*, than either the young or old periods of life; and people are most subject to fall into them who have been subject to irregularities in the hæmorrhoidal discharges, and who have nephritic complaints. Men are often thrown into the bilious *colic* by violent passions of anger, especially if they eat or drink immediately afterwards, or they themselves be of a CHOLERIC temperament.

Prognostics in colics. The oftener any person has been affected with *colics*, the more subject they are to return on any slight occasion, and the more likely to become habitual. All *colics* that attack persons with a chilliness first, are more violent than those which do not, and they often are either attended at the very first with an inflammation, or have one come on soon afterwards. In general also *colics* attended with costiveness are worse than those in which the patients have some stools. Reachings to vomit are always bad symptoms in *colics*, and give a suspicion of the case turning to a miserere or iliac passion; but this is to be observed, that when the patient has all before eaten very heartily, and drank much, especially of cold liquors, then such reachings are natural, and are not to be accounted the bad symptoms they are at other times. In women, when the reachings are violent, there is always danger of a vomiting of blood. The more violent the pains of the *colic* are, the more danger there is of their bringing on convulsions. A *colic* arising from a stoppage of the menses, and attended with a stagnation of blood about the viscera, when it is of long standing, threatens the coming on of a quartan, a dropsy, or cachexy. And a hæmorrhoidal *colic*, when arising from a retrocession of the gout or sciatica, by wrong medicines, is always a case of great danger. This, however, always happily goes off, if there comes on a discharge of blood, or even of a serous matter, from the hæmorrhoidal veins. Sometimes also it goes off at once, but very unhappily, by a sudden regurgitation of the matter upon the viscera, especially upon the liver: the consequences of which are, obstruction of that viscus, ascites, hectics, or dropsies. Sometimes also this *colic* goes off by the appearance of scorbutic spots on the body, in different parts.

The bilious *colic*, if the offending matter be not immediately evacuated, after its acrimony has been abounded by a proper medicine to fit it for evacuation, too often brings on dangerous inflammatory fevers. In *colics* which have held the patient a long time, a hiccough coming on is a very bad omen. Finally, a *colic*, when improperly treated with opiates and anodynes, often brings on a palsy.

Method of cure. In flatulent and sweating colics, carminative and emollient clysters are to be injected, composed of decoctions of chamomile-flowers, marshmallows, and a mucilage of the elder proprietas, or common salt, by way of ptisan; and after this the carminative medicines, such as angelica-root, Winter's bark, anise and caraway seeds, and cloves, with the other spices, are to be given, with intermediate doses of laxative medicines; and to these medicines may be added occasionally, the digestive salts, such as vitriolated tartar, with nitre and cinnabar, and the spirit of tartar, and sweet spirit of nitre, with the essence of orange-peel, &c.

In the bilious colic, the attemperating and absorbent medicines are to be given; as nitre, mother of pearl, calcined crystal, oil of almonds, and manna, with the broths of white meats, and the carminative seeds. If these things are thrown up by vomit, recourse must be had to clysters, and to applications of warm things to the abdomen, such as are before described.

In the hæmorrhoidal and nephritic cases, clysters are to be frequently given of oil of olives and linseed, with a little nitre. After this, warm broths, with oil of sweet almonds, are to be drunk in frequent draughts, and powders composed of nitre, crab's eyes, and cinnabar, are to be given at frequent intervals; and if the pains are vehement, a small dose of theriac, or of the Burgundy-pitch, may be given with the powder, to be taken at night. When the violence of the fit is over, the gentle alexipharmics are to be given, with strengthening medicines, to restore the due tone of the parts. Externally fomentations may be applied to the rectum, and cataplasms of the leaves of mullein and mallows, on which the patient may sit while they are warm; and hemp may be applied to the abdomen by bladders half filled with water, or milk made of a due warmth, and by bricks heated a little, and by bags containing carminative and nervine ingredients. Liniments may also be rubbed in of the oils of naturings and bays, and spirit of wine and camphor, particularly in the part where the pain is most violent.

In the hysteric colic, clysters are frequently to be injected, made of decoctions of the herb vervain in broth, with a little of the oil of dill and common salt. When the patient is averse to clysters, and the case is not violent, warm baths for the feet, and the sitting over the steam of warm water, will sometimes prove sufficient, and gentle purges of decoction of senna, and the like, are to be given, or a gentle dose of the extract of soap, dissolved with the yolk of an egg in some of the uterine waters: after these, alexipharmics and carminatives are to be given, such as the roots of pimpernel and angelica, with anise and the other warm seeds. If the case is violent, the intemperating nitrous medicines may be given, and with them gentle anodynes; and finally, such things as will restore the due tone to the parts. The person should be kept in a gentle warmth during the whole time of the disease, and spirit of castor may be occasionally rubbed in on the abdomen.

By way of preservative from the hæmorrhoidal and hysteric *colic*, it is very proper to bleed in the foot at the spring and autumn seasons, and proper marine medicines should be taken to keep up the menstrual discharges; and to prevent suppressions of the hæmorrhoidals, leeches should be applied to the parts, and the bowels should be carefully kept gently lax. Juncker's Conspect. Med. p. 573. Dr. Percival recommends alum, in doses of ten to twenty grains every four or six hours, as an effectual remedy in various painful disorders of the bowels. Cayenne, administered either in clysters, or by the mouth, is likewise an excellent remedy in all cases of this kind. See Med. Obs. vol. ii. p. 285, &c.

This distemper has sometimes taken its rise from concretions formed on plum-stones lodged in the guts. See Memoir. Lit. Edinb. vol. i. art. 32. Abridgm. vol. ii. p. 214.

Colics have sometimes arisen from vitrifiables in the intestines; and the VITRUM *antimonii crocum* has been found successful in such cases.

Bagliv recommends chamomile as an antidote against the *colic*, from what cause so ever it arise. Where the disease is obstinate, much riding has been found of special service.

COLICA *Dammoniorum, or Devonshire* COLIC of Huxham, is probably the same disease with the *colica saturnina* of Juncker, the *colica Pictonum*, and *plumbariorum*, of others, and the dry belly-ach of the West Indies; and has been described by different writers under a variety of names, as the *bilious colic*, the *painter's colic*, &c. taken from the peculiar circumstances that have attended it: and as the immediate cause of it is a spasm, it has been frequently called the *spasmodic colic*. The *colic of Poitou*, and that of *Devonshire*, have been ascribed by Dr. Baker to the same cause; viz. the poisonous quality of lead. As the former disease prevailed most, where the wines were weak and sour, some writers attributed it to the acid of the wine; whilst others, with greater probability, ascribed it to the litharge which was used to correct the acid, and to improve the taste of the wine: and it is observable, that the most acid wines were drunk with impunity, till this fraudulent adulteration was introduced. Dr. Baker has attributed the endemial *colic* of Devonshire to the lead, with which the cyder of that county is impregnated: in proof of which charge, he alledges, that this disease is no longer known in the province of Poitou, and other parts of France and Germany, since the pernicious method of adulteration, above recited, has been made punishable with death: and that in the counties of Hereford, Gloucester, and Worcester, where no lead is used in the cyder apparatus, this disease is not known: that it prevails most in those parts of Devonshire where the greatest quantity of cyder is made: and that their machinery for making it has a quantity of lead in it: and that the must, or expressed juice of the apples before fermentation appeared, by experiments, to have had dissolved lead in it. Others have ascribed this disease to the roughness and acidity of the Devonshire cyder, and not to the lead solution. Gentle purges and opiates have been recommended for the cure of this disorder: some have prescribed mercurial salivation: others have applied blisters to the thighs, near the groin, and to the belly: and others again have extolled alum. Med. Trans. vol. i. p. 175, &c. Ibid. vol. ii. p. 68, &c. Husham de Morbo Colico Dammoniorum apud Oblerv. de Aeris, &c. vol. i.

COLICA *Arteriæ* and *Venæ*, in *Anatomy*. See MESENTERIC.

COLIC-*ſtell*, in *Natural Hiſtory*, a name given by ſome to the *porcellana*, or *concha veneris*, from its ſuppoſed virtue in curing that diſeaſe.

COLIC-*ſtone*, in *Natural Hiſtory*, the name given by ſome modern authors to a ſtone found in New Spain, and ſome other parts of America, and eſteemed of great virtues there in the cure of the colic, and in diſeaſes of the womb. It is a ſpecies of jaſper very nearly approaching to the lapis nephriticus, and called by the natives *thoyſtle*, and by the Spaniards, *piedra de hyada*. It is of a conſiderable weight and hardneſs, and is of a duſky green colour without any variegations. The Indians cut it into various forms, ſometimes of men, ſometimes of their idols; ſometimes alſo they figure it into long and even columns, and ſometimes into round and flat pieces. All theſe are nicely poliſhed, and thoſe of the laſt ſhape are what are principally uſed in the caſe of the colic. They wet theſe with their ſpittle, and then rubbing them, till hot, with their hands, they apply them to the navel in a fit of the colic; and they ſay, that they immediately carry it off, by determining the humours to paſs off, either upwards, or downwards, or both ways. They ſometimes cut this ſtone into flat plates alſo, with two holes cut at each end, by means of which it may be worn, tied to the wriſt by a ribband, and it is ſuppoſed thus to be a preſervative from all diſeaſes of this kind, and from many others.

COLIN, in *Ornithology*, the name of an American bird, called by moſt authors a quail, but ſuppoſed by Nieremberg to be rather a ſpecies of partridge. There are ſeveral diſtinct ſpecies of this bird, all very common in the Spaniſh Weſt Indies, very well taſted, and much eſteemed at table.

COLIPHIUM, a name given by Athenæus, and ſome other authors, to coarſe bread made of meal with the bran among it, and ſuch as is eaten by the poorer people in moſt countries.

The word is derived from κολον, *a limb*, and ἰσχυς, *ſtrength*, and is a very expreſſive word, as this ſort of bread makes people robuſt and ſtrong, and is greatly preferable to any other kind for people of ſtrong conſtitutions, who uſe hard labour, or much exerciſe. It ſignifies alſo a kind of food compoſed of bread, new cheeſe, and roaſted fleſh, which Pythagoras taught the athletæ to uſe, who before had been uſed to live on figs.

COLIR, an officer in China, who inſpects what paſſes in every court or tribunal in the empire; and though himſelf not of the number, yet is aſſiſting at all aſſemblies, the proceedings whereof are communicated to him.

He is properly what we may call an *inſpector*: he gives ſecret intelligence to the court; and even, on occaſion, accuſes the mandarins of their faults openly; and that not only of faults in their public offices, but even in private life. To keep him impartial, he is kept independent; by having the poſt for life. Theſe *colirs* make even the princes of the blood tremble.

COLISEUM, or COLISEUM, in the *Ancient Architecture*, an oval amphitheatre, built at Rome by Veſpaſian, in the place where ſtood the baſon of Nero's gilded houſe.

The word is formed from *coloſſeum*, on account of the coloſſus of Nero, that ſtood near it; or, according to Naraini, from the Italian *coliſeo*.

In this were placed ſtatues, repreſenting all the provinces of the empire; in the middle whereof ſtood that of Rome, holding a golden apple in her hand. The ſame term *coliſeum*, is alſo given to another amphitheatre of the emperor Severus.

In theſe *coliſea* were repreſented games, and combats of men and wild beaſts: but there are now little remaining of either of them; time and war having reduced them to ruins.

COLITES, in *Natural Hiſtory*, a name given by ſome writers to a ſtone ſuppoſed to imitate the human *penis*, or *teſtes*, ſeparately, or both together.

COLLAR, an ornament worn by the knights of ſeveral military orders, hanging over their ſhoulder, on the mantle; and its figure drawn and blazoned in their armories.

The *collar* ordinarily conſiſts of a chain of gold, enamelled, frequently ſet with cyphers, or other devices, and having the badge of the order ſuſpended at bottom.

The *collar* of the order of the Garter conſiſts of SS, with roſes enamelled red, within a garter enamelled blue, the George at the bottom.

Maximilian is ſaid to have been the firſt of the emperors who put the *collar* of an order round his arms, upon his being made chief of that of the Golden Fleece.

COLLAR, in *Roman Antiquity*, a chain fixed round the necks of ſlaves who had run away, after they were taken, with an inſcription denoting that they were deſerters, and requiring them to be reſtored to their proper owners.

COLLARS, in *Antiquity*, were not only worn by way of ornament, but alſo as AMULETS, againſt incantations, &c.

COLLAR, *Knights of the*, a military order in the republic of Venice; called alſo the *order* of St. Mark, or the *Medal*. This order is conferred by the doge and the ſenate: the knights bear no particular habit, only the *collar*, or chain, which the doge puts around the neck; with a medal, whereon is repreſented the winged lion of the republic.

COLLAR *of Brawn*. See BRAWN.

COLLAR, in *Building*. See CINCTURE.

COLLAR *of the plough*, a term uſed in agriculture for a ring of iron, which is fixed to the middle of the beam, and ſerves to receive the ends of two chains, the one called the tow-chain, and the upper one the bridle-chain. The lower chain is fixed at its other end to the box, and the upper, or bridle-chain, to the head, which runs parallel with the left hand crow-ſtaff. Theſe chains, by means of this *collar*, and their other inſertions, ſerve to join the head and tail of the PLOUGH together. In ſome places the bridle-chain is not fixed to the *collar*, but to the beam itſelf, by means of a pin; and this is the better way on many accounts.

COLLAR-*beam*, among *Houſe-Carpenters*, the beam which is framed acroſs between two principal rafters.

COLLAR, in *Ship-Building*, a rope faſtened about her beak-head, into which the dead man's eye is raiſed that holds the main-ſtay. Theſe is alſo a *collar*, or garland, about the main-maſt head, which is a rope wound about there, to ſave the ſhrouds from galling.

COLLATERAL, in *Geography*, any thing, place, country, &c. ſituate by the ſide of another.

The word is compounded of *cum*, *with*, and *latus*, *ſide*.

COLLATERAL *Points*, in *Coſmography*, the intermediate points; or thoſe between the cardinal points. The *collateral points* are either *primary*, which are thoſe removed by an equal angle on each ſide from two cardinal points; or *ſecondary*; which, again, are either thoſe of the firſt, or ſecond order. The firſt are thoſe equally diſtant from a cardinal, and firſt primary; the latter equally diſtant from ſome cardinal primary, and the firſt ſecondary.

COLLATERAL *Winds*, are thoſe blowing from *collateral* points. See WIND.

Such are the north-eaſt, ſouth-eaſt, north-weſt, ſouth-weſt, &c. with their ſubdiviſions.

COLLATERAL *Bre-bouts*. See HAVE.

COLLATERAL, in *Genealogy*, is underſtood of thoſe relations which proceed from the ſame ſtock, but not in the ſame line of aſcendants, or deſcendants; but bring, as it were, aſide of each other.

Thus uncles, aunts, nephews, nieces, and couſins, are *collaterals*, or in the *collateral line*. Thoſe in a higher degree, and nearer the common root, repreſent a kind of paternity with regard to thoſe more remote; but there is a kind of equality between *collaterals* in the ſame degree. *Collateral deſcent* ſtands in oppoſition to *direct deſcent* in poſterity; the former paſſing to brothers children, but the latter only from father to ſon. See DISTRIBUTION, INTESTATE, KINDRED.

COLLATERAL *aſſurances*, in *Law*, is a bond, or other ſecurity, made over, and beyond the deed itſelf, for the performance of covenants between man and man; thus called, as being external, and without the nature and eſſence of the covenant.

Crompton ſays, that to be ſubject to the feeding of the king's deer, is *collateral* to the ſoil within the foreſt. It may be added, that liberty to pitch booths in a fair, or another man's ground, is *collateral* to the ground.

COLLATERAL *Condition*. See CONDITION.

COLLATERAL *Warranty*. See WARRANTY.

COLLATERALIS *Penis*, in *Anatomy*, a muſcle, otherwiſe called *erigens*, or ERECTOR *penis*.

COLLATIO *ſtirpium*. See HOTCHPOT.

COLLATION, in *Canon Law*, the conferring, or beſtowing of a benefice by a biſhop, who has it in his own gift, or patronage, and this he does, *jure pleno*.

Collation differs from *inſtitution*, in that the latter is performed by the biſhop, at the motion or preſentation of another: and the former on his own motion.

Beſides, by *collation*, the church is not full; for the high-tail patron may at any time remove the collatee, except he have a right to *collate*, which *plenary* by *collation* may be pleaded: the biſhop's *collation*, in this reſpect, is no more than a temporary proviſion for celebration of divine ſervice, till the patron preſents.

Collation alſo differs from *preſentation*, in that the latter is properly the act of a patron, offering his clerk to the biſhop to be inſtituted into a benefice; whereas the former is the act of the biſhop himſelf. The *collator* can never confer a benefice on himſelf.

In the Romiſh church, the pope is the collator of all the benefices, even elective ones, by prevention; ſetting aſide conſiſtorial benefices, and thoſe in the nomination of lay patrons. Prelates and biſhops are called *ordinaries*, or ordinary collators.

If the ordinary collator neglect to exerciſe his right for ſix months, the ſuperior collator may collate by devolution. Thus, if the biſhop neglect, the metropolitan may confer; then

then the primate; and so on from degree to degree. In France, the king is the collator of all the benefices whereof he is patron, excepting consistorial ones, to which he has only the nomination, and the pope, by virtue of the concordat, is obliged to confer on whomsoever the king nominates. For the rest, he is direct and absolute collator: and may confer them, by virtue of a kind of priesthood annexed to royalty.

Other lay-patrons have seldom more than a mere presentation; the *collation* properly belonging to the bishops: yet there are some abbots who have the full right of *collation*. The canonists reckon two kinds of *collation*; the one free and ordinary, the other necessary. The first depending on the mere will of the collator, who may chuse whom he pleases to fill the vacancy. In the latter, the collator is not at his liberty; which is the case where a benefice has been resigned, or changed, and that resignation, or permutation, allowed of by the superior; for here the collator is obliged to grant the provision to the resignatory, or compermutant.

It is a maxim in the new canon law, *collationes sunt in fructibus*; "Those who have the fruits of a benefice, "have the *collation*." But in that case, the word *collation* is used for presentation.

COLLATION, in *Common Law*, is the comparison, or presentation of a copy to its original, to see whether or no it be conformable: or the report, or act of the officer who made the comparison.

A collated act is equivalent to an original, provided all the parties concerned were present at the *collation*.

COLLATION is also used among the Romanists for the meal or repast made on a fast-day, in lieu of a supper.

Only fruits are allowed in a *collation*. F. Lobineau observes, that anciently there was not allowed even bread in the *collations* for Lent: not any thing besides a few comfits, and dried herbs, and fruits: which custom, he adds, obtained till the year 1333.

Cardinal Humbert observes farther, that in the middle of the eleventh century, there were no *collations* at all allowed in the Latin church in the time of Lent: and that the custom of *collations* was borrowed from the Greeks, who themselves did not take it up till about the eleventh century.

COLLATION, *collatio, conferre*, in *Rhetoric*, is used for COMPARISON.

But Scaliger distinguishes, alledging that in *collation*, one thing is compared to another that has preceded it: and that the contrary happens in comparison. That in which any thing is compared is called protasis; and that which is compared is called antapodosis.

COLLATION is also popularly used for a repast between dinner and supper.

The word *collation*, in this sense, Du-Cange derives from *collectio, conferences*; and maintains, that originally, *collation* was only a conference, or conversation on subjects of piety, held on fast-days in monasteries; but that, by degrees, the custom was introduced of bringing in a few refreshments: and that by the excesses to which those sober repasts were at length carried, the name of the abuse was retained, but that of the thing lost.

COLLATION *of seals*, denotes one seal set on the same label, on the reverse of the other.

COLLATIONE *facta sui post mortem alterius*, in *Law*, a writ directed to the justices of the common-pleas, commanding them to issue their writ to the bishop, for the admission of a clerk, in the place of another presented by the king, who died during the suit between the king and the bishop's clerk: for judgment once passed for the king's clerk, and he dying before admittance, the king may bestow his presentation on another.

COLLATIONE *hermitagii*, in *Law*, a writ whereby the king conferred the keeping of an hermitage upon a clerk.

COLLATIONIS *forma*. See CONTRA.

COLLATIVE *Advowson*. See ADVOWSON.

COLLEAGUE, a companion, partner, or ASSOCIATE in the same office, or magistrature. See ADJUNCT.

The word is particularly used in speaking of the Roman consuls and emperors.

COLLECT, COLLECTION, a voluntary gathering of money for some pious or charitable purpose.

Some say, the name *collect* or *collection* was used, because those gatherings were anciently made on the days of *collects*, and in *collects*, i. e. in assemblies of Christians; but it was more probably, *quia colligebatur pecunia*.

COLLECT is sometimes also used for a tax, or imposition, raised by a prince for any pious design.—Thus, historians say, that in 1166, the king of England, coming into Normandy, appointed a *collect* for the relief of the Holy Land, at the desire, and after the example of the king of France.

COLLECT, in the liturgy of the church of England, and the mass of the Romanists, denotes a prayer accommodated to any particular day, occasion, or the like.

In the general, all the prayers in each office are called *collects*; either because the priest speaks in the name of the whole assembly, whose sentiments and desires he sums up by the word *oremus, let us pray*, as it is observed by pope Innocent III. or because those prayers are offered when the people are assembled together; which is the opinion of Pamelius on Tertullian.

The congregation itself is by some ancient authors called *collecta*.

The popes Gelasius and Gregory are said to have been the first who established *collects*. Delpenie, a doctor of the faculty of Paris, has an express treatise on *collects*, their origin, antiquity, authors, &c.

COLLECTION, *collectio, in Logic*, a term used by some for what is commonly called SYLLOGISM, and RATIOCINATION.

COLLECTIVE *Idea*, in *Logic*, is a COMPLEX idea, which unites many ideas of the same kind under one name, or under one view: as army, dictionary, flock, &c. See COMPOUNDED *idea*.

COLLECTIVE, in *Grammar*, a term applied to a word that expresses a multitude; though itself be singular. Thus, troop, company, and army, are nouns *collective*.

COLLECTOR, a person nominated by the commissioners of any duty, the inhabitants of a parish, or the like, to raise or gather any tax, &c.

COLLECTORS, in *Botany*, such students as have attempted the knowledge of plants, without reducing it to any certain science, being barely employed about observing, or getting together the various species. Linnæi Fund. Bot. p. 1.

COLLEGATORY, in the *Civil Law*, a person to whom is left a legacy in common with one or more other persons. If a thing be bequeathed *in solido*, the portion of a deceased *collegatory* accrues to the rest.

COLLEGE, an assemblage of several bodies, or societies: or even of several persons in one society.

College, collegium, among the Romans, was used for an assemblage of several persons employed in the same functions, and as it were bound together to act, or serve in concert. It served indifferently for those employed in the offices of religion, of government, the liberal arts, and even mechanical arts, or trades; so that the word properly signified what we call a *corporation*, or *company*.

In the Roman empire, there were not only the *college of augurs*, and the *college of capitolins*; i. e. of those who had the superintendance of the capitoline games; but also *colleges* of artificers, *collegia artificum: college* of carpenters, *fabrorum*, or *fabrorum tignuariorum*; of potters, *figulorum*; of founders, *aratiarorum*; the *college* of locksmiths, *fabrorum ferrariorum*; of engineers of the army, *tignuariorum*; of butchers, *lanionum*; of dendrophori, *dendrophorum*; of centonaries, *centonariorum*; of makers of military cuisses, *femoralium*; of tent-makers, *tabernaculariorum*; of bakers, *pistorum*; of musicians, *tibicinum*, &c.

Plutarch observes, that it was Numa who first divided the people into *colleges*: which he did to the end, that each consulting the interest of their *college*, whereby they were divided from the citizens of the other *colleges*, they might not enter into any general conspiracy against the public repose.

Colleges were distinguished from other societies not formed into *colleges* by public authority, in this, that those who composed a *college*, were qualified to treat of the common interest of their *college*, which was, as it were, a member of the state, and had a common purse, an agent to negociate their affairs; send deputies to the magistrates when they wanted to treat with them; might make statutes and by-laws for the administration of their *college*, &c.

There are various *colleges* on foot among the moderns, built on the model of those of the ancients; as the *three colleges of the empire*, viz. the *college of electors, college of princes*, and *college of cities*, &c.

COLLEGE *of Electors*, is the body of electors, or their deputies, assembled in the diet at Ratisbon. See ELECTOR.

Anciently, the king of Bohemia had no deputy in this *college*, as present he has.

COLLEGE *of Princes*, is the body of princes, or their deputies, at the diet of Ratisbon.

COLLEGE *of Cities*, is in like manner, the body of deputies which the several imperial cities send to the diet.

COLLEGE *of Cardinals*, or the *sacred* COLLEGE, is a body composed of the three orders of cardinals, viz. cardinal-bishops, cardinal-priests, and cardinal-deacons.

Each order has its dean or chief. The dean of the cardinal-bishops is always the bishop of Ostia. See CARDINAL.

COLLEGE is also used for a public place, endowed with certain revenues, where the several parts of learning, both divine and human, are taught, in schools, halls, or classes, appointed for that purpose.

An

An assemblage of several of these *colleges* constitutes an university.

The university of Oxford consists of twenty *colleges*, and five halls; that of Cambridge of twelve *colleges*, and four halls; and that of Paris of fifty-four *colleges*, such as they are: in reality there are but eleven where there is *full exercise*, as it is called; for the rest, the author of a late description of Paris says it is needless to recite their names, since there is no teaching in them.

Among the Greeks, the lyceum and academy were celebrated *colleges*; the latter of which has given its name to our universities, which in Latin are called *academiæ*. With them, the house or apartment of each philosopher, or *rhetor*, might be esteemed a kind of *college* of itself.

The Romans came late into the institution of such *colleges*: they had, however, several, founded by their emperors: especially in Gaul: the chief whereof were those of Marseilles, Lyons, Besançon, and Bourdeaux.

The Jews, and Egyptians too, have had their *colleges*; the chief of the first were those of Jerusalem, Tiberias, Nardea, Pompoditta, Sura, and Babylon: the last is said to have been instituted by Ezekiel, and to have subsisted in the time of Mahomet.

Colleges of this kind have been generally in the hands of those consecrated to the offices of religion: the Magi in Persia, the Gymnosophists in the Indies, and the Druids in Gaul and Britain, had the care of educating youth in the sciences.

After Christianity became established, there were almost as many *colleges* as monasteries; Charlemagne, in his Capitulars, enjoining the monks to instruct youth in music, grammar, and arithmetic: but this calling the monks from their solitude, and taking up too much of their time, the care of the *colleges* was at length put into the hands of those who had nothing else to do.

In the canon law, it is said, three persons make a *college*, *tres collegium faciunt*.—The *colleges* in London are,

COLLEGE *of Civilians*, commonly called *Doctors Commons*; a *college* founded by Dr. Harvey, dean of the arches, for the professors of the civil law residing in this city; where usually, likewise, resides the judge of the arches court of Canterbury, judge of the Admiralty, of the prerogative court, &c. with other *civilians*; who all live, as to diet and lodging, in a collegiate manner, commoning together: whence the appellation of *Doctors Commons*.

Their house being consumed in the great fire, they all resided at Exeter-house in the Strand, till 1672; when their former house was rebuilt, at their own expence, in a very splendid manner. To this *college* belong thirty-four proctors: who make themselves parties for their clients, manage their causes, &c.

COLLEGE, *Gresham*, or COLLEGE *of Philosophy*; a *college* founded by Sir Thomas Gresham, and endowed with the revenue of the Royal Exchange: one moiety of this endowment the founder bequeathed to the mayor and aldermen of London, and their successors, in trust, that they should find four able persons to read, within the *college*, divinity, geometry, astronomy, and music; who are chosen by a committee of the common-council, consisting of the lord mayor and three aldermen and eight commoners, and allowed each, besides lodging, fifty pounds *per annum*. The other moiety he left to the company of mercers, to find three more able persons, chosen by a committee of that company, consisting of the master and three wardens, during their office, and eight of the court of assistants, to read law, physic, and rhetoric, on the same terms: with this limitation, that the several lectures should read in term-time every day in the week, except Sundays: in the morning in Latin, in the afternoon the same in English: but that no music to be read only in English.

By 8 Geo. II. cap. 32. the building appropriated to this *college* was taken down, and the excise-office erected in its room. Each of the professors is allowed fifty pounds *per annum*, in lieu of the apartments, &c. relinquished by them in the *college*, and is permitted to marry, notwithstanding the restriction of Sir Thomas Gresham's will. The lectures are now read in a room over the Royal Exchange: and the city and mercer's company are required to provide a proper place for this purpose.

In this *college* formerly met the Royal Society, that noble academy, instituted by king Charles II. and celebrated throughout the world, for their improvements in natural knowledge. See their history and policy, under ROYAL *Society*.

COLLEGE *of Heralds*, or COLLEGE *of Arms*, a corporation founded by charter of king Richard III. who granted them several privileges; as to be free from subsidies, tolls, offices, &c. See HERALD.

They had a second charter from king Edward VI. and a house built near Doctors Commons, by the earl of Derby, in the reign of Henry VII. was given them by the duke of Norfolk in the reign of queen Mary; which house is now rebuilt.

Of this collegiate society, are three officers styled *kings of arms*, *reges armorum Anglicanum*, see KING *at arms*; six HERALDS, and four PURSUIVANTS.

COLLEGE *of Heralds* in Scotland, consists of Lyon King of arms, his heralds, and six pursuivants, and a number of messengers.

COLLEGE *of Physicians*, a corporation of physicians; who, by several charters and acts of [illegible] Henry VIII. and his successors, have certain [illegible] whereby no man, though a graduate in physic in the university, may, without licence under the [illegible] *fari*, practise physic in, or within seven miles of [illegible] don; with power to imprison, fine and imprison offenders in that and several other particulars: to search the apothecaries shops, &c. in and about London, to see if their drugs, &c. be wholesome, and their compositions according to the form prescribed by the said *college* in their dispensatory.

By the said charter they are also freed from all troublesome offices: as to serve on juries, be constable, keep watch, provide arms, &c.

The society had anciently a *college* in Knight-rider-street, the gift of Dr. Linacre, physician to king Henry VIII. Since that they have had a house built them by the famous Dr. Harvey, in 1653, at the end of Amen-corner, which he endowed with his whole inheritance in his lifetime; but this being burnt in the great fire in 1666, a new one was erected at the expence of the fellows, in Warwick-lane; with a noble library, given partly by the marquis of Dorchester, and partly by Sir Theodore Mayerne.

Of this *college* there are at present, a president, four censors, eight electors, a register, and a treasurer, chosen annually in October: the censors have by charter, power to survey, govern, and search all physicians, or others practising physic, in, or within seven miles of London; and to fine, enforce, and imprison them at discretion.

The number of fellows was anciently thirty, till king Charles II. increased their number to forty; and king James II. giving them a new charter, allowed the number of fellows to be enlarged, so as not to exceed fourscore; reserving to himself and successors the power of placing and displacing any of them for the future.

The *college* is not very rigorous in asserting their privileges: there being a great number of physicians, some of very good abilities, who practise in London, &c. without their licence, and are connived at by the *college* yet, by law, if any person, not expressly allowed to practise, take upon him the cure of any disease, and the patient die under his hand, it is deemed felony in the practiser. In 1696, the *college* made a subscription, to the number of forty-two of their members, to set on foot a dispensatory for the relief of the sick poor: since that, they have erected two other dispensatories.

COLLEGE, *Royal of Physicians*, in Scotland, is a corporation of physicians at Edinburgh, established by patent of Charles II. This *college* consists of a president, two censors, a secretary, and the ordinary society of fellows. They have similar rights and privileges with those of the English *college*.

COLLEGE, *Sion*, or the *college* of the London clergy; which has been a religious house time out of mind, sometimes under the denomination of a priory, sometimes under that of a *sistel*, or hospital; at its dissolution under 31 Hen. VIII. it was called *Elsyn's Spital*, from the name of its founder, a rector, in 1329.

At present it is a composition of both, viz. a *college* for the clergy of London, who were incorporated in 1630, in pursuance of the will of Dr. White, under the name of the *President and Fellows of* SION-COLLEGE; and an hospital for ten poor men, and as many women.

The officers of the corporation are the president, two deans, and four assistants, who are annually chosen from among the rectors and vicars of London; and are subject to the visitation of the bishop. They have a good library, built and stocked by Mr. Simpson, and furnished by several other benefactors, chiefly for the clergy of the city, without excluding other students on certain terms; and a hall with chambers for students, generally occupied by the ministers of the neighbouring parishes.

COLLEGE *de Propaganda Fide*, was founded at Rome, in 1622, by Gregory XV. and enriched with ample revenues. It consists of thirteen cardinals, two priests, one monk, and a secretary; and was designed for the propagation and maintenance of the Romish religion in all parts of the world. The funds of this *college* have been very considerably augmented by Urban VIII. and many private donations. Missionaries are supplied by this institution, together with a variety of books suited to their several appointments. Seminaries for their instruction are supported by it, and a number of charitable establishments connected with it, and conducive to the main object of its institution.

Another *college* of the same denomination was established by Urban VIII. in 1627, in consequence of the liberality of John Baptist Viles, a Spanish nobleman. This is set apart for the instruction of those who are designed for the foreign missions. It was at first committed to the care of three canons of the patriarchal churches; but ever since the year 1642 it is under the same government with the former institution.

COLLEGE *of justice*, in Scotland. See SESSION.

COLLEGES *of common law*. See INNS *of Court*, and CHANCERY.

COLLEGES *for disabled soldiers, seamen, &c.* See HOSPITAL.

COLLEGIAL. See COLLEGIATE.

COLLEGIANS, COLLEGIANI, COLLEGIANTS, a religious sect formed among the Arminians and Anabaptists in Holland, about the beginning of the seventeenth century; so called, because of their *colleges*, or meetings, twice every week; where every one, females excepted, has the same liberty of expounding the Scripture, praying, &c.

They are said to be all either Arians, or Socinians: they never communicate in the *college*, but meet twice a year from all parts of Holland at Rhinsbergh, whence they are also called *Rhinsberghers*, a village two miles from Leyden, where they communicate together; admitting every one that presents himself, professing his faith in the divinity of the holy Scriptures, and resolution to live suitably to their precepts and doctrines, without regard to his sect or opinion. They have no particular ministers, but each officiates as he is disposed. They never baptize without dipping.

COLLEGIATE, or COLLEGIAL *churches*, are those which have no bishop's see, yet have the ancient retinue of the bishops, the canons and prebendaries.

Such are, among us, Westminster, Rippon, Windsor, &c. governed by DEANS and CHAPTERS.

Of these *collegiate* churches, there are two kinds; some of royal foundation, others of ecclesiastical foundation: each of them, in matters of divine service, are regulated in the same manner as the cathedrals.

There are even some *collegiate* churches which have the episcopal rights. Some of these churches were anciently abbeys; which, in time, were secularised.

The church of St. Peter's, Westminster, was anciently a cathedral; but the revenues of the monastery being, by act of parliament, 1 Eliz. vested in the dean and chapter, it commenced a *collegiate* church. In several causes, the styling it *cathedral*, instead of *collegiate church of* Westminster, has occasioned error in the pleadings.

COLLEGIATE *auditors*. See AUDITOR.

COLLEGIATE *churches, vergers of*. See VERGER.

COLLET, in the *Glass Trade*, that part of a glass vessel which, in the manufacture, sticks to the hollow iron by which the metal is first taken out of the melting pot. This is broken off before the vessel is fashioned, and is never seen in the least mark, when finished.

These they throw together, and afterwards grind down, and put into the green glass metal, for the purest green glass, but never into any other, though they be the product of the finest virgin metal.

COLLET, among *Jewellers*, the small horizontal plane, or face, at the bottom of the brilliant.

COLLETICS, COLLETICA, in *Medicine*, such remedies as join and glue together the separated parts, or lips of a wound, or ulcer; and thus re-establish them in their natural union. See AGGLUTINANT.

The word comes from κολλαω, something that has the virtue of gluing together; of κολλα, *gluten*.

Colletics are more delicative than SARCOTICS; but less so than EPULOTICS. Among *colletics* are ranked litharge, aloes, myrrh, &c.

COLLICLÆ, in *Anatomy*, is used by some, as Steno, for the CARUNCULÆ *lachrymales*.

COLLIERS, are vessels employed to carry coals from one port to another; and serving as an excellent nursery for seamen.

COLLIERY, see COAL.

The most remarkable *colliery*, or coal-work, that we have ever had in this island, was that wrought at Burrowstoneness, under the sea. The veins of coal were found to continue under the bed of the sea in this place, and the colliers had the courage to work the vein near half way over; there being a mote half a mile from the shore, where there was an entry that went down into the coal pit, under the sea. This was made into a kind of round key, or mote, as they call it, built so as to keep out the sea, which flowed there twelve feet. Here the coals were laid, and a ship, of that draught of water, could lay her side to the mote, and take in the coal.

This famous *colliery* belonged to the earl of Kinkardin's family. The fresh water which sprung from the bottom and sides of the coal pit, was always drawn out upon the shore by an engine moved by water, that drew it forty fathom. This coal pit continued to be wrought many years to the great profit of the owners, and the wonder of all that saw it; but, at last, an unexpected high tide drowned the whole at once, and the labourers had not time to escape, but perished in it. Phil. Trans. N° 93.

COLLIGENDUM *bona defuncti, letters ad*. See ADMINISTRATION.

COLLIMATION, *line of*, in a telescope, is a line passing through the intersection of those wires, which are fixed in the focus of the object-glass, and the centre of the same glass. It is also called the line of *sight*.

COLLINSONIA, in *Botany*, a genus of the *diandria monogynia class*. The characters are these: the flower is funnel-shaped, of one petal, which is unequal, cut into five parts at the top, the upper part being short and obtuse, and two of them reflexed; the lower lip or beard being longer, and ending in many points. It hath two long bristly stamina, which are erect; and a quadrifid obtuse germen, with a large gland, supporting a bristly style, which afterward becomes a single roundish seed, situated in the bottom of the empalement. We have but one species of this plant, which was brought from Maryland.

COLLINS's *Quadrant*. See QUADRANT.

COLLIQUAMENTUM denotes a very transparent fluid observable in an egg two or three days after incubation, containing the first rudiments of a chick. It is inclosed in its own proper membrane, distinct from the *albumen*. Harvey calls it *exitus*.

COLLIQUATION, from *colliquo, to melt*, in *Pharmacy*, the action of melting together two, or more solid substances; or rendering them liquid by fusion, or dissolution; as wax, mucilages, &c. by heat; gums, &c. by moisture.

COLLIQUATION is also used to express such a temperament, and disposition of the animal fluids, as proceeds from a too lax compages; whereby they flow off through the several glands, and particularly through those of the skin, faster than they ought; which occasions fluxes of many kinds, but mostly, profuse, greasy, clammy sweats.

If this *colliquation* continue, it generally terminates in an hectic fever, and is usually a concomitant of one.

The curative intention in this case is the giving a better consistence to the juices by balsamics and agglutinants; and the hardening of the solids by astringents. Hence,

COLLIQUATIVE *fever*, is a fever attended with a diarrhœa, or profuse sweats, from too loose a contexture of the fluids.

COLLISEUM. See COLISEUM.

COLLISION, the friction, or PERCUSSION, of two bodies moving violently with different directions, and dashing against each other.

COLLOQUIUM, in *Law*, *(a colloquendo)* a talking together, or affirming of a thing, laid in declarations for words in actions of slander, &c.

COLLUCIANISTÆ, in *Church History*, a designation given to the Arians, from the martyr Lucian, a presbyter of Antioch.

COLLURIO, in *Ornithology*, a name by which some authors have called the lanius, or BUTCHER *bird*, a very small species of hawk, not larger than a thrush, but a great destroyer of small birds.

COLLUM, in *Anatomy*. See NECK, and CERVIX.

COLLI *interspinales*. See INTERSPINALES.

COLLI *intertransversales*. See INTERTRANSVERSALES.

COLLI *transversalis*. See TRANSVERSALIS.

COLLUSION, a secret understanding between two parties, who plead, or proceed, fraudulently against each other, to the prejudice of a third.

In the canon law, *collusion*, in matters of benefices, vacates the benefice, and incapacitates the person from holding any benefice at all.

COLLUTHIANS, a religious sect, *who* rose about the beginning of the fourth century; on occasion of the indulgence shewn to Arius by Alexander patriarch of Alexandria.

Several people being scandalized at so much condescension; and, among the rest, Colluthus, a priest of the same city; he hence took a pretence for holding separate assemblies, and by degrees proceeded to the ordination of priests, as if he had been a bishop; pretending a necessity for this authority, in order to oppose Arius. To his schism he added heresy; teaching, that God did not create the wicked; that he was not author of the evils that befall men, &c.—He was condemned by a council held at Alexandria by Osius, in the year 330.

COLLUTION, *Collutio*, in *Medical Writers*, is sometimes used for the washing of the mouth, particularly when done to clean or fasten bad or loose teeth; or free the gums, &c. from ulcers.

COLLYBUS, κολλυβος, in *Antiquity*, the same with what is now called the rate of EXCHANGE.

COLLYRÆ, or COLLYRIDES, in *Antiquity*, a certain ornament of hair, worn by the women on their necks. It was made up in the form of the small, roundish, cakes, called κολλυρα, *collyræ*.

COLLYRIDIANS, in *Church History*, a sect, towards the close of the fourth century, denominated from a little cake, called by the Greeks κολλυριδια, *collyridia*, which they offered to the Virgin Mary.

This sect, it seems, consisted chiefly of Arabian women, who, out of an extravagance of devotion to the Virgin, met, one a certain day in the year, to celebrate a solemn feast, and to render divine honours to Mary as to a goddess; eating the cake which they offered in her name.—St. Ephiphanius, who relates the history of this superstitious ceremony, ridicules it. They sprung up in opposition to the ANTIDICO-MARIANITES.

COLLYRIUM, in *Medicine*, an external remedy, appropriated to diseases of the eyes.

The word comes from κολλυριον; and that, according to Martinius, from κολλαω του ῥεω; because it glues up, and prevents defluxions.

There are two kinds of *collyriums*; the one *liquid*, the other *dry*. *Liquid collyriums*, υγροκολλυρια, are composed of ophthalmic powders in water; as rose-water, plantain-water, that of fennel, eyebright, &c. wherein they dissolve tutty, white vitriol, or some other proper powder.

The *dry collyria*, ξηροκολλυρια, are troches of thale, sugar-candy, iris, tutty prepared, &c. blown into the eye with a little pipe.

COLLYRIUM is also a name given to unguents used for the same purpose; as unguent of tutty, and several others.

COLLYRIUM is also a denomination given, though improperly, to some liquid medicines used against venereal ulcers.

COLLYRIUM *Samium*. See SAMIA *terra*.

COLMESTRE, in *Ornithology*, the name of a bird of the LAGOPUS kind, more usually called OTOMO, and supposed not to differ from the lagopus, otherwise than by its changing its colour, in the summer months.

COLOBIUM, Κολοβιον, from κολοω, *I mutilate*, among the *Ancients*, an upper garment, without sleeves, longer than the tunic.

COLOBOMA, in *Medical Writers*, is used for the preternatural growing together of the lips, or eyelids, or for the adhesion of the ears to the head.

COLOCOLO, in *Ornithology*, a name given by the people of the Philippine islands to a species of bird, called *also* there *coffili*, and by some authors, the water-raven, *corvus fluviatilis*. It is very much of the shape of a common raven, but is truly an amphibious bird, living more of its time under water than in the air; it is black in colour; its neck is remarkably long; and it feeds on fish, which it hunts under water, as they do one another; it feeds likewise on frogs, serpents, and shell-fish. It is common to see it under water in clear rivers, where it seems perfectly at ease, and runs about with great swiftness; at times it comes up to the surface, and dries its wings in the air and sunshine. Phil. Trans. N° 285. p. 1896.

COLOCYNTHIS, in *Botany*, the name of a genus of plants of the gourd kind, of which there are many species, the COLOQUINTIDA of the shops being the pulp of one of them. In the Linnæan distribution, it is a species of the COCUMER or *cucumis*. The characters which distinguish this genus from the others of the same class, are, that the leaves are very deeply divided, and the fruit is not eatable, but of an intolerable bitterness.

COLOGNE *Earth*, a substance used in painting, as a water colour, much approaching to amber in its structure, and of a deep brown. It has generally been esteemed a genuine earth, but has been discovered to contain a great deal of vegetable matter, and, indeed, it is a very singular substance.

It never constitutes an entire stratum in the earth, but is lodged among other strata in large flat detached masses.

It is moderately dry, while in the earth, and of a soft crumbly texture. When dried, it is of a deep, dusky brown, of a very close, compact, and fine structure, and very remarkably light; it is of a smooth, even surface, dry, but not harsh to the touch, crumbles easily to pieces between the fingers, and slightly stains the hands; it adheres firmly to the tongue, and is of a very austere and astringent taste, but not at all resembling the astringency of the bole, or any thing else of the mineral kingdom, but plainly resembling the taste of oak bark. It makes no effervescence with acids, if thrown into water, it swims on the surface, till thoroughly wetted; and if brought into contact with burning coals, it takes fire, and burns of itself, till reduced to yellowish ashes.

It is easy to discern from this account, that, though this is generally esteemed an earth, and known to the world by no other name, it is no pure native fossil, but contains more vegetable than mineral matter, and owes its origin to the remains of wood which has been long buried in the earth. It is dug in Germany and France in quantities consumed in painting, in London, [illegible] from Cologne, where it is found very [illegible] our own kingdom is not without it, it being [illegible] Birmingham, and on Mendip hills in Somer[illegible] what has been yet found there is not so pure [illegible] that imported from Cologne. Hill's Hist. [illegible] p. 64. and Da Costa's Hist. of Fossils, p. 171.

COLON, in *Anatomy*, denotes the second of the three intestines.

Some derive the word from κωλυω, *to retard*, in regard it is in the folds of this intestine that the excrements are stopped and formed. Others fetch it from κωλος, on account of its capacity: other again from κολαζομαι, *to be tormented*; in regard of the grievous pain it frequently undergoes.—It is from this part that the colic takes its name. The *colon* is placed between the *ileum* and *rectum*, and is wider than either of them: in length it is eight or nine hands. It begins where the *ileum* ends, viz. in the cavity of the *os ilium*, on the right side; whence, ascending by the kidney on the same side, it passes under the concave side of the liver, to which it is sometimes tied, as likewise to the gall-bladder, which tinges it yellow in that place: then it runs under the bottom of the stomach to the spleen in the left side, to which it is also knit; from thence it turns down to the left kidney; and thence passing in form of an S, it ends in the upper part of the *os sacrum* in the *rectum*.

At the beginning of this gut, there is a valve formed by the production of the utmost coat of the intestines in this place; which hinders the excrements, when once fallen into the *colon*, from ever returning again to the *ileum*.

It has strong ligaments, which running along its upper side, from the *ileum* to the *rectum*, strengthen it against the weight of the excrements, and draw it together into cells; which, with the *valvulæ conniventes*, retard the passages of the excrements, that we may not be continually obliged to be going to stool.

The fleshy fibres of its second coat are greater and stronger than those of the other intestines; because a greater strength is requisite to cause the excrements to ascend.

The chief design of the *colon* surrounding the abdomen, and, with the *rectum*, touching all the parts contained in it, seems to be, that by immediate fomentation with clysters, they might be eased of their maladies.

Meso-COLON. See MESO-COLON.

COLON, in *Grammar*, a point, or character, formed thus [:] serving to mark a pause, and to divide the members of a period. See POINTING. See also PERIOD, COMMA, and SEMICOLON.

Grammarians generally assign the use of a *colon* to be to mark the middle of a period; or to conclude a sense less perfect than the dot, or period: but a sense less perfect than the period is an expression extremely vague and indeterminate.

Others say, a *colon* is to be used when the sense is perfect, but the sentence not concluded: but neither is this sufficiently clear and express. Add to this, that in practice our best writers confound the *colon* with the semicolon.

P. Buffier attempts to fix the use of the *colon*; but he does not much distinguish it from the semicolon: he prescribes the use of either, indifferently; and calls them by a common name, *intermedian pointings*; as being mediums between the comma, and full-point, or period. Their use, according to this author, is to distinguish the supernumerary members of a period. By supernumerary members are meant such as the precedent ones do not raise any expectation of; i. e. such parts as have indeed a dependence on what goes before, even though what goes before has a complete sense, independent hereon: v. gr. *The Augustan age was fo eminent for good poets, that they have ferved as models to all others: yet did it not yield any good tragic poets.* Where the supernumerary member, and the use of the *colon*, are obvious. The most obvious and sensible use of the *colon*, he adds, is, when the supernumerary member is distinguished by some conjunction; as, *notwithstanding, however, but, except that, unless, inasmuch as, yet, since, the rather as, provided that*, &c. Some, indeed, use the *colon* in the middle of long periods without any regard to supernumerary members: which custom was probably introduced, to mark that the breath is here to be taken almost as much as in a common period, in the place where the supernumerary period commences. But this, at best, is arbitrary; and the intermediate pointings may always be omitted in a period, if there be no supernumerary member, i. e. if there be no subsequent member,

member but what is expected from the precedent. As to the occasions where the *colon* is to be used, rather than the semicolon, there is nothing precise to be said of it; except that the *colon* shews the supernumerary member more detached, and sets it at a greater distance from the rest: and therefore marks a longer pause than the semicolon.

Accordingly it seems preferable to the semicolon before conjunctions adversative, restrictive, conditional, &c. as, *nevertheless, but, excepting that, however, otherwise, provided that.* Again, where the supernumerary phrases not only suppose the precedent, but depend on them for their regimen, and are, as it were, new parts thereof; there the semicolon seems preferable to the *colon*: e. gr. *You are regardless of the goodness of God, who first chose you; a God who is only jealous of your heart for your own happiness; a God who could be equally glorious in destroying you by his justice, as in saving you by his mercy.* Or thus: *The discourse unfolded of two parts; in the first was shewn the necessity of fighting; in the second, the advantages that would redound from it.* But this difference, it must be owned, has a dependence on something that influences all the points, and sways the whole doctrine of punctuation; viz. the length, or shortness, of the members and periods: for when the phrases are long, we point higher than when short.

A later author, in an ingenious discourse, De Ratione Interpungendi, marks the office of the *colon*, and its difference from the semicolon, &c. more precisely; a *colon*, on his principles, serves to distinguish those conjunct members of a sentence, which are capable of being divided into other members; whereof one, at least, is conjunct.

Thus in the sentence, *As we cannot discern the shadow moving along the dial-plate, so the advances we make in knowledge are only perceived by the distance gone over*; the two members, being both simple, are only separated by a comma: in this, *as we perceive the shadow to have moved, but did not perceive it moving; so our advances in understanding, in that they consist of such minute steps, are only perceivable by the distance*; the sentence being divided into two equal parts, and those conjunct ones, since they include others; we separate the former by a semicolon, and the latter by comma: but in this, *as we perceive the shadow to have moved along the dial, but did not perceive it moving; and it appears the grass has grown, though nobody ever saw it grow: so the advances we make in knowledge, as they consist of such minute steps, are only perceivable by the distance.* The advancement in knowledge is compared to the motion of a shadow, and the growth of grass; which comparison divides the sentence into two principal parts: but since what is said of the movement of the shadow, and likewise of the growth of grass, contains two simple members, they are to be separated by a semicolon; consequently a higher pointing is required to separate them from the other part of a sentence, which they are opposed to: and this is a *colon*.

Bishop Lowth observes, that a *colon* distinguishes a member of a sentence, whether simple or compounded, which of itself would make a complete sentence, and so requires a greater pause than a semicolon, yet is followed by an additional part, making a more full and perfect sense. He adds, that a *colon* may be also used, when a semicolon has preceded, and a greater pause is still necessary, though the sentence be incomplete; and that it is commonly used, when an example, or a speech, is introduced. Introd. to Eng. Gram. ed. 1772. p. 207.

COLONEL, an officer in the army, who has the command in chief of a regiment, either of horse, foot, dragoons or artillery.

Skinner derives the word from *colony*; being of opinion, the chiefs of colonies, called *colonidæ*, might give the name to chiefs of forces.

In the French and Spanish armies, *colonel* is confined to the infantry and dragoons; the commanding officer of a regiment of horse they usually call *mestre de camp*.

Formerly, instead of *colonel*, the French used the word *coronel*; and this old spelling comes nearer to our common way of pronouncing the word *colonel*.

COLONEL-*Lieutenant*, is he who commands a regiment of guards, whereof the king, prince, or other person of the first eminence, is *colonel*.

These *colonels lieutenants* have always a *colonel's* commission, and are usually general officers.

COLONEL, *Lieutenant*, is the second officer in the regiment: is at the head of the captains, and commands in the absence of the *colonel*.

Lieutenant-colonel of horse, or dragoons, is the first captain of the regiment. See CAPTAIN.

COLONNADE, a PERISTYLE of a circular figure; or a series of columns disposed in a circle, and insulated within-side.

Such is that of the Little Park at Verſailles, which conſiſted of thirty-two Ionic columns; all of ſolid marble, and without interſtition.

A Palyſtyle COLONNADE is that whoſe number of columns is too great to be taken in by the eye at a ſingle view. Such is the *colonnade* of the palace of St. Peter at Rome; which conſiſts of two hundred and eighty-four columns of the Doric order, each about four feet and an half in diameter; all of Thurtine marble.

COLONUS, an husbandman, or villager, who was bound to pay yearly a certain tribute, or, at certain times of the year to plow ſome part of the the lord's land; and from hence comes the word *clown*, who is called by the Dutch *boer*.

COLONY, COLONIA, a company of people of all ſexes and conditions, tranſported into a remote province, in order to cultivate and inhabit it.

Originally the word *colony* ſignified no more than a *farm*; i. e. the habitation of a peaſant, *colonus*, with the quantity of land ſufficient for the ſupport of his family; *quantum colonus unus arare poterat*.

We may diſtinguiſh three kinds of *colonies*: thoſe ſerving to eaſe or diſcharge the inhabitants of a country; where the people are become too numerous, ſo that they cannot any longer conveniently ſubſiſt.

The ſecond are thoſe eſtabliſhed by victorious princes and people, in the middle of vanquiſhed nations, to keep them in awe and obedience.

The third may be called *colonies of commerce*; becauſe, in effect, it is trade that is the ſole occaſion and object thereof.

It was by means of the firſt kind of *colonies*, that ſome ages after the deluge, the Eaſt firſt, and ſucceſſively all the other parts of the earth, became inhabited: and without mentioning any thing of the Phœnician and Grecian *colonies*, ſo famous in ancient hiſtory, it is notorious that it was for the eſtabliſhment of ſuch *colonies*, that, during the declenſion of the empire, thoſe torrents of barbarous nations, iſſuing, for the generality, out of the North, overran the Gauls, Italy, and the other ſouthern parts of Europe: and after ſeveral bloody battles, divided it with the ancient inhabitants.

As for the ſecond kind of *colonies*, the Romans uſed them more than any other people; and that to ſecure the conqueſts they had made from the Weſt to the Eaſt. Every one knows how many cities in Gaul, Germany, Spain, and even in England, value themſelves on their having been of the number of Roman *colonies*.

Laſtly, the *colonies of commerce*, are thoſe eſtabliſhed by the Engliſh, French, Spaniards, Portugueſe, and other nations, within theſe two laſt centuries, and which they continue ſtill to eſtabliſh in ſeveral parts of Aſia, Africa, and America: either to keep up a regular commerce with the natives, or to cultivate the ground, by planting ſugar-canes, indigo, tobacco, and other commodities. See CHARTER-*Government*.

The principal of this kind of *colonies* are, or were, in the one and the other America, northern and ſouthern; particularly Peru, Mexico, Canada, Virginia, New England, Carolina, la Louiſiane, l'Acadie, Hudſon's Bay, the Antilles iſlands, Jamaica, Domingo, and the other iſlands.—In Africa, Madagaſcar, Cape of Good Hope, Cape Verd, and its iſlands, and all thoſe vaſt coaſts extended thence as far as to the Red Sea.—Laſtly, in Aſia, the famous Batavia of the Dutch; Goa, Diu, of the Portugueſe; and ſome other leſs conſiderable places of the Engliſh, French, and Danes.

There were two kinds of *colonies* among the Romans; thoſe ſent by the ſenate: and the military ones, conſiſting of old ſoldiers, broken and diſabled by the fatigues of war, who were thus provided with lands, as the reward of their ſervices.

The *colonies* ſent by the *ſenate* were either Roman, or Latin: i. e. they were compoſed either of Roman citizens, or Latin. The *colonies* of Roman citizens had the right of ſuffrages: but had no part in the offices or honours of the republic. The inhabitants of Latin *colonies* had no right of ſuffrages without an expreſs permiſſion.

According to Ulpian, (lib. i. D. de Cenſ.) there were other *colonies*, which had little more than the name; only enjoying what they called *jus Italicum*, i. e. they were free from the tribute and taxes paid by the provinces.—Such were the *colonies* of Tyre, Berytus, Heliopolis, Palmyra, &c.

M. Vaillant has filled a volume in folio with medals ſtruck by the ſeveral *colonies*, in honour of the emperors who founded them. The ordinary ſymbol they engraved on their medals, was, either an eagle; as when the veteran legions were diſtributed in the *colonies*: or a laborer holding a plough drawn by a pair of oxen; as when the *colony* conſiſted of ordinary inhabitants. On all the medals are ſeen the names of the decemviri, who

held

held the same rank, and had the same authority there as the consuls had at Rome.

COLONY *of Bees*. See HIVE.

COLOPHONY, in *Natural History*, and *Chemistry*, a resinous substance prepared of turpentine, by boiling it in water. When cold, it becomes of a hard consistence, and has the same properties as other resins, and the same principles may be obtained from it by analysis.

The chief use of this drug is in the cure of venereal ailings, seminal weaknesses, the whites in women, &c. The apothecaries make it into pills, which they roll in liquorice powder, or cover with gold-leaf, and call them *turpentine-pills*.

It is also used by musicians, to rub the hairs of the bow; the effect whereof is, that the gum cleaving to the hairs, and communicating to them a tenacious quality, prevents their sliding too easily over the strings; and promotes that trembling which forms the sound.

The common black *colophony*, or black resin, is said to be procured from the turpentine of the mountain pine. The oil being extracted from this by distillation, what remains in the still is the *colophony*.

To be good it must be shining and odoriferous; and when thrown on the fire, render a smoke like that of frankincense.

Pliny says, *colophony* took its name from *Colophon*, a city of Ionia, whence it was first brought. It is now frequently called *Spanish wax*, or *Grecian resin*, as it is brought from the one or the other of those countries. It is found to warm, dry, soften, and agglutinate: and usually enters the composition of plasters and unguents.

COLOQUINTIDA, or COLOCYNTHIS, usually called *bitter apple*; the fruit of a plant of the same name, brought from the Levant; about the bigness of a large orange.

This word comes from κολη κοιλος, a name which was given it, because it *moves the belly*.

Its colour is a sort of golden brown: its inside is full of kernels, which are to be taken out before the *colocynth* be used. The pulp is intolerably bitter.

Coloquintida is of considerable use in medicine, but mostly in officinal compositions; the violence of its operation rendering it unsafe to be given inwardly in extemporaneous prescriptions, except with great caution.

It enters, as an ingredient, in the confectio hamec, and most of the purging pills, called *pilulæ cochiæ*; and in such cases as require brisk purging, is attended with great success. But it requires proper management, as it is one of the most violent purgative drugs known: insomuch that it excoriates the passages to that degree, as sometimes to bring away blood, and induce a superpurgation. Sometimes it is taken boiled in water, or small beer, in obstructions of the menses; which, in strong constitutions, is often attended with success. Some women have made use of it, in the same manner, in the beginning of pregnancy, to procure abortion; which it often effects by the violence of its operation.

The powder of *coloquintida*, is sometimes used externally, with aloes, &c. in unguents, emplasters, &c. with remarkable success against worms; and some for the same purpose, recommend decoctions of the pulp, given clysterwise. In the iliac passion, clysters of *coloquintida* have been found of service, after most other medicines have failed.

In the common analysis by chemistry, there appears no principle predominant in this fruit, by which its violent effects may be accounted for. Distilled by the retort, it yields first a phlegm; then a phlegm with an acid salt dissolved in it: after this, a phlegm less acid, and containing a quantity of an urinous alkaline salt, which strongly affects the smell. These three liquors bring over with them a foetid oil, and the fixed salt drawn from the remainder in the retort, was of the nature of the rest of the salts of that kind. Mem. Acad. Par. 1701.

Colocynth, infused in rain water, yields only an insipid phlegm by distillation, but the remainder yields a very fine extract of a tolerably mild purgative virtue: a pound of the pulp of *colocynth* thus yields two ounces and a half of extract, and the remaining mass of the *colocynth* does not appear to contain any resin. It is usual to attribute the violence of all purgative medicines to their abounding in resinous parts. To try whether this was the case in this simple, Mr. Boulduc finished his experiments on it by making an extract from it by means of spirit of wine. Eight ounces of the clean pulp yielded only half an ounce of a resinous extract, and the residuum yielded two ounces of a coarse extract, by means of water; but this was of a bad consistence, and would scarce hang together.

Either of these extracts, given alone, proved troublesome medicines; and all that appeared from this, and from the whole, was, that in order to have the virtues of this fruit in a gentle, and safe manner, its saline and resinous parts must be left together, and only separated from its terrestrial and mucilaginous ones, by means of a long fermentation with malt or water, before its being evaporated into an extract: because all its violent effects are owing to these terrestrial and mucilaginous particles.

Troches made of *colocynth* are called *troches of alhandal*: they are prepared by cutting the *coloquintida* very small, and reducing it to a fine powder in a mortar, rubbed with oil of sweet almonds; adding gum tragacanth, and mastich afterwards.

COLOR, in the *Ancient Music*. See COLOURS.

COLOR *Indicus*. See INDICUS *color*.

COLORATURA, in the *Italian Music*, is used to denote all sorts of variations, TRILLOS, DIMINUTIONS, &c. that can render a song agreeable.

COLOBRASIANS. See COLARBASIANS.

COLORISATION, or COLORATION, in *Pharmacy*, a term applied to the several changes of colour which bodies undergo in the various operations of nature, or art; as by fermentations, lotions, coctions, calcinations, &c.

COLORITES, in *Ecclesiastical History*, a congregation of Augustin monks instituted about 1530, and so called from *Colorito*, a mountain near Moranc, in Calabria, where a church was erected to the Virgin Mary.

COLOSSAL *column*. See COLUMN.

COLOSSUS, a statue of enormous or gigantic size.

The most eminent of this kind was the *Colossus* of Rhodes, one of the wonders of the world, a brazen statue of Apollo, so high, that ships passed with full sails betwixt its legs. It was the workmanship of Chares, a disciple of Lysippus; who spent twelve years in making it: it was at length overthrown by an earthquake, after having stood sixty-six years. Its height was a hundred and five feet: there were few people who could fathom its thumb, &c.

Some critics observe, that the *colossus* of Rhodes gave its own name to the people among whom it stood; and that many, at least among the ancient poets, call the Rhodians, *Colossians*: hence they advance an opinion, that the Colossians in Scripture, to whom St. Paul directs his Epistle, are, in reality, the inhabitants of Rhodes. Of this sentiment are Suidas, Calepine, Munster, &c.

When the Saracens became possessed of the island, A. D. 672, the statue was found prostate on the ground: they sold it to a Jew, who loaded nine hundred camels with the brass which amounted to seven hundred and twenty thousand pounds weight.

The basis that supported it was of a triangular figure: its extremities were sustained by sixty pillars of marble. There was a winding stair-case to go up to the top of it; from whence one might discover Syria, and the ships that went into Egypt, in a great looking-glass that was hung about the neck of the statue. Among the antiquities of Rome, there are seven famous *colossuses*: two of Jupiter, as many of Apollo, one of Nero, one of Domitian, and one of the sun.

COLOSTRUM, or COLOSTRA, in *Medicine*, the first milk of any animal after bringing forth young, called in common *beestings*.

It is remarkable that this milk is generally cathartic, and purges off the meconium; thus serving both as an aliment and medicine.

This name is likewise given to a disease which this thick coagulated milk sometimes occasions.

An emulsion prepared with turpentine, dissolved with the yolk of an egg, is sometimes also called by that name.

COLOUR, COLOR, in *Philosophy*, a property inherent in light, whereby, according to the different sizes or magnitudes of its parts, it excites different vibrations in the fibres of the optic nerve; which, propagated to the sensorium, affect the mind with different sensations.

Or, *colour* may be defined a sensation of the soul, excited by the application of light to the retina of the eye: and different, as that light differs in the degree of its refrangibility, and the magnitude of its component parts.

In the former view, therefore, light is the subject of *colour*: in the latter it is the agent. See its properties under the article LIGHT.

Various are the opinions of ancient and modern authors, and of the several sects of philosophers, with regard to the nature and origin of the phenomenon *colour*: the most popular opinion was long that of the Aristotelians; who maintain *colour* to be a quality residing in the coloured body: and to exist independently of light.

The Cartesians come nearer the matter: they own, that as the coloured body is not immediately applied to the organ, to occasion the sensation; and that as no body can affect the sense but by immediate contact, the coloured body does not excite the sensation of itself, or contri-

bute any thing to it, otherwiſe than by moving ſome interpoſed medium, and by that the organ of ſight.

They add, that, as we find that bodies do not affect the ſenſe in the dark, light only occaſions the ſenſe of *colour*, by moving the organ; and that coloured bodies are no farther concerned in this than as they reflect the light with a certain modification; the differences in their *colours* ariſing from a difference in the texture of their parts, whereby they are diſpoſed to reflect the light with this or that modification.

B. Porta thought that light was *colourleſs*, but that it was capable of having *colour* ſuperinduced upon it from foreign cauſes, in certain circumſtances. Dr. Hooke maintained, that the primary *colours* are only two, viz. blue and red, and that all the reſt are compoſed of them; and that theſe two *colours* are occaſioned by impreſſions on the retina from pulſes of light, of different ſtrength. M. de la Hire reſolves the difference of *colours* into the degree in which the light agitates or affects the optic nerve; and he obſerves, that whatever tends to weaken this impreſſion, makes a change in the *colour*. See Prieſtley's Hiſt. of Viſion, &c. p. 43, 146, 147.

But it is to ſir Iſaac Newton alone we are to reſer for a ſolid and conſiſtent theory of *colours*; built on pure experiments, and ſolving all the phenomena thereof: his doctrine is as follows.

It is found by experience, that rays, or beams of light, are compoſed of particles very heterogeneous, or diſſimilar to each other: i. e. ſome of them, as it is highly probable, are larger, and others leſs. For a ray of light, as FE (*Tab. Optics, fig.* 5.) being received on a refracting ſurface, as AD, in a dark place, is not wholly refracted to L; but it is ſplit, as it were, and diffuſed into ſeveral radioli, or little rays, ſome whereof are refracted to L, and others to the other intermediate points between L and G; i. e. thoſe particles of the light, which are the moſt minute, are of all others the moſt eaſily and moſt conſiderably diverted, by the action of the refracting ſurface, out of their rectilinear courſe towards L; and with reſpect to the reſt, as each exceeds another in magnitude, ſo is it with more difficulty, and leſs conſiderably, turned out of its right line to the points between L and G. Now, each ray of light, as it differs from another in its degree of refrangibility, ſo does it differ from it in *colour*: this is warranted by numerous experiments. Thoſe particles, v. gr. which are moſt refracted, are found to conſtitute a ray of a violet *colour*, i. e. in all probability, the moſt minute particles of light, thus ſeparately impelled, excite the ſhorteſt vibrations in the retina; which are thence propagated by the ſolid fibres of the optic nerves into the brain, there to excite the ſenſation of violet *colour*; as being the moſt dulky and languid of all *colours*. Again, thoſe particles which are the leaſt refracted, conſtitute a radiolus, or ray of red *colour*; i. e. the largeſt particles of light excite the longeſt vibrations in the retina; ſo as to excite the ſenſation of red *colour*, the brighteſt and moſt vivid of all others.

The other particles being in like manner ſeparated, according to their reſpective magnitudes, into little rays, excite the intermediate vibrations, and thus occaſion the ſenſations of the intermediate *colours*; much in the ſame manner as the ſeveral vibrations of the air, according to their reſpective magnitudes, excite the ſenſations of different ſounds.

To this it may be added, that not only the more diſtinct and notable *colours* of red, yellow, blue, &c. have thus their riſe from the different magnitude and refrangibility of the rays; but alſo the intermediate degrees or ſhades of the ſame *colour*; as of yellow up to green, or red down to yellow, &c.

Farther, the *colours* of theſe little rays, not being any adventitious modifications thereof, but connate, primitive, and neceſſary properties; as conſiſting, in all probability, in the magnitudes of their parts, muſt be perpetual and immutable; i. e. they cannot be changed by any future refraction or reflexion, or any modification whatſoever. This is confirmed by abundance of experiments; all endeavours having been uſed, after ſeparating a coloured ray from thoſe of other kinds, to change it into ſome other *colour*, by repeated refractions, but to no effect. Apparent tranſmutations of *colours*, indeed, may be effected; viz. where there is an aſſemblage, or mixture of rays of different kinds, the component *colours* never appearing in their natural hue in ſuch mixtures, but always allayed and tempered with each other: whence reſults an intermediate kind of *colour*, which, by refraction, may be ſeparated into the component ones; and theſe after ſeparation, being remixed, return to their former *colour*.

Hence the tranſmutation of *colours*, by mixing thoſe of different kinds, are not real, but mere appearances, or deceptions of the ſight; for the rays, being again ſevered, exhibit the ſame *colours* as at firſt. Thus blue and yellow powders, well miſed, appear to the naked eye green; yet, without having paſſed any alteration; for, when viewed through a microſcope, the blue and yellow particles ſtill appear diſtinct.

Mr. Melvill apprehends, that differently coloured rays may be affected with different velocities at their emiſſion from the luminous body, and that the velocity is greater, if the luminous body is placed in a denſer medium, and proportional to its refractive power; and this hypotheſis he thinks preferable to that of ſir Iſaac Newton, which makes them to conſiſt of particles of different ſizes and denſities. M. Muſchenbroeck alſo infers, from the leſs degree of refrangibility of red rays, that they move more ſlowly than the reſt, after their ſeparation from thoſe of other *colours*, though in a ſtate of union with the reſt, they have the ſame velocity; but he does not think that the *colour* depends upon the velocity, ſince this changes with the medium through which the rays are tranſmitted. Their different refrangibility will be the ſame on this hypotheſis, and their different velocities will be nearly as the ſines of refraction out of air into glaſs, beginning from the extreme red, and ending with the extreme violet, viz. as 78000, 77873, 77707, 77663, 77496, 77330, 77220, 77000, the ſine of incidence being 1201201 therefore, ſince the time which the extreme violet rays take to move through any ſpace, is to that which the red takes as 78 to 77, the laſt violet light reflected from a ſatellite, before its total immerſion into the ſhadow of Jupiter, in a quadrate aſpect with the ſun, when his light takes about 41′ in coming to the earth, ought to affect the eye 32 ſeconds after the red light, reflected at the ſame time, is gone; and at the emerſion, there would be a contrary ſucceſſion of *colours*; and the difference of time between the arrival of the different *coloured* rays, being more than half a minute, would afford time ſufficient to make the obſervation. The marquis de Courtiveron, in a treatiſe publiſhed in 1752, advances the ſame opinion with Mr. Melvill, and propoſed the ſame trial of his hypotheſis, viz. by obſerving the eclipſes of Jupiter's ſatellites; but he ſtates the difference of velocity, by a theorem of M. Clairaut, in the proportion of 45 to 44. Mr. Short made the obſervation recommended by Mr. Melvill, and could not perceive the leaſt alteration in the *colour* of the light reflected by the ſatellite; and therefore the hypotheſis ſtill wants that kind of confirmation. By this hypotheſis, Mr. Melvill accounts for Newton's fits of reflexion and tranſmiſſion, as ariſing from the pulſes of the medium through which the differently coloured rays paſs; theſe pulſes muſt overtake rays, moving with different velocities, at different times; and thus the intervals of the fits would be leaſt in the violet, and gradually increaſing in the priſmatic order, agreeably to obſervation. This hypotheſis, however, is liable to many inſuperable objections. The difficulty, which prevented Mr. Muſchenbroeck from aſcribing the *colour* of rays to the velocity, viz. that the *colour* of homogeneous rays is not altered by paſſing through different mediums, though their velocity is thereby always increaſed or diminiſhed, is reſolved by Mr. Melvill, by ſuppoſing that every ray, as it muſt at laſt paſs through the humours of the eye, in order to viſion, falls upon the retina with one given velocity, however it may have been previouſly refracted; ſince the velocity of any ray, in any one medium, is to its velocity in any other medium, in a conſtant and invariable proportion. It has been objected, that if this hypotheſis were true, a ſtar muſt change its place, on account of the aberration $\frac{1}{2}$′,th more for the deepeſt blue rays than the red ones, according to Mr. Melvill, and $\frac{1}{4}$′,th more, according to M. de Courtiveron; and conſequently a ſtar placed in the pole of the ecliptic, whoſe mean ABERRATION is about 20″, ought to appear in the form of a ſpectrum, formed by a priſm of $\frac{1}{2}$″, or 17″ nearly in length, by the former hypotheſis, and of $\frac{1}{4}$″, or 27″, by the latter. This is a quantity which would be ſufficiently viſible in teleſcopes of pretty high magnifying powers; but no ſuch appearance has yet been obſerved. Beſides, the experiments of Mr. Dollond cleaſly prove, that the different refrangibility of the rays of light reſults from properties that are independent of their different velocity; ſince the proportion of it varies according to the nature of the ſubſtance from which it falls; (ſee ABERRATION) and the diſtances at which differently coloured rays are attracted and repelled are different. M. Clairaut, in the courſe of his inquiry concerning Mr. Dollond's improvement in teleſcopes, has taken occaſion to examine this hypotheſis, and found, that the refractions, which would reſult from it, were very different from thoſe which actually took place in nature. Phil. Tranſ. vol. xlviii. part i. art. 38. and part ii. art. 92. Hiſt. Acad. Sc. 1756. p. 194. and Prieſtley's Hiſt. of Viſion, &c. p. 401, &c.

From the Newtonian theory above explained, there arife two kinds of *colours*, the one *original* and *ſimple*, produced by homogeneal light; or by rays that have the ſame degree of refrangibility, and the ſame magnitude of their parts: ſuch as red, yellow, green, blue, violet, purple, orange, and indigo; with all their intermediate teints and gradations.

The other kind of *colour* is *ſecondary*, or *heterogeneous*; compounded of the primary ones, or of a mixture of rays, differently refrangible, &c.

There may alſo be ſecondary *colours* produced by compoſition, like the primary ones, or thoſe conſiſting of homogeneal light, as to the ſpecies or appearance of the *colour*; but not as to the permanency, or immutability thereof. Thus, yellow and blue make green; red and yellow orange; orange and yellowiſh green, yellow; and in the general, if any two colours be mixed, which, in the ſeries of thoſe generated by the prism, are not too far apart, from their mixture there reſults that *colour*, which in the ſaid ſeries is found in the mid-way between them; but thoſe ſituated at too great a diſtance do not produce the ſame effect.

Indeed, the more any *colour* is compounded, the leſs perfect and vivid it is, by too much compoſition they may be diluted and weakened till they ceaſe. By compoſition there may likewiſe be produced *colours* not like any of thoſe of homogeneal light.

The moſt extraordinary compoſition is that of whiteneſs; for to this, all the primary *colours* above mentioned are required; and theſe to be mixed in a certain degree. Hence it is that white is the ordinary *colour* of light, light being nothing elſe but a confuſed aſſemblage of rays of all *colours*.

If the rays of different *colours* do thus begin to be ſeparated by one refraction of one ſingle ſurface, that ſeparation is much promoted, ſo as even to become ſenſible to the eye, by a double refraction. This is obſerved in the two ſurfaces of any glaſs, provided thoſe ſurfaces be not parallel; but, of all others, it is moſt ſenſible in the two faces of a triangular priſm; the phenomena whereof, as they are the touchſtone of all theories of *colours*, and as they contain the foundation of that here delivered, we ſhall lay down as follows.

1. The rays of the ſun, tranſmitted through a triangular priſm, exhibit an image of various *colours* (the chief whereof are red, yellow, green, blue, and violet) on the oppoſite wall.

The reaſon is, that the differently coloured rays are ſeparated by refraction: for the blue rays, v. gr. marked with the dotted lines *Tab. Optics, fig.* 6.) which begin to be ſeparated from the reſt by the firſt refraction in *d d*, of the ſide *c a* of the priſm *a b c*, (as alſo in the firſt ſurface of the globe of water *a b c*, *fig.* 7.) are ſtill farther ſeparated in the other ſide of the priſm *b c* (as alſo in their egreſs out of the globe *a b c*,) by a ſecond refraction in *e e*, in the ſame direction as in the former: whereas, on the contrary, in the plain glaſs *a b c*, *fig.* 9. (as alſo in the priſm *g f e*, *fig.* 8.) now placed in another ſituation) thoſe blue rays which begin to be ſeparated from the reſt in the firſt ſurface, in *d d*, by a ſecond refraction, the contrary way, paſs out parallel, i. e. remixed with all the *colours* of the other rays.

2. This image is not round, but oblong; its length, when the priſm forms an angle of 60 or 65 degrees, being five times its breadth. The reaſon is, that ſome of the rays are refracted more than others; and by that means, they exhibit ſeveral images of the ſun, extended lengthwiſe, inſtead of one.

3. Thoſe rays which exhibit yellow, are turned farther from the rectilinear courſe than thoſe which exhibit red; thoſe which exhibit green, farther than thoſe which exhibit yellow; but of all others, thoſe which exhibit violet, the moſt: accordingly, if the priſm through which the light is tranſmitted be turned about its axis, ſo that the red, yellow, green, &c. rays be projected in order, through a narrow aperture into another priſm, placed at the diſtance of about twelve feet; the yellow, green, &c. rays, though falling through the ſame aperture, in the ſame manner, and on the ſame point of the ſecond priſm, will not be refracted to the ſame place as the red, but to a point at ſome diſtance from it; on that ſide to which the rotation is made.

This is what Sir Iſaac Newton calls the *experimentum crucis*; being that which led him out of the difficulties into which the firſt phenomenon, &c. had thrown him; and plainly ſhewed a different degree of refrangibility, and a different *colour* correſponding thereto in the rays of light; and that yellow rays, v. gr. are more refracted than red ones, green ones more than yellow ones, and blue and violet ones moſt of all.

4. The *colours* of coloured rays, well ſeparated by the priſm, are not at all changed or deſtroyed by paſſing through an illuminated medium, nor by their mutual deculſation, their bordering on a deep ſhadow, nor their being reflected from any natural body, or refracted through any one in a place howſoever obſcure.

The reaſon is, that *colours* are not modifications ariſing from refraction or reflexion, but immutable properties; and ſuch as belong to the nature of the rays.

5. An aſſemblage of all the kinds of coloured rays, collected either by ſeveral priſms, by a convex lens, or a concave mirror, or in any other manner, form what we call *whiteneſs*; yet each of theſe, after deculſation, becoming ſeparated, again exhibits its proper *colour*: for, as the ray was white before its parts were ſeparated by refraction; ſo, the parts being remixed, it becomes white again; and coloured rays, when they meet together, do not deſtroy one another, but are only interſperſed.

Hence, a red, green, yellow, blue, and violet *colour*, being mixed in a certain proportion, appear whitiſh, i. e. they are of ſuch a *colour* as ariſes from white and black mixed together; and if there were not ſome rays abſorbed and loſt, they would be plainly white. In like manner, if a paper cut into a circle, be ſtained with each of thoſe *colours*, ſeparately, and in a certain proportion; then ſwiftly turned round its centre, ſo that the ſpecies of *colours* be mixed together in the eye, by the briſkneſs of the motion, the ſeveral *colours* will diſappear, and the whole paper appear of one continued *colour*; which will be a mean between white and black.

6. If the rays of the ſun fall very obliquely on the inner ſurface of a priſm, thoſe that are reflected will be violet; thoſe tranſmitted, red.

For the rays were coloured before any ſeparation; and by how much they are the more refrangible, by ſo much they are the more eaſily reflected; and by that means are ſeparated.

7. If two hollow priſms, the one filled with a blue fluid, the other with a red one, be joined together, they will be opake; though each, apart, be tranſparent.

For, the one tranſmitting none but blue rays, and the other none but red ones, the two together will tranſmit none at all.

8. All natural bodies, eſpecially white ones, viewed through a priſm held to the eye, appear fimbriated, or bordered, on one ſide with red and yellow, and on the other with blue and violet. For theſe *fimbriæ* are the extremes of entire images, which the rays of any kind, as they are more or leſs refracted, would exhibit nearer, or at a greater diſtance from the real place of the object.

9. If two priſms be ſo placed, as that the red of the one, and the purple of the other, meet together in a paper fit for the purpoſe, encompaſſed with darkneſs, the image will appear pale; and if viewed through a third priſm, held to the eye at a proper diſtance, it will appear double; the one red, the other purple.

In like manner, if two powders, the one perfectly red, the other blue, be mixed; any little body covered pretty deeply with this mixture, and viewed through a priſm held to the eye, will exhibit a double image, the one red, and the other blue: becauſe the red and purple of blue rays are ſeparated by their unequal refraction.

10. If the rays, tranſmitted through a convex lens, be received on a paper before they meet in a focus, the confines or boundary of light or ſhadow will appear tinged with a red *colour*: but if they be received beyond the focus, with a blue one.

Becauſe, in the firſt caſe, the red rays, being ſomewhat more refracted, are the higher; but, in the ſecond, after deculſation in the focus, the blue ones.

11. If the rays about to paſs through either ſide of the *pupilla*, be intercepted by the interpoſition of any opake body near the eye; the extremes of bodies, placed as if viewed through a priſm, will appear tinged with *colours*; though they are not very vivid.

For, then, the rays tranſmitted through the reſt of the pupil will be ſeparated by refraction into *colours*; without being diluted with the admixture of the intercepted rays, which would be refracted in a different manner.—And hence it is, that a body viewed through a paper pierced with two holes, appears double, and alſo tinged with *colours*.

COLOURS *of thin laminæ, or plates.* As rays of *different colours* are ſeparated by the refraction of priſms, and other thick bodies; ſo are they ſeparated, though in a different manner, in the thin lamellæ, or plates of any pellucid matter, v. gr. in the bubbles raiſed in water, thickened by ſoap, &c. For all lamellæ, under a determinate thickneſs, tranſmit rays of all *colours*, without reflecting any at all: but as they increaſe in thickneſs, in arithmetical proportion, they begin to reflect, firſt blue rays; then, in order, green, yellow, and red, all pure: then, again, blue, green, yellow, red, more and more mixed and diluted; [illegible] arriving at a certain thickneſs

they reflect rays of all *colours* perfectly intermixed, viz. white.

Hence, in whatsoever part a slender lamella reflects any one *colour*, v. gr. blue, or violet, in that part it always transmits the opposite *colour*, v. gr. red, or yellow.

It is found, by experiment, that the difference of *colour* of a plate does not depend on the medium that encompasses it; but the degree of vividness does: *cæteris paribus*, the *colour* will be more vivid, if the denser medium be encompassed with the rarer. A plate, *cæteris paribus*, reflects more light as it is thinner; as far as a certain degree of thinness, beyond which it reflects no light at all.

In plates whose thicknesses increase in the arithmetical proportion of the natural numbers 1, 2, 3, 4, 5, &c. if the first, or thinnest, reflect any homogeneal ray, the second will transmit it; the third again will reflect it: and thus if the same ray alternately reflected and transmitted; i. e. the plates corresponding to the odd numbers 1, 3, 5, 7, &c. will reflect the same rays that those corresponding to the even ones, 2, 4, 6, 8, &c. transmit. Hence, an homogeneous *colour* in a plate is said to be of the *first order*, if the plate reflect all the rays of that *colour*: in a plate whose thickness is triple the first, it is said to be of the *second order*: in another, whose thickness is five times that of the first, it is said to be of the *third order*, &c.

A *colour* of the first order is the most vivid of any; and successively, the vividness of the *colour* increases, as the quantity of the order increases: the more the thickness of the plate is increased, the more *colours* it reflects, and those of more different orders. In some plates, the *colours* will vary as the position of the eye varies; in others it is permanent. See on this subject Priestley's Hist. of Vision, p. 279, &c. p. 311, &c. p. 498. See Rings *of Colours*, and Reflection.

Colours *of natural bodies*. Bodies only appear of different *colours*, as their surfaces are disposed to reflect rays of this or that *colour* alone; or of this or that *colour* more abundantly than any other: hence bodies appear of that *colour* which arises from the mixture of reflected rays. See Body.

All natural bodies consist of very thin transparent *lamellæ*; which, if they be disposed, with regard to each other, so that there happen no reflexions or refractions in their interstices, those bodies become pellucid, or transparent: but if their intervals be so large, and those filled with such matter; or so empty (with regard to the density of the parts themselves) as that there happen a number of reflexions and refractions within the body; the body, in that case, becomes opake.

The rays, which are not reflected from an opake body, penetrate into it; and there suffering innumerable reflexions and refractions, at length unite themselves to the particles of the body itself.

Hence, an opake body grows hot the sooner, as it reflects light less copiously; whence we see why a white body, which reflects almost all the rays that strike upon it, is heated much more slowly than a black one, which reflects scarce any.

To determine that constitution of the surface of bodies whereupon their *colour* depends, it must be observed, that the smallest corpuscles, or first particles whereof surfaces are made up, are most thin and transparent, and separated by a medium of a different density from the particles themselves. In the surface, then, of every coloured body, are innumerable smaller thin plates, corresponding to those of bubbles: wherefore, what has been observed of those, may be understood of these. Hence we gather, that the *colour* of any body depends on the density and thickness of the parts of the body, between the pores of the surface: that the *colour* is more vivid and homogeneous, as the parts are thinner: that, *cæteris paribus*, the said parts are the thickest when the body is red; and the thinnest when violet: that the parts of bodies are usually much denser than the medium contained in their interstices; but that in the tails of peacocks, in some silks, and, generally, in all bodies whose *colour* varies according to the situation of the eye, it is less: and that the *colour* of a body is less vivid to the eye, as it has a denser medium within its pores.

Now, of the several opake bodies, those consisting of the thinnest *lamellæ* are black; those consisting either of the thickest *lamellæ*, or of *lamellæ* very different from each other in thickness, and on that account fitted to reflect all *colours*, as the froth of water, &c. are white: those again, consisting of *lamellæ*, most of which are of some intermediate thickness, are blue, green, yellow, or red: insomuch as they reflect the rays of that particular *colour* much more copiously than the rest of any other *colour*; most of which fall they either absorb and extinguish, by interposing them, or else transmit. Hence it is, that some liquors, v. gr. an infusion of *lignum nephriticum*, will appear red, or yellow, if viewed by reflected light; and blue by transmitted light; and gold leaves yellow in the former circumstances, but green or blue in the latter.

To this may be added, that some of the powders used by painters have their *colour* changed by being very finely ground; which must be occasioned by the comminution or breaking of their smaller parts into others still smaller; just as a *lamella* has its *colour* altered, by altering its thickness.

In fine, those odd phenomena, arising from the mixture of liquors of different *colours*, can no way be better accounted for, than from the various actions of the saline, &c. corpuscles of one liquor, with the coloured corpuscles of another: if they unite, the mass will either swell or shrink, and thereby its density will be altered: if they ferment, the face of the particles may be diminished, and thereby coloured liquors may become transparent: if they coagulate, an opake liquor may be produced out of two transparent ones.

Hence it is easy to see why a coloured liquid in a glass of a conical figure, placed between the eye and the light, appears of a different *colour* in different parts of the vessel; there being more and more rays intercepted, as they pass through a longer or a shorter section of the vessel; till, at the base, they are all intercepted, and none tent that those reflected.

From the various colours of natural bodies, Sir Isaac Newton observes, the bigness of their component parts may be estimated: because the parts of bodies do properly exhibit the same *colour* with a *lamella* of equal thickness, provided the density in both be the same.

The Newtonian doctrine concerning the *colours* of bodies, as depending on the thickness of those *lamellæ*, or fine plates, which form their surfaces, is more lately confirmed by means of electrical explosions. Dr. Priestley found, that, if these are received on the surface of any metal, they will mark it with a spot, consisting of all the prismatic *colours* disposed in concentric circles, and formed by scales of the metal separated by the force of the explosion. Besides other curious observations, he informs us, that when a pointed piece of metal is fixed opposite to a plain surface, the nearer it is placed to the surface, so much the sooner the *colours* appear, the closer do the rings succeed one another, and the less space they occupy, and *vice versâ*; and that the more acutely the wire or needle, from which the electric matter issues, or at which it enters, is pointed, so much greater is the number of rings that appear: whilst a blunt point produces larger, but fewer rings. Besides, that it is of no importance, whether the electric matter issue from the pointed body on the plate, or from the plate on the pointed body, and that the points themselves are *coloured* in concentric rings to a considerable distance, but not very distinctly. Mr. Canton likewise produced all the prismatic *colours* from all the metals, by extending fine wires of them over the surface of pieces of glass; and when the wires were exploded, he observed that the glass was tinged with all the *colours*. The experiment has been often repeated, and with peculiar advantage, by the ingenious Mr. Henly. Phil. Trans. vol. lxiii. art. 10. Priestley's Hist. of Elect. vol. ii. p. 280, 8vo. ed. 1775. See Circular *Spots*, and Fairy *Circles*.

Colours, *accidental*. See Accidental.

Colours *of the clouds*, is thus accounted for by Sir Isaac Newton. Concluding from a series of experiments, that the transparent parts of bodies, according to their several sizes, reflect rays of one *colour*, and transmit those of another, he hence observes, that when vapours are first raised, they are divided into parts too small to cause any reflexion at their surfaces, and therefore do not hinder the transparency of the air; but when they begin to coalesce, in order to compose drops of rain, and constitute globules of all intermediate sizes, these globules are capable of reflecting some *colours*, and transmitting others, and thus form clouds of various *colours*, according to their sizes. Mr. Melvill controverts this doctrine, in its application to the red *colour* of the morning and evening clouds. "Why, he says, should the particles of the "clouds become at that particular time, and never at "any other, of such a magnitude as to separate those "*colours*? And why are they rarely, if ever, seen tinctured with blue and green, as well as red, orange, or "yellow? Is it not more credible, that the separation "of rays is made in passing through the horizontal atmosphere, and that the clouds only reflect and transmit the sun's light, as any half-transparent coloured "body would do? For since the atmosphere reflects a "greater quantity of blue and violet rays than of the "red, the sun's light transmitted through it ought to "incline towards yellow, orange, or red; especially "when it passes through a long tract of air: and thus

"it is found that the sun's horizontal light is tinctured "with a deep orange, and even red; and the *colour* be- "comes still deeper after sun-set." And hence he concludes, that the cloud, according to their different attitudes, may assume all the variety of *colours* at sun-rising and setting, by barely reflecting the sun's incident light as they receive it. Edinb. Ess. vol. ii. p. 75. Priestley's Hist. of Vision, p. 446, &c.

For the different properties, &c. of the several COLOURS, see BLACK, WHITE, BLUE, &c. See also RAINBOW, &c.

COLOUR, in *Painting*, is applied both to the drugs, and to the tints produced by those drugs, variously mixed and applied.

The principal *colours* used by painters, are red and white lead or ceruse; yellow ochre; several kinds of earth, as umber, &c. besides orpiment, black lead, cinnabar, gamboge, lake, bice, verditer, indigo, vermillion, verdegris, ivory black, bistre, lamp black, smalt, ultramarine, and carmine; each of which, with the manner of preparing them, their uses, &c. see under their respective heads.

Of these *colours*, some are used ground in oil, others only in fresco, others in water, and others only for miniature.

COLOURS, *dark and light*. Under these two classes the painters reduce all the *colours* they use: under *light colours* are comprehended white, and all those which approach nearest it; and under *dark colours*, black, and all those which are obscure and earthy, as umber, bistre, &c.

COLOURS, *simple and mineral*, is another division among the painters: under *simple colours*, they range all those used by limners, illuminers, &c. extracted from vegetables, and which will not bear the fire: as the yellow made of saffron, of French berries, &c. lakes, and other tinctures extracted from flowers. The salt are *mineral*, drawn from metals, &c. and are able to bear the fire: these alone are used in enamelling.

COLOURS, *changeable and permanent*, in another division of *colours*: by *changeable* are meant those which depend on the situation of objects with regard to the eye: as that of taffetas, of a pigeon's neck, &c. The salt, however, being attentively viewed with a microscope, each fibre of the feathers appears composed of several little squares, alternately red and green; so that they are really fixed *colours*.

Kircher tells us, that the *changeable colours* observed in the necks of pigeons, peacocks, &c. arise from the feathers being transparent, and of a figure resembling a prism; and consequently the light's being differently refracted from them. On the contrary, the fixed and *permanent colours* are not exhibited by refraction, but reflexion.

M. Mariotte observes, that there are two different gradations, or series of *colours*, from white to black; the one white, yellow, red, and black; the other white, blue, violet, and black.

COLOURS, *local*. See LOCAL.

COLOURS, *rings of*. See RINGS.

COLOURS, *water*. See WATER.

COLOUR, in *Dying*.—These are five simple, primary, or mother *colours*, used by the dyers; from the mixture whereof all the other *colours* are formed: these are blue, red, yellow, brown, and black; each of which see under their proper head, BLUE, RED, &c.

Of these *colours*, variously mixed and combined, they form the following *colours*; *purple*, *blue*, *red*, from the mixture of blue and scarlet, are formed *amaranth*, *violet*, and *purple*; from the same mixture of blue and crimson-red, are formed the *scarlet-dye* or *dove-colour*, *purple*, *crimson*, *amaranth*, *pansy*, and *crimson-violet*. It may be observed, that they give the name *crimson* to all *colours* made with cochineal. See CRIMSON, COCHINEAL, &c.

Of blue, and red madder, they likewise make a good *purple*, a *pepper-colour*, *tan-colour*, and *dry-rose*. The same blue, with red half in grain, makes *amaranth*, *tan-colour*, and *dry-rose*. Blue and half-red crimson, compose *amaranth*, *tan-colour*, *dry-rose*, a *brown pansy*, and *fur-brun*.

Blue and yellow. These two *colours*, mixed together, compose a *yellow-green*, *spring-green*, *grass-green*, *laurel-green*, *brown-green*, *olive-green*; as well as *sea-green*, *parrot-green*, and *cabbage-green*, &c. These three last *colours* are to be less boiled than the first.

Note, with regard to green, there is no simple ingredient or drug in nature that will dye it: but the stuffs are dyed twice; first in blue, then in yellow.

Blue and brown. These two *colours* are never mixed alone; but with the addition of red, either of madder or cochineal, they form several *colours*.

Red and yellow. All the shades composed of these two *colours*, as *gold-colour*, *aurora*, *marigold*, *orange*, *nasturtium*, *peasant-flower*, *flame-colour*, &c. are made with yellow, and red of madder; scarlet being less proper, as well as too dear.

Red and brown. Of these two *colours* are formed *cinnamon-colour*, *chestnut*, *musk*, *bears-hair*; and even *purple*, if the red be that of madder.

Yellow and brown. The *colours* formed from these two are all the shades of *feuille-morti* and *hair-colours*.

It may be observed, that though we say there are no *colours*, or shades made from such and such mixtures, it is not that none can be made; but only that they are more easily formed from the mixture of other *colours*. See DYING.

The greatest perfection in the art of *colours* would be to find the means of preparing the finest *colours* without the use either of acid or alkaline salts, which usually subject the *colours* to change, or else are apt to prey upon the cloth, canvas, &c. as we see in verdigrise, the blue and green crystals of copper, &c. It appears highly probable, that the Indians, for making the fine bright and durable *colours*, wherewith their chintzes and callicoes are painted, make use of mercurial solutions; for some painted callicoes, brought from thence, having been kept forty or fifty years, the bright *colours* have been observed to eat out the cloth, exactly in the same manner as acid spirits, which dissolve metals, are found to do.

Since these, then, are the inconveniences attending such *colours*, we ought to search for menstruums with which to extract *colours*, which are neither acid nor alkaline; and for such mercurial calces, precipitates, or powders, as will not lose their *colours*, by being well washed to get out their salts; to prepare certain mercurial matters by mere calcination, or the bare assistance of fire; and lastly, to look out for native *colours*, wherein no saline matter abounds.

Mr. Geoffroy has given a very curious process for making two clear, spirituous, inflammable liquors, which differ very little in taste and smell, and being mixt together give a fine carnation *colour*, without any sensible fermentation.

To make the first of these liquors, put a small handful of dried red roses into a glass bottle; pour on them rectified spirit of wine, till it covers them an inch; let this stand in a cold infusion four or five hours; then pour off the liquor, which will be clear and colourless, as when put on. The second liquor is made by dropping into rectified spirit of wine so much oil of sulphur, by the bell, or spirit of vitriol, as will be borne in it without giving it any very sensible acidity when tasted. When these liquors are thus prepared, let a small quantity of the latter be dropped into some of the former, and the whole will become of a fine carnation *colour*, though there is no fermentation, nor any other change perceived in it, but barely that of *colour*. If, instead of this last liquor, there be added to the first a few drops of the spirit of sal ammoniac, the whole will become green.

Make a slight infusion of galls in water, so as not to *raise* the water; make also a weak solution of green vitriol in water, so that it may appear colourless; mix these two colourless liquors together, and an inky blackness is immediately produced; add to this black liquor a little oil of vitriol, and the liquor becomes pellucid and colourless again; then add to this a little salt of tartar, and the whole is black again.

Put a little bruised camphor into rectified clear oil of vitriol; shake the mixture, and it will become black, and the camphor will be dissolved; add to this a little water, and the liquor becomes clear, and the camphor is found separated at top, in its own form, and native whiteness.

Infuse lignum nephriticum in cold water, and pour off the clear liquor. This held up against the light, appears of a fine yellow, but, viewed from the light, of a beautiful blue: a little spirit of nitre put to this liquor makes it lose the power of reflecting the blue rays, and a little oil of tartar, afterwards added, recovers that power again.

Logwood, infused in water, gives a red colour. Put to this a little spirit of urine, and it becomes of a fine purple; and drop in afterwards a little spirit of salt, and it becomes of a pale red.

A beautiful blue tincture may be made from filings of copper, by digesting them in spirit of urine, hartshorn, or the like. The addition of oil of vitriol destroys the blue *colour*; and a little spirit of salt turns it green.

Pellucid oil of vitriol, mixed with pellucid oil of turpentine, produces a thick red balsam. And common oil, mixed with fair water, by means of a little wax, and continued rubbing, turns into a thick white balsam, called cold cream.

Oil of vitriol, distilled from quicksilver, leaves a white powder behind, which, if water be poured on it, becomes yellow.

Dissolve quicksilver in spirit of nitre, and to part of it add spirit of urine, and a white powder is precipitated; to another part of the solution add oil of [illegible] yellow powder falls [illegible]

Dip a new pen in spirit of vitriol, and write with it on common blue paper, and the letters will appear red.

A diluted solution of saccharum saturni being written with on paper, becomes invisible when dried; but the brine fumes of an infusion of quick lime, and orpiment, in water, will render the invisible writing black and legible.

Volatile salt of sal ammoniac, which is white, mixed with crystals of copper, which are green, produce a fine purple.

The original and simple, as well as the mixt, *colours* are producible by mixture. Thus, if the sun's rays pass through two pieces of glass, the one blue, and the other yellow, and be afterwards received upon a white paper, the colour these form is green. The dyers have both blue with woad, and their yarn is given by the yellow herb called luteola, or dyer's weed. Two yellow solutions of gold in aqua regia, add a blue one of copper in spirit of nitre, and the mixture becomes green. The painters every day practise this art of producing new colours by mixture.

Metallic and mineral matters are reducible to a considerable degree of subtlety, or smallness of parts, by fire, or other animation, so as to leave them durably possessed of their native or adventitious *colours*. Thus lapis lazuli, by being calcined, becomes the fine rich blue called ultramarine; light ochre, by the same treatment, becomes a light red, or flesh-colour, the most useful flesh-colour in painting. Lead, by calcination, becomes durably red, and iron durably brown; but a proper method seems wanting for the dry calcinations of the nobler metals, gold and silver; though, for the uses of gilding, these are easily prepared by dipping linen rags in their respective solutions, and then drying, and burning them to ashes, whereby a dry and fine metalline powder is procured.

COLOURS *from metals*. See METAL.

COLOUR, *gold*. See GOLD.

COLOUR, *wine*. See WINE.

COLOURS, in *Heraldry*. The *colours* generally used in heraldry, are red, blue, black, green, and purple; which by the learned in that science, are called *gules*, *azure*, *sable*, *vert* or *sinople*, and *purpure*. *Tenne*, or *tawny*, and *sanguin*, are not so common. See each colour under its proper article, GULES, AZURE, VERT, SINOPLE, &c. As to yellow and white, called *or* and *argent*, they are metals, not *colours*.

These *colours* and metals are sometimes also expressed in blazon by the names of precious stones; and sometimes by those of planets, or stars.—Thus, or is called *Sol*, and *topaz*; argent, *Luna* and *pearl*; gules, *Mars*, and *ruby*; azure, *Jupiter*, and *sapphire*; sable, *Saturn*, and *diamond*; vert, *Venus*, and *emerald*; purpure, *Mercury*, and *carbuncle*; tenne, the *Dragon's head*, and *hyacinth*; and sanguin, the *Dragon's tail*, and *jordan*.

There is a general and fundamental rule in BLAZON, not to place *colour* upon *colour*, nor metal upon metal. That is, if the field be of a *colour*, the bearing must be of a metal: though this rule, on some occasions, and in some circumstances, is dispensed with; as in the diminutions and differences which distinguish the younger from the elder branches of families; and in the extremities of animals tongues, claws, horns, &c. In which cases *colour* may be on *colour*, and metal on metal, without false heraldry. Camden is said to have first invented the distinction of *colours*, to distinguish the quadrilles of combatants at the Circensian games: the green for those who represented the earth; and the blue for those who represented the sea.

Hence the ancient cavaliers took occasion to distinguish themselves in their tournaments, by habits, plumes, and ribbands of different colours; which were ordinarily those of their mistresses, and were the symbol of some passion or quality.—Hence also the origin of *colours* in liveries.

COLOURS, in the *Military Art*, include the banners, flags, ensigns, &c. of all kinds, borne in an army, a fleet, or the like. See FLAG, and STANDARD.

COLOURS, *field*. See FIELD.

COLOURS are also used in the Latin and Greek churches, to distinguish several mysteries and festis celebrated therein.

In the Latin church are only regularly admitted five *colours*, viz. *white*, *red*, *green*, *violet*, and *black*: the *white* is for the mysteries of our Saviour, the feasts of the Virgin, those of the angels, fasters, and confessors; the *red* for the mysteries and solemnities of the holy sacrament, the feasts of the apostles and martyrs; the *green* for the time between Pentecost and Advent, and from Epiphany to Septuagesima; those in Advent, Christmas, in vigils, rogations, and in votive masses in time of war; fasts, mourning, and in votive masses for the dead; the *violet* for the vigils and eves, and embroideries, leave indifferent all solemnities.

In the Greek church the use of *colours* is almost obliterated, as well as among us: *red*, among them, was the *colour* for Christmas, and the dead; as black is still for the last among us.

COLOUR, in *Law*, is a probable, or plausible plea; though in reality false at bottom; and only calculated to draw the trial of the cause from the jury to the judge.

Thus, e. g. in an action of trespass for taking away the plaintiff's beasts, the defendant urges, that before the plaintiff had any interest in them, he himself was possessed of them, as his proper goods; and delivered them to A. B to deliver to him again, when, &c. and A. B. gave them to the plaintiff; and the plaintiff, supposing the property to be in A. B. at the time of the gift, took them; and the defendant took them again from the plaintiff; whereupon the plaintiff brings his action.—This is a good *colour*, and even a good plea. Dock. and Stud.

COLOURS, *Colores*, in the *Ancient Music*, was used to figure the musical species belonging to a genus.

In this sense the CHROMATIC *genus* was said to have three *colours*; and the DIATONIC two. The ENHARMONIC, having no subordinate species, had but one *colour*. Hence the ancients reckoned three *genera*, and six *colours*, in music; that is, so many different divisions of the monochord, or fourth.

COLOUR *of office*, is when some unjust action is done, under countenance of office or authority.

To COLOUR *strangers goods*, is when a freeman allows a foreigner to enter goods at the custom-house in his name.

COLOURABLE *title*. See TITLE.

COLOURING, in *Painting*, the manner of applying, and conducting the colour of a picture; or the mixture of lights and shadows, formed by the various colours employed in a painting.

The *colouring* is one of the principal branches in painting: M. Fresnoi divides the painter's art into three parts; the design, the composition, and the *colouring*. The *colouring* strikes the most; but among masters it always gives place to rightness of design.

De Piles observes, that the word *colouring*, in its confined sense, is chiefly applicable to a history-piece; scarce at all to a landscape. He adds, that the term *colouring* relates more immediately to the carnations than any thing else.

The *colouring*, in its general sense, taken in whatever relates to the nature and union of *colours*; their agreement or antipathy; as also how to use them to advantage in light and shadow, so as to throw a relievo to the figures, and a sinking of the ground; what relates to the aerial perspective, i. e. the diminution of colours by means of the interposition of air; the various accidents and circumstances of the harmony and the medium; the different sights, both of the bodies illuminating and illuminated; their reflexions, shadows, different views, with regard either to the position of the eye or the object; what produces strength, boldness, sweetness, &c. in paintings well coloured; the various manners of *colouring*, both in figures, landscapes, &c.

COLOURING, *method of*. *Colours* are considered, either in respect of their use, or their economy and disposition.

1. With regard to their use. They are either in oil, or water; those in oil, again, may either be considered with a view to their preparation, or application.

In the preparation of oil colours, care must be taken that they be ground fine; that in putting them on the pallet, those which will not dry of themselves, be mixed with drying oil, or other driers; and that the tinged colours be mixed in as small quantities as possible.

For their *application*, it is considered either with regard to the kinds of painting, whether in works of various colours, or in those of one single colour.

For the *first*, in the large pieces, the colours are either laid on full, so as that they may be impasted, or incorporated together, which makes them hold the more firmly. Or else they mix those more agreeable ones, which dry too hard, and too lastlily, with a little colour, and the cleanest of the oil: but, in both cases, the colours are to be laid on strong at first, in order to weaken those that are to be afterall back, and to heighten the others: the touches to be bold, by the conduct of a free and steady pencil; that the work may appear the most finished at a proper distance, and the figures animated with life and spirit.

For glazed colours, particular care must be taken that the under-colour be painted strong, and that it be a body-colour, and laid smooth.

In finished works, which are to be viewed near at hand, they proceed, either by applying each colour in its place; preserving their purity, without fretting or tormenting them, but tenderly softening off their extremities; or by filling up all the great parts with one single colour; and laying the other colours, which are to form the little things, upon it; which is the more expeditious way, but is more apt to decay.

For the *second* the kinds of pictures in one colour are used viz. *camieus*, where the degradations of colours of objects afar off are usually managed by lights, as with crayons; and *bosso relievos*, which is an imitation of sculpture, of whatsoever matter and colour: in both these, the colours are wrought dry.

For water-colours, they are wrought various ways: viz. in *distemper*, as the painters express it, where the colours are prepared in size; which method is used in all kinds of mettre; in *fresco*, or painting on fresh mortar; where the *colouring* must be quick, that the matter dry not; and with much care and method, laying each colour in its place, and intermingling them by parcels: in *agnada*, where the colours are mixed with gum, and the pencil dragged as in paint and washings: in *miniature*, for small and delicate works; where the colours are to be very fine and clean, mixed with gums, and wrought in dots or points.

But in all the kinds of painting, both in oil and distemper, especially the latter, proper care must be taken, that the design be fixed, and all the parts marked out, before any colours be applied.

For the second part of *colouring*, or the œconomy and disposing thereof in paintings; regard is either had, first to the qualities of the colours, to appropriate them according to their value or agreement; or, secondly, to their effects in the union and œconomy of the work.

For the *qualities*, it must be observed, that white represents light, and gives the brightness and heightening: black, on the *contrary*, like darkness, obscures and effaces the objects again, black sets off the light parts; and by that they serve each other to loosen the objects.

A proper shine is to be made of colours, and the too much changed manner to be avoided; both in carnations, where red colours are not to be affected, as rather resembling the flesh when flayed than skin; and all bright glowing colours in the skin, how delicate fever, being always of a down colour; in the drapery, where the painter has his whole flock of colours to chuse out of, to procure a good effect; and in the landscape to dispose those colours near one another, which mutually assist and raise each other's force and brightness; as red and green, yellow and blue. He is likewise to manage them so, as that they be accommodated to the effects of the great parts of light and colour; that the strong colours lead to the soft ones, and make them more looked at; bringing them forwards, or keeping them back, according to the situation, and the degree of force required.

For the *effects of colours*, they either regard the union, or the œconomy: with respect to the first, care must be taken, that they be laid so as to be sweetly united, under the brightness of some principal one; that they participate of the prevailing light of the piece; and that they partake of each other by the communication of light, and the help of reflexion.

For the *œconomy in managing their degrees*, regard is to be had to the contrast, or opposition intervening in the union of the colours, that by a sweet interruption, the brightness, which otherwise fades and palls, may be raised to the harmony, which makes the variety of colours agree; supporting and sustaining the weakness of some by the strength of others; neglecting some places, on purpose to serve as a base or repose to the sight, and to enhance those which are to prevail through the piece: also, to the degradation, where, the better to proportion the colours that fall behind, some of the same kind are to be preserved in their purity, as a standard for those carried off or to be compassed by, in order to justify the diminutions regarded: and always to have had to the quality of the aire, which, when loaded with vapours, weakens the colours, more than when clear: to the situation of the colours, where care must be taken, that the purest and strongest be placed before, or in the front of the piece; and that by their force the compound ones, which are to appear at a distance, be kept back; particularly the glazed colours to be used in the first rank: lastly to the exposition of the subject, and the nature of the matter, or stuffe, whether shining or dull, opake or transparent, polished or rough.

COLOURING *and* NON-COLOURING, *Stage*. That the dyers distinguish their materials; the first are applicative, and communicate their colours to the matter boiled in them; or rather strong; such as woad, fenegreek, green, cochineal, indigo, madder, turmeric, &c.

The second serve to prepare and dispose the stuffe, and other matters; and to extract the colour out of the *colouring* ingredients: as alum, salt or crystal of tartar, arsenic, realgar, tale-stone, common salt, sal ammoniac, sal gemmæ, aqua fortis, spirit of wine, bran, pear, flour, wheat, starch, lime, and ashes.

COLOURING *of glass*. See GLASS.

COLOURING *of earthen ware*. See GLAZING.

COLOURING *of porcelain*. See PORCELAIN.

COLOURING *of spirits*. See SPIRITS.

COLPISCIS, a name given by some to the *pisis Veneticus*, or sickle fish, commonly called the marmot fish by the people of Venice. See PALX.

COLT, in *Zoology*. See FOAL.

COLT *Evil*, a disease incident both to horses and geldings. It is an unnatural swelling of the yard and cods, proceeding from wind, or else through the abundance of seed in horses. It happens to geldings for want of natural heat.

COLT'S-*foot*, *Tussilago*, in *Botany*, a genus of the *syngenesia polygamia superflua* class. Its characters are these: it hath compound flowers, which are included in one common cylindrical empalement; the flowers are tubulous and funnel-shaped, and have each five short segments. The germen is crowned with down, and afterward becomes a single oblong seed, crowned with long down. Linnæus mentions fourteen, and Miller three species, the first of which is very common in watery places in most parts of England.

The common *colt's-foot* stands generally recommended as a very great medicine in coughs, and all disorders of the breast and lungs. It is also sometimes used externally in inflammations.

COLT'S *foot*, *Alpine*, or *foreign Canada*, in *Botany*, a genus of the *syngenesia polygamia superflua* class. Its characters are these: it hath compound flowers, which are included in one common cylindrical empalement; the flowers are tubulous and funnel-shaped, and have each five short segments. The germen is crowned with down, and afterward becomes a single oblong seed, crowned with long down. Linnæus mentions fourteen, and Miller eight species.

The root of *cacalia*, macerated in wine, and made into an eclegma, or chewed by itself, is said to cure coughs. Its roots pulverised and made into a cerate, and used as an ointment, render the skin smooth and free from wrinkles.

COLTE, among the *Tinners*, denotes a wood used to express a tree which has a defect in some one of its annual circles, which renders it unfit for many of the uses it might have been otherwise fit for. In this case sometime of the annual circles near the centre is perceived by the eye to be thicker than the rest, and its sap-wells larger. It has an appearance much different from that of the others, and is so loosely connected both to its innermost, and invelled circles, that, on sawing a transverse piece of the trunk off, it will fly out from the others, and so leave the heart loose, and the rest hollow, seeming to have been only fitted, not connected, to the others. In splitting the wood for other uses, it yet more readily drops out, and the timber of such a tree is therefore much less fit for general use than that of others. It is not easy to say to what accident, in the growth of the tree, this is owing, but it seems probable that it exposes the tree to other accidents; in particular Dodoens seems to think, that among the trees which were split by the hard frost, in the year 1683, while other trees of the like sizes and kinds escaped, this *defect* might be the occasion of the mischief, as well as their being windbroken, or lagged. Phil. Trans. N° 165.

COLUBER, in *Zoology*, the name of a very numerous genus of SERPENTS, the characters of which are reported with *fangs*, and the under part of the tail with *feathers* or scales. See VIPER.

COLUBRINUM *Agaricum*. See LICHEN *cylindricus*.

COLUM, in *Ornithology*, is probably a species of the CRANE, and common at Surat in the East Indies. These birds have a remarkable action in the *ejicta arteriæ*, taken notice of by Dr. Parsons; and which he conjectures may serve for the retention of inspired air, whilst they plunge deep into the water in pursuit of food, or traverse different climates through various degrees of rarefied and condensed air. Phil. Trans. vol. lxiv. art. 24. *passim*.

COLUMBA. See PIGEON.

COLUMBA *quinata*. See HELMET *flower*.

COLUMBA *Groenlandica*, in *Ornithology*, a name given by authors to a small, web-tailed, water fowl, called, in English, the *sea pigeon*. See DOVE.

COLUMBA *Nasonum*. See MADONNA *flower*.

COLUMBA *rubra*. See LAUGHER.

COLUMBA *marina*, the *pochion*, in *Ichthyology*, the name of an East Indian fish, and one said to be a species of the orbis, or moon fish, but which has not any of the prominent chi[illegible]

scales, but it is variegated with several very oddly placed marks on the back and sides. It is a scarce fish, and not much valued, being but an ill-tasted one.

COLUMBA is also the name of a military order instituted by John I. of Castile, about the year 1379.

COLUMBA *Noachi*, a small constellation in the southern hemisphere, consisting of ten stars. In Sharp's Catalogue their longitudes, latitudes, &c. are as follow.

Names and Situations of the Stars	Mag.	Longit.		Latitude.		Precession
		S.	D.	S.	D.	
First of the brightest	0	18	22	30	23	2.5
Second		22	33	46	59	1.5

Second, ditto, in Canis Major		4	14	29	56	44	58	5
Laſt in the triangle		0	45	1	55	47	37	5

COLUMBAC denotes that part of the SMALL GUT, which is between the ileon, and that part next to the anus.

COLUMBINA, a name given by Agricola, and some other medical writers, to the *perenne*, or common VERVAIN.

COLUMBINA *Myrra*. See MARLE.

COLUMBINE. *Aquilegia*, in *Botany*, a genus of the *polyandria pentagynia* claſs. Its characters are these: the flower hath no corolament, but is compoſed of five equal oval petals, which are plain, and ſpread open wide, and have five equal nectariums, ranged alternately with the petals, each of the horns widening upwards. It hath many awl-ſhaped ſtamina, and five oval germina, which after ward become five cylindrical veſſels, which are filled with oval ſhining ſeeds. There are four ſpecies.

The manner of propagating theſe flowers is either by ſowing, or parting the old roots; but the old roots being very apt to degenerate, the ſowing of them is much the beſt method.

The ſeeds muſt be ſown in a nurſery-bed in Auguſt or September, and in the March following the plants will appear above the ground, at which time they muſt be carefully cleared of weeds, and watered gently at times, if the dryneſs of the ſeaſon requires it. In the beginning of May they will be ſtrong enough to be tranſplanted, and muſt then be placed at eight inches diſtance, in beds of good, freſh, unmanured earth, and they muſt here be alſo kept cleared from weeds, and watered as they may require it; at Michaelmas they may be removed into the borders of the flower-garden, and in the May following they will flower. The ſeeds of columbine have been commended, in ſubſtance and in emulſion, as an anthelmintic, as an aperient in the jaundice, and for preventing the eruption of the meaſles and ſmall pox. But their ſuppoſed qualities afford little foundation for virtues of this kind. Thoſe aſcribed to a tincture of the flowers as an ophthalgitic, and for ſtrengthening the gums, and clearing ſcorbutic ulcerations in the mouth, appear to be better founded: the tincture being made with an addition of the vitriolic acid, and differing little from our officinal tincture of roſes.

COLUMBINE, *ſtarbleed*, in *Botany*. See *Monkſhood* RUE.

COLUMBINE, a kind of *violet-colour*, called alſo *deep-colour*. See DYING.

COLUMBO root derives its name from *Columba*, a town in the iſland of Ceylon, whither it was tranſplanted from Aſia. This root is compoſed of three laminæ, the cortical about one fourth of an inch thick, the ligneous about half an inch, and the medullary, which is about an inch in diameter. It is brought into Europe in circular pieces about three inches thick, covered with a wrinkled bark of a dark brown hue, and internally it is of a light yellow. It hath an aromatic ſmell, and is bitter, and ſlightly pungent to the taſte. It is reckoned almoſt a ſpecific in the cholera morbus, naufea, indigeſtion, bilious fever, diarrhœa, dyſentery, and moſt diſorders of the ſtomach and bowels. It is ſedative, corroborant, and antiſeptic. It is more effectual than the bark in preſerving the bile from putridity, and in ſome caſes a good ſubſtitute for it. The common doſe is from ten to fifteen grains every three or four hours. A tincture is made by infuſing an ounce of this root in a pint of brandy, which may be taken in the quantity of a table ſpoonful, and ſpeedily relieves colicky pains ariſing from flatulence and indigeſtion. An extract likewiſe of this root is prepared by digeſting twelve ounces of the powder in three pints of rectified ſpirit of wine; then filtring the tincture, and boiling the reſiduum in different waters, till it yields little or no taſte to the liquor. This decoction is ſtrained and evaporated, until only ſix pints remain; which after evaporation in a vapour bath, and having the tincture added to it, may be reduced to the conſiſtence of a pill.

COLUMBUS, *Congregation of St.* is the name of a congregation of regular canons, formerly of great extent; having under it an hundred abbeys, or monaſteries, in the Britiſh iſlands. See CONGREGATION, and CANON.

COLUMELLA, in *Natural Hiſtory*, a name given by *Mr. Lhuyd to the teſticulæ*, or FUNGITÆ, a ſort of foſſil cones, often found foſſil, as they very frequently are, in beds of clay, or lodged in ſtone.

COLUMELLA, in *Anatomy*. See UVULA.

COLUMELLA *muſculus tarsi*, a name given by *Morgagni*, and ſome others, to the muſcle called by Albinus *tenſor ſuralis*.

COLUMN, in *Architecture*, a round pillar, made to ſupport, or adorn, a building.

The *column* is the principal, or reigning part, of an architectonical order.

The principal laws and properties of this eminent member of architecture are thus deduced. Every fulcrum, or ſupport, is ſo much the more perfect, as it is the firmer, or carries the greater appearance of firmneſs: and hence all *columns*, or pillars, ought to have their baſe, or foot broader than themſelves. See BASE.

Again, as a cylinder and a quadrangular prism are more eaſily removed out of their place than a truncated cone, or a pyramid on the ſame baſe, and of the ſame altitude; the figure of *columns* ought not to be cylindrical; nor that of a pilaſter, pyramidal; but both the one, and the other, to be contracted, or diminiſhed; i. e. to grow leſs and leſs, like a truncated cone, and a truncated pyramid.

For the ſame reaſon, the loweſt parts of *columns* ought to be cylindrical; that of pilaſters, pyramidal: hence, again, as *columns* are more firm, if their diameter bears a greater proportion to their height, than if it bore a leſs; the greater ratio is to be choſen, where a large weight is to be ſuſtained; and leſs, where a leſſer. Farther as the deſign of a *column* is to ſupport a weight, it muſt never be ſuppoſed without an entablature: though a *column* ſtand on an eminent place, ſo as to leave no room to fear its being thruſt out of its place, needs no pedeſtal.

The entire *column*, in each order, is compoſed of three principal parts; *the baſe*, *the ſhaft*, and *the capital*. See the deſcription of each, under its reſpective head, CAPITAL, &c. Each of theſe parts, again, is ſubdivided into a great number of leſſer, called *members*, or *mouldings*: ſome whereof are eſſential, and found in all *columns*; others are only accidental, and found in particular orders.

Columns are different, according to the ſeveral orders they are uſed in, and likewiſe, not only with regard to their order, but alſo to their matter, conſtruction, form, diſpoſition, and uſe. With regard to order, we have the

COLUMN, *Tuſcan*, the ſhorteſt, and moſt ſimple, of all the *columns*. Its height, according to Vitruvius, Palladio, and Vignola, is ſeven diameters, or fourteen modules; according to Scamozzi, it is fifteen modules; to De Lorme, twelve; to Trajan's *column*, fifteen. Its diminution, according to Vitruvius, is one fourth of the diameter; according to Vignola, a fifth; and according to Trajan's *column*, a ninth. Its ſeveral parts, mouldings, &c. See under their proper heads; and the entire figure, ſee repreſented in *Tab. Architect. fig.* 24.

COLUMN, *Doric*, is ſomewhat more delicate; its ſhaft is adorned with flutings: its height according to Vitruvius, is from fourteen to fifteen modules; to Scamozzi, ſeventeen; to Vignola, ſixteen; in the Coliſeum, nineteen; in the theatre of Marcellus, fifteen two thirds. Its diminution, according to the theatre of Marcellus, twelve minutes; to the Coliſeum, four minutes and a half. See *Tab. Architect. fig.* 25.

COLUMN, *Ionic*, is more delicate ſtill; it is diſtinguiſhed from the reſt by the volute in its capital, and by its baſe. See VOLUTE.

Its height, according to Palladio, is ſeventeen modules one third; according to Vignola, eighteen: its diminution in the temple of Concord, ten minutes and a half; of Fortuna Virilis, ſeven and a half; Coliſeum, ten minutes. See *Tab. Architect. fig.* 26.

COLUMN, *Corinthian*, is the richeſt and moſt delicate of all the *columns*. Its capital is adorned with two rows of leaves, and with cauliculos; whence ſpring our little volutes.

Its height, according to Vitruvius, and many remains of antique porticos, temples, &c. is nineteen modules; according to Serlio, eighteen: to the Coliseum, seventeen and seven tenths; to the three *columns* in the Campo Vaccino, twenty; the basilica of Antoninus, twenty. Its diminution, according to the temple of Peace, is fix minutes and a half; the Pantheon, fix one eighth; temples of Sybil and Faustina, eight; Conftantine's arch, feven; portico of Septimius, feven and a half. See *Tab. Architect. fig.* 27.

COLUMN, *Compofite*, has two rows of leaves in its capital, like the Corinthian; and angular volutes, like the Ionic. See COMPOSITE.

Its height, according to Vignola, and the arch of Titus, is twenty modules; to Scamozzi, and the temple of Bacchus, nineteen and a half; the arch of Septimius, nineteen and nine tenths. Its diminution, according to Titus's and Septimius's arches, feven minutes; baths of Diocletian, eleven minutes one third; temple of Bacchus, fix and a half. See *Tab. Architect. fig.* 28.

An ingenious architect has furnifhed the editor with the following table, accommodated to the meafures of the moft approved architects for the four firft orders; and as the Compofite (which many will not allow to be a diftinct order) has the beft effect when put to the meafures of the Corinthian, the meafures may be fuppofed from thofe of that order.

It may be here obferved, that there feems more of caprice than reafon in that diverfity found in the heights of *columns* of the fame order, in different authors; each of whom frequently takes the liberty of difpenfing with his own rules. Vitruvius, for inftance, makes the Doric *columns* of temples fhorter than thofe of porticos behind theatres; Palladio gives a greater height to columns ftanding on pedeftals, than to thofe which have none; and Serlio makes his columns a third fhorter, when coupled or detached, than when contiguous to [illegible]. But notwithftanding [illegible] the fame order [illegible]

proportion in the several orders compared with each other; by which they go increasing, as the orders are less massive.

But this augmentation is greater in some ordonnances than in others: for in the antique it is but of five modules, or semidiameters, for the five orders; the thinnest *column*, that is, the Tuscan, being fifteen modules; and the largest, the Composite, twenty. In Vitruvius, this increase is also of five modules; but commences from fourteen modules, and ends at nineteen. The moderns usually make it greater: Scamozzi makes it five modules and a half; Palladio and Serlio, six.

From the several proportions of *columns* assigned by several authors, M. Perrault has drawn a new one, which is a mean between the extremes of the reſt. Thus, he makes the Tuscan *column* fourteen modules two thirds; which is a kind of mean between the Tuscan of Vitruvius, fourteen, and that of Trajan's *column*, eighteen: the height of the Doric *column* he makes fixteen modules; which is a mean between the fourteen of Vitruvius, and the nineteen of the Coliſeum: the Ionic he makes seventeen modules one third; which is a mean between the fixteen of Serlio, and the nineteen of the Coliſeum: the Corinthian *column* he makes eighteen modules two thirds; as being a medium between the fixteen modules six minutes of the temple of the Sybil, and the twenty modules fix minutes of the three *columns* of the Roman Forum; laſtly, the Compoſite *column*, by the ſame rule, he makes twenty modules; that height being a mean between the arch of Titus, and the temple of Bacchus.

Indeed, the rule by which he proceeds ſeems very reaſonable; viz. that the progreſſional advance of each *column* in the different orders is to be equal; ſo that having ſettled the whole progreſſion, from the Tuscan to the Compoſite, at five modules ten minutes; this being a mean between the five modules of the antique, and the five and the half of the moderns; he divides this ſum, which is one hundred and ſixty minutes, into four equal parts, giving forty minutes to the progreſſion of each order: this makes the Tuscan *column* fourteen modules twenty minutes; the Doric becomes fixteen; the Ionic ſeventeen ten minutes, the Corinthian eighteen twenty minutes, and the Compoſite twenty modules.

For the diſtinguiſhing characters of each order of *columns*, ſee ORDER. For the matter of *columns*, ſee STONE, MARBLE, &c. For their uſe and application, ſee BUILDING. For the ranging of *columns*, and the ſpaces to be obſerved between each, ſee INTERCOLUMNIATION.

COLUMNS, *different with regard to their matter.*

COLUMN, *ſolid*. Under this term are comprehended, not only *columns* of various metals, and other fuſible matters, as glaſs, &c. but alſo thoſe of ſtone, ſaid to have been caſt; the ſecret of which ſome will have us believe to have been known to the ancients.

COLUMN, *hydraulic*, is that whoſe ſhaft appears to be of cryſtal; being formed by a number of little threads of water, falling from holes made in a git of metal, at equal diſtances, by means of a pipe mounting through the middle thereof; as in the grottos at Verſailles.

COLUMN, *hydrauloc*, alſo denotes a *column* from whoſe top proceeds a *jet d'eau*, to which the capital ſerves as a baſon; hence the water deſcends by a little pipe, which turns ſpirally around the ſhaft. Such are the Ionic *columns* of the caſcade of the Belvidera at Frescati; and thoſe of the vineyard Matthei at Rome.

COLUMN, *muſſoid*, is that made by inſpiſſation, of gravel and ſtone of divers colours, which are bound together with a cement, which grows perfectly hard, and receives a poliſh like marble.

The ſecret of making theſe, it appears, the ancients were maſters of, by the *columns* lately diſcovered near Algiers; which are, doubtleſs, the ruins of the ancient Julia Cæſarea: on all theſe is found the very ſame inſcription in antique characters; the contours, accents, and even faults, being repeated in every ſhaft: an inconteſtible proof of their being moulded.

COLUMN, *tranſparent*, any *column* made of tranſparent matter: as were thoſe of cryſtal in the theatre of Scaurus, mentioned by Pliny; and thoſe of tranſparent alabaſter, in the church of St. Mark, at Venice.

COLUMN, *watery*, is a ſort whoſe ſhaft is formed of a large *jet d'eau*; which, ſpouting out water violently from the baſe, drives it within the cavity of the capital, which is made hollow; whence, falling down again, it has the effect of a liquid cryſtal *column*. See FOUNTAIN.

An inſtance of this we have at Quinta d'Arelio, near Lisbon.

COLUMN *of ſtands*, or *tambours*, that whoſe ſhaft is formed of ſeveral courſes of ſtone, or blocks of marble, leſs high than the diameter of the *column*: this is what Vitruvius means by *columna ſcapillis*, or *ſcapacea*; which is oppoſed to the *columna ſolida*, or *integra*, i. e. of one piece.

COLUMNS, *with regard to their conſtruction.*

COLUMN *of Joiners*, is that made of ſtrong timber-boards, joined, glued, and pinned together: it is hollow, turned in the lathe, and uſually fluted. Such are the *columns* in moſt altar-pieces.

COLUMN *of Maſons*, is made of rough ſtone, well laid and covered with plaiſter; or of bricks moulded triangular-wiſe, and covered with ſtucco.

COLUMN *in tranchions*, or pieces, conſiſts of three, four, or five pieces of ſtone, or metal; differing from the tambours, as being higher than the diameter of the *column*.

COLUMN, *generated*, that whoſe ſhaft is formed of three ſimilar and equal ſides, or ribs of ſtone, fitted within one another; and faſtened at bottom with iron pins, and at the top with cramp-irons. This is in be fluted, that the joints may be the leſs diſcernible.

COLUMN, *incruſtated*, is made of ſeveral ribs, or thin ſhells of fine marble, or ſome other rare ſtone, cemented upon a mould of ſtone, brick, or the like. This is done with deſign both to ſave the precious matter, as oriental jaſper, lapis lazuli, agat, &c. or to repreſent pieces of ſuch ſtones of an extraordinary ſize, by the neatneſs and cloſeneſs of the incruſtation, which renders the joints imperceptible.

COLUMN, *cabled*, or *rudented*, is a *column* having projections in form of cables, or canes, in the naked of the ſhaft; each cable having an effect oppoſite to that of the fluting; and accompanied with a little liſt on each ſide.

COLUMN, *curvilin*, that adorned with foliages, or leaves and branches turned ſpirally around the ſhaft; or in form of crowns and feſtoons.

Theſe were uſed by the ancients for erecting ſtatues on; which hence took the denomination of *curvilin*. They are very ſuitable in triumphal arches, and decorations of theatres.

COLUMN, *coloſſal*, a *column* of enormous ſize, too large to enter any ordonnance of architecture; to be placed ſolitary in the middle of a ſquare, &c.

Such is the Trajan *column*; whoſe proportions are Doriſh, as the Trajan *column*; whoſe proportions are Doriſh, as the Trajan *column*; whoſe proportions are Doriſh, as

COLUMN, *fluted and cabled*, is that whose flutes are filled up with cables, reeds, or staves; beginning from the bottom of the shaft, and reaching one third of its height.

COLUMN, *fluted, enriched*, is that whose flutings are filled up with ornaments, of foliages, rands, ribbons, &c. instead of cables.

COLUMN, *Gothic*, a round pillar, either too short for its bulk, or too slender for its height; as having, sometimes, twenty diameters; and this without either diminution, or swelling: yet its ornaments, and the characters of its work, being as far from those of the antique, as its proportions.

COLUMN, *Hermetic*, a kind of pilaster, in manner of a terme; having the head of a man, in lieu of a capital. It had its name from a cuftom, among the ancients, of placing Mercury's head, whom the Greeks call *Hermes*, at the top of *columns*.

COLUMNS, *massive*, are those too short for the order whose capital they bear; as the pillars in Gothic churches usually are. See MASSIVE.

Under the term *massive* are, likewise, frequently comprehended *rustic* and *Tuscan columns*.

COLUMN, *oval*, that whose shaft has a flatness; its plan being made oval, to reduce the projecture.

COLUMN, *pastoral*, that whose shaft is formed in imitation of the trunk of a tree, with bark and knots.

This kind of *column*, in the Tuscan proportion, may be used in the gates of parks and gardens; and in the decoration of pastoral scenes, &c.

COLUMN, *polygonous*, has several sides or faces: the most regular of these have eight faces.

Thefe, with the oval and cylindrical *columns*, Daviler regards as abufes in architecture.

COLUMN, *serpentine*, a *column* formed of three serpents, twifted together; the heads whereof serve as a capital.

An inftance of this is at Conftantinople, in the fquare called Atmeidan, anciently the Hippodrome. P. Gyllius calls this the *Delphic column*; as imagining it anciently ferved for the tripod of Apollo, in the temple at Delphos. It is now ordinarily called the *bofsman*, or *embroider's column*.

COLUMNS, *fwelled*, are thofe which have a bulging, or fwelling, in proportion to the height of the fhaft.

Authors are much divided on the fubject of this *fwelling*. Sir H. Wotton treats it as a moft ridiculous abufe: yet the practice obtains among the modern architects; who generally make their *columns* a little bigger at one third of their height, than at the bafe; i. e. they diminifh the *column* near the bafe, which makes the upper part appear big, and occafions a fwelling at about one third of the height.

This fwelling appears to have been unknown to the ancients. M. Le Clerc obferves, it ought not to exceed one minute and a half at moft. He thinks it ought never to be ufed, excepting where there is a particular occafion for it; as where *columns* are to be placed over one another.

COLUMN, *twifted*, is that whofe fhaft is twifted round, in manner of a ferpent, with fix circumvolutions; being, ordinarily, of the Corinthian order. Vignola firft found a method of drawing it by rule.

COLUMNS, *twifted fluted*, is that whofe flutes follow the contour of the fhaft, in a fpiral line throughout the whole length; wherein there are fome antique ones of porphyry, and hard marble.

COLUMN, *twifted and enriched*, is that, one third of whofe fhaft is fluted, and the reft adorned with foliages and other enrichments: and which, being all of marble, is enriched with fculpture from bottom to top.

Sometimes, again, the *twifted column* is formed of two or three flender ftalks, twifted round fo as to leave a cavity in the middle. Sometimes the flutings are fpiral, yet the fhaft ftraight; which fucceeds very well in the more delicate orders.

COLUMNS, *denominated from their difpofition*.

COLUMN *inferted*, or *backed*, is that let into a wall, a third or fourth part of its diameter.

COLUMN *niched*, is that whofe fhaft enters, with half its diameter, into a wall, which is hollowed for its reception; with its plane parallel to the projecture of the turé. Such is that in the portal of St. Peter at Rome.

COLUMN, *angular*, is an infulated *column*, placed in the coin, or corner of a portico; or inferted into the corner of a building: or even a *column* that ftands an angle, either acute or obtufe, of a figure of many fides.

COLUMN, *Attic*, according to Pliny, is a pilafter infulated, having four equal faces, or fides; and of the higheft proportion, v. g. Corinthian.

COLUMNS, *cantoned*, are thofe engaged in the four corners of a fquare pillar, to fupport four fprings of an arch.

COLUMNS, *coupled*, are thofe difpofed, by two and two, fo as almoft to touch each other at their bafes, and capitals.

COLUMN, *doubled*, is an aflemblage of two *columns*, joined in fuch a manner, as that the two fhafts penetrate each other with a third of their diameter. Such are thofe of the four angles in the court of the Louvre.

COLUMN, *flanked*, according to M. Blondel, is a *column* engaged with one half, or at leaft one third of its diameter, between two demi-pilafters.

COLUMNS, *grouped*, are thofe placed on the fame pedeftal, or focle; either by three and three, or by four and four.

COLUMN, *infulated*, is that ftanding free, and detached on all fides, from any other body.

COLUMN, *median*. Vitruvius gives the name *columna mediana* to the two *columns* in the middle of a porch, which have the intercolumniation larger than the reft: that if thefe laft, for inftance, be *pycnoftyle*, the *median* are *euftyle*.

The term may alfo be applied to the middle row of *columns*, in a frontifpiece adorned with three orders.

COLUMN, *Trajan*, a famous hiftorical *column*, erected in Rome, in honour of the emperor Trajan. See COLUMN, *celebrated*.

COLUMNS *denominated from their ufe*.

COLUMN, *aftronomical*, is a kind of obfervatory, in form of a very high tower; built hollow, and with a fpiral afcent to an armillary fphere placed at the top, for obferving the motions of the heavenly bodies.

Such is that, of the Doric order, erected at the Hotel de Soiffons, at Paris, by Catherine de Medicis, for the obfervations of Orontius Finæus, a celebrated aftronomer of that time.

COLUMN, *chronological*, that which bears fome hiftorical infcription, digefted according to the order of time; as by luftres, olympiads, faſti, epochas, annals, &c. At Athens there were *columns* of this kind, whereon were inferibed the whole hiftory of Greece, digefted into olympiads.

COLUMN, *funeral*, is that which bears an urn, where are fuppofed to be inclofed the afhes of fome deceafed hero; and whofe fhaft is fometimes overfpread with tears, or flames; which are fymbols of grief, and of immortality.

COLUMN, *gnomonic*, is a cylinder, wherein the hour of the day is reprefented by the fhadow of a ftyle.

Of thefe there are two kinds: in the one, the ftyle is fixed, and the hour-lines are no more than the projection of a vertical dial on a cylindrical furface.

In the other, the ftyle is moveable; and the hour-lines are drawn to the different heights of the fun, in the different feafons of the year. See DIAL.

COLUMN, *hiftorical*, is that whofe fhaft is adorned with a baſſo relievo, running in a fpiral line its whole length, and containing the hiftory of fome great perfonage. Such are the Trajan and Antonine *columns* at Rome.

Hiftorical columns may likewife be divided by bands, or tambours, into feparate baſſo relievos, containing diſtinct fubjects; by which means the fame *columns* may likewife be made to anfwer the end of chronological ones. This manner Vignola prefers to the former; which, he thinks, appears too much confufed.

COLUMN, *hollow*, that which has a fpiral ftaircafe within-fide, for the convenience of afcending to the top. As the Trajan *column*, the ftaircafe whereof conſiſts of one hundred and eighty-five ſteps, and is illumined by forty-four little windows.—The Antonine *column* has one hundred and ninety-eight ſteps, with fifty-fix windows; each of thefe is divided by tambours of white marble. The monument or fire-*column* at London, has alſo a ſtaircaſe; but it does not reach to the top. Thefe kinds of *columns* are called alſo *columnæ cochlides*, or *cochlitæ*. See MONUMENT.

COLUMN, *indicative*, that which ſerves to ſhew the tides, &c. along the ſea-coaſts. Of this kind there is one at Grand Cairo, of marble, whereon the overflowings of the Nile are expreſſed: by this they form a judgment of the ſucceeding ſeaſon: when the water, for inſtance, aſcends to twenty-three feet, it is a ſign of great fertility in Egypt.

COLUMN, *inſtructive*, that raiſed, according to Joſephus, lib. I. cap. 3. by the ſons of Adam, whereon were engraven the principles of arts and ſciences.

Baudelot tells us, that the ſon of Piſiſtratus raiſed another of this kind, of ſtone; containing the rules and precepts of agriculture.

COLUMN, *itinerary*, a *column* with ſeveral faces, placed in the croſs-ways in large roads; ſerving to ſhew the different routes, by the inſcriptions thereupon.

COLUMN, *lactary*, at Rome, according to Feſtus, a *column* erected in the [illegible] place Montanara.

wherein young children, abandoned by their parents, out of poverty, or inhumanity, were exposed, to be brought up at the public expence.

COLUMN *legal*. Among the Lacedæmonians, there were *columns* raised in public places, whereon were engraven the fundamental laws of the state.

COLUMN, *limitrophus*, or *boundary*, is that which shews the limits of a kingdom, or country conquered. Such was that, which Pliny says Alexander the Great erected at the extremities of the Indies.

As to those of Hercules, ordinarily called his *columns*, or *pillars*: they are two very steep mountains in the straights of Gades, now Gibraltar.

COLUMN, *luminous*, is a sort of *column* formed on a cylindrical frame, mounted and covered over with oiled paper, or gauze; so that lights being disposed in ranks within, over each other, the whole appears as on fire.

This sort of *column* is likewise made with rows of lamps, or torches, running round its shaft; either in horizontal belts or bands; or in a spiral line, over a continued festoon of flowers.

COLUMN, *monitory*, from the Latin *monibia*, *spoils of the enemy*; a *column* adorned with trophies, built in imitation of trees, whereon the spoils of enemies were anciently hung.

COLUMN, *memorial*, that raised on occasion of any remarkable event; as the monument in London, built to perpetuate the memory of the burning of that city, in 1666. It is of the Dorie order, fluted, hollow, with a winding staircase; and terminated at top with waving flames. See MONUMENT.

There is also another of the like kind, in form of an obelisk, on the banks of the Rhine in the Palatinate, in memory of the famous passage of that river, by the great Gustavus Adolphus, and his army.

COLUMN, *mænia*, any *column* which supports a balcony, or mænians. The origin of this kind of *column*, Suetonius and Asconius refer to one Mænius; who, having sold his house to Cato and Flaccus, consuls, to be converted into a public edifice, reserved to himself the right of raising a *column* without-side, to bear a balcony; whence he might see the shows.

COLUMN, *military*, was a *column* of marble, raised by order of Augustus, in the middle of the Roman Forum; from whence, as a centre, the distances of the several cities, &c. of the empire were reckoned, by other *military columns* disposed at equal distances, on all the grand roads. This *column* was of white marble; the same with that which is now seen on the balustrade of the perron of the Capitol at Rome. Its proportion is mulliver; being a short cylinder, supporting a symbol of the globe of the earth.

It was called *miliarium aureum*, as having been gilt, at least the ball, by order of Augustus. It was restored by the emperors Vespasian and Adrian; as appears by the inscriptions.

COLUMN, *military*, among the Romans, a *column* whereon was engraven a list of the forces in the Roman army, ranged by legions, in their proper order; with design to preserve the memory of the number of soldiers, and of the order observed in any military expedition.

The Romans had another kind of *military column*, which they call *columna bellica*, standing before the temple of Janus: at the foot whereof the consul declared war, by throwing a javelin towards the enemies countries.

COLUMN, *pharophorical*, a *light-house*; or a hollow *column* built on a rock, or the tip of a mole, or other eminence, to serve as a lantern to a port.

COLUMN, *rostral*, that adorned with the beaks or prows of ships, and galleys, with anchors and grapplers; erected, either in memory of a naval victory; as the Tuscan *column*, in the Capitol: or, in honour of some admiral, as the Dorie one, at the entrance of the caſtle de Richelieu.

COLUMN, *sepulchral*, anciently, was a *column*, erected on a tomb or sepulchre; with an inscription on its base. See TOMB, &c.

Those over the tombs of persons of distinction were very large: those for the common people small: these last are called *stelæ* and *cippi*.

COLUMN, *statuary*, that which supports a statue. Such was that erected by pope Paul V. on a pedestal before the church of St. Maria Major at Rome; to support a statue of the Virgin, which is of gilt brass. See STATUE.

This *column* was dug up in the temple of Peace; its shaft is a single block of white marble, forty-nine feet and a half high, and five feet eight inches diameter; of the Corinthian order, fluted.

The term *statuary column*, may likewise be applied to Caryatides, Persians, Termini, and other human figures; which do the office of *columns*; and which Vitruvius called *Telamones* and *Atlantes*.

COLUMN, *symbolical*, is a *column* representing some particular country, by the attributes proper thereto; as that of the French order, for with fleurs-de lys, as the frontispiece of the Jesuits church at Rouen: or some memorable action; as the *Corvinian column*, on which was a crow, erected to Valerius Maximus, surnamed Corvinus, in memory of his defeat of a giant in the army of the Gauls, by the assistance of a crow.

Under the title of *symbolic columns* may also be comprehended those which serve for symbols. Such is that on a medal of Nero, which expresses the stability of the Roman empire. See SYMBOL.

COLUMN, *triumphal*, a *column* erected among the ancients in honour of a hero; the joints of the stones, or courses whereof, were covered with as many crowns, as he had made different military expeditions.

Each crown had its particular name: as vallaris, which was beset with spikes, in memory of having forced a palisade: muralis, adorned with little turrets, or battlements; for having mounted an assault: navalis, of prows and beaks of vessels; for having overcome at sea: obsidionalis, or graminalis, of grass; for having raised a siege: ovans, of myrtle; which expressed an ovation or little triumph: and triumphalis, of laurel; for a grand triumph.

Procopius tells us of a *column* of this kind, erected in the place called Augustæum, before the imperial palace of Constantinople, supporting an equestrian statue of the emperor Justinian.

COLUMN, *trophoric*, a kind of statuary *column*, whereon is placed a figure of some animal. Such is one of the two *columns* of the great gate of Venice; whereon is the lion of St. Mark, and the arms of the republic: or that at Sienna, which bears the wolf that suckled Romulus and Remus.

COLUMN, *scenography of a*. See SCENOGRAPHY.

COLUMN, in *War*, denotes a deep file, or row of troops; or division of an army, which marches at the same time, and towards the same place, at intervals large enough to avoid confusion.

An army marches in one, two, three, or more *columns* according as the ground will allow, and the general sees expedient.

The word is sometimes also used in speaking of vessels at *sea*, following each other in the same line.—It is difficult to form *columns* at sea, unless the wind be in them.

COLUMN, among *Printers*, is half a page, when the page is divided into two parts, from top to bottom. See PRINTING.

COLUMNA *nasi*, is used by some writers of anatomy, for the fleshy end of the NOSE, jutting out over the upper lip.

COLUMNA *oris*, is sometimes used for the UVULA.

COLUMNÆ *carneæ*, in *Anatomy*, called also *lacertuli*, and *columnæ cordis*, are several small muscles in the ventricles of the heart; derived, and, as it were, detached from the parietes of those ventricles, and connected by tendinous extremities to the valves of the heart.

These little *columns*, or pillars, being fastened to the parietes of the heart on one side, and the tricuspid and mitral valves on the other, do, by their contraction in the systole of the heart, draw out the valves; and by that means, not only shut the orifices of the veins, but more exactly close their ventricles in their systole.

COLUMNAR *marble*. See BASALTES.

COLUMNARIS, in *Botany*, a name given by some to the tall, milky bell-flower; the *campanula latifolia*. German. Ind. 1.

COLUMNARIUM, in *Roman Antiquity*, a heavy tribute, demanded for every pillar of a house. It was first laid on by Julius Cæsar, in order to put a stop to the extravagant expences laid out on sumptuous buildings.

COLUMNEA, in *Botany*, a genus of the *didynamia angiospermia* class. Its characters are these: the flower hath one petal, of the singent or grinning kind, with a swelling tube, divided above into two lips; the upper erect and entire; the lower divided into three parts which spread open: it hath four stamina, two longer than the other; these are enclosed in the upper lip. In the centre is situated a roundish germen, which afterwards becomes a globular berry, with two cells, sitting in the empalement, containing several oblong seeds. We know but one species, which grows naturally in the warmest parts of America.

COLUMNELLA, *little column*, in *Botany*, denotes the substance that passes through the capsule, and connects the several partitions and seeds.

COLUMNIATED *winding staircase*. See STAIRS.

COLUMNIFERI, an order of plants in the Fragmenta Methodi Naturalis of Linnæus.

COLURES,

COLURES, in *Geography* and *Astronomy*, are two great circles, imagined to intersect each other at right angles, in the poles of the world.

The word is derived from κόλος, *mutilus*, or *truncatus*, and ὤρα, *tail*; q. d. *appearing with the tail cut off*; because never seen entire above the horizon.

The *solstitial colure*, one of them through the solstitial, and the other through the equinoctial point of the ecliptic: whence the first is denominated the *solstitial*, and the second the *equinoctial colure*.

The equinoctial *colure* determines the equinoxes; and the solstitial, the solstices.

By thus dividing the ecliptic into four equal parts, they also mark the four seasons of the year.

It is disputed over what part of the back of Aries the equinoctial *colure* passed in the time of Hipparchus. Sir Isaac Newton, in his Chronology, takes it to have been over the middle of the constellation. Father Souciet insists on its having passed over the duodecimedium of Aries, or midway between the rump and first of the tail. We have some observations, in the Philosophical Transactions, N° 466, concerning the position of this *colure* in the ancient sphere, from a draught of the constellation Aries, in the Arateæ published at Leyden and Amsterdam, 1652, which seem to confirm sir Isaac's opinion; but the antiquity and authority of the original draught may still remain in question. See CHRONOLOGY.

COLUTEA, in *Botany*. See *Bladder Senna*.

COLYBA, or COLYBUS, a term in the *Greek Liturgy*, signifying an offering of corn, and boiled pulse, made in honour of the saints, and for the sake of the dead.

Balsamon, P. Goar, Leo Allatius, and others, have written on the subject of *colyba*: the substance of what they have said, is as follows.

The Greeks boil a quantity of wheat, and lay it in little heaps on a plate; adding beaten pease, nuts cut small, and grape-stones, which they divide into several compartments, separated from each other by leaves of parsley. A little heap of wheat, thus seasoned, they call κόλυβα.

They have a particular formula for the benediction of the *colyba*: wherein, praying that the children of Babylon may be fed with pulse, and that they may be in better condition than other people, they desire God to bless those fruits, and those who eat them, because offered to his glory, to the honour of such a saint, and in memory of the faithful deceased. Balsamon refers the institution of this ceremony to St. Athanasius; but the Greek Synaxary to the time of Julian the Apostate.

Many of the Latin divines having spoken injuriously of this ceremony, Gabriel, archbishop of Philadelphia, has written a discourse in its vindication: wherein he endeavours to shew that the *colyba* is only to represent the resurrection of the dead, and to confirm the faithful in the belief thereof. The *colyba*, he says, are symbols of a general resurrection; and the several ingredients added to the wheat, signify so many different virtues.

COLYMBIS, in *Ornithology*, a name given by Bellonius to a species of duck, remarkable for a large tuft of feathers behind its head, and thence called by us the tufted duck, and known among authors by its Venetian name CARO negro. See DUCK.

COLYMBUS, the *diver*, in the Linnæan system of *Ornithology*, the name of a distinct genus of birds, of the order of the *anseres*. See DIVER.

COLYTEA, in *Botany*, is used by some to denote the *arbor Judæa*, or SILIQUASTRUM.

COMA, in *Medicine*, a sort of sleepy disease, otherwise called *catapbora*; always bringing on a violent propensity to sleep, whether sleep ensue, or not.

If sleep do ensue, the disease is called *coma somnolentum*, wherein the patient continues in a profound sleep; and when awaked, immediately relapses, without being able to keep open his eyes. If he does not sleep, but is continually awaked with frightful dreams, it is called *coma vigil*: in this case also his eyes are shut, and he appears asleep.

The cause of the *coma somnolentum* may be any thing that presses the cortex of the spirits; as a cold humid temperature of the brain; hot putrid vapours ascending into the head, and stopping the canals of the animal spirits; narcotic vapours, &c. The *coma vigil* is supposed to arise from the conflict, or jarring mixture of bile with pituita; the one urging to sleep, the other to waking. Hence the patient sleeps either not at all, or, at most, but for a moment; is uneasy, starts, rises up, and sometimes throws himself on the person near him; his eyes continuing all the time fast closed.

The remedies for a *coma*, are those which occasion great evacuations, as violent clysters, or vomitives; medicines that purge, and dry the brain; and those which occasion revulsion of humours, as vesicatories, cauteries, &c. to which may be added volatile spirits, salts, and mother-phisics. See LETHARGY.

The natural process of death is described by physicians by the following words in the following order; *Anxietas, convulsio, coma, mors*.

COMA, in *Botany*, a species of fulcra, composed of large bracteæ in form of a brush of hair, which terminates the stalk.

COMA AUREA, in *Botany*. See GOLDY locks.

COMA BERENICES, *Berenice's Hair*, in *Astronomy*, a modern constellation of the northern hemisphere; composed of unformed stars between the Lion's tail, and Bootes.

This constellation is said to have been formed by Conon, an astronomer, in order to confole the queen of Ptolemy Euergetes, for the loss of a lock of her hair, which was ſtolen out of the temple of Venus, where ſhe had dedicated it on account of a victory obtained by her husband. Riccioli, Almag. lib. ix. cap. 4.

The ſtars in the conſtellation *Coma Berenices*, in Tycho's Catalogue, are fourteen; in Hevelius's, twenty-one; and in the Britannic Catalogue, forty-three. The order, names, longitudes, latitudes, magnitudes, &c. whereof, are as follow:

Names and ſituations of the ſtars.	Signs	Degrees	Longit.	Latitude.	Magnitudes.
			° ′ ″	° ′ ″	
	♍	10	53 32	21 36	7
			17 44	20 2 11	6
			21 14	30 16 27	0 6

40.					
Former of two at the extremity of the hair.	♍	22	2	42 51 49	41 5.4
	♎	4	38	31 22 59	12 4.5
Poſterior in the extremity of the hair.		0	6	31 32 28	33 5.6

All theſe ſtars Ptolemy ranks among the *informes* of Leo: and the cluſter of little ſtars, in form of a nebulous one, between the Lion and Bear, he calls ſimply ΠΛΟΚΑΜΟΣ; as reſembling an ivy leaf: the pointed part whereof is turned towards the north, and the ſides bounded by the ſeventh and twenty-ſecond ſtars. Bayer, inſtead of hair, gives a ſheaf of corn.

COMARCHIOS, in [illegible] air, or tune, [illegible]

COMARIS, in *Lithology*, a name given by the Greek writers to the SELENITES, *or aphroselene*.

They call this stone also *euphrosine*.

COMARUM, *Marsh cinquefoil*, in *Botany*, a genus of the *icosandria polygynia* class. Its characters are these: the flower hath five oblong petals, which are inserted in the empalement, but are much smaller. It hath twenty permanent stamina, which are inserted into the empalement; and a great number of small roundish germins collected into a head. The common receptacle afterward becomes a large fleshy fruit, having many pointed seeds adhering to it. We know but one species of this plant, which grows naturally in bogs.

COMB, an instrument made of horn, ivory, &c. and used for separating and adjusting the hair, &c.

COMB, in *Husbandry*, a measure of corn, containing four Winchester bushels: in some places the bushel contains eight gallons and a quart.

COMB, in *Natural History*, the crest, or red fleshy tuft growing on the head of a cock.

COMB, in a ship, a little piece of timber set under the lower part of the beak-head, near the middle: it has two holes in it, and supplies to the fore-tacks, what the chess-trees do to the main-tacks; that is, to bring the main-tacks aboard.

COMB, in the *Manufacture of Tapestry*. See TAPESTRY.

COMB, *Ladies*, or *Venus's* COMB, the name of a distinct genus of plants, called by Tournefort SCANDIX.

COMB-*fish*, *pecten*, in *Ichthyology*. See PECTEN.

COMBARONES, in *Antiquity*, the fellow-barons or commonalty of the Cinque-Ports.

COMBAT, in a general sense, denotes an engagement; or a difference decided by means of arms.

Authors sometimes distinguish in an army, between a *combat* and a battle; the latter expressing the general notion of the whole army; the former only a particular skirmish, or engagement of a single part: so that the *combat* is properly a part of a BATTLE.

COMBAT, in *Law*, or *single combat*, denotes a formal trial, between two champions, of some doubtful cause or quarrel, by the sword, or batoons.

This form of proceeding was anciently very frequent, particularly among the barbarous nations in their original settlements; and obtained not only in criminal, but also in civil causes: being built on a presumption, that God would never grant the victory, but to him who had the best right. It was originally permitted, in order to determine points respecting the reputation of individuals, but afterwards became much more extensive. See DUEL. The form and ceremony of the *combat* are described in the grand Coutumier of Normandy. The accuser, first, swore to the truth of his accusation; the accused gave him the lye; upon which, each threw down a gage, or pledge of battle; and the parties were committed prisoners to the day of *combat*. See CHAMPION.

Historians tell us, that Alphonsus, king of Castile, in the eleventh century, desiring to abolish the Mosarabic liturgy, and to introduce the Roman office; the people opposing it, it was agreed to terminate the difference by *combat*, and leave the cause to the decision of Heaven. One of the earliest reflections of this practice that occurs in the history of Europe, is that of Henry I. of England; which was afterwards followed by an edict of Louis VII. of France to the same effect. Robertson's Hist. of Charles V. vol. i. p. 61, &c. and 330, &c. &c.

COMBAT is also used for the solemn games of the ancient Greeks and Romans, performed in honour of their gods: as the Olympic games, Pythian, Isthmian, and Nemean games; the bull Actiac, Circenses, &c. which see in their places. OLYMPIC, ISTHMIAN, &c.

The *combats* here celebrated, were *running*, *wrestling*, *boxing*, *quoits*, &c. The combatants, who were called *athletæ*, prepared themselves for it from their youth, by constant exercise, and a very rigid regimen: they only eat certain things, and at certain hours; drank no wine; had no commerce with women; and both their labour and their rest were regulated.

COMBATANT, in *Heraldry*, a term for two beasts, as lions or hounds, borne in a coat of arms in a fighting posture, erect on their hinder feet, and affronted, or with their faces toward each other.

COMBER, in *Ichthyology*, a species of fish in Cornwall, of a slender form, with red back-fins, and tail; yellow belly; a smooth, even stripe from gills to tail, of a lily-very colour; and a round tail. Barr. Syn. 163. fig. 5.

COMBINATION, is properly understood of an assemblage of several things by two and two: but is more particularly used in *Algebra* and *Arithmetic* to denote the variation, or alternation of any number of quantities, letters, sounds, or the like, in all the different manners possible.

P. Mersenne gives us the *combination* of all the notes and sounds in music, so as to forty-four; the sum whereof amounts to thirty figures, or places.

The number of possible *combinations* of the twenty-four letters of the alphabet, taken first two by two, then three by three, &c. according to Mr. Prefet's calculation amounts to 1391724128887252399045515849402200. The words in the following verse may be combined a thousand twenty-two several ways.

Tot tibi sunt dotes, virgo, quot sidera cœlo.

F. Truchet, in the Memoirs of the French Academy, shews, that two square pieces, each divided diagonally into two colours, may be arranged and *combined* sixty-four different ways, so as to form as many different kinds of chequer-work, which appears surprising enough, when one considers that two letters, or figures, can only be combined twice.

This rule may be of use to masons, pavioors, &c. See PAVEMENT, and CHANGES.

COMBINATION, *doctrine of.—Any number of quantities being given, together with the number in each* combination; *to find the number of* combinations.

One quantity, we observe, admits of no *combination*; two, *a* and *b*, of one; of three, *a*, *b*, *c*, there are three *combinations*, viz. *a b*, *a c*, *b c*; of four, *a*, *b*, *c*, *d*, *a b*, *a c*, *a d*, *b c*, *b d*, *c d*; of five, ten, *a b*, *a c*, *a d*, *a e*, *b c*, *b d*, *b e*, *c d*, *c e*, *d e*.

Whence it appears, that the number of *combinations* proceed as 1, 3, 6, 10, &c. i. e. are triangular numbers, whose side differs by unity from the number of given quantities: if that, *v. gr.* be 5, the 6th of the number of *combinations* will be 5—1; and therefore the number of *combinations* $\frac{5-1\times 5-0}{1\quad 2}$. See TRIANGULAR *number*.

If three quantities are to be combined, and the number in each *combination* be three, there will be only one *combination*, *a b c*; if a fourth be added, the *combinations* will be found *a b c*, *a b d*, *a c d*, *b c d*; if a fifth, ten, *a b c*, *a b d*, *a b e*, *a c d*, *a c e*, *a d e*, *b c d*, *b c e*, *b d e*, *c d e*; if a sixth, twenty, &c. The numbers of *combinations*, therefore, proceed, as 1, 4, 10, 20, i. e. they are the first pyramidal triangular numbers, whose sides differ by two units from the number of given quantities. See PYRAMIDAL *number*. Hence, if the number of given quantities be *q*, the side will be *q*—2; and therefore, the number of *combinations*, $\frac{q-2\times q-1\times q-0}{1\quad 2\quad 3}$.

Hence is easily deduced a general rule for determining the number of *combinations* in any case: for, suppose the number of quantities to be combined, *q*, the exponent of the *combination* *n*, the number of *combinations* will be $\frac{q-n+1\times q-n+2\times q-n+3\times q-n+4\times q-n+5}{1\quad 2\quad 3\quad 4\quad 5}$ &c. till the number to be added be equal to *n*.

Suppose, *v. gr.* the number of quantities to be combined $=6$, the exponent of the *combination* 4: the number of *combinations* will be $\frac{6-4+1\times 6-4+2\times 6-4+3\times}{1\quad 2\quad 3}$ $\frac{6-4+4=6-3\times 6-2\times 6-1\times 6-0}{4\quad 1\quad 2\quad 3\quad 4}=\frac{3}{1}\times\frac{4}{2}\times\frac{5}{3}$ $=15$.

Corol. If it be desired to have all the possible *combinations* of the given quantities beginning with the *combinations* of the several two's, proceeding to three's, &c. there must be added $\frac{q-1\times q-0}{1\quad 2}+\frac{q-2\times q-1\times q-0}{1\quad 2\quad 3}+\frac{q-3\times}{3\quad 4}$ $\frac{q-2\times q-1\times q-0}{2\quad 3\quad 4}$, &c.

Whence the number of *combinations* possible will be $\frac{q\times q-1+q\times q-1\times q-2+q\times q-1\times q-2\times q-3+q}{1\quad 1\quad 1\quad 2\quad 3\quad 1\quad 2\quad 3\quad 4\quad 1}$ $\times\frac{q-1\times q-2\times q-3\times q-4}{2\quad 3\quad 4\quad 5}$, &c. which is the sum of the units of the binomial, raised to the power *q*, and abridged of the exponent of the power increased by unity, $q+1$. Wherefore, if $1+1=2$ represents the binomial to which these units belong, 2^q-q-1 is the number of all the possible *combinations*. *V. gr.* If the number of quantities be 5, the number of possible *combinations* will be $2^5-5-1=32-6=26$.

2. *The number of quantities being given, to find the number of changes and alterations, which those quantities, combined in all the manners possible, can undergo.*

Suppose two quantities, *a* and *b*: their variations will be 2; consequently, as each of those may be combined, even with itself, to these there must be added two variations. The whole number, therefore, will be $2+2=4$. If there were three quantities, and the exponent of the variation were 2, the *combination* will be 3, and the changes 3; to which if the three *combinations* of each

quantity with itself $a a$, $b b$, $c c$, be added, we shall have the number of changes, $3+3+3=9$.

In like manner, it is evident, if the given quantities were 4, and the exponent 2, the number of changes would be 16; if 5, 25, &c. in general, if n, n^2.

Suppose the quantities 3, and the exponent of variation 3; the number of changes is found $27=3^3$; viz. $a a a$, $a a b$, $a b a$, $a b b$, $b a a$, $b a b$, $a c a$, $a c c$, $a b c$, $b a c$, $b c a$, $a c b$, $c b a$, $c a c$, $c c a$, $b b c$, $b c b$, $b b b$, $c b b$, $b c b$, $b c c$, $c b c$, $c c c$.

After the same manner, it will appear, if the quantities were 4, and the exponent 3; the number of changes would be $64=4^3$; and, in general, if the number of quantities be $=n$, and the exponent 3, the number of changes will be n^3. By thus proceeding, it will be found, that if the number of quantities be n, and the exponent n, the number of changes will be n^n: wherefore if all the antecedents be added, where the exponent is less, the number of possible changes will be found $n^n+n^{n-1}+n^{n-2}+n^{n-3}\ldots+n^3+n^2+n^1$, &c. Till at length the number subtracted from n leaves 1; because the beginning is from single quantities taken once.

Since then the number of possible changes is in a geometrical progression, whose first or smallest term is n^1, the greatest n^n, and the ratio n; it will be $=\frac{n^n+1-n}{n-1}$.

Suppose, v. gr. $n=4$, the number of possible changes $\frac{4^5-4}{4-1}=\frac{1020}{3}=340$. Suppose, again, $n=24$, the number of possible changes will be $\frac{24^{25}-24}{24-1}=$ 32009658644406819868777955348272600 + 23 = 1391724218887357999925128493402200. In so many various manners, therefore, may the twenty-four letters of the alphabet be varied and combined among themselves.

COMBINATION, in *Chemistry*, denotes the union of two bodies of different natures, from which a new compound body results. An acid united with an alkali furnishes an instance of *combination*. See AFFINITY.

COMBINATIONS, in *Law*. *Combinations* to do unlawful acts are punishable before the unlawful acts are executed: this is to prevent the consequences of *combinations* and conspiracies, &c. 9 Rep. 57.

COMBINATORY *distillation*. See DISTILLATION.

COMBINATORY *music*. *Musica combinatoria*, that part of music which teaches the manner of combining sounds variously; that is, of changing their place and figure in different manners. See MUSIC.

COMBING *of wool*, in *Commerce*, the drawing or pulling wool across the teeth of a kind of card, called a *comb*, to dispose it for spinning.

COMBRETUM, *in botany*, a genus of the *decandria monogynia* class; the characters of which are, that the calyx is bell-shaped, and separated into four horizontal points: the corolla has four petals inserted in the calyx: the stamina are very long: and the seed is single and quadrangular. There are two species.

COMBS *of bees*. See HONEY-COMB.

COMBURENDO *haretica*. See HERETICO.

COMBUST, in *Astronomy*. When a planet is in conjunction with the sun, or not distant from it above half their disk; it is said to be *combust*, or in COMBUSTION. According to Argol, a planet is *combust* or in *combustion*, when not above eight degrees and thirty minutes distant from the sun, either before or after him.

COMBUSTIO *personæ*, the ancient way of trying mixed and corrupt money, by melting it down, upon payments into the Exchequer. In the time of king Henry II. a constitution was made, called the trial by *combustion*; the practice of which differed little or nothing from the present method of assaying silver. But whether this examination of money by *combustion* was to reduce an equation of money only of sterling, viz. a due proportion of alloy with copper, or to reduce it pure fine silvery does not appear. On making the constitution of trial it was considered, that though the money did answer *numero et ponderi*, it might be deficient in value; because mixed with copper or baser, &c. Vide Lowndes's Essay upon Coin. p. 5.

COMBUSTION, in *Chemistry*, denotes the decomposition of bodies by the action of fire, or the disengagement of the phlogiston or inflammable principle contained in them, from the union of which in larger or less quantities, or in various degrees of combination, they are said to be more or less *combustible*. The more *combustible* bodies are either such as possess a large quantity of phlogiston in an oily state, and burn with a bright flame, accompanied with smoke and soot; as wood, dry vegetables, resins, oils, and fat: or such, in which the inflammable principle is not in an oily state, nor intimately combined, which flame is less luminous, and unattended with smoke and soot; of this kind are spirit of wine, sulphur, phosphorus, charcoal, some metallic substances, and particularly zinc. The less *combustible* bodies are those in which a smaller quantity of phlogiston is strongly combined with incombustible principles, and which burn with difficulty, and without any sensible flame: such are some animal coals, soot, ashes of vegetables, and imperfect metals. *Combustion* requires free access of air; and the process is more rapid and complete as the contact of the burning body with air is more immediate and entire. Macquer.

See AIR, CALCINATION, FIRE, and PHLOGISTON.

COME. The final tones or tails of notes, upon its first sheeting forth, is thus called.

COME *sopra*, in the *Italian Music*, literally signifies *as above*, and is used when any foregoing part is to be repeated.

COMEDONES, a name given to a species of worm, with which the children of Misnia, and some other countries, are terribly afflicted; and of which Hoffman, in his Treatise of Endemial Diseases, gives this account: children in the country, are frequently seized with a sort of tabes, which so destroys their flesh, that they appear merely like shadows. The common people generally suppose these children to be under the influence of witchcraft; but such as have enquired more narrowly into the distemper, have found that it is owing to worms, which resemble black hairs, or cords, lodged under the skin. When the skin is rubbed with honey, in a bath, or any warm place, they will appear and come out; but when it is contrasted by cold, they keep concealed within. See AFFECTIO *taenia*, and DRACUNCULI.

COMEDY, in its proper sense, a dramatic piece, representing some agreeable and diverting transaction: or an allegorical representation of something in private life, for the amusement and instruction of the audience.

There are those who derive the word *comedy* from *comus*, and who suppose that *comedies* is the same with *cantus comitis*. This etymology appears to be the better founded, in that the first farces were exhibited at feasts, which have been since improved to *comedies* in their present form.

In this sense, *comedy* is opposed to *tragedy*, the subjects whereof are grave, and the persons of higher rank.

Boileau defines *comedy*, a dramatic poem, very lively, pleasant in the conclusion, and written in a popular style. Aristotle calls it an imitation of the worst, or, rather, of the lowest class of persons, by way of ridicule. This definition Corneille finds fault with, and maintains, that the actions of kings themselves may enter *comedy*; provided they be such as are not very momentous, nor attended with any considerable danger. He adds, that a poem, wherein the greatest peril is the loss of a mistress, has no right to any higher appellation than that of *tragedy*: but then he makes a distinction in *comedies*, and dignifies those where great personages are introduced, with the epithet of *heroic comedies*, to distinguish them from the ordinary ones. Mr. Congreve seems pretty much of the same sentiment: he understands Aristotle's definition as meant of the worst men; on which foundation it is sufficient to constitute a *comedy*, that the action represented be that of some ill men brought on the stage to be exposed.

M. Dacier is of a contrary opinion: he maintains, that *comedy* allows of nothing grave, or serious, unless it be turned to ridicule; and that raillery and ridicule are its only proper and genuine characteristics: in which opinion he is warmly seconded by Mr. Dennis.

Thus different are critics and comic authors in their sentiments on the nature of *comedy*; some shillingwit it from tragedy by the lowness of the subject; others by the ridiculous light it is set in.

The accurate P. Bossu fixes the notion of *comedy* much better: according to that critic, *comedy* differs from tragedy in this, that the comic writer invents both the names of his persons, and the action which he presents; whereas the tragic writers only invent the latter, the former they are to take from history. See ACTION.

Upon the whole, *comedy* may be defined an image, or representation of the ordinary life of men: it exhibits their common actions and passions; exposes and ridicules their failings, to preserve the spectators from them or to correct them. Cicero defines it the imitation of life, the mirror of custom, and the image of truth.

There is a dispute among critics, whether *comedy* be a poem, or a mere conversation? They who maintain the latter, contend, that a poem is a discourse in verse: P. Bossu insists on the former, and thence that *comedy* has its fable, or allegory, with [illegible] essential to poetry.

Comedy

Comedy and tragedy were originally one and the same thing: their common origin lie under TRAGEDY.—M. Boileau says, *comedy* took its rise at Athens, from the happy issues or conclusions of tragedies. On this principle, the catastrophe should have been the proper criterion, or distinguishing mark between tragedy and *comedy*; and all other differences only accidental.

After the grave and serious became separated from the ridiculous, and tragedy and *comedy* were become two distinct arts, people applied themselves to cultivate the former and neglected the latter; so that *comedy* continued in its infancy, with little improvements, while tragedy grew up to a perfect art: this once arrived at its height, they began to think of cultivating *comedy*.

With regard to the various changes and revolutions *comedy* has undergone, it is commonly distinguished into three kinds; viz. the *ancient*, wherein there was nothing feigned; the *middle*, where the subject was real, but the names fictitious; the *new*, where both names and things are fictitious.

The *ancient* was that first in use, when the supreme power was in the hands of the people; and when, on that account, the poets were at their full liberty to say what they pleased, and of whom they pleased; by name to rail at people in authority, and openly to charge magistrates with crimes; sparing no age, sex, or quality.

This is very observable in the Frogs, and the Clouds of Aristophanes; where it is to be noted, that though the railing part was occasionally distributed among all the actors, yet the chief of it was laid on the chorus.

When the Athenian liberty became sunk in the tyranny of a few, it was no longer safe for the poets to use their old licence; men of office being now to be screened from reproach. The chorus, hereupon, became useless, and was therefore dropped; and thus commenced what we call *comedia media*, *nova*, or the *middle comedy*. See CHORUS.

Under this, the poets were not allowed to name the persons; and therefore names were to be invented: but then the persons were to well pointed out, that it was no difficult matter to know them.

The *middle*, however, they were obliged to repress even this licence in; and this reform gave occasion to the *new comedy*, which only brought upon the stage feigned adventures and imaginary names.

This last kind alone was received among the Romans; who yet made a new distinction between their comedy, according to the various periods of the commonwealth. Among the *ancient comedies* were ranked those of Livius Andronicus; among the *middle*, those of Pacuvius; and among the *new ones*, those of Terence.

Comedy, as well as tragedy, has its essential, and its integrant parts. Its essential parts, in the language of the ancients, are the *protasis*, *epitasis*, *catastasis*, and *catastrophe*.

The *protasis* is the beginning, or opening; where the subject is just entered upon, the characters of the persons shown, and the intrecit, or part each has in the action, signified.

In the *epitasis*, the intrigues begin; they are carried on, and heightened in the *catastasis*; and unravelled in the *catastrophe*.

These are called parts of quantity, by way of contra distinction from those of quality, which are the fable, the manners, the sentiments, and the diction; to which may be added the music and decoration, pertaining only to the representation.

The integrant parts are the five acts into which the *comedy* is divided, agreeable to that precept of Horace:

Nec minor quinto, nec fit productior actu.

The acts are divided into scenes: the number whereof is not fixed, but depends on the business to be done in each act, and the number of persons to be employed. See ACT, SCENE, &c. See also HUMOUR, MANNERS, &c.

Among the ancient Romans, *comedies* were distinguished according to the quality of the persons represented, and the dress they wore, into *togatæ*, *prætextatæ*, *trabeatæ*, and *tabernariæ*; which last were those where the scene lay in cottages, or among people of the lowest rank, affecting pretty nearly with our farces.

In the representation, *comedy* was distinguished from tragedy by the sock worn in the former, and the buskin in the latter. Among us *comedy* is distinguished from farce, in that the former represents nature as she is; the other distorts or overcharges her, they both paint from life, but with different views: the one to make nature known, the other to make her ridiculous.

COMET, a heavenly body, in the planetary region, appearing suddenly, and again disappearing: and during the time of its appearance moving in a proper, though very eccentric orbit, like a planet.

Comets, popularly called *blazing stars*, have this to distinguish them from the other stars, that they are usually attended with a long train of light, always opposite to the sun, and which is of a shorter length, the farther it is from the body. Hence arises a popular division of *comets* into three kinds; viz. *bearded*, *tailed*, and *hairy*, *comets*; though in effect, this division rather relates to the several circumstances of the same *comet*, than to the phænomena of several.

Thus, when the *comet* is eastward of the sun, and moves from it, the *comet* is said to be *bearded*, because the light precedes it in manner of a beard.

When the *comet* is westward of the sun, and follows it, it is said to be *tailed*, because the train follows it, in manner of a tail.

Lastly, when the *comet* and the sun are diametrically opposite (the earth between them), the train is hid behind the body of the *comet*, excepting a little that appears around it in form of a border of hair, hence called *hairy*.

COMETS, *nature of*.—As to the nature of *comets*, the unfrequency of their appearing, together with the seeming irregularities of their phænomena, have left philosophers much in the dark. Those who lived before Aristotle, accounted for them by supposing the heavenly spaces full of an infinite number of stars; and many of them too remote, or too small, to have ever come under the notice of astronomers: these invisible stars they farther supposed to move by their own proper motion every way; fulfilling their courses in very unequal times. Now, a *comet*, according to them, was a vast heap or assemblage of their little stars meeting together, by reason of the inequality of their motions, and uniting into a visible mass; which mass again disappear, as their stars separated, and each proceeded in its course.

But how these stars should thus meet, coalesce, and form a body, which in all positions of the sun flowing resemble a tail, and again separate, is a mystery.

This opinion, therefore, Aristotle early overturned, substituting another in its stead. According to Aristotle, *comets* were only a kind of transient fires, or meteors, constituting of exhalations raised to the upper region of the air, and there set on fire; the matter of the moon's course. But neither is this hypothesis more full than the other: for on this principle, the light of the *comet*, being independent on the sun, would be dispersed every way alike, without the appearance of a train, or tail, which is constant to the phænomena. Moreover, they are observed at the same time to pass on the earth very remote from each other. Besides, the modern astronomers who have measured the distance between the *comets* and the earth, find that the *comets* have no sensible diurnal parallax; which could not be, were they not much more remote from the moon, whose parallax is sensible: and yet as they have a sensible annual PARALLAX, they are not so remote as the fixed stars. Tycho Brahe was the first among the moderns, who after diligently observing the *comet* of 1577, and finding that it had no sensible diurnal parallax, assigned it its true place in the planetary regions. See his book De Cometis, anno 1577.

Hevelius, from a great number of observations, proves it as his opinion, that the *comets*, like the solar macula or spots, are formed and condensed out of the gentler exhalations of his body. In which opinion he agrees nearly with Kepler, who maintains, that comets are generated in the ether by full numbers, like flies in the ocean; though they do not all become visible; either because of their smallness, or because they be a long time under the horizon.

But Sir Isaac Newton has shewn the fallacy of this hypothesis, by proving that the *comet* of 1680, in its passage through the neighbourhood of the sun, would have been dilitated, had it consisted of exhalations of the sun and planets: for the heat of the sun, it is allowed, is as the density of his rays, i. e. reciprocally as the squares of the distances of places from the sun. Wherefore, since the distance of that *comet* in its perihelion, December the 8th, was observed to be to the distance of the earth from the sun, nearly as 6 to 1000; the sun's heat in the *comet*, at that time, was to his heat with us at midsummer, as 1000000 to 36, or 28000 to 1.

And again, finding by experiment, that the heat of boiling water is little more than three times the heat of our dry earth, when exposed to the midsummer's sun; and assuming the heat of red-hot iron to be about three or four times as great as that of boiling water; he thence concludes, that the heat of the dried earth, or body of the *comet* in its perihelion, must be near 2000 times as great as that of red-hot iron.

Such an immense heat once acquired in its perihelion, the *comet* must be a long time in cooling again. The same author computes, that a globe of red-hot iron, of the dimentions of our earth, would scarce be cool in

50000 years. If then the *comet* be supposed to cool 100 times as fast as red-hot iron; yet since its heat was 2000 times greater, supposing it of the bigness of the earth, it would not be cool in a million of years.

James Bernoulli, in his Systema Cometarum, supposes some primary planet revolving round the sun in the space of four years and one hundred and fifty-seven days; and at the distance, from his body, of 2583 semidiameters of the magnus orbis: this planet, he concludes, either from its vast distance, or smallness, to be visible to us: but, however, to have, at various distances from him, several satellites moving round him, and sometimes descending so low as the orbit of Saturn; and that these becoming visible to us, when in their perigæum, are what we call *comets*.

Des Cartes advances another opinion: he conjectures that *comets* are only stars, formerly fixed, like the rest, in the heavens; but which becoming by degrees, covered with maculæ, or spots, and at length wholly robbed of their light, cannot keep their place, but are carried off by the vortices of the circumjacent stars; and, in proportion to their magnitude and solidity, moved in such manner as to be brought nearer the orb of Saturn; and thus coming within reach of the sun's light, rendered visible.

But the vanity of all these hypotheses abundantly appears from the phenomena of *comets*; the chief of which we shall enumerate; as being the test by which all theories are to be tried.

First, then, those *comets* which move according to the order of the signs, do all, a little before they disappear, either advance slower than usual, or else go retrograde, if the earth be between them and the sun; and more swiftly, if the earth be situate in a contrary part. On the other hand, those which proceed contrary to the order of the signs, proceed more swiftly than usual, if the earth be between them and the sun; and more slowly, to go retrograde, when the earth is in a contrary part.

2. So long as their velocity is increased, they move, nearly, in great circles; but towards the end of their course, they deviate from those circles: and as often as the earth proceeds one way, they go the contrary way.

3. They move in ellipses, having one of their foci in the centre of the sun; and by radii drawn to the sun, describe areas proportionable to the times.

4. The light of their bodies, or nuclei, increases in their recess from the earth toward the sun; and on the contrary, decreases in their recess from the sun.

5. Their tails appear the largest and brightest, immediately after their transit through the region of the sun, or after their perihelion.

6. The tails always decline from a full opposition to the sun towards those parts which the bodies, or nuclei, pass over, in their progress through their orbits.

7. The declinations, *ceteris paribus*, is the smallest, when the heads, or nuclei, approach nearest the sun: and is less, still, nearer the nucleus of the *comet*, than towards the extremity of the whole.

8. The tails are foremost brighter, and more distinctly defined in their convex, than in their concave part.

9. The tails always appear broader at their upper extreme, than near the centre of the *comet*.

10. The tails are always transparent, and the smallest stars appear through them.

These are the chief phenomena of *comets*; which, it is evident, cannot easily be reconciled with the wild notions of the ancients, and the weak conjectures of many of the moderns. Indeed, there were some, Pliny tells us, among the ancients, who, "had juster notions; who took their "stars to be perpetual, and believed they moved in their "proper orbs; but were never seen, unless when left "by the sun." Apollonius Myndius declared, that he took *comets* for regular stars; and ventured to foretel, that one day the periods and laws of their motion would be discovered. And more fully Seneca. Quæst. Nat. lib. vii. "I am not of the common opinion, nor do I "take a *comet* to be a sudden fire, but esteem it among "the eternal works of nature." *Quid autem miramur cometas, tam rarum mundi spectaculum, tandem inter sidera recipi, ac in certis eorum finibus contineri, quorum ex ingressu celsissimi quique motus est?* Venit tempus quo ista quæ nunc cometæ, ex tam longo ævi circuitu, & longioris ac diligentis studii tempore vix fideles vetus ætas annotavit, in quinis commentariis ponat, ut sciat posteritas nostra cui errent, quantæ quoque spatio.

This prediction we have seen accomplished in our days, by the great sir Isaac Newton; whose doctrine is as follows.

The *comets*, he says, are compact, solid, fixed, and durable bodies: in one word, a kind of planets; which move in very oblique orbits, every way with the greatest freedom; persevering in their motions, even against the course and direction of the planets; and their tail is a very thin, tender vapour, emitted by the head, or nucleus of the *comet*, ignited or heated by the sun.

This at once solves all the foregoing phenomena: for, 1. "It is evident, that those which proceed according to "the order of the signs, a little before they disappear, "must move more slowly, or appear retrograde, if the "earth be between them and the sun; and swifter if the "earth be on a contrary part. On the contrary those "proceeding against the order of the signs," &c. For since this *comet* is not among the fixed stars, but among the planets; as the motion of the earth either conspires with them, or goes against them; their appearance, with regard to the earth, must be changed; and, like the planets, they must sometimes appear swifter, sometimes slower, and sometimes retrograde.

2. "When the *comets* move the swiftest, they must pro-"ceed in straight lines; but in the end of their course, "decline," &c. Because, in the end of their course, when they recede almost directly from the sun, that part of the apparent motion which arises from the parallax, must bear a greater proportion to the whole apparent motion.

3. "The *comets* must move in ellipses, having one of "their foci in the centre of the sun." Because they do not wander precariously from one fictitious vortex to another; but, making a part of a solar system, return perpetually, and run a constant round.

Hence, their elliptic orbits being very long and eccentric, they become invisible, when in that part most remote from the sun.

From considering the curvity of the paths of *comets*, sir Isaac concludes, that when they disappear, they are much beyond the orb of Jupiter; and that in their perihelion they frequently descend below the orbit of Mars, and the inferior planets.

4. "The light of their nuclei must increase in their re-"cess from the sun, and *vice versa*." Because as they are in the regions of the planets, their access toward the sun bears a considerable proportion to their whole distance.

From observations of the *comet* of 1680, sir Isaac Newton found that the vapour in the extremity of the tail, January 25th, began to ascend from the head before December 11th; and had therefore spent more than forty-five days in its ascent: but that all the tail which appeared December 10th, ascended in the space of those two days, then just past since its perihelion. The vapour, therefore, at the beginning, when the *comet* was near the sun, ascended prodigiously swift; and afterwards continued to ascend with a motion retarded by the gravity of its particles; and by that ascent increased the length of the tail: but the tail, notwithstanding its length, consisted almost wholly of vapours, which had ascended from the time of its perihelion: and the vapour which ascended first, and composed the extreme of the tail, did not vanish till it was too far from the sun to be illuminated by him, and from us to be visible. Hence also, the tails of *comets* that are shorter, do not ascend with a quick and continual motion from the head, and then presently disappear; but are permanent columns of vapours and exhalations, gathered from the head by a very gentle motion, and in a great space of time; which yet, by participating of that motion of their heads they had at the beginning, continue easily to move along with their heads through the celestial regions: whence also the vacuity of those regions is argued. See VACUUM.

5. "Their tails must appear the largest and brightest "immediately after their transit through the region of "the sun." Because, then, their heads being the most heated, will emit the most vapours.

From the light of the nucleus, or apparent star, we infer their vicinity to the earth, and that they are by no means in the region of the fixed stars, as some have imagined; since, in that case, their heads would be no more illuminated by the sun than the planets are by the fixed stars.

6. "The tails must still decline from a full opposition "to the sun, towards the parts which the heads pass "over, in their progress through their orbits." Because all smoke, or vapour, emitted from a body in motion, tends upwards obliquely, still receding from that part, towards which the smoking body proceeds.

7. "That declination will be still the least near the nu-"cleus of the *comet*; and when the *comet* is nearest the "sun." Because the vapour ascends more swiftly near the head of the *comet*, than in the hinder extremity of its tail; and when the *comet* is [illegible] from the sun, than when [illegible]

"The

4. "The tail is brighter, and better defined in its convex part, than in its concave." Because the vapour in the convex part, which goes first, being somewhat nearer and denser, reflects the light more copiously.

5. "The tail must appear broader towards the higher extremity of the *comet*, than towards the head." Because the vapour in a free space perpetually rarefies and dilates.

10. "The tails must be transparent." Because consisting of infinitely thin vapour, &c.

Thus accurately does the hypothesis tally to the phenomena.

COMETS, *phases of.*—The nuclei, which we also occasionally call the *heads* and *bodies* of *comets*, viewed through a telescope, shew a very different face from those of the fixed stars, or planets. They are liable to apparent changes, which Sir Isaac Newton ascribes to changes in the atmosphere of *comets*: and this opinion was confirmed by observations of the *comet* in 1744. Hist. Acad. Scienc. 1744. Sturmius tells us, that, observing the *comet* of 1680, with a telescope, it appeared like a coal dimly glowing, or a rude mass of matter illumined with a dusky fumid light, less sensible at the extremes than in the middle; rather than as a star, which appears with a round disk, and a vivid light.

Hevelius observed of the *comet* of 1661, that its body was of a yellowish colour, very bright and conspicuous, but without any glittering light: in the middle was a dense ruddy nucleus, almost equal to Jupiter, encompassed with a much fainter, thinner matter. February 5th, its head was somewhat bigger and brighter, of a gold colour; but its light more dusky than the rest of the stars: here, the nucleus appeared divided into several parts. February 6th, the disk was lessened; the nuclei still existed, though less than before: one of them, on the lower part of the disk, on the left, much denser and brighter than the rest; its body round, and representing a very lucid little star: the nuclei still encompassed with another kind of matter. February 10th, the head somewhat more obscure and the nuclei more confused, but brighter at top than bottom. February 13th, the head diminished much, both in magnitude and brightness. March 2d, its roundness a little impaired, its edges lacerated, &c. March 28th, very pale, and exceeding thin; its matter much dispersed; and no distinct nucleus at all appearing.

Wegelius, who saw the *comet* of 1664, the moon, and a little cloud illumined by the sun at the same time, observed, that the moon, through the telescope, appeared of a continued luminous surface; but the *comet* very different; being perfectly like a little cloud in the horizon, illumined by the sun. From these observations it was, that Hevelius concluded *comets* to be like maculæ, or spots formed out of the solar exhalations.

COMETS, *magnitude of.*—The estimates that have been given by Tycho, Hevelius, and some others, of the magnitude of *comets*, are not sufficiently accurate to be depended upon; for it does not appear, that they distinguished between the nucleus and the surrounding atmosphere. Thus Tycho computes that the true diameter of the *comet* in 1577, was in proportion to the diameter of the earth as 2 to 10 to 14. Hevelius made the diameter of the *comet* of 1652 to 10 that of the earth, as 52 to 100. The diameter of the atmosphere is often ten or fifteen times as great as that of the nucleus: the former, in the *comet* of 1682, was measured by Flamsteed, and found to be 2′, but the diameter of the nucleus only 11 or 12″. Some *comets*, from their apparent magnitude and distance compared, have been judged to be much larger than the moon, and even equal to some of the primary planets. The diameter of that of 1744, when at the distance of the sun from us, measured about 1′, and therefore its diameter must be about three times the diameter of the earth: at another time the diameter of its nucleus was nearly equal to that of Jupiter.

The lengths of the tails of *comets* are various, and depend on a variety of circumstances. Longomontanus mentions a *comet* that in 1618, December 10th, had a tail above 100° in length: that of 1680, according to Sturmius, about the 20th of November, was but small; at most, not exceeding 20° in length; in a little time it grew to a length of 60°, after which it dwindled very sensibly. The *comet* of 1744 had a tail which at one time appeared to extend above 16° from its body; and which, allowing the sun's parallax 10″, must have been above twenty-three millions of miles in length.

COMETS, *formation of the tails of.*—Sir Isaac Newton shews that the atmospheres of *comets* will furnish vapour sufficient to form their tails: this he argues from that wonderful rarefaction observed in our air, at a distance from the earth: a cubic inch of common air, at the distance of half the earth's diameter, or four thousand miles, would necessarily expand itself so as to fill a space larger than the whole region of the stars. Since then the coma, or atmosphere of a *comet*, is ten times higher than the surface of the nucleus, counting from the center thereof; the tail ascending much higher, must necessarily be immensely rare: so that it is no wonder the stars should be visible through it.

Now, the ascent of vapours into the tail of the *comet*, he supposes occasioned by the rarefaction of the matter of the atmosphere at the time of the perihelion. Smoke, it is observed, ascends the chimney by the impulse of the air wherein it floats; and air, rarefied by heat, ascends by the diminution of its specific gravity, taking up the smoke along with it: why then should not the tail of a *comet* be supposed to be raised after the same manner by the sun? for the sun-beams do not act on the medium they pass through, any otherwise than by reflection and refraction.

The reflecting particles, then, being warmed by the action, will again warm the æther wherewith they are compounded; and this, rarefied by the heat, will have its specific gravity, whereby it before tended to descend, diminished by the rarefaction; so as to ascend, and carry along with it those reflecting particles, whereof the tail of the *comet* is composed.

This ascent of the vapours will be promoted by their circular motion round the sun; by means whereof, they will endeavour to recede from the sun, while the sun's atmosphere, and the other matters in the celestial spaces, are either at rest, or nearly so; as having no motion but what they receive from the sun's circumrotation.

Thus are the vapours raised into the tails of *comets* in the neighbourhood of the sun, where the orbits are most curve; and, where the *comets*, being within the denser atmosphere of the sun, have their tails of the greatest length.

The tails thus produced, by preserving that motion, and at the same time gravitating towards the sun, will move round his body in ellipses, in like manner as their heads; and, by this means, will ever accompany, and freely adhere to their head. In effect, the gravitation of the vapours towards the sun will no more occasion the tails of the *comets* to forsake their heads, and fall down towards the sun, than the gravitation of their heads will occasion them to fall off from their tails: but by their common gravitation, they will either fall down together to the sun, or be together suspended, or retarded. This gravitation, therefore, does not at all hinder, but that the heads and tails of *comets* may receive and retain any position towards each other, which either the above mentioned causes, or any other, may occasion. The tails, therefore, thus produced in the perihelion of *comets*, will go off along with their head into remote regions; and either return thence, together with the *comets*, after a long series of years; or, rather, be there left bare; till at its return, descending towards the sun, some little short tails are gradually and slowly produced from the heads; which afterwards, in the perihelion, descending down into the sun's atmosphere, will be immensely increased.

The vapours, when they are thus dilated, rarefied, and diffused through all the celestial regions, the same author observes, may probably, by little and little, by means of their own gravity, be attracted down to the planets, and become intermingled with their atmospheres.

He adds, that for the conservation of the water, and moisture of the planets, *comets* seem absolutely requisite; from whose condensed vapours and exhalations, all that moisture which is spent in vegetations and putrefactions, and turned into dry earth, &c. may be *resupplied* and recruited. For all vegetables grow and increase wholly from fluids; and, again, as to their greatest part, turn, by putrefaction, into earth again; as earthly slime being perpetually precipitated to the bottom of putrefying liquors. Hence, the quantity of dry earth must continually increase, and the moisture of the globe decrease and at last be quite evaporated, if it has not a continual supply from some part or other of the universe. And I suspect, adds our great author, that the spirit, which makes the finest, subtilest, and best part of our air, and which is absolutely requisite for the life and being of all things, comes principally from the *comets*.

On this principle, there seems to be some foundation for the popular opinion of presages from *comets*; since the tail of a *comet* thus intermingled with our atmosphere, may produce changes very sensible in animal and vegetable bodies. See MEDIUM, and SPIRIT.

But the transmutation of water into earth is now justly exploded: Woodward, Boerhaave, and others having observed that water is only an agent in conveying the nutritious matter to vegetable bodies, and not that matter itself.

Another use which he conjectures *comets* may be designed

to serve, is that of recruiting the sun with fresh fewel, and repairing the consumption of his light by the streams continually sent forth in every direction from that luminary. In support of this conjecture he observes, that *comets* in their perihelion may suffer a diminution of their projectile force, by the resistance of the solar atmosphere; so that by degrees their gravitation towards the sun may be so far increased, as to precipitate their full into his body.

There have been various conjectures about the generation of the tails of *comets*. Apian, Tycho Brahe, and some others, apprehended that they were produced by the sun's rays transmitted through the nucleus of the *comet*, which they supposed to be transparent, and there refracted as in a lens of glass, so as to form a beam of light behind the *comet*. Des Cartes accounted for the phenomenon of the tail by the refraction of light from the head of the *comet* to the eye of the spectator. Mairan supposes that the tails are formed out of the luminous matter that composes the sun's atmosphere; M. De la Lande combines this hypothesis with that of Newton above recited. Mr. Rowning, who is not satisfied with Sir Isaac's opinion, accounts for the tails of *comets* in the following manner. It is well known, says he, that when the light of the sun passes through the atmosphere of any body, as the earth, that which passes on one side, is by the refraction thereof made to converge toward that which passes on the opposite one; and this convergency is not wholly effected either at the entrance of the light into the atmosphere, or at its going out; but beginning at its entrance, it increases in every point of its progress. It is also agreed that the atmospheres of the *comets* are very large and dense. He therefore supposes that by such time as the light of the sun has passed through a considerable part of the atmosphere of a *comet*, the rays thereof are so far refracted toward each other, that they then begin sensibly to illuminate it, or rather the vapours floating therein; and so render that part they have yet to pass through, visible to us: and that this portion of the atmosphere of a *comet* thus illuminated, appears to us in form of a beam of the sun's light and passes under the denomination of a *comet*'s tail. Rowning's Natural Philosophy, part iv. chap. 11.

We have an inquiry into the cause of the tails of *comets*, by Mr. Euler, in the Mem. de l'Acad. de Berlin, tom. ii. p. 119, seq. He thinks there is a great affinity between these tails, the zodiacal light, and the Aurora Borealis; and that the common cause of them all, is the action of the sun's light on the atmospheres of the *comets*, of the sun, and of the earth. He supposes that the impulse of the rays of light on the atmosphere of *comets*, may drive some of the finer particles of that atmosphere far beyond its limits; and that this force of impulse combined with that of gravity towards the *comet*, would produce a tail, which would always be in opposition to the sun, if the *comet* did not move. But the motion of the *comet* in its orbit, and about an axis, must vary the position and figure of the tail, giving it a curvature, and deviation from a line drawn from the center of the sun to that of the *comet*; and that this deviation will be greater, as the orbit of the *comet* has the greater curvature, and that the motion of the *comet* is more rapid. It may even happen, that the velocity of the *comet*, in its perihelion, may be so great, that the force of the sun's rays may produce a new tail, before the old one can follow: in which case the *comet* might have two or more tails. The possibility of this is confirmed by the *comet* of 1744, which was observed to have several tails while it was in its perihelion. See Aurora *Borealis*, and Zodiacal *light*.

Dr. Hamilton urges several objections against the Newtonian hypothesis; and concludes that the tail of a *comet* is formed of matter which has not the power of reflecting or reflecting the rays of light; but that it is a fluid or self-shining substance: and from its similarity to the Aurora *borealis*, produced by the same cause, and a proper electrical phenomenon. Dr. Halley seemed inclined to this hypothesis, when he said, that the streams of light in an Aurora borealis so much resembled the long tails of *comets*, that at first sight they might well be taken for such: that that light seems to have a greater affinity to that which the effluvia of electric bodies emit in the dark. Phil. Trans. N° 347. Hamilton's Philosophical Essays, p. 91, &c.

M. Fatio has suggested, that some of the *comets* have their nodes so very near the annual orbit of the earth; that if the earth should happen to be found in that part next the node, at the time of a *comet*'s pulling by, as the apparent motion of the *comet* will be incredibly swift, so its parallax will become very sensible; and the proportion thereof to that of the sun will be given: whence, such transits of *comets* will afford the best means of determining the distance of the earth and *sun*.

The *comet* of 1472, v. gr. had a parallax above twenty times greater than the sun's: and if that of 1618, had come down in the beginning of March to its ascending node, it would have been much nearer the earth, and its parallax much more sensible. But, hitherto, none has threatened the earth with a nearer approach than that of 1680: for, by calculation, Dr. Halley finds, that November 11th, 1 h. 6 min. P. M. that *comet* was not above one semidiameter of the earth, to the northward of the way of the earth; at which time, had the earth been in that part of its orbit, the *comet* would have had a parallax equal to that of the moon: what might have been the consequence of so near an approach, a contact, or, lastly, a shock of the celestial bodies? Mr. Whiston says, a DELUGE!

Comets, *motion of*.—If the paths of *comets* be supposed directly parabolic, as some have imagined, it would follow, that being impelled towards the sun by a centripetal force, they descend as from spaces infinitely distant; and by their falls acquire such a velocity, as that they may again run off into the remotest regions, still moving upwards, with such a perpetual tendency as never to return. But the frequency of their appearance, and their degree of velocity, which does not exceed what they might acquire by their gravity towards the sun, seem to put it past doubt that they move, planet-like, in elliptic orbits, though exceedingly eccentric; and to return again, though after very long periods. See Elliptic.

The apparent velocity of the *comet* of 1472, as observed by Regiomontanus, was such as to carry it through 40° of a great circle in 24 hours: and that of 1770 was observed to move through more than 45° in the last 25 hours.

Newton, Flamsteed, Halley, and the English astronomers, &c. seem satisfied of the return of *comets*: Cassini, and others of the French, think it highly probable; but De la Hire, and others oppose it.

Those on the affirmative side suppose the *comets* to describe orbits prodigiously eccentric, insomuch that we can only see them in a very small part of their revolutions: out of this they are lost in the immense spaces, but not only from our eyes, but our telescopes. That little part of their orbit next us, M. Cassini, &c. have found to pass between the orbits of Venus and Mars.

For the reasons of the return of *comets*, M. Cassini gives these which follow. 1. In considering the course of the *comets*, with regard to the fixed stars, they are found to keep a considerable time in the arch of a great circle, i. e. a circle whose plane passes through the center of the earth: indeed, they deviate a little from it, chiefly towards the end of their appearance; but this deviation is common to them with the planets.

2. *Comets*, as well as planets, appear to move so much the faster as they are nearer the earth; and when they are at equal distances from their perigee, their velocities are nearly the same.

By subtracting from their motion the apparent inequality of velocity occasioned by their different distance from the earth, their equal motion might be found: but we should not be certain this motion were their true one; because they might have considerable inequalities, not distinguishable in that small part of their orbit visible to us. It is, indeed, probable, their real motion, as well as that of the planets, is unequal in itself; and hence we have a reason why the observations made during the appearance of a *comet*, cannot give the just period of their revolution. See Period.

3. There are no two different planets whose orbits cut the ecliptic in the same angle, whose nodes are in the same points of the ecliptic, and whose apparent velocity in their perigee is the same; consequently, two *comets* seen at different times, yet appearing in all points in those circumstances, can only be one and the same *comet*.

And this were the *comets* of 1577 and 1680 observed to do; and those of 1652 and 1698: not that this exact agreement, in these circumstances, is absolutely necessary to determine them the same *comet*. M. Cassini finds the moon herself irregular in them all: accordingly, he is of opinion, there are several which disagree herein, and yet may be accounted the same.

The great objections against the return of *comets*, are, the rarity of their appearance, with regard to the number of revolutions assigned to them.

In 1702, there was a *comet*, or rather the tail of one, seen at Rome, which M. Cassini takes to be the same with that observed by Aristotle, and that since seen in 1668, which would imply its period to be thirty-four years. Now, it may seem strange, that a star which has so short a revolution, and of consequence such frequent returns, should be so seldom seen.—Again, in April, of the same year, 1702, a *comet* was observed by Maff. Bianchini, and Marakli, supposed by the latter to be the same with that

that of 1664, both by reason of its motion, velocity, and direction. M. De la Hire took it to have some relation to another he had observed in 1698, which M. Cassini refers to that of 1652. On this supposition, its period appears to be forty-three months; and the number of revolutions between 1652 and 1698, fourteen: but it is hard to suppose, that in this age, wherein the heavens are so narrowly watched, a star should make fourteen appearances unperceived; especially such a star as this, which might appear above a month together; and of consequence be frequently disengaged from the crepuscula.

For this reason M. Cassini is very reserved in maintaining the hypothesis of the return of *comets*, and only proposes those for planets, where the motions are easy and simple, and are solved without straining, or allowing many irregularities.

M. De la Hire proposes one general difficulty against the whole system of the return of *comets*, which would seem to hinder any comet from being a planet: and it is this; that by the disposition necessarily given to their courses, they ought to appear as small at first as at last; and always increase, till they arrive at their greatest proximity to the earth: or, if they should chance not to be observed, as soon as they become visible, for want of attention thereto, at least it is impossible but they must frequently shew themselves before they have arrived at their full magnitude and brightness. But he adds, that none were ever yet observed till they had arrived at it.

But the appearance of a *comet* in the month of October, 1723, while at a great distance, so as to be too small and dim to be viewed without a telescope, may serve to remove this obstacle, and set the *comets*, still, on the same footing with the planets.

Sir Isaac Newton supposes, that as those planets which are nearest the sun, and revolve in the least orbits, are the smallest; so among the *comets*, such as in their perihelion come nearest the sun, are the smallest, and revolve in lesser orbits.

Dr. Halley has given us a table of the astronomical elements of all the *comets* that have been yet observed with due care; whereby, whenever a new *comet* shall appear, it may be determined, by comparing it therewith, whether it be any of those which have yet appeared; and consequently its period, and the axis of its orbit, be determined, and its return foretold. This table contains the astronomical elements of twenty-four *comets*, on the supposition that they moved in parabolas; though he thought it extremely probable that they really moved in very eccentric ellipses, and consequently returned after long periods of time. This table commences with the year 1337, and closes with 1698. See his Synopsis of the Astronomy of *Comets*, annexed to Gregory's Astronomy.

There are many things in the *comet* of 1532, observed by Peter Apian, which intimate its being the same with that of 1607, observed by Kepler and Longomontanus; and which Dr. Halley himself again observed in 1682. All the elements agree, and there is nothing contradicts the opinion, but that inequality in the periodic revolution; which, however, he thinks is no more than may be accounted for from physical causes; no more, in effect, than is observed in Saturn; the motion of which planet is so disturbed by the rest, especially Jupiter, that its period is uncertain for several days together; to what errors then may not a *comet* be liable, which rises to almost four times the height of Saturn; and whose velocity, if but a little increased, would change its elliptic orb into a parabolic one?

What further confirms the identity, is the appearance of another *comet* in the summer of 1456, which, though observed by none with accuracy, yet, by its period, and the manner of its transit, he concludes to be the same; and thence ventures to foretel its return in the year 1758, or the beginning of the next year: and time has verified the prediction. The *comet* of 1661 seems to be the same with that of 1532, and to have its period in one hundred and twenty-nine years: and Halley also thought that the *comet* of 1680 was the same that was observed in 1106, 531, and in the forty-fourth year before Christ, when Julius Cæsar was murdered; and that its period was five hundred and seventy-five years. Mr. Dunthorne, in the Phil. Trans. vol. xlvii. has endeavoured to shew from a MS. in Peterhouse-hall library, that the *comet* of 1106 could not be the same with that of 1680. But M. De la Lande adopts the opinion of Dr. Halley.

Another table has since been computed, from observations contained in the Philosophical Transactions, De la Caille's Astronomy, and De la Lande's Histoire de la Comete de 1759, & Connoissance des Mouvemens Celestes 1762 & 1764. In this table are seen the elements of twenty-five other *comets* from the year 1104 to 1762.

By comparing theſe tables, it will be found that none of theſe *comets*, except that of 1759, appears to be the ſame with any other in either of the tables; unleſs we admit thoſe of 1264 and 1556, and thoſe of 1596 and 1669, to be the ſame. See the elements of the *comet* of 1770, and the trajectory of its path, in the Tranſactions of the American Philoſophical Society, vol. i.

See Whiſton's Solar Syſtem, where the orbits of the ſeveral *comets* are delineated, and the periods of as many of them as are known, expreſſed.

To determine the place and courſe of a COMET.—Obſerve the diſtance of the *comet* from two fixed ſtars, whoſe longitudes and latitudes are known; from the diſtances thus found, calculate the place of the *comet* by trigonometry, after the manner delivered under PLANET. By repeating the obſervations and operations for ſeveral days ſucceſſively, the courſe of the *comet* will be had.

To determine the courſe of a COMET *mechanically, and without any apparatus of inſtruments.*—The following ingenious method, by a thread, we owe to Longomontanus: obſerve four ſtars round the *comet*, ſuch, as that the *comet* may be in the interſection of the right lines that join the two oppoſite ſtars; which is eaſily found by means of a thread placed before the eye, and extended over-againſt the ſtars and *comet*.

Suppoſe, v. gr. the *comet*'s place in the heavens A *(Tab. Aſtronomy, fig.* 23.) between the four ſtars, B, C, D, E; where the line joining the ſtars B and D paſſes through the body of the *comet*; and the like does the line paſſing through C and E.

On a globe, whereon theſe four ſtars are found, extend a thread through B and D, and another through C and E; the point of interſection will give the place of the *comet*. This practice being repeated for ſeveral days the *comet*'s courſe will be had on the globe; which courſe will be found to be a great circle: from any two points whereof, it will be eaſy to find its inclination to the ecliptic, and the place of the nodes; only by obſerving where a thread ſtretched through the two points cuts the ecliptic.

To determine the parallax of a COMET. See PARALLAX.

COMET, *trajectory of a*. See TRAJECTORY.

COMETARIUM, a curious machine, exhibiting an idea of the revolution of a *comet* about the ſun. It is contrived in ſuch a manner, as by elliptical wheels to ſhew the unequal motion of a *comet* in every part of its orbit. The *comet* is repreſented by a ſmall braſs ball, carried by a radius vector, or wire, in an elliptic groove about the ſun in one of its foci; and the years of its period are ſhewn by an index moving with an equable motion over a graduated ſilver circle. See a particular deſcription, with a cut, in Ferguſon's Aſtronomy, 4to. p. 288.

COMETIS, in *Botany*, a genus of the *tetrandria monogynia* claſs, of which there is only one known ſpecies. The involucrum is formed of three leaves and three flowers; the calyx has four leaves; and the capſule contains three berries.

COMETITES, in *Natural Hiſtory*, a name given by ſome writers to a kind of aſtroites, which has ſtars much larger than thoſe of the common kind, and therefore called *cometi*.

COMEUS, in *Mythology*, a ſurname of Apollo, under which title he was worſhipped at Selencia, whence his ſtatue was carried to Rome, and placed in the temple of Apollo Palatine.

COMFREY, *ſymphytum*, in *Botany*, a genus of plants, of the *pentandria monogynia* claſs; the characters of which are theſe: the flower has a five-cornered, erect, permanent empalement, cut into five acute parts: it has one petal with a ſhort tube, above which the limb has a ſwelling belly, and thicker rube. The limb is indented in five obtuſe parts, which are reflexed: the chaps are armed with five awl-ſhaped rays, which are connected in a cone; it has five awl-ſhaped ſtamina, which are alternate with the rays of the chaps, terminated by erect acute ſummits, and four germina, ſupporting a ſlender ſtyle the length of the petal, crowned by a ſingle ſtigma; the germina afterwards turn to four gibbous, acute, pointed ſeeds, which ripen in the empalement. There are ſeveral ſpecies; but only three are to be found in the Engliſh gardens; which are cultivated either by ſeed, or by parting the roots, which latter is the moſt expeditious way. They are extremely hardy, and will grow on almoſt any ſoil, and in any ſituation.

Comfrey-root has been extolled as a famous vulnerary, both externally and internally; and as a noble balſamic and agglutinant; and given with ſucceſs in diarrhœas from dyſenteries, and ſpittings of blood. The beſt way of taking it is in decoction, or ſyrup; but the decoction muſt not be too ſtrong. A conſerve of them is found of excellent uſe in hæmorrhages of all kinds. They have been alſo recommended in the gout and ſciatica, as of great virtues in mitigating the pain, and ſhortening the paroxyſms. It is now rarely employed in practice, though it may be deemed ſuperior to the althea roots. The mucilage derived from the root is its only medicinal principle.

Symphytum was a name given among the ancients to ſeveral different plants, which had the common virtues of agglutinators. We have appropriated the word to *comfrey*; but Dioſcorides plainly uſes it ſometimes as the name of elecampane, and ſometimes as that of the common horſe-tail. Pliny has collected the virtues and characters of the *ſymphytum* from all the authors he had, in whom

whom the word occurred, and therefore he has given a list of virtues that belong to no one plant.

COMFREY, *ſymſted*, in *Botany*. See LUNG-wort.

COMIOLA, in *Botany*, a name given by ſome of the old Roman authors to the plant commonly called hoteots, or dyer's weed. See DYER'S *weed*.

COMITATU *commiſſo*, in *Law*, a writ or commiſſion, by which a ſheriff is authoriſed to take upon him the charge of the county.

COMITATU *et caſtro commiſſo*, a writ, by which the charge of a county, together with the keeping of a caſtle, is committed to the ſheriff.

COMITATUS, in *Law*, a county. Ingulphus tells us, that England was firſt divided into counties by king Alfred; and the counties into hundreds, and theſe again into tythings; and Forteſcue writes, that *regnum Anglie per* comitatus, *et regnum Francie per ballivatus diſtinguitur*. Sometimes it is taken for a territory or juriſdiction of a particular place; as in Mat. Paris, anno 1234. See COUNTY.

COMITATUS *poſſe*. See POSSE.

COMITIA, an aſſembly of the Roman people, either in the Comitium, or Campus Martius, i. e. FIELD *of Mars*; meeting for the election of magiſtrates, or for conſulting on the important affairs of the republic.

The word comes from the verb *eo*, or *coneo*, *to go together*.

There were certain days fixed for theſe aſſemblies, called *dies comitiales*; marked with a C in the calendar of Julius Cæſar. *Comitial* aſſemblies, held for the election of conſuls, were called *conſular comitia*: in like manner, the other *comitia* took names from the officer to be created; whether a tribune, a pontif, edile, or the like.

There were three kinds of theſe *comitia*, viz. *curiata*, *centuriata*, and *tributa*; ſo diſtinguiſhed from the manner wherein the people voted, and gave their ſuffrages, viz. by curiæ or pariſhes, tribes, or centuries.

The power of calling theſe aſſemblies pertained to moſt of the chief magiſtrates, and ſometimes to the ſovereign pontif.

Authors make the difference between *comitia* and *concilia*, to conſiſt in this; that in the former the whole people were called together, in the latter only a part.

COMITIA *curiata*. Romulus inſtituted the *comitia curiata*, or the public aſſemblies of the people, called to vote in their ſeveral curiæ; and it is agreed by all that the matters ſubjected to their deciſion, were the choice of all the magiſtrates, and the right of making laws, war, and peace: an ample juriſdiction, and the moſt important articles of government, yet not wholly obſolete, according to Dionyſius, unleſs the ſenate concurred with them. This method of tranſacting all the greater affairs by the people, aſſembled in their curiæ, after it had ſubſiſted through five ſucceſſive reigns, was found to be inconvenient.

Servius Tullius, the ſixth king of Rome, in order to correct the inconvenience of the *comitia curiata*, inſtituted a new diviſion of the people into ſix claſſes, according to a cenſus, or valuation of their eſtates; whence aroſe the *comitia centuriata*: then he ſubdivided theſe claſſes into one hundred and ninety-three centuries, and contrived to throw a majority of theſe centuries, that is ninety-eight of them, into the firſt claſs of the richeſt citizens. By which regulation, though every man voted now in his century, as before in his curia; yet, as all matters were decided by a majority of the centuries, ſo the balance of power was wholly tranſferred into the hands of the rich; and the poorer ſort deprived of their former weight and influence in the affairs of ſtate: which wiſe inſtitution was ever after obſerved, through all ſubſeeding ages, in the elections of the principal magiſtrates, and the determination of all the principal tranſactions of the republic.

COMITIAL *days*. Pauſus Manutius is of opinion, that there were certain days on which the Roman ſenate might regularly be aſſembled; and others on which it could not: and that theſe laſt were called *comitial* days, and marked under that name in the calendars, as days wholly deſtined, and ſet apart by law, for the aſſemblies of the people. But Sigonius contends, that the ſenate might meet on any of theſe days, unleſs when the people were actually aſſembled; and tranſacting buſineſs on them: and conſequently that the title of *comitial* denoted ſuch days only, on which the people *might* be legally aſſembled, not ſuch on which they were or could in fact be aſſembled. Middlet. of Rom. Senat. p. 132, ſeq.

The truth of the matter ſeems to be this, that though the days called *comitial* were regularly deſtined to the aſſemblies of the people, yet the ſenate who might not only be convened on the ſame, after the popular aſſemblies were diſſolved; but had the power likewiſe, whenever they found it expedient, to ſuperſede and poſtpone the aſſemblies of the people to another day; and, by a particular decree, to authoriſe their own meetings upon them, for the diſpatch of ſome important affair therein ſpecified.

COMITIALIS *morbus*, an ancient term for the EPILEPSY, or falling-ſickneſs; ſo called, becauſe if any perſon was ſeized with it in the Roman *comitia*, the aſſembly was immediately diſſolved; this being eſteemed an unlucky omen; or, rather, becauſe thoſe liable to it were chiefly ſeized in the *comitia*, or great aſſemblies.

COMITIUM, the place where the *comitia* were ordinarily held, was a large hall in the Roman Forum: it was a long time open at top; on which account, the aſſemblies were often interrupted by bad weather: it was firſt covered over in the time of the ſecond Punic war. See FORUM.

Roſinus obſerves, that the conſuls and tribunes were not created in the *Comitium*, but in the Campus Martius.

It was in this place that the roſtra were placed. See COMITIA.

COMMA, in *Grammar*, a point, or character, formed thus [,]; ſerving to mark a ſhort ſtop, or pauſe; and to divide the members of a period.

The word is formed of κόπτω, *ſco*, *I cut*.

It is very difficult to fix the preciſe uſe of the *comma*; different authors define, and uſe it differently: the ordinary doctrine is, that the *comma* ſerves to diſtinguiſh nouns, verbs, adverbs, and the ſeveral parts of a period that are not neceſſarily joined together. But this conveys no clear, preciſe idea: for what is it *to diſtinguiſh the parts of a period not neceſſarily joined together?* F. Buffier has carried the doctrine of the *comma* farther; according to him, the *comma* ſerves to diſtinguiſh thoſe members of a period, in each whereof is a verb, and the nominative caſe of the verb. Thus, *That ſo many people are pleaſed with trifles, is owing to a weakneſs of mind, which makes them love things eaſy to be comprehended.*

Beſides this, the *comma* is uſed to diſtinguiſh, in the ſame member of a period, ſeveral nouns ſubſtantives, or nouns adjectives, or verbs, not united by a conjunction. Thus, *Virtue, wit, knowledge, are the chief ornaments of a man*: or, *A man never becomes learned without applying conſtantly, methodically, with a good apparatus, &c.*

If thoſe words be united in the ſame phraſe by a conjunction, the *comma* is omitted: thus, *The imagination and the judgment do not always agree.* The *comma* may alſo be omitted between the phraſes that are very ſhort, eſpecially if they depend upon the ſame regimen, and are united by a conjunction: thus, *Alexander conquered Aſia and eſtabliſhed the monarchy of the Greeks.*

The ingenious author of the treat. De Ratione interpungendi, printed with Vaillin's Elements. Rhetor. Lond. 1724. lays down the rule of a *comma* to be, *to diſtinguiſh the ſingle members of a period, or ſentence*; i. e. ſuch as only conſiſt of one ſubject, and one definite verb. Thus Cicero, *Quis nunc ad accuſatoris ſubſtantiam, quibus ego incredibiliter delector, quæ nos vim, ſanguinem ſenectutis, & mihi ad ſalutis ſuæ preſidia accidere videmus.* See SENTENCE.

But this rule does not go throughout: the ſame author influencing many particular caſes, not included herein, where yet the *comma* is advifable.

Sometimes, e. gr. a propoſition includes another, which may be called *partitive*, as being only a part of the entire phraſe; in which caſe, the two are to be divided from each other by *commas*. Thus, *Elocution ſays, as he tells us, the fineſt things in the world.*

The points, or pauſes in diſcourſe, it is obſerved, are in a kind of muſical proportion: the *comma* ſtops the reader's voice while he may privately tell one; the ſemicolon, two; the colon, three; and the period, or full-ſtop, four. Others make the ſtop at the colon, four; and the period, ſix. Profeſſor Ward obſerves, that the ſuſpenſion of the voice ſhould be twice as long for a *comma* as between words ſeparated by no mark of diſtinction; thrice for the ſemicolon; and ſo on in the ſame proportion. Biſhop Lowth aſſigns to the period a pauſe in duration double to the colon; to the colon, double of the ſemicolon; and to the ſemicolon, double of the *comma*: ſo that they are in the ſame proportion to one another as the ſemibreve, the minim, the crotchet, and the quaver, in muſic. But, whatever be the duration of the ſeveral pauſes, the proportion between them muſt be ever invariable, if the doctrine of punctuation were exact. Introd. to Engliſh Grammar, edit. 1772. p. 107.

The ancients only made uſe of two kinds of points, or pauſes, in a period; the larger they call *members*, the Greeks κῶλα, marked thus [:]; the ſmaller *inciſa*, the Greeks *commata*, thus [,].

The moderns, reſuming on their predeceſſors, have ſubdivided the firſt into a colon, and ſemicolon; ſome ſay, without any good foundation in nature; though others maintain the uſefulneſs of the diviſion.

As the member, or colon, divides the period into two parts, each containing a ſenſe, though that imperfect: thus, *Antequam de republicâ, patres conſcripti, dicam ea quæ dicenda hoc tempore arbitror*; where the ſenſe does not reſt, nor is the period or ſentence perfect, without the addition of, *ea potiùm vobis breviter & poſſeſſionis & reverentiæ mea*: the *comma* ſubdivides each member into intermediate diviſions, which, of themſelves, have no preciſe meaning at all: v. gr. *Nihil eſt, mihi credite, virtute formoſius, nihil pulchrius, nihil amabilius.*

Frequent *commas*, as on other occaſions they promote perſpicuity and diſtinctneſs, and eaſe the reader, both in the reliſcarſal and comprehenſion of his author; ſo, in oratory, are of eſpecial uſe and effect; particularly, where an adverſary is to be cloſely and pointedly attacked, upbraided, reprehended, wounded, &c. Witneſs that of Cicero againſt Verres: *Non enim ea color iſte ſervitii, nec piloſæ genæ, nec dentes putreſi deceperunt: nunc, ſupercilia, frons, vultus denique totus, qui ſorme quidem locatus mentis eſt, hic in fraudem, homines impudici, hic, ecce, quibus erat ignotus, decepti, ſeſellit, in fraudem induxit: puncta tua iſta lutulenta vitia reverunt: pauci teruditatem ingenii, ſtuporem, debilitatemque linguæ, &c.*

COMMA, in *Muſic*, is the ſmalleſt of all the ſenſible intervals of tone. Ptolemy conſidered it as inſenſible; but Salinas aſſerts, that he was capable of diſtinguiſhing it. Muſical writers have enumerated three kinds of *comma*. The greater *comma*, or the interval of two ſounds, having the ratio of 81 to 80, which is the difference of the major and minor tones. To this the term is commonly applied. It is ſeldom in uſe, except in the theory of muſic, to ſhew the juſtneſs of the concords; for in the practice, the diviſion is drowned and loſt.—The ſmaller *comma* is the difference between the greater and leſſer ſemitones; and the proportion expreſſing it is that of 2048 to 2025.—The *comma* of Pythagoras is expreſſed by the ratio of 531441 to 524288: or, it is the difference between ſix tones major and an octave. The tone, in the diſtribution aſcribed by Boethius and others to Philolaus, contained nine *commas*. See TONE, &c.

COMMAND, in the *Royal Navy*, implies the rank or power of an officer who has the management of a ſhip of war of any kind under twenty guns. He ranks with a major in the army.

COMMANDER, is a name given to a large wooden mallet uſed in a ſhip.

COMMANDING *Ground*, in *Fortification*, an eminence, or riſing ground, which overlooks any poſt, or ſtrong place.

Of this they reckon three ſorts: 1°, *A front commanding ground*, which is an height oppoſite to the face of the poſt, which plays upon its front.

2°, *A reverſe commanding ground*, which is an eminence that can play upon the back of any place or poſt.

3°, *An enfilade commanding ground, or oblique commanding ground*, which is a high place, that can with its ſhot ſcour all the length of a ſtrait line.

COMMANDMENT, in a *Legal Senſe*, has various uſes: as, *Commandment of the king*, when, on his own mere motion, and from his own mouth, he calls a man into priſon.

Commandment of the juſtices, is either *abſolute*, or *ordinary*; *abſolute*, as when, on their own authority, and their own diſcretion, they commit a man to priſon for puniſhment. *Ordinary*, as when they commit him rather for ſafe cuſtody, than puniſhment.—A man committed to an ordinary *commandment* is repleviable.

COMMANDMENT is alſo uſed for the offence of him who directs or wills another to tranſgreſs the law; as by murder, theft, and the like.

He that commandeth any one to do an unlawful act, is acceſſary to it, and all the conſequences, if it be executed in the ſame manner as *commanded*: but if the *commander* revoke the *command* or if the execution varies from it, or in the nature of the offence; in ſuch caſe he will not be acceſſary. 3 Inſt. 51, 57. 2 Inſt. 182.

In another ſenſe of this word, magiſtrates may *command* others to aſſiſt them in the execution of their offices, for the doing of juſtice; and ſo may a juſtice of peace, to ſuppreſs riots, apprehend felons; or any officer to keep the king's peace, &c. Pro. 3.

In trespaſs, &c. the maſter ſhall be accountable for the act of the ſervant done by his *command*, but ſervants ſhall not be excuſed for committing any crime, when they act by *command* of their maſter, who *have* no authority to enforce ſuch *commands*. The *commands* of infants and feme coverts are void.

COMMANDMENTS, *&c.* See DECALOGUE.

COMMANDRY, a kind of benefice or fixed revenue belonging to a military order, and conferred on ancient knights, who had done conſiderable ſervice to the order.

There are *fixed* or regular *commandries*, obtained in order, and by merit; there are others of *grace* or *favour*, conferred at the pleaſure of the grand-maſter.

There are alſo *commandries* for the knights in the order of St. Bernard and St. Antony.—The kings of France have converted ſeveral of the hoſpitals for lepers into *commandries* of the order of St. Lazarus.

The commandries of Malta are of different kinds; for as the order conſiſts of knights, chaplains, and brother ſervitors, there are peculiar *commandries*, or revenues, attached to each.

The knight to whom one of theſe benefices or *commandries* is given, is called *commandeur*, which anſwers pretty nearly with the *præpoſitus* we meet with in charters at a diſtance from the grand-maſtery, whoſe adminiſtration was called *obedientia*: becauſe depending entirely on the abbot who gave him his commiſſion. Thus it is with the ſimple *commanders* of Malta, who are rather farmers of the order, than beneficiaries: paying a certain tribute, or rent, called *reſponſio*, to the common treaſure of the order.

The *commandries* belonging to the priory of St. John of Jeruſalem in England, conſiſting of manors, lands, &c. ſuch was that of New Eagle in Lincolnſhire, were given to Henry VIII. by ſtat. 32 Hen. VIII.

COMMELINA, in *Botany*, a genus of the *triandria monogynia* claſs: ſo named by F. Plumier, in compliment to Dr. Commeline, a famous profeſſor of botany at Amſterdam. Its characters are theſe: it hath a permanent heart-ſhaped ſpatha; the flower hath ſix concave petals, three of which are ſmall and oval, the other large, roundiſh, and coloured. It hath three nectariums, which hath been ſuppoſed to be ſtamina) and three awl-ſhaped ſtamina which recline: in the centre is ſituated a roundiſh germen, which afterward becomes a naked globular capſule with three ſu-rows, having three cells, each containing two angular ſeeds. There are five ſpecies, natives of Africa and America. Miller's Gard. Dict.

No medicinal propertie are attributed to this plant.

COMMEMORATION, the remembrance of any one; or ſomething done in honour of a perſon's memory.

Among the Romaniſts, it is a practice for dying perſons to leave a legacy to the church, for the celebrating to many maſſes in *commemoration* of them.

The euchariſt is a *commemoration* of the ſufferings of Jeſus Chriſt.

COMMEMORATION is alſo the name of two religious feaſts, otherwiſe called ALL-SAINTS, and ALL-SOULS. The occaſion of their inſtitution is variouſly related.

COMMENDAM, in the *Canon Law*, expreſſes the charge, truſt, and adminiſtration of the revenues of a benefice, given to a layman to enjoy, by way of depoſitum, for the ſpace of ſix months, in order to its being repaired, &c. or to another biſhop, or eccleſiaſtic, to perform the paſtoral offices thereof, till ſuch time as the benefice is provided of a regular incumbent.

Anciently, the adminiſtration of vacant biſhoprics belonged to the neareſt neighbouring biſhop; which is ſtill practiſed between the archbiſhoprick of Ayrom, and the biſhoprick of Antun: on this account they were called *commendatory biſhops*.

This cuſtom appears to be very ancient: St. Athanaſius ſays of himſelf according to Nicephorus, that there had been given him in *commendam*, that is in adminiſtration, another church beſides that of Alexandria, when of he was fixed biſhop.

The care of churches, it ſeems, which had no paſtor, was committed to a biſhop till they were provided with an ordinary: the regiſter of pope Gregory I. is full of theſe commiſſions, or *commendams*, granted during the abſence or ſickneſs of a biſhop, or the vacancy of a ſee. Some ſay, that pope Leo IV. firſt for the modern *commendams* on foot, in favour of eccleſiaſtics who had been expelled their benefices by the Saracens; to whom the adminiſtration of the vacant churches was committed for a time, in expectation of their being reſtored: though St. Gregory is ſaid alſo to have uſed the ſame, while the Lombards deſolated Italy.

In a little time the practice of *commendam* became exceedingly abuſed; and the revenues of monaſteries were given to laymen for their ſubſiſtence. The biſhops alſo procured ſeveral benefices, or even biſhoprics in *commendam*, which ſerved for a pretext for holding them all without directly violating the canons. Part of the abuſe has been retrenched; but the uſe of *commendam* is ſtill retained, as an expedient to take off the incompatibility of the perſon, by the nature of the benefice.

When a perſon is made biſhop, his paſtorage becomes vacant; but if the king gives him power, he may ſtill hold it in *commendam*; but this muſt be done before conſecration.

There are ſeveral ſorts of *commendams* founded on the ſtat. 25 Hen. VIII. cap. 21. 21 & 22 *commendam ſimilitudinis*,

which is a provisionary act of the ordinary, and only implies a sequestration of the cure: and fruits till the patron presents his clerk: *commendam retinere*, by means of which a bishop retains benefices on his preferment, which has operated for a certain number of years, or even so long as the *commendatory lived*, and continued bishop: a *commendam recipere*, which is to take a benefice *de novo*, in the bishop's own gift, or of some other patron, which eminent is obtained; and for life.

A benefice cannot be *commended* by parts, any more than it may be presented unto by parts: to that one shall have the glebe, another the tythes, &c. Nor can a commendatory have a *jus in re*, or take to him and his successors, sue or be sued, in a writ of annuity, &c. But a *commenda perpetua* may be admitted to do it, 12 Hen. IV. Compl. Incumb. 360. See 1 Neif. Abr. 454.

COMMENDAM, in popish countries, is a real title of a regular benefice; as an abbey, or priory given by the pope to a secular clerk, or even to a layman, with power to dispose of the fruits thereof during his life.

No benefice that has a cure of souls, i. e. no parsonage, or bishopric, can be given *in commendam*. This practice being entirely contrary to the canons, none but the pope, who has a power of dispensing with the canons, can confer it.

When the *commendam* becomes vacant by the death of the *commendatory*, it is not esteemed vacant by his death; but as it was before the *commendam* was granted; that making no alteration in the thing: yet the pope gives the same benefice in *commendam* again, by a privilege which he still continues.

By the pope's bulls, a *commendatory* abbot has the full authority of the regular abbot to whom he is substituted. For this reason, the bulls expressly require, that he be a priest; or, that if he have not yet attained the age of priesthood, he shall take orders as soon as he has. But this is a mere formality, or matter of style: the thing is never executed.

Indeed, the spiritual direction of the abbey, while it is *in commendam*, is lodged wholly in the claustral prior. The *commendatory* abbots have not any authority over the religious in *spiritualibus*: they even cannot either appoint or set aside the claustral priors, who are nominated in the bulls the administrators of the spiritualities; in which, however, this restriction is added, viz. till the abbot arrive at the age of twenty-five years, to assume the priesthood.

The pope grants benefices *in commendam*, not only to clerks, by dispensing with their age, and other qualifications required; but they also dispense with the clericate even in children yet in the cradle, till they become of age to take the tonsure: it being sufficient to obtain a bull, that it be represented at Rome, that the child is destined for the ecclesiastic state.

In this case there is an ŒCONOMUS, or steward, appointed to take care of the temporal concerns.

COMMENDATORY *Abbot*. See ABBOT *in commendam*.

COMMENDATORY *Letters*, are such as are written by one bishop to another in behalf of any of the clergy, or others of his diocese travelling thither; that they may be received among the faithful: or that the clerk may be promoted; or necessaries may be administered to others, &c. Several forms of these letters may be seen in our historians; as in Bede, lib. ii. cap. 18.

COMMENDATUS, one that lives under the protection of a great man.

Commendati homines, were persons who by voluntary homage, put themselves under the protection of any superior lord. For ancient homage was either predial, due for some tenure, or personal, which was by compulsion as a sign of necessary subjection; or voluntary, with a desire of protection. And those who by voluntary homage put themselves under the protection of any men of power, were sometimes called *homines ejus commendati*, sometimes *suis commendati*, as often occurs in Domesday. *Commendati domini*, were those who depended on two several lords, and paid one half of their homage to each: and *subcommendati*, were like under tenants, under the command of persons who were dependants themselves on a superior lord. There were also *amicitiæ subcommendati*, who bore a double relation to such depending lords. Domesday. This phrase seems to be still in use in the usual compliment, *commend me to such a friend*, &c. which is to let him know I am his humble servant. Spelm. of Feuds, cap. 20.

COMMENSURABLE *quantities*, in *Geometry*, are such as have some common aliquot part, or which may be measured by some common measure, so as to leave no remainder in either. Thus a foot and a yard are *commensurable*; there being a third quantity which will measure each, viz. an *inch*; which taken 12 times makes a *foot*, and 36 times a yard.

Commensurables are to each other, either as units to a rational whole number; or as one rational whole number to another. In *incommensurables* it is otherwise. The ratio of *commensurables* therefore is rational; that of *incommensurables* irrational: hence, also, the exponent of the ratio of *commensurables* is a rational number.

COMMENSURABLE *numbers*, whether integers or fractions are such as have some other number which will measure or divide them without any remainder.

Thus, 6 and 9, $\frac{1}{2}$, and $\frac{1}{3}$, are respectively *commensurable* numbers.

COMMENSURABLE *in power*. Right lines are said to be *commensurable in power*, when their squares are measured by one and the same space, or superficies.

COMMENSURABLE *surds*, are such surds as, being reduced to their least terms, become true figurative quantities of their kind; and are therefore as a rational quantity to a rational: such are $\sqrt{2}$ and $2\sqrt{2}$. See SURD.

COMMENTACULA, among the Romans, the rod which the flamens carried in their hands when going to sacrifice.

COMMENTARIENSIS, among the Romans, an officer who had the keeping of the prisen, and was to obey the *triumviri capitales*.

COMMENTARY, or COMMENT, a gloss, or interpretation, offered to some ancient, obscure, or difficult author, to render him more intelligible, or to supply what he has left undone.

COMMENTARY is also used for a sort of history, written by a person who had a chief hand in the transactions related.

Such are the *commentaries* of Cæsar, of Sleidan, of Montluc, &c.

The word is also used for certain books written on some particular subject: Kepler has an excellent book of *commentaries in Adam*, containing observations on the motion of that planet.

COMMERCE, the exchange of commodities; or, the buying, selling, or trafficking of merchandize, money, or even paper, in order to profit by the same.

There is no doubt but *commerce* is nearly as ancient as the world itself: necessity set it on foot; the desire of conveniency improved it; and vanity, luxury, and avarice, have brought it to its present pitch. At first it could only consist in the exchange of things necessary for life: the plowman gave his corn and his gusto to the shepherd, and received milk and wool in exchange: which method of *commerce* by exchange subsists still in many places; as about the coasts of Siberia, and the Danish, and Muscovite Lapland; among several nations on the coasts of Africa: among some of those of America, and many of Asia. See EXCHANGE.

It is not precisely known when the *commerce* by buying and selling first began; nor when coins, and the several species of gold, silver, and copper, had their rise. The first moneys were wood, leather, and iron: and even at this day, it is the custom in some places of both Indies, to give a certain value in feathers and cocoa-nuts, for merchandizes, drugs, &c. See MONEY and COIN.

The first instance of this kind of *commerce* in the sacred writing, is in the time of the patriarch Abraham. As for prophane authors, they usually fix its epocha to the reign of Saturn and Janus in Italy: and the ancient authors, according to Cæsar, attribute its invention to the god Mercury.

The Egyptians, Phœnicians, and Carthaginians, who were a Tyrian colony, were the first, the most dating and expert traders of all antiquity: at least, it is evident they were the first who ran the hazard of long voyages; and who set on foot a traffic by sea between coasts very remote.

Among the ancients, *commerce* did not appear unworthy the application of persons of the first rank: Solomon, we are told, frequently joined his merchant-fleets with those of the king of Tyre, for their voyage to Ophir; and by this means rendered himself, though in a little kingdom, the richest king of his time in the universe.

Under the Attalic and Grecian empires, ancient history gives us from time to time the traces of a *commerce* cultivated by several nations: but it flourished more considerably under the dominion of the Romans; as appears from that vast number of colleges and companies of merchants in the several cities mentioned in historians, and ancient inscriptions.

The destruction of the Roman empire by the irruptions of the barbarians, brought that of *commerce* along with it; or at least suspended its ordinary operation for some time: by degrees it began to recover itself, and make a new progress; especially in Italy. Hence, the Pisans, Florentines, Genoese, and Venetians, who, abounding in shipping, took occasion to spread themselves through all the ports of the Levant and Egypt, bringing thence

silk, spices, and other merchandises; and furnishing the greatest part of Europe therewith. And thus was the modern *commerce* founded on the ruins of that of the ancient Greeks and Romans to the same places: and thus did those famous republics acquire their riches and power; which were considerably increased by the commercial effects of the crusades. These republics furnished the crusaders with transports, military stores and provisions, and obtained charters very favourable to the establishment and extension of their *commerce*. When Constantinople was taken under the banner of the holy cross, many valuable branches of trade, which formerly centered in that city, were transferred to Venice, Genoa, or Pisa. Robertson's Hist. vol. i. chap. v. p. 34. &c. 8vo.

The Germans, however, had a long time carried on a separate *commerce*; which was not borrowed from the Romans, nor did it fall with theirs. Towards the end of the twelfth century, the German cities situate on the coast of the Baltic, and the rivers that run into it, got into a considerable traffic with the neighbouring states.

As their *commerce* was much interrupted by pirates, seventy-two of them united together for their mutual defence; and were thence called *Hanseatic*, or *Hans towns*. See HANS *Towns*.

Thus they flourished till the beginning of the fifteenth or the end of the fifteenth century; when a division arising among them, and about the same time a new passage to the Indies, by the Cape of Good Hope, being discovered by the Portugese; and settlements made on the coast of Africa, Arabia, and the Indies, the ancient Italian and Hanseatic *commerce* sunk, and the chief trade came into the hands of the Portuguese.

The Portugese had not possessed those different trades above a hundred years, when, about the beginning of the seventeenth century, the Dutch began to share it with them; and in a little time dispossessed them of almost the whole. The English, French, Danes, and Hamburghers, excited by their success, have likewise made settlements in the Indies, and on the coasts of Africa; though much less considerable ones, excepting those of the English.

Lastly, America, discovered by Columbus in 1492, in favour of the Spaniards, soon after the Portugese had discovered the new way to the Indies, likewise became the object of a new, vast, and most important *commerce*, for all the nations of Europe; whereof Cadiz and Seville were made the centre.

It is true, the first conquerors of this new world still possess the greatest and richest part of it, and preserve the *commerce* thereof to themselves with great jealousy: yet, besides that the English, French, Portuguese, and Dutch, have several rich and flourishing colonies, both in the islands and the continent; it is certain, that it is as much for other nations as themselves that the Spaniards every year send their fleets for the treasures of Peru and Mexico.

The trade of Europe was no sufferer by this new one of America; the north and south have still the same mutual occasion for each other as before.

The navigation from the Baltic to the Mediterranean was tedious and difficult: the situation of Flanders, and the manufactures which there flourished from the tenth century, together with the free sales of that country, engaged the merchants, both of the north and south, to establish their magazines first in Bruges, and then in Antwerp.

The establishment of the republic of Holland, the favourable reception it gave to strangers, and the refuge it afforded to religionaries, drew store of manufacturers to it, as well as manufactures; and soon sunk the *commerce* of Antwerp.

And the same reasons, the convenience and multitude of the ports of England, the goodness of the wools, and the industry of the workmen, have brought hither a considerable part of the *commerce* of Europe.

In France the nobles are allowed to exercise *commerce* without derogating from their nobility: by an ordonnance of Louis XIII. merchants are allowed to take on them the quality of nobles; and by another of Louis XIV. they are declared capable of being secretaries of state, without laying aside their *commerce*. It may be added, for the honour of trade, that some of the Italian princes, looking on themselves as the chief merchants of their states, do not disdain to make their own palaces serve as magazines; and there are several kings in Asia, as well as most of those on the coasts of Africa and Guinea, who negotiate with the Europeans by their factors, and frequently in person.

Commerce, on the foot it now stands, is divided into *commerce by land*, and *by sea*; *inland* or *domestic*, and *foreign*; and by *wholesale* and *retail*.

With respect to domestic *commerce*, we may observe, that the king is the arbiter of it; as it pertains to his prerogative to establish public marts, as markets and fairs, to regulate weights and measures, and to give money, which is the universal medium of *commerce*, authority and currency.

A great part of the foreign *commerce* of England is now carried on by collective companies: some incorporated by the king's charters, with an exclusive privilege, as the East-India company; others only private associations, as the Turky and Hamburgh companies. See COMPANY.

COMMERCE, *Chambers of*. See CHAMBER.

COMMERCE, *Characters in*. See CHARACTER.

COMMINATORY, a clause inserted in a law, edict, patent, &c. importing a punishment wherewith delinquents are menaced; which, however, is not to be executed in its rigour.

Thus, in France, when an exile is enjoined not to return on pain of death, it is deemed a *comminatory* penalty; since, if he do return, it is not strictly executed; but a second injunction is then laid on him, which is more than *comminatory*, and from the day of the date thereof, imports death without remedy.

COMMINUTION, the act of grinding, or breaking any matter into smaller particles.—The effect of chewing, or masticating our food, is the *comminution* thereof.

COMMISSARY, an officer of the bishop, who exercises ecclesiastical jurisdiction in those parts of the diocese which are so remote from the see, that the chancellor cannot call the subjects thereof to the bishop's principal consistory, without their too great molestation.

This officer, called by the canonists *commissarius*, or *officialis foraneus*, is appointed to supply the bishop's office in the out-parts of the diocese, and to such parts as are peculiar to the bishop, and exempted from the jurisdiction of the archdeacons: for where the archdeacons have jurisdiction, as in most places they have, either by prescription or composition, the *commissary* is superfluous, and frequently vexatious.

COMMISSARY, in an *army*.—There are several sorts of *commissaries*.

COMMISSARY *of horses*, an officer in the artillery, appointed to have the inspection of the artillery-horses, to see them mustered, and to send such orders as he receives from the commanding officer of the artillery, by some of the conductors of horses, of which he has a certain number for his assistants.

COMMISSARY-GENERAL *of the musters*, or muster-master general, takes an account of the strength of every regiment, reviews them, sees that the horse be well mounted, and all the men well armed and accoutred.

COMMISSARY *of provisions*, is he who has the inspection of the bread and provisions of the army.

COMMISSARY *of stores*, an officer in the artillery who has the charge of all the stores, for which he is accountable to the office of the ordnance; he is allowed an assistant, clerks, and conductors, under him.

COMMISSION, in *Common Law*, is the same with *delegation* among the civilians; and is taken for the warrant, or patent, which any man exercising jurisdiction, either ordinary or extraordinary, hath to authorise him to hear or determine any cause or action.

The term, however, is sometimes extended farther than to matters of judgment; as in the *commission of purveyors*, which seems to be null by the statute for taking away purveyance, 12 Car. II. and the high *commission court*, which was founded on the statute 1 Eliz. and is also abolished by act of parliament 16 Car. I. The persons charged with a *commission* are hence called *commissioners*; sometimes *committees*.

COMMISSION *of anticipation*, was anciently a *commission* given under the great-seal, to collect a subsidy before the day. See ANTICIPATION.

COMMISSION *of assessation*, is a *commission* under the great-seal to associate two, or more learned persons, with the several justices, in the several circuits and counties in Wales.

COMMISSION *of bankruptcy*, a *commission* under the great seal, directed to five or more commissioners, to enquire into the particulars of a man's circumstances, who hath failed, or broke; and to act according to certain statutes made in that behalf. See BANKRUPT and PETITION *of Bankruptcy*.

COMMISSIONS *of charitable uses* go out of the chancery to the bishop and others, where any lands given to charitable uses are misemployed, or there are any fraud or disputes concerning them, to enquire of and redress the abuse, &c. 43 Eliz. cap. 4.

COMMISSION *of Delegates*. See DELEGATES and COURT.

COMMISSION *of lunacy*, a commission out of chancery to enquire whether a person represented to be lunatic, be so or not; that, if lunatic, the king may have the care of his estate, &c. 17 Edw. II. cap. 10.

COMMISSION *of peace*. See JUSTICE *of peace*.

COMMISSION *of rebellion*, or *writ of rebellion*, is issued out when a man, after proclamation iſſued out of the chancery, or the exchequer, and made by the ſheriff, to preſent himſelf, under pain of his allegiance, to the court by a certain day, does not appear. See REBELLION.

This *commiſſion* is directed, by way of command, to certain perſons; three, two, or one of them; to apprehend, or cauſe to be apprehended, the party as a rebel; and to bring him to the court on a day aſſigned.

This writ or *commiſſion* goes forth after an attachment returned, *non eſt inventus*, &c.

COMMISSION *of ſewers*, is directed to certain perſons to ſee drains and ditches well kept, and maintained, in the marſhy and ſunny parts of England, for the better conveyance of wates into the ſea, and preſerving the graſs upon the land. Stat. 23 Hen. VIII. cap. 5. 13 Eliz. cap. 9.

COMMISSION *to examine witneſſes*, is ſometimes appointed by the court of equity in caſes that require it, as when the cauſe ariſes in a foreign country, and the witneſſes are at home, or when the witneſſes are abroad, or ſoon to leave the kingdom; or again, when they are aged and infirm. This *commiſſion* is impowered to exerciſe the ſame juriſdiction as would have been exerciſed if the witneſſes had attended.

COMMISSION-*Officers*. See OFFICERS.

Book of COMMISSIONS. See BOOK.

COMMISSION, in *Commerce*. See FACTORAGE.

COMMISSIONER, he who has a COMMISSION, c. gr. a patent or other legal warrant, to execute any public office. See WARRANT, &c.

Such are, *commiſſioners* of hawkers and pedlars, *commiſſioners* of alienation, *commiſſioners* of the ſtamps, &c.

COMMISSIONERS *of the Cuſtoms*. See CUSTOMS.

COMMISSIONERS *of the Dock-yards*. See DOCK-*yards*.

COMMISSIONERS *of Exciſe*. See EXCISE.

COMMISSIONERS *of the Navy*. See NAVY.

Lords COMMISSIONERS *of the Treaſury*. See TREASURY. and EXCHEQUER.

COMMISSIONERS *of Trade*, &c. See BOARD.

COMMISSUM *Fidei*. See FIDEI.

COMMISSURE, COMMISSURA, a term uſed by ſome authors, for the junctures, or for the ſmall interſtices of bodies; or the little clefts between the particles; eſpecially when thoſe particles are broadiſh and flat, and lie contiguous to one another, like thin plates, or LAMELLÆ. See PORE.

The word literally ſignifies *a joining*, or connecting of one thing to another.

COMMISSURE, in *Architecture*, &c. denotes the joint of two ſtones; or, the application of the ſurface of the one to that of the other.

Among anatomiſts, *commiſſure* is ſometimes alſo uſed for a future of the cranium, or ſkull.

COMMITMENT, in *Law*, the ſending of a perſon to priſon by warrant or order, who hath been guilty of any offence not bailable, or for which bail is refuſed. It may be by the king and council, by the judges of the law, juſtices of peace, and other magiſtrates, who have authority by the laws and ſtatutes of the realm to do it, which muſt be exactly purſued. Every *commitment* to priſon ought generally to be made by warrant, under the hand and ſeal of him who commits the party, and the cauſe of *commitment* to be expreſſed in the warrant, &c. And where a man is committed as a criminal, it muſt be until he is diſcharged by due courſe of law; but if it be for contempt, then it is only till he comply and perform the thing required. Carthew's Rep. 153. If the words of a ſtatute are not purſued in a *commitment*, the party ſhall be diſcharged by *habeas corpus*. Ib. 291. See BAIL, IMPRISONMENT, MITTIMUS, &c.

COMMITTEE, in *Law*, one or more perſons, to whom the conſideration of any matter is referred, either by a court, or by conſent of the parties concerned.

COMMITTEE *of Parliament*, is a board conſiſting of a certain number of members, appointed by the whole houſe, for the examining of a bill, or making report of an inquiry, or proceſs of the houſe, &c.

Sometimes, the whole houſe is reſolved into a *committee*; on which occaſion each perſon has a right to ſpeak, and reply as much, and as often as he pleaſes: an expedient they uſually have recourſe to in extraordinary caſes and where any thing is to be thoroughly canvaſſed. — When the houſe is not in a *committee*, each gives his opinion regularly, and is only allowed to ſpeak once, unleſs to explain himſelf.

The ſtanding *committees*, appointed by every new parliament, are thoſe of *privileges* and *elections*, of *religion*, of *grievances*, of *courts of juſtice*, and of *trade*: though only the former act.

COMMITTEE *of the king*, is uſed for a widow of one of the king's tenants: thus called, as being by the ancient law of the realm *committed* to the king's care and protection. See WIDOW.

COMMODATE, COMMODATUM, in the *Civil Juriſprudence*, the loan, or free conceſſion of any thing moveable or immoveable, for a certain time, on condition of reſtoring again the ſame individual after a certain term.

The *commodate* is a kind of loan: there is this difference, however, between a loan and a *commodate*, that the latter is gratis, and does not transfer the property: the thing muſt be returned in eſſence, and without impairment; ſo that things which conſume by uſe, or time, cannot be objects of a *commodate*, but of a loan; in regard they may be returned in kind, though not in identity.

COMMODAVIENSIS, an appellation given by ſome authors to a ſpecies of *lapis calaminaris* found in Bohemia. But as it yields no ZINC, Mr. Margraf denies it to be true CALAMINE.

COMMODITIES *Staple*. See STAPLE.

COMMODORE, in the *Britiſh Marine*, a general officer, inveſted with the command of a detachment of ſhips of war deſtined on any particular enterpriſe; during which time he bears the rank of a brigadier-general in the army, and his ſhip is diſtinguiſhed by a broad red pendant tapering towards the outer end, and ſometimes forked.

COMMODORE is alſo a name given to a ſelect ſhip in a fleet of merchantmen, which leads the van in time of war, bearing a light in her top to conduct the reſt.

COMMOIGNE, in *Law*, a word ſignifying a fellow-monk, that lives in the ſame convent. 3 Inſt. 15.

COMMON, COMMUNIS, ſomething that belongs to all alike; is owned or allowed by all; and is not confined to this more than that.

In which ſenſe, *common* ſtands oppoſed to *proper*, *peculiar*, &c. Thus, the earth is ſaid to be our *common* mother; in the firſt or golden age, all things were in *common*, as well as the ſun and elements: the ſame animal is *common* to man and beaſt; that of ſubſtance to body and ſpirit. Philoſophers diſpute whether there be any ſuch thing as *common* notions, innate, or impreſſed on the mind by nature herſelf; or whether our ideas are all adventitious.

COMMON, *communia* (i. e. *quaſi cum munia poſſeſſa*) ſignifies that ſoil, the uſe whereof is *common* to a particular town or lordſhip: or it is a profit that a man hath in the land of another perſon, uſually in common with others; or a right which a perſon hath to put his cattle to paſture into ground that is not his own. And there is not only *common* of PASTURE, but alſo *common* of PISCARY, *common* of ESTOVERS, *common* of TURBARY, &c. And in all caſes of *common*, the law doth much reſpect the cuſtom of the place: for there the rule is, *conſuetudo loci eſt obſervanda*. 7 Rep. 5. *Common* of paſture is divided into *common* in groſs, *common* appendant, *common* appurtenant, and *common per cauſe de vicinage*.

COMMON *in groſs*, is a liberty to have *common* alone, that is, without any land or tenement in another man's land, granted either to a perſon for life, or to him and his heirs. This is commonly paſſed by deed, or ſpecialty, and claimed by preſcriptive right.

COMMON *appendant*, and COMMON *appurtenant*, are uſually confounded; both being defined to be a liberty of *common* appertaining to, or depending on, ſuch or ſuch a freehold; which *common* muſt be taken with beaſts *commonable*; as horſes, oxen, &c. being accounted fitteſt for the plowman; and not with goats, geeſe, and hogs. Others diſtinguiſh between the two, thus: *common appurtenant* may be ſevered from the land whereto it appertains; and is where the owner of land has a right to put in other beaſts not *commonable*; as hogs, goats, &c. which neither plough nor manure the land. Whereas *common appendant*, according to my lord Coke, had its original in the following manner:

"When a lord enfeoffed another in arable lands to hold "of him in ſoccage: the feoffee, to maintain the ſervice "of his plough, had at firſt, by courteſy of his landlord, "*common* in his waſtes, for neceſſary beaſts, to eat and "compoſt his lands: and that for two cauſes; 1°. Be"cauſe it was tacitly implied in the inveſtment; by rea"ſon the feoffee could not till, or compoſt his paſture; "by conſequence, therefore, the feoffee had, as a thing "neceſſary, or incident, *common* in the waſtes, or lands "of the lord. 2°. For the maintenance and advance"ment of tillage."

COMMON *per Cauſe de Vicinage*, i. e. by reaſon of neighbourhood; is a liberty that the tenants of one lord in one town, have to *common* with the tenants of another lord in another town.

But it is to be obſerved, that thoſe who claim this kind of *common* (which is uſually called INTERCOMMONING) may not put their cattle into the common of the other two, for then they are diſtrainable; but turning them into their own fields, if they ſtray into their neighbours *common*, they muſt be ſuffered.

COMMON, in *Geometry*, is applied to an angle, line or the like, which belongs equally to two figures, or makes a necessary part of both.

COMMON, in *Grammar*, denotes the gender of nouns which is equally applicable to both sexes, male and female. Such is that of *parent*, parent; which is either masculine, or feminine, as it is used to signify either father or mother.

The Latin grammarians, besides this, which they call the *common of two*, also make a *common of three*: which extends to masculine, feminine, and neuter.

COMMON, *communis*, in *Ancient Music*, was an appellation given to the seventh species of the diapason. See DIAPASON.

COMMON *Bail*. See BAIL.

COMMON *Barretry*. See BARRETRY.

COMMON *bench*. The court of *common* PLEAS was anciently called *communi banco*.

In law books and references, the court of *common* pleas is writ C. B. from *communi banco*: and the juftices of that court are ſtyled *juſticiarii de banco*.

COMMON *Centre of Gravity*. See CENTRE *of Gravity*.

COMMON *Chords*, in *Muſic*, is ſometimes uſed to denote the third, fifth, and octave of any note, conſidered as a baſe.

COMMON *Clerk*. See TOWN *Clerk*.

COMMON *Crier*. See CRIER.

COMMON *Council*. See *Mayor's* COURTS.

COMMON *day*, in plea of land, ſignifies an ordinary day in court, as *octabis Hilarii*, *quindene Paſche*, &c. It is mentioned in 13 Rich. II. ſtat. 1. cap. 17. and in the ſtatute 51 Hen. III. concerning general days in bank. *Blount* and Cowel.

COMMON *Doll*, in *Anatomy*. See DUCTUS *Communis*.

COMMON *Fine*, in *Law*, a certain ſum of money, which the reſiants within the liberty of ſome leets pay to the lord thereof; called in ſome places, *head-ſilver*; in others, *cert-money*, or *certum leta*, and *head-penie*.

It was firſt granted to the lord towards the charge of his purchaſe of the court-leet; whereby the reſiants have now the conveniency of doing their ſuit-roval near home, without being compelled to go to the ſheriff's turn.

COMMON *Hunt*, the chief huntſman belonging to the lord mayor and aldermen of London.

COMMON *Intendment*, in *Law*, the *common* underſtanding, meaning, or conſtruction of any thing; without ſtraining it to any foreign, remote, or particular ſenſe.

Bar to COMMON *Intendment*, is an ordinary or general BAR, which commonly diſables the reputation of the plaintiff. See INTENDMENT.

COMMON *Law*, that body of rules generally received, and held as law in this nation, in contradiſtinction to the ſtatute, or written law, and to particular cuſtoms and uſages.

After the decay of the Roman empire, Britain became invaded by three kinds of German people, viz. the Saxons, Angles, and Jutes. From the Jutes deſcended the men of Kent, and thoſe of the Iſle of Wight: from the Saxons came the people called the Eaſt, South, and Weſt Saxons: and from the Angles came the Eaſt Angles, Mercians, and Northumbrians.

Now, as each people had its peculiar cuſtoms, ſo each inclined to different laws; whereof, thoſe of the Weſt Saxons, and Mercians, who inhabited the midland counties, were, upon the diſſolution of the heptarchy, and eſtabliſhment of a monarchy, preferred to the reſt, and acquired the common appellation of *Jus Anglorum*. Their particular names were *Weſt Saxon-lage*, and *Mercheu-lage*.

The firſt Saxon laws publiſhed in England, were thoſe of king Ethelbert, in the ſixth century. Three hundred years after, king Alfred, whom our hiſtorians call *magnus juris Anglicani conditor*, having united the heptarchy, and rendered himſelf maſter of the whole nation, made a collection from among the ſeveral laws of the ſeveral provinces of his domains; and commanded them to be obſerved throughout his kingdom. This collection was denominated *folc-riehts*, and ſoon after, the *common law*; as being *communis* the whole nation.

This was written in Alfred's *dome-book*, or *liber judicialis*, which was deſigned for the general uſe of the whole kingdom.

By theſe laws the nation was governed for a conſiderable time, till, being at length ſubdued by the Danes, the cuſtoms of thoſe people were introduced, and incorporated with the reſt; and thus a new form of common law aroſe, called *Danelage*.

The three ſyſtems of law above recited, viz. the *Danelage*, the *Weſt Saxon-lage*, which was the ſame with the code compiled by Alfred, and the *Mercheu-lage*, were in uſe about the beginning of the eleventh century, in different counties of the realm. In proceſs of time king Edgar began what his grandſon Edward the Confeſſor, on this account called *legum Anglicanarum inſtitutor*, completed; viz. to form one digeſt or body of laws to be obſerved throughout the whole kingdom. This ſeems to have been only a new edition, or freſh promulgation of Alfred's *dome-book*, with ſuch additions and improvements as the experience of a century and a half had ſuggeſted.

The Danes being afterwards, in their turn, overcome by the Normans; the Conqueror on a review of the ſeveral laws and cuſtoms that then obtained, abrogated ſome, and aboliſhed others; adding ſome of his own country laws.

His ſon, William Rufus, broke through the ancient laws and cuſtoms which his father had eſtabliſhed; but his next ſon, Henry I. excluded the civil cuſtoms which his brother had introduced, and reſtored the laws of Edward the Confeſſor, with thoſe amendments made by his father, under the aſſiſtance of his barons. Theſe were afterwards confirmed in ſucceeding reigns.

Hence is derived that ſyſtem of maxims and unwritten cuſtoms, now known by the name of the *common law*, which is of Saxon parentage; though the cuſtoms and maxims themſelves are of higher antiquity than memory or hiſtory reach; many of them being as old as the primitive Britons.

The *common law* of England is, properly, the common cuſtoms of this kingdom; which, by length of time, have obtained the force of laws.

It is called *lex non ſcripta*, the *unwritten law*: not but that we have moſt of it written in the old Norman dialect, and the monuments and evidences of our legal cuſtoms are contained in the records of the ſeveral courts of juſtice, in books of reports and judicial deciſions, and in the treatiſes of learned ſages of the profeſſion, preſerved and tranſmitted from times of the higheſt antiquity: but becauſe it does not appear to be made by charter, or parliament; for thoſe are always matters of record. Its original inſtitution and authority are not ſet down in writing, but it receives its binding power and the force of law, by long and immemorial uſage, and by univerſal reception through the kingdom. See AUTHORITIES and REPORTS.

Beſide the *common law* of England in general, there are in divers parts of the nation particular cuſtoms, and common uſages, which have the force of *common law* among thoſe people who have retained them: ſuch as the Borough-Engliſh, Gavelkind, &c.—Where the common law is ſilent, there the STATUTE-*law* ſpeaks. See STATUTE.

All TRIALS at *common law* are by a JURY of twelve men.

COMMON *meaſure diviſor*, in *Arithmetic*, a number that exactly meaſures two other numbers, without a remainder. And the greateſt number that can meaſure any two other numbers, is called their greateſt *common meaſure*; thus 4 is the greateſt *common meaſure* of 8 and 12.

To find the greateſt *common meaſure* of two numbers; divide the greater by the leſs, and if there be no remainder, the leſs number is the meaſure required. If there be a remainder, divide the laſt diviſor by it, and thus proceed, till there be no remainder left, and the laſt diviſor is the greateſt *common meaſure*. For algebraic quantities, the remainders are to be divided by their ſimple diviſors, and the quotients will be the quantities required. And if FRACTIONS are divided by their greateſt *common meaſure*, they will thus be reduced to their loweſt terms.

COMMON *mouth*, *motion*, and *object*. See the ſubſtantives.

COMMON-PLACE *Book*, *Adverſaria*, among the learned, denotes a regiſter, or orderly collection of things which occur worthy to be noted, and retained in the courſe of a man's reading, or ſtudy; ſo diſpoſed, as that among a multiplicity of ſubjects any one may be eaſily found.

Common-place-books are of great ſervice: they are a kind of promptuaries or ſtorehouſes, wherein to repoſit the moſt valuable parts of authors, to be ready at hand when wanted. Several perſons have their ſeveral methods of ordering them: but that which comes beſt recommended, is the method of that great maſter of order Mr. Locke. He has thought fit to publiſh it in a letter to M. Toſſand; determined thereto, by the great convenience and advantage he had found from it in twenty years experience; as well as by the recommendations and intreaties of many of his friends, who had likewiſe proved it.

The ſubſtance of this method we ſhall here give the reader; whereby he will be eaſily enabled to execute it himſelf.

The firſt page of the book you intend to take down the *common-places* in, is to ſerve as a kind of index to the whole; and to contain references to every place, or matter, therein: in the commodious contrivance of which index, for as it may admit of a ſufficient copia, or variety of materials, without any confuſion, all the ſecret of the method conſiſts.

In order to this, the firſt page, as already mentioned, or for more room, the two firſt pages that front each other, are to be divided, by parallel lines, into twenty-five equal parts; whereof, every fifth line is to be diſtinguiſhed, by its colour, or ſome other circumſtance. Theſe lines are to be cut perpendicularly by others, drawn from top to bottom; and in the ſeveral ſpaces thereof, the ſeveral letters of the alphabet, both capital and minuſcule, are to be duly written. The form of the lines and diviſions, both horizontal and perpendicular, with the manner of writing the letters therein, will be conceived from the following ſpecimen; wherein what is to be done in the book for all the letters of the alphabet, is here ſhewn in the firſt four, *A*, *B*, *C*, and *D*.

The index of the *common-place* book being thus formed, matters are ready for the taking down any thing therein.

In order to this, conſider to what head, the thing you would enter is moſt naturally referred; in this head, or word, regard is had to the initial letter, and the firſt vowel that follows it; which are the characteriſtic letters whereon all the uſe of the index depends.

Suppoſe, e. gr. I would enter down a paſſage that refers to the head *beauty*; *B*, I conſider, is the initial letter, and *e* the firſt vowel: then looking upon the index for the partition *B*, and therein the line *e* (which is the place for all words whoſe firſt letter is *B*, and firſt vowel *e*; as *Beauty*, *Beneficence*, *Bread*, *Bleeding*, *Blemiſh*, &c.); and finding no numbers already down to direct me to any page of the book where words of this characteriſtic have been entered, I turn forward to the firſt blank page I find, which in a freſh book, as this is ſuppoſed to be, will be page 2, and here I now write what I have occaſion for on the head *beauty*; beginning the head in the margin, and indenting all the other ſubſequent lines, that the head may ſtand out, and ſhew itſelf: this done, I enter the page where it is written, viz. 2, in the index, in the ſpace *B e*, from which time, the claſs *Be* becomes wholly in the poſſeſſion of the 2d and 3d pages, which are configned to letters of this characteriſtic.

Had I found any page or number already entered in the ſpace *B e*, I muſt have turned to the page, and have written my matter in what room was left therein; ſo, if after entering the paſſage on beauty, I ſhould have occaſion for *benevolence*, or the like, finding the number 2 already poſſeſſed of the ſpace of this characteriſtic, I begin the paſſage on benevolence in the remainder of the page; which not containing the whole, I carry it on to page 3, which is alſo for *B e* and add the number 3 to the index.

When the two pages deſtined for one claſs are full, look forwards for the next backſide that is blank; if it be that which immediately follows, write at the bottom of the margin of the page filled, the letter *v* for *verte*, turn over; and the ſame at the top of the next page; and continue from this new page as before. If the pages immediately following be already filled with other claſſes; then write at the bottom of the page laſt filled the letter *v*. with the number of the next blank page: and at the top of that page, the number of the page laſt filled: then entering that head in this new page, proceed as before. By theſe two numbers of reference, the one at the top, and the other at the bottom of the page, the diſcontinued matters are again connected. It may not be amiſs, every time you put a number at the bottom of a page, to put it like wiſe in the index. Note, if the head be a monoſyllable beginning with a vowel, the vowel is at the ſame time both the initial letter, and the characteriſtic vowel: thus the word *art* is to be wrote in *Aa*. Mr. Locke omits three letters of the alphabet in his index, viz. *K*, *Y*, and *W*, which are ſupplied by *C*, *I*. *U*, equivalent to them: and as for *Z*, ſince it is always followed by an *a*, he puts it in the fifth place of *Z*; and ſo has no *Z a*, which is a characteriſtic that very rarely occurs. By thus making *Z* the laſt in the index, its regularity is preſerved, without diminiſhing its extent. Others chooſe to retain the claſs *Za*, and aſſign a place for *Z* below the index.

If any imagine, that three hundred claſſes are not ſufficient to comprehend all kinds of ſubjects without confuſion, he may follow the ſame method, and yet augment the number to five hundred, by taking in one more characteriſtic to them.

But the inventor aſſures us, that in all his collections, for a long ſeries of years, he never found any deficiency in the index, as above laid down.

COMMON *Place*, in *Rhetoric*. See ARGUMENTS and TOPICS.

COMMON-PLEAS. See COURT *of Common Pleas*.

COMMON *Prayer*, is the LITURGY of the church of England. Clergymen are obliged to uſe this liturgy in the ſervice of the church; and refuſing to do ſo, or uſing any other public prayers, is puniſhable by 1 Eliz. cap. 2. and every incumbent, reſident on his living, is obliged, once every month at leaſt, to read the *common prayer* in his parith church, in his own perſon, under a forfeiture of 5*l*. for every failure, by 14 Car. II. cap. 4. and by the ſame ſtat. every church is to be provided with a book of *common prayer*, under the penalty of 3*l*. a month. Every miniſter who ſpeaks any thing in derogation of this book is liable to ſix months impriſonment, and the forfeiture of a year's value of his benefice, and for the ſecond offence to deprivation: and any perſon convicted of reviling it, ſhall forfeit for the firſt offence a hundred marks, four hundred for the ſecond; and for the third offence all his goods and chattels, and ſuffer impriſonment for life. Stat. 1 Eliz. cap. 2.

COMMON *rey*. See RAY.

Tenants in COMMON. See TENANT.

COMMON *receptacle*. See RECEPTACULUM.

COMMON *Recovery*. See RECOVERY.

COMMON *Senſe*. See SENSE.

COMMON *Sewers*. See SEWER.

COMMON *Serjeant*. See SERJEANT.

COMMON *Time*. See TIME.

COMMON *Year*. See YEAR.

COMMONER, is uſed for a ſtudent in ſome univerſities, entered in a particular rank.

The word is alſo applied to a member of the houſe of *commons*; in contradiſtinction to a *peer*.

COMMONS, in parliament, are the lower houſe, conſiſting of knights elected by the counties, and of citizens and burgeſſes by the cities and borough towns.

In theſe elections, anciently, all the people had voices; but king Henry VI. to avoid tumults, firſt appointed, that none ſhould vote for knights but ſuch as were freeholders, did reſide in the county, and had forty ſhillings yearly revenue; the perſons elected for counties to be *milites notabiles*, at leaſt eſquires, or gentlemen fit for knighthood; native Engliſhmen, at leaſt naturalized; and twenty-one years of age: no judge, ſheriff, or eccleſiaſtical perſon, to ſit in the houſe for county, city, or borough.

The *houſe of commons*, in Forteſcue's time, who wrote during the reign of Henry VI. conſiſted of upwards of three hundred members: in ſir Edward Coke's time their number amounted to four hundred and ninety three.

At the time of the union, there were five hundred and thirteen members for England and Wales; to which forty-five repreſentatives for Scotland were added; ſo that the whole number of members is at this day five hundred and fifty-eight.

All members of either houſe, with their menial ſervants, and neceſſary goods brought with them, are priviledged by the common law from all attachments and impriſonments; except for treaſon, felony, or breach of peace; all the time of the ſeſſion, and till they arrive at home, *eundo, morando, ad propria redeundo*.

By 12 and 13 W. cap. 3. and 11 G. II. cap. 24. actions may be brought againſt members of parliament and their ſervants immediately after the diſſolution or prorogation

or any adjournment for more than fourteen days, till they are reassembled: and in the mean while the courts may give judgment and award execution. By 4 G. III. cap. 33. the petitioners, in a case of bankruptcy, where the debtor is a trader within the statutes, may sue out a summons or an original bill and summons, and serve a member with a copy of it: and if the debts with costs be not paid within two months, the creditors may proceed as against other bankrupts: arrest during the time of privilege excepted. And by 10 G. III. cap. 50. action *may* be prosecuted in any court of record, of equity, of admiralty, or such as have cognizance of causes matrimonial and testamentary, against any peer or member of the *house of commons*, or any of their servants, or any other person intitled to privilege of parliament, provided that the person of any member of the *commons* is exempted from arrest or imprisonment.

The *commons* sit in their house promiscuously: only the *speaker* has a chair, or seat, fixed towards the upper end; and the clerk, with his assistant, sits near him.

The members have no robes, as the lords ever had; excepting the speaker and clerks; and sometimes the professors of law in term time, and the members of the city of London.

On the first day of the new parliament, before any affair is meddled with, all the members take the oaths; usually before the lord steward, and in the court of wards. They then proceed to the choice of a SPEAKER, they take the oaths a second time.

Privileges of the COMMONS. All bills for levying money on the subject, begin in the house of *commons*; in regard, it is from them the greatest part of the moneys arise: not will they allow the lords to make any alteration in a money-bill. They have the privilege to propose laws, and are, in effect, the grand inquest of the realm; present public grievances; impeach public delinquents, even the highest officers of the kingdom; and prosecute them before the house of lords, which is a court of judicature, though the *commons* are not.

The *commons* were formerly allowed their expences during parliament time, *rationabiles expensæ*, as the words of the writ are; i. e. such allowance as the king, considering the price of things, shall think proper to impose on the people they represent. In 17 Edward II. the allowance was ten groats for knights, and five for burgesses, per day; afterwards it was raised to four shillings a day for dubbed knights, and two shillings for all the rest: but all allowance is now grown into disuse; and considerable sums are too often expended in order to obtain the honour or advantage accruing from a seat in PARLIAMENT. See BURGESS.

COMMONS is also used in opposition to *nobles*, or *peers*, viz. for all sorts of persons under the degree of a baron; including the orders of knights, esquires, gentlemen, the sons of the nobility, and yeomen. See each under its proper Article, ESQUIRE, GENTLEMAN, YEOMAN, &c.

Doctor COMMONS. See COLLEGE *of Civilians*.

Proctor of the COMMONS. See PROCTOR.

COMMONS is also used for the stated and ordinary diet, or eating, of a college, inn of court, or other society. See INN, &c.

COMMONWEALTH. See REPUBLIC.

COMMOTE, an ancient term in Wales, denoting half a cantred, or HUNDRED; containing fifty villages.

Wales was anciently divided into three provinces: each of these subdivided into cantreds; and every cantred into two *commotes*, or half hundreds.

Silvester Giral', however, tells us, in his Itinerary, that a *commote* is but a quarter of a hundred.

COMMOTION, an intestine motion, or agitation in the parts of any thing.

In medicine, the term is chiefly used for a blow, or shake of the brain. A convulsion is a *commotion* of the fine medullary fibres of the brain. A fall occasions a *commotion*, whence frequently arises a counterstroke on the opposite part; which occasions sometimes a contrafissure, and at other times a rupture of the vessels, and an impediment by shaking the whole mass of the brain.

COMMUNAM *appropriare*. See APPROPRIARE.

COMMUNE *retinere*. See RETINUM.

COMMUNEM *legem, Writ of Entry ad*. See LEGEM.

COMMUNIBUS *locis*, a Latin term, in frequent use among philosophical, &c. writers; implying some medium, or mean relation, between several places.

Dr. Keil supposes the ocean to be one quarter of a mile deep, *communibus locis*, q. d. at a medium, or taking one place with another.

COMMUNIBUS *annis*, has the same import with regard to years, that *communibus locis* has with regard to places.

Dr. Derham observes, that the depth of rain, *communibus annis*, i. e. one year with another, were it to stagnate on the earth, would amount to, at Townly in Lancashire, 42½ inches; at Upminster in Essex 19½; at Zurick, 32½; at Pisa, 43½; and at Paris to 19 inches.

COMMUNICATING, in *Theology*, the act of receiving the sacrament of the EUCHARIST.

Those of the *reformed*, and of the Greek church *communicate* under both kinds; those of the Romish under only one.

The oriental communicants receive the species of wine by a spoon; and anciently they sucked it through a pipe, as has been observed by Beat. Rhenanus on Tertullian.

COMMUNICATION, the act of imparting a thing to another, or making him a sharer with us therein.

The use of speech is for the *communicating* of our ideas and sentiments to each other.

COMMUNICATION is also used for the connexion of one thing with another; or the passage from one place to another.

Anciently it was frequent to have subterraneous *communications* between one place and another.

Bridge of COMMUNICATION. See BRIDGE.

Lines of COMMUNICATION, in war, called also simply *lines*, are trenches six or seven feet deep, and twelve broad, made between one fort, or work, and another; designed for a safe passage between one quarter and another; especially in sieges. See *Tab. Fortification, fig.* 21, 22, &c.

COMMUNICATION *of idioms*, in *Theology*, the act of imparting the attributes of one of the natures in Jesus Christ to the other.

The *communication of idioms* is founded on the supposed union of two natures in the person of Christ: by this *communication of idioms* it is, that some divines say, God suffered, died, &c. which is strictly and rigorously of the human nature; and signifies that God suffered in his humanity, that he died as to his human nature, &c.

The Lutherans carry the *communication of idioms* to far, as to say, that Jesus Christ is not only in his divine nature, and by reason of his divine person, but also really and properly in his humanity, immortal, immense, &c.

COMMUNICATION *of motion*, that act of a moving body, whereby another body at rest is put by it in motion, or a body already in motion is accelerated.

F. Malebranche looks on the *communication of motion* as something metaphysical; i. e. as not necessarily arising from any physical principles, or any properties of bodies, but flowing from the immediate agency of God: there being, according to him, no more connexion, or dependence, between the motion or rest of one body, and that of another, than between the form, colour, magnitude, &c. of one body, and those of another. The motion of one body, therefore, on his principle, is not any physical cause of that of another. See CAUSE.

The *communication of motion* results from, and is an evidence of the impenetrability and inertia of matter as such: unless we admit the hypothesis of penetrable matter, advanced by M. Boscovich and Mr. Michell, and ascribe to the powers of repulsion those effects which have been usually ascribed to its solidity and actual resistance. See MATTER.

Laws of the COMMUNICATION *of motion*.—Action, and reaction, sir Isaac Newton demonstrates, are equal and opposite; so that one body striking against another, and thereby occasioning a change in its motion, does itself undergo the very same change in its own motion, the contrary way. See MOTION.

Hence, a moving body striking directly against another at rest, the one loses just as much of its motion as it *communicates* to the other; and they will proceed with the same velocity as if united into one mass.

If, therefore, the body in motion be triple that at rest against which it strikes, it will lose a fourth part of its motion: and whereas, before, it would have run over (v. gr.) a line of twenty feet, in a given time, it will now only run over fifteen; i. e. it will lose a fourth part of its velocity.

If the moving body strike on another already in motion, the first will augment the velocity of the latter; but will lose less of its own motion, than had the latter been absolutely at rest. Thus, v. gr. if a body in motion be triple of another at rest, and strike against it with thirty-two degrees of motion; it will *communicate* eight degrees of its motion to the other, and retain twenty-four to itself. If the other body had already four degrees of motion, the first would only *communicate* five, and retain twenty-seven; since those five were sufficient on account of the inequality of the bodies, to make them proceed with equal velocity.

After the same manner may the other laws of *communication* of motion in bodies perfectly hard, and void of all elasticity, be determined. But all hard bodies, that we know of, have an elastic power; and in elastic bodies, the laws are different, and much more intricate. See ELASTICITY;

ELASTICITY; and the laws of percuſſion in elaſtic bodies, ſee under PERCUSSION.

If a body, when moved by another, happen to decline out of the way, ſo as to leave a free paſſage to the body whereby it was moved; yet, that will only proceed with the velocity which it had after its *communication* to the other, not with that it had before: it being a rule that every thing endeavours to perſevere, not in the ſtate wherein it was formerly, but in that wherein it is: if that ſtate be therefore, a body which has already loſt part of its motion, by its meeting with another, may loſe ſtill by a ſecond and a third, ſo as at length to become perfectly quieſcent.

Hence, firſt, if two unequal homogeneous bodies move in a right line with the ſame velocity, in a reſiſting medium, the greater muſt perſevere in motion longer than the ſmaller: for the motions of both bodies are as their maſſes; but each *communicates* of its motion to the circumjacent bodies which touch its ſurface, in proportion to the magnitude of its ſurface; the larger body, therefore, though it has more ſurface than the ſmaller, yet having leſs, in proportion to its maſs or quantity of matter, than the ſmaller, will loſe a leſs portion of its motion every moment than a ſmaller.

Suppoſe, v. gr. a cube, A, to be two feet every way, and another, B, one foot; the ſurfaces here will be as four to one, but their maſſes as eight to one. If therefore thoſe bodies move with the ſame velocity, the cube A will have eight times as much motion as the cube B (the quantity of motion being ever as the quantity of matter). That each of them, therefore, may become quieſcent at the ſame time, the cube A muſt loſe eight times as much portion every moment as the cube B, but that is impoſſible, becauſe as their ſurfaces are to each other as four to one; the bodies againſt which they ſtrike will only be as four to one: therefore, when the cube B is become perfectly quieſcent, A will have loſt its motion.

Hence, ſecondly, we ſee the reaſon why any long body, as a dart, thrown lengthwiſe, continues its motion longer than any thrown tranſverſely: it meeting fewer bodies in the way to *communicate* its motion to in the one caſe than in the other.

Hence alſo, thirdly, if a body be moved almoſt wholly within itſelf, ſo as to *communicate* little of its motion to the ambient body, it muſt continue its motion a long time. Thus, a ſmooth braſs ball of half a foot diameter, ſupported on a ſlender ſmooth axis, with a very weak impulſe, is found to revolve, for the ſpace of three or four hours.

COMMUNICATION, *communicatio*, in *Rhetoric*. See ANACOINOSIS.

COMMUNION, in *Theology*, an uniform belief in ſeveral perſons; whereby they are united under one head, in one CHURCH. See UNITY, UNIFORMITY, &c.

In this ſenſe, the Lutherans, Calviniſts, &c. are ſaid to have been cut off from the Romiſh *communion*.

This is the primitive uſe of the word *communion*, as appears from the canons of the council of Elvira.

Though the term has been more extenſively applied to denote a general agreement in matters of doctrine, diſcipline, and worſhip. And unleſs the term be underſtood in this large ſenſe, ſo various are the opinions of men, there could be no *communion* among the members of any one church on earth.

COMMUNION is alſo uſed for the act of *communicating* in, or participating of, the ſacrament of the EUCHARIST.

The fourth council of Lateran decrees, that every believer ſhall receive the *communion*, at leaſt, at Eaſter; which ſeems to impoſe a tacit deſire, that they ſhould do it oftener; as, in effect, they did it much oftener in the primitive days. Gratian, and the maſter of the ſentences, preſcribe it as a rule for the laity, to *communicate* three times a year, at Eaſter, Whitſuntide, and Chriſtmas. But in the thirteenth century, the practice was got on foot, never to approach the euchariſt except at Eaſter; and the council thought fit to enjoin it then by a law, leſt their coldneſs and remiſſneſs ſhould go farther ſtill.

And the council of Trent renewed the ſame injunction, and recommended frequent *communion* without enforcing it by an expreſs decree.

In the ninth century, the *communion* was ſtill received by the laity in both kinds; or, rather, the ſpecies of bread was dipped in the wine, as is owned by the Romaniſts themſelves. Acta SS. Benedict. Sæc. III. M. de Marca obſerves, that they received it at firſt in their hands. Hiſt. de Beam. and believes the *communion* under one kind alone to have had its riſe in the Weſt under pope Urban II. in 1096, at the time of the conqueſt of the Holy Land. And it was more ſolemnly enjoined by the council of Conſtance in 1414. The twenty-eighth canon of the council of Clermont enjoins the *communion* to be received under both kinds, diſtinctly; adding, however, two exceptions; the one of neceſſity, the other of caution, *ne ſit neceſſitatem, & cautelam*; the firſt in favour of the ſick, the ſecond of the abſtemious, or thoſe who had an averſion for wine.

It was formerly a kind of canonical puniſhment, for clerks guilty of any crime, to be reduced to *lay communion*, i. e. only to receive as the laity did, viz. under one kind.

They had another puniſhment of the ſame nature, though under a different name, called *foreign communion*; to which the canons frequently condemned their biſhops, and other clerks. This puniſhment was not any excommunication, or depoſition; but a kind of ſuſpenſion from the function of the order; and a degradation from the rank they held in the church.

It had its name becauſe the *communion* was only granted to the criminal on the foot of a foreign clerk, i. e. being reduced to the loweſt of his order. It took place after all thoſe of his rank, as all clerks, &c. did in the churches to which they did not belong. The ſecond council of Agda orders every clerk that abſents himſelf from the church to be reduced to foreign *communion*.

Infant COMMUNION. Some inſtances occur in the early ages of the church, of the practice of adminiſtering the euchariſt to infants; and ſome now have imitated this practice in more modern times. Mr Pierce pleads the uſe of it even to this day among the Greeks, and in the Bohemian churches till near the time of the Reformation; and he refers to the uſage of the ancient churches, recorded by Photius, Auguſtin, and Cyprian. He urges from Scripture the right which children have to all the privileges of which they are capable, as well as the Jewiſh children under the law, who were allowed to eat of the paſſovers, and other ſacrifices. To which it has been anſwered, that the facts here, of which they were allowed to partake, were chiefly peace-offerings, which became the common food of the family, and were not conſidered as acts of devotion in ſuch a degree as our euchariſt. He replies to the objection founded on the incapacity of infants to examine themſelves and diſcern the Lord's body, by obſerving that the precept extends only to thoſe who were capable of underſtanding and complying with it; on the ſame ground that faith is required previous to baptiſm. Biſhop Bedell ſuggeſts the following enquiry relative to this ſubject; what neceſſity of baptiſing infants, if their baptiſm produces no effect till they come to years of diſcretion? To which he replies, though the moſt principal effect be not attained preſently, the leſs principal are not to be refuſed: ſo children were circumciſed, who could not underſtand the reaſon of it, and the ſame alſo did eat the paſſover: and ſo did children baptized, in the primitive church, communicate in the Lord's ſupper: which I know not why it ſhould not be ſo ſtill; *de quo vide*. It has been alleged, that the foundation of this practice was a miſtaken apprehenſion of the abſolute neceſſity of this ordinance in order to ſalvation, reſulting from an erroneous interpretation of John vi. 53. See Biſhop Bedell's Letter to Dr. Ward, in p. 442 of Archbiſhop Uſher's Life by Parr. Pierce's Eſſay on the Euchariſt. Wall's Hiſt. of Infant Baptiſm, part ii. chap. 9. § 15 and 16. Waterland's Review of the Doctrine of the Euchariſt, and preface to his two volumes of Poſthumous Sermons, p. 32. &c. and Inquiry concerning Infant Communion, vol. ii. p. 75. &c.

COMMUNION-*table*. See ALTAR.

COMMUNIS *aspicio*. See CAPRULA.

COMMUNIS *ductus choledochus*. See DUCTUS.

COMMUNIS *digitorum manus extenſor*. See EXTENSOR.

COMMUNIS *labiorum depreſſor*. See DEPRESSOR.

COMMUNIS *labiorum elevator*. See ELEVATOR.

COMMUNIS *miſericordia*. See MISERICORDIA.

COMMUNITY, a ſociety or body of men united together under certain common laws, agreed on among themſelves, or impoſed by a ſuperior.

The Romans, who ſeem to have given the firſt hint of *communities* to the ſeveral nations into which their empire was divided, doubtleſs borrowed it from ſome rules of their neighbours: they call them *colleges*; which term, among them, had nearly the ſame ſignification with *community* among us.

Communities now are of two kinds, *eccleſiaſtic*, and *lait*; the firſt are either *ſecular*, as chapters of cathedral and collegiate churches; or *regular*, as convents, monaſteries, &c.

Lay communities are of various kinds; ſome contracted by a fixed abode of a year and a day in the ſame place;

others formed by the diſcharge of the ſame office, the profeſſion of the ſame art, or attending the ſame place of worſhip; as thoſe of pariſhes, fraternities, &c.

Accordingly, the word is commonly underſtood of pious foundations for the ſupport of ſeveral perſons, either in a ſecular or regular life; as *colleges, abbies, convents, priories, ſeminaries, hoſpitals, inns*, &c.

Community is more particularly uſed in the French law, for the joint property in goods between the huſband and the wife: the reſult of which is, that during marriage they are equally entitled to all effects, and liable to all debts, contracted either before or under marriage.

Community is a ſpecies of ſucceſſion, and the acceptance of *community* reſembles an *additio hereditatis*.

Community was ſet on foot in favour of the wives, to enter them as ſharers in their huſbands effects.

In countries where the civil law obtains, this *community* has no place; nor even in ſeveral cuſtomary countries as being reputed a burden on the man.

Anciently, the woman's ſhare in the *community* was only one third: and this appears ſtill the ſenſe of the law among us; the widow, at the deceaſe of her huſband, being only intitled to one third part of the moveables.

COMMUNITY *continued*, in the *French Law*, is that which ſubſiſts between the ſurvivor of two perſons joined in marriage, and the minor children of that marriage; when the ſurvivor has not made an inventory of the effects in poſſeſſion during marriage. The widow may either renounce *community* with her children, or continue it.

COMMUNITY *tacit*, is a *community* contracted between a man and woman, by the mere mingling of their effects; provided they have lived together the ſpace of a year and a day: this *community*, being odious, is now aboliſhed.

COMMUTATION, *in Aſtronomy*. *Angle of* COMMUTATION, is the diſtance between the ſun's true place ſeen from the earth, and the place of a planet reduced to the ecliptic. See PLACE.

Thus the angle ESR (*Tab. Aſtronomy, fig.* 26.) ſubtended between the ſun's place E, viewed from the earth at S, and that of a planet reduced to the ecliptic, R, is the *angle of commutation*.

The *angle of commutation*, therefore, is found by ſubtracting the ſun's longitude from the heliocentric longitude of the planet R; or contrarily.

COMMUTATION, in *Law*, a change of a penalty, or puniſhment, viz. of a greater for a leſs, &c. as when death is commuted for, by baniſhment or perpetual impriſonment, &c.

Some doubt whether the word be properly applied to any change but that of puniſhment: others will have it indifferently ſerve for the exchanging, or trucking of any thing.

COMORTH, in our *Statutes*, is uſed for a contribution or ſubſidy. It is ſaid to be derived from the Britiſh *cymorth, ſubſidium*.

The ſtat. 4 Hen. IV. cap. 27. and Hen. VIII. cap. 6. prohibit the levying any ſuch in Wales, or the Marches. It is ſaid this *cymorth* was gathered at marriages, and when young prieſts ſaid their firſt maſſes, and ſometimes for redemption of murders or felonies.

COMOSANDALOS, in *Antiquity*, a crown of flowers worn in the feſtival CHTHONIA.

COMPACT, in *Phyſics*, is a relative term, denoting a body to be cloſe, denſe, and heavy; having few pores, and thoſe ſmall ones.

The heavieſt metals, as gold and ſilver, are the moſt *compact*. See GRAVITY.

COMPACT, in a *Legal Senſe*, ſignifies an agreement, or a contract, ſtipulated between ſeveral parties. See CONTRACT.

COMPACT is alſo the name of a celebrated bull, confirmed by pope Paul IV. relating to the cardinals.

In virtue of the bull of *compact*, cardinals can only confer benefices in their natural ſtate; i. e. regular benefices on regulars.

COMPAGES *circularis mundana*, a term deviſed by Kircher to expreſs what he in other places calls the annularity, or annular diſpoſition of MOUNTAINS, which he ſays run in continued chains, forming belts or ridges in the manner of ſpines, all round the globe of the earth, from north to ſouth, and ſo on from that point to north again, and in the ſame manner from eaſt to weſt, and from weſt to eaſt again.

COMPAGUS, in *Antiquity*, a kind of ſummer-ſhoe worn by the Roman ſenators, conſiſting only of a ſole at the bottom; it was faſtened with leathern ſtraps, croſſing one another many times about the leg.

Rubenius makes the *compagi* to have been a ſort of caligæ worn by the Roman generals as well as ſenators. Under the later emperors, in the middle age, we read of the ſame worn by popes, biſhops, and abbots.

COMPANY, a collective term, underſtood of ſeveral perſons aſſembled together in the ſame place, or with the ſame deſign. See SOCIETY.

The word is formed of the French *compagnie*, and that of *compania*, or *companati*, which, Chifflet obſerves, are found in the Salic law, tit. 66. and are properly military words, underſtood of ſoldiers, who, according to the modern phraſe, are comrades, or meſs-mates, i. e. lodge together, eat together, &c. of the Latin *cum*, with, and *panis*, bread. It may be added, that in ſome Greek authors under the Weſtern empire, the word μαγιστρος occurs in the ſenſe of *ſociety*.

COMPANY, *in Commerce*, is an aſſociation of ſeveral merchants, or others, who unite in one common intereſt, and contribute by their ſtock, their counſel, and ſkill, to the ſetting on foot, or ſupporting, of ſome lucrative eſtabliſhment.

Though *company* and *ſociety*, or fellowſhip, be, in reſpect, the ſame thing, yet cuſtom has made a difference between them; *ſociety*, or partnerſhip, being underſtood of two, or three *dealers*, or not many more; and *company* uſually of a greater number. See SOCIETY.

A ſecond difference between *companies* and ſocieties is, that the firſt, eſpecially when they have exclaſive privileges, cannot be eſtabliſhed without the conceſſion of the prince; and need letters patent, charters, &c.

Whereas, for the latter, the conſent of the members, fixed and certified by acts and contracts; and authorized by bye-laws, is ſufficient.

The ſeveral profeſſions and trades exerciſed in the city of London, being incorporated into diſtinct fraternities, governed by their particular laws, a tabular view of them may not be unacceptable.

The abſtract of their incorporations, and particular privileges, is taken from the records of the Tower, &c. and from the Firma-Burgi of Maitor, the king's hiſtoriographer; an account of their charities from thoſe eminent hiſtorians Stowe and Strype, and the number of the liverymen, with their fines on admiſſion, is taken from the returns of the clerk to the parliament, and the ſcrutiny-books made after the ſeveral polls for the magiſtrates and repreſentatives of the city.

The companies are here placed according to their precedence, beginning with the twelve principal ones, of one or other of which the lord mayors have generally made themſelves free at their election, if they were not ſo before; for they are not only the oldeſt, but the richeſt, many of them having had the honour of kings and princes to be their members, and the apartments of their halls being fit to entertain a monarch.

Companies.	Halls.	Incorporated by	A. D.	Livery men.	Livery fines.	Charitable Gifts, paid yearly, and Privileges, &c.
					l. s. d.	*l.*
1 Mercers	Cheapſide	Richard II.	1393	232	2 13 4	5000 Excluſive ſale of 20 per cent. paid yearly to the widows of ſubſcribing clergymen during life, purſuant to a propoſal accepted in 1698, when they lented a fund of 14,000l. a year for that purpoſe.

38	Bowyers	No hall	James I.	1620	30	8 0 0	
39	Fletchers ¶	St. Mary Axe	No charter		23	10 0 0	¶ It is only a company by prescription.
40	Blacksmiths	Lombard-hill	Q. Elizabeth	1577	220	8 0 0	
41	Joiners and Ceilers	Thames-street	Q. Elizabeth	1569	323	8 0 0	
42	Weavers	Basinghall-street	Henry II.		270	6 0 0	
43	Woolmen	No hall	No charter		No livery; but they have a master, 2 wardens, and 11 assistants. They are only a company by prescription, but supposed to have commenced with the wool-trade.		
44	Scrivenors	No hall	James I.	1616	53	5 0 0	
45	Fruiterers	No hall	James I.	1605	63	5 0 0	
46	Plaisterers	Addle-street	Henry VII.	1501	57	8 0 0	
47	Stationers ††	Ludgate-street	Phil. & Mary	1557	300	20 0 0 ††	This company, which also includes booksellers, letter-founders, printers, and bookbinders, have a stock which is employed in printing almanacks, primers, psalters, school-books, &c. of which they have the sole privilege, by virtue of a grant from the crown. This stock consisted of shares, which are distributed in different proportions among those who have fined for, or served the office of, master-warden; whose shares, if they die married, devolve to their widows. They pay above 200l. a year in pensions and other charities. They are likewise trustees for the disposal of the considerable legacies of Mr. William Boyer, a learned printer, (who died Nov. 12, 1728) consisting of 50l. a year to the most learned journeyman that can be met with; and 180l. a year in annuities to necessitous printers of fifty-three years of age or upwards.
48	Broderers	Gutter-lane	Q. Elizabeth	1561	115	5 0 0	
49	Upholders	No hall	Charles I.	1627	131	4 10 0	
50	Musicians	No hall	James I.	1604	508	10 0 0	
51	Turners	College hill	James I.	1604	144	8 0 0	
52	Basket-makers	No hall	No charter		No livery; yet a company by prescription, governed by 2 wardens and 28 assistants, with this motto to its arms, *Let us love one another.*		
53	Glaziers ‖	No hall	Charles I.	1637	91	3 0 0	‖ The glass painters are incorporated with them.
54	Horners	No hall	Charles I.	1638	No livery; yet they have a master, 2 wardens, and 9 assistants, with a warehouse in Spital-fields; where they divide in lots, among themselves, such horns as are bought up by their members in Leadenhall and other markets: And in 1405, they obtained an act of parliament that none should be exported, but such as they refused.		
55	Farriers	No hall	Charles II.	1675	76	5 0 0	
56	Paviours	No hall	No Charter		No livery; yet it is a fellowship by prescription, with 3 wardens, and 25 assistants.		
57	Loriners	London wall	Q. Anne.	1712	69	20 0 0	
58	Apothecaries	Blackfryars	James I.	1617	144	16 0 0	They are exempt from ward and parish-offices, and have a spacious physic-garden at Chelsea; which, in 1721, was granted to the company for ever by Sir Hans Sloane, Bart. the lord of the manor, on condition of their paying a quit-rent of 5l. and continuing it always as a physic-garden, and of presenting every year to the Royal Society fifty samples of different sorts of plants, three grown, till they amount to two thousand.—The future of these conditions hath been long since more than completed.
59	Shipwrights	No hall	James I.	1605	No livery; yet they have a master, 2 wardens, and 16 assistants.		
60	Spectacle-makers	No hall	Charles I.		No livery; yet have a master, 2 wardens, and 15 assistants.		
61	Clock-makers	No hall	Charles I.	1633	360	20 0 0	
62	Glovers	No hall	Charles I.	1638	110	5 17 4	
63	Comb-makers	No hall	Charles I.	1636	No livery; yet have a master, 2 wardens, and 13 assistants.		
64	Felt-makers	No hall	James I.	1604	60	5 0 0	
65	Framework-knitters	Red cross-street	Charles II.	1663	58	10 0 0	
66	Silk-throwers	No hall	Charles I	1630	No livery; yet have a master, 2 wardens, and 20 assistants.		
67	Silkmen	No hall	Charles I	1631	No livery; yet have a governor, and 20 assistants.		
68	Carmen, have no hall, nor charter, nor livery; but are a fellowship by act of common council, with the title of Free Carmen of the city of London, and have a master, 2 wardens, and 32 assistants, under the direction of the lord mayor and aldermen. The carts that belong to this fellowship, which are between 4 and 500, are, by an act of common council, subjected to the rule of the president and governors of Christ's hospital; to whom the owners of every cart pay 17s. 4d. a year for a licence to work it, and every cart is brought to the hospital to have a number in brass put upon it.						
69	Pin-makers	No hall	Charles I.	1636	No livery; yet have a master, 2 wardens, and 18 assistants.		
70	Needle-makers	No hall	O. Cromwell	1656	110	5 5 0	

Companies.	Halls.	Incorporated by	A. D.	Livery men.	Livery men.	Charitable Gifts paid yearly, and Publick Offices, &c.
				£.	s. d.	
71 Gardeners	No hall	James I.	1616	No livery; yet have a master, 2 wardens, and 18 assistants.		
72 Soap-makers	No hall	Charles I.	1630	No livery; yet have a master, 2 wardens, and 18 assistants.		
73 Tin-plate-workers	No hall	Charles II.	1670	60	10 0 0	
74 Wheelwrights	No hall	Charles II.	1670	100	15 10 0	
75 Distillers	No hall	Charles I.	1638	112	13 6 8	
76 Hatband-makers	No hall	Charles I.	1638	Incorporated with the company of Needle-makers.		
77 Patten-makers	No hall	Charles II.	1670	46	8 0 0	
78 Glass-sellers and looking-glass-makers	No hall	Charles II.	1664	44	5 0 0	
79 Tobacco-pipe-makers	No hall	Charles II.	1663	No livery; yet have a master, 2 wardens, and 18 assistants.		
80 Coach and harness makers	Noble-street	Charles II.	1677	104	10 0 0	
81 Gun-smiths	No hall	Charles I.	1638	100	10 0 0	
82 Gold and silver wire-drawers	No hall	James I.	1623	No livery; yet have a master, 2 wardens, and 18 assistants.		
83 Long-bow-string-makers	No hall	No charter		No livery; yet a company by prescription, and have 2 wardens, and 19 assistants.		
84 Card-makers	No hall	Charles I.	1629	No livery; yet have a master, 2 wardens, and 18 assistants.		
85 Fan-makers	No hall	Q. Anne	1709	No livery; yet have a master, 2 wardens, and 20 assistants.		

86 Woodmongers, were a company incorporated with the carmen by K. James I. 1605, but surrendered their charter in 1668; by an act of common council in 1691, they obtained a privilege of keeping 126 carts, exclusive of the number kept by the carmen, *extinct*.

87 Search-makers, *extinct*	No hall	James I.	1623	
88 Fishermen, *extinct*	No hall	James II.	1685	
89 Parish-clerks	Wood-street	Henry III.	1233	By a decree of the Star-chamber court in 1635, they obtained a privilege to keep a press in their hall, for printing the weekly bills of mortality, by a person appointed by the archbishop of Canterbury. They are, by their charter, to make a report of all the weekly christenings and burials in their several parishes every Tuesday; and they have a master, 2 wardens, and 17 assistants.

90 Porters, are another fellowship, without hall, or livery; consisting of tackle and ticket-porters. They were constituted a fraternity by act of common council in 1649, with a power of annually choosing twelve rulers, being six of each denomination. However, the court of lord mayor and aldermen have reserved to themselves a power of appointing one of their own body, as the chief judge in all controversy. One very laudable custom of the master tackle-porters is, that such of their brethren as happen to be disabled from working, receive their share of all profits, as if actually in business, during life.

91 The watermen, wherrymen, and lightermen of this city and neighbouring places, were by act of K. William III. constituted a society, or company, under the direction of the lord mayor and aldermen. They are to furnish 2000 men for the navy, upon demand by the admiralty. They have a hall at Coal Harbour, near the Thames; and pay to their poor about 200l. a year; chiefly raised by ferries over the Thames on Sunday.

N. B. The company of Surgeons, Parish-clerks, Porters, and Watermen, have not the privilege of making their members freemen of the city of London.

From the foregoing list, it appears on the whole, that there are ninety-one *companies*, forty-eight halls, and that the number of liverymen, according to the most exact account that could be procured, in 1779, is 8054. The sums of money yearly distributed in charity by only twenty-three of the *companies*, amounts to 2365*l*. and if but forty pounds each be annually given by the remaining forty-eight *companies*, the whole will be no less than 4273*l*. *per annum*.

COMPANY, *New-River*. This corporation consists of a governor, deputy-governor, treasurer, and twenty-six directors, who hold a weekly board for appointing officers, granting leases, and redressing grievances. The projector of this CANAL for bringing water to London, with the assistance of king James I. and the corporation of London, is supposed to have expended 500,000*l*. upon it; the profits, which are divided into seventy-two shares, for the first thirty years admitted of little more than five pounds to each share; but their value is much increased, and now estimated at four or five thousand pounds each. This *company* supplies more than thirty thousand houses with water.

COMPANY seems more peculiarly appropriated to those grand associations, set on foot for the commerce of the remote parts of the world; as the *English* and Dutch East India *company*, South Sea *company*, Mississippi *company*, &c. The rise and establishment whereof, we shall here set before the reader.

However injurious *companies* with joint-stock, and incorporated with exclusive privileges, may, at this time, be reckoned to the nation in general; it is yet certain that they were the general parent of all our foreign commerce: private traders being discouraged from hazarding their fortunes in foreign commerce, until the method of trade had been first settled by joint-stock *companies*. From this principle it is, that we find several nations that are now endeavouring to improve their trade, and to establish or increase maritime power, by the means of joint-stock *companies*.

But since the trade of this kingdom, and the number of traders have increased, and the methods of assurance of shipping and merchandize, and the navigation to all parts of the known world have become familiar to us; these companies, in the opinions of most men, have been looked upon in the light of monopolies: their privileges have therefore been declined from time to time, in order to favour a free and general trade; and experience has shewn, that the trade of this nation has advanced, in proportion as monopolies have been discouraged.

COMPANIES, *English*. *East India* COMPANY was formed towards the latter end of the reign of queen Elizabeth; their charter being dated in 1600, and renewed by James I. in 1610.

Their first fleet, sent out in 1600, brought back so rich a cargo, that in a few years they numbered twenty ships. King James I. to shew how much he had its interest at heart, sent several embassies to the great Mogul, the kings of Persia, Japan, and other princes, to make treaties of commerce in his name, and that of the *company*; some of which subsist still: the king of Persia, in particular, granted the *company* several extraordinary favours, in recompence for the service the English had done him, in assisting him to expel the Portuguese from Ormus; who, by means of their lodgment there, usurped the whole commerce of the Persian gulf.

But its chief favours the *company* received at the hands of king Charles II. who, by a charter in 1668, granted them the port and island of Bombay, with all the rights thereof as surrendered to him by the Portuguese; only reserving to himself the sovereignty and homage thereof, with a yearly acknowledgment of ten pounds *per ann.* in gold. Another charter, containing preceding ones, was granted in 1676. In 1677 he also granted them in like manner, the island of St. Helena, belonging to him by right of conquest from the Dutch, who had before taken it from the English. By a fifth charter, purposely designed against interlopers, in 1683, he granted them a power to erect a court of judicature, composed of a lawyer, and two merchants, in all their places, settlements, factories, &c. to judge of seizures, and all marine disputes; as also about bargains, exchanges, &c. and even of all crimes committed on the high seas, or in the countries and territories of the *company*, in Asia, Africa, and America: the whole, however, agreeable to the usages and custom of merchants, and the laws of England. In 1691, the same prince granted the *company* a charter, which contained a confirmation of the ancient ones of king James I. and queen Elizabeth; or rather, a new charter, granting them abundance of privileges, which they had not before enjoyed: this charter is properly the basis of the *company*, and that whereon are founded all the rights, and the policy of the *new company*, afterwards established in 1698.

All these five charters of king Charles II. were confirmed by king James II. in 1685, especially the last, which was enforced with new sanctions; particularly, the article of exclusion; which, in the time of king Charles, had been but little regarded, but was now enforced with such rigorous prohibitions, that all interlopers seemed for ever excluded.

No person may trade within, until sufficient security be given to the commissioners of the customs, that all the goods caused by them to be there laden, shall be brought, without breaking bulk, to some port in England, which security the English East India *company* are to give under their common seal, after the rate of 2500*l*. for every hundred tons they are let at, for every ship by them sent out, according to the form prescribed, 9 and 10 W. III. cap. 44. sect. 68. 6 Anne, cap. 3. sect. 1.

The shares, or subscriptions of the *company*, were originally only of 50*l.* sterling: but the directors, having a considerable dividend to make in 1676, it was agreed to join the profit to the original, instead of withdrawing it; and thus the shares were doubled, and became of 100*l.* sterling. The first capital was only 369,891*l.* sterling, and 5*s.* which, being thus doubled, amounted to 739,782*l.* sterling, and 10*s.* to which, if the profits of the *company*, to the year 1685, viz. 963,030*l.* sterling be added, the whole stock will be 1,703,422*l.* sterling.

The *company* had, from time to time, undergone great losses; first, in 1682, by the loss of Bantam, out of which they were driven, and had their magazines plundered by the Dutch; under pretence of assisting sultan Agui against sultan Agoon, his father. Secondly, about the same time, when the great numbers of interlopers, to whom king Charles II. too easily granted permissions, lowered *their* shares *cent. per cent.* Thirdly, by the war, which the *company* maintained in the Indies, against the great Mogul; wherein it was obliged to abandon the factory of Surat, and to retire to Bombay; on which occasion king James II. granted them a new charter in 1686, being their sixth since the Restoration. But still the repaired her stock, and supported the reputation of her commerce, till the Revolution which happened soon after: when the war, and the incredible losses the *company* sustained by the French privateers, &c. put it into so desperate a condition, that appearing scarce possible to be supported, a new one was erected.

The charter of the new East-India *company* was of the year 1698. Its stock was to consideable, and the subscriptions so very ready, that, in two years time, the *company* had forty vessels equipped in its service; which was double of what the old one ever had; and sent to the Indies (*commodos annis*) at least a million sterling in silver; whereas the former had never sent above 500,000*l.* After the two *companies* had subsisted a few years in a separate state, means were contrived to unite them, which was effected by an indenture tripartite, between the queen and the two *companies*, in 1702, and they were perfectly consolidated in 1708, when a new charter of union was granted them, under the name of the *United Company of Merchants of England trading to the East-Indies*; their whole capital consisting of 3,200,000*l.* which being since expired, another charter with new powers, was granted them in 1726, and their exclusive privileges prolonged for thirty-three years, in 1730, viz. to 1769; and it was continued to the 17th year of Geo. II. to the year 1780, in which year another million was advanced by this *company* to the public.

The cargo which the *company* sends to the East-Indies, is chiefly silver, bullion, and pieces of eight; with cloth, either scarlet or blue; they also send some iron, and lead. The returns from the Indies are chiefly silks, both raw and manufactured, cottons, calicoes, and muslins, drugs, tea, coffee, china-ware, rice, sago, red wood, salt-petre, pepper, Carmania wool, indigo, &c.

For the economy and policy of the *United Company*, all persons, without exception, are admitted members of it, natives and foreigners, men and women; with this circumstance, that 1000*l.* in the stock of the *company* gives the owner a vote in the general courts; and 2000*l.* qualifies him to be chosen a director.

The directors are twenty-four in number, including the chairman and deputy-chairman, but may be re-elected for four years successively. They have a salary of 150*l. per ann.* and the chairman and deputy-chairman of 200*l.*

The meetings, or courts of directors, are to be held, at least once a week, but are commonly oftener; and they are summoned as occasions require.

Out of the body of directors are chosen divers committees, who have the peculiar inspection of certain particular branches of the *company's* business; as, the committee of correspondence, committee of buying, committee of treasury, committee of warehouses, committee of shipping, committee of accounts, committee of private trade, committee of house, committee of law-suits, committee of military fund, and committee to prevent the growth of private trade.

No persons are allowed to have any private trade, except the *company's* officers and seamen sent to India on board their ships; who are regularly licensed to carry out, and bring back commodities to a certain value, greater or less, according to their rank. But at their return, their cargoes are to be consigned to the *company*, and sold by them at their next sale. The Jews also, and others dealing in diamonds, are allowed to trade for themselves by the *company's* ships, on allowing so much *per cent.* to the *company* for freight.

The *company* has three principal settlements, viz. Fort William in Bengal; Fort St. George on the coast of Coromandel; and the island of Bombay; each of which has several subordinate factories.

The factories dependent on Fort William, are Cassimbuzar, Patna, Dacca, Ballasore, and Jugnea. Those on Fort St. George, are Fort Marlborough, Fort St. David, Vizagapatam, Ingeram, and Madipollam.—Those on the island of Bombay, are Gombroon, Surat, Anjego, and Tellicherry.

COMPANY, *Royal African*, established for the commerce of the coasts of Guinea, is governed much like that of the East-Indies. Its privilege is exclusive: it sends out yearly ten or a dozen ships, of about 150 tons, loaden with old and new draperies, and with iron-works, scissars, knives, muskets, cottons, and other less considerable merchandizes.

The returns are in gold-dust, elephants teeth, wax, and leathers: but the best article of its commerce is NEGROES, which it sends to Jamaica, Barbadoes, and other English isles in America; frequently, even to the ports of New Spain. See ASIENTO, &c.

Though England began to trade to Africa as early as the year 1536, and several voyages were made to Guinea in 1588, and some following years, for the importation of gold and elephants teeth, nothing like a *company* was formed till the year 1588, when queen Elizabeth granted a patent of exclusive privilege to certain persons for ten years. In 1618, king James I. established a *company* by charter, which was soon dissolved. Another *company* was erected by charter of Charles I. in 1631, which met with little success; but the demand for negroes in the English American plantations increasing, a third *company* was established by a charter granted 1663, in favour of the duke of York; securing to him the commerce of all the country, coasts, islands, &c. belonging to the crown of England, or not possessed by any other Christian prince: from Cape Blanco in 20° N. lat. to the Cape of Good Hope in 34° 30′ S. lat. The charter was soon after returned into the king's hands by the duke, and revoked, by consent of the parties interested with him in the enterprize; in consequence of which, the fourth and last exclusive *company* was established and incorporated by letters patent in 1672. A capital was soon raised of 111,000*l.* and this new *company* improved their trade, and increased their forts; but after the Revolution in 1689, this trade was laid open. In 1698, all private traders to Africa were obliged by stat. 9 and 10 Will. to pay ten *per cent.* in order to assist the *company* in maintaining their forts and factories. However this assistance proving ineffectual, an annual sum of 10,000*l.* was granted by the British parliament in 1730, for this purpose. In 1752, parliament established an African *company* under new regulations; and in 1752, absolutely, the old *company*, having given them a pecuniary satisfaction for their charter, lands, forts, slaves, &c. and vested their forts and factories, &c. in the new *company*, which is impowered to arm and train military forces at their forts, and to punish offences, so as not to extend to life or limbs, and to erect courts of judicature for mercantile and maritime bargains, &c.

The direction of the affairs of this *company* is referred to a committee of nine persons, chosen annually by the freemen at London, Bristol, and Liverpool, who purchase their freedom, and right of election, by the payment of 40*s.* and accountable to the board of trade and plantations.

For the incorporation of this *company*, and the regulations concerning it, see 23 Geo. II. *cap.* 31.—25 Geo. II. *cap.* 40.

COMPANY, *Hamburgh*, is the eldest trading establishment in the kingdom; though not always known by that name, nor restrained to those narrow bounds under which it is now confined. It was first called, the *Company of Merchants trading to Calais, Holland, Zealand, Brabant, and Flanders*: then it acquired the general title of *Merchant-adventurers of England*; as being composed of all the English merchants who traded to the Low Countries, the Baltic, and the German Ocean. Lastly, it was called the *Company of Merchant-adventurers of England trading to Hamburgh*.

This *company*, as well as some others in England, built on its model, is very different from those above mentioned; and differs widely from the ordinary plan and system of such societies. In effect this is not a society of dealers, each furnishing a part of the sum to constitute the capital stock of the *company*; but a mere association, or body of merchants, who have nothing in common, but the grant and privilege of trading to Hamburgh, and some other cities of Germany, each managing his own commerce, and trading on his own foundation: only observing a certain discipline, and some regulations, which none but the company can establish, or change.

This *company* was first incorporated by Edward I. in 1296; and established again, by charter, in 1406, under the reign of king Henry IV. It was afterwards confirmed, and augmented with divers privileges by many of his successors:

successors; among the rest, by Henry V. in 1413; Henry VI. in 1422; Henry VII. in 1493, 1505, and 1506; Henry VIII. in 1509, 1527, and 1530; Edward VI. in 1552; queen Mary, in 1553; Elizabeth, in 1564, and 1580; James I. in 1605; and Charles II. in 1661. But of all these charters, there are, properly, none but those of Henry IV. Henry VII. Elizabeth, James, and Charles, that are of any importance, or that give the *company* any thing new; the rest being only confirmations. Before the charter of king Henry IV. all the English merchants, who travelled out of the realm, were left to their own discretion, and managed their affairs with foreigners as might be most for their respective interests; without any regard to the general commerce of the nation.

Henry, observing this disorder, endeavoured to remedy it, by uniting all the merchants in his dominions into one body; wherein, without losing the liberty of trading each for himself, they might be governed by a *company* like fraternities; and be subject to regulations, which should secure the general interest of the national commerce, without prejudice to the interest of particulars. With this view, he granted all the merchants of his states, particularly those of Calais, then in his hands, a power of associating themselves into a body politic, with directors and governors, both in England and abroad; to hold assemblies, both for the direction of business, and the deciding of controversies among merchants; make laws, punish delinquents; and impose moderate duties and taxes on merchandizes, and merchants, to be employed in the service of the corporation.

These few articles of the charter of Henry IV. were afterwards much augmented by Henry VII. who first gave them the title of *Merchant-adventurers to Calais, Holland*, &c. gave them a power of proclaiming and continuing free fairs at Calais; and ordered, that to be reputed a member of the society, each person pay twenty marks sterling; and that the several members should attend the general meetings, or courts, appointed by the directors, whether at London, Calais, or elsewhere.

The inexecution of this last article, and contempt of some of the rest, occasioning great inconveniencies to the *company's* affairs, another charter was procured; whereby the pain of imprisonment was menaced, for those who should absent themselves from the meetings without lawful cause, or should disobey the laws. A petition being made to queen Elizabeth, in 1564, for an explanation of certain articles in the charter of Henry VII. and a confirmation of the rest granted by other kings; that princess, by a charter of the same year, declares, that, to end all disputes, they shall be incorporated anew, under the title of *the Company of Merchant-adventurers of England*; that all who were members of the former *company* should, if they desired it, be admitted members of this; that they should have a common seal; that they should admit into their society what other persons, and on what terms, they pleased; and expel them again on misbehaviour; that the city of Hamburgh, and neighbouring cities, should be reputed within their grant, together with those of the Low Countries, &c. in that of the former *company*; that no member should marry out of the kingdom, nor purchase lands, &c. in any city beyond sea; and that those who do, shall be, *ipso facto*, excluded for ever.

Twenty-two years after this first charter, queen Elizabeth granted them a second, confirming the former, and further granting them a privilege of excision; with a power of erecting in each city within their grant, a standing council.

The woollen manufacture being the principal object of their application, they met with great opposition; first, from the Hanse, who feared them frequently to change their mart, or staple; and afterwards under king James I. who having erected a corporation in 1616, in favour of some private persons, who offered to set up a manufacture for dying and pressing cloths, &c. under pretence thereof, the *company* of merchant-adventurers were prohibited dealing therein. But that project not succeeding, and the charter being revoked two years afterwards, the merchant-adventurers, whose *company* had been dissolved two years before, were restored in 1617, to their ancient privileges, and a new charter was given them, confirming their exclusive rights; and allowing them to have officers in the several custom-houses, to have an eye that they were not prejudiced in their woollens, under pretence of the like merchandizes, which others were allowed to send to other parts. This charter of king James, is the last of those confirmed by Charles II. in the grand charter of 1661.

The revolutions which had happened in the Low Countries towards the end of the fifteenth century, and which laid the foundation of the republic of Holland, having hindered the *company* from continuing their commerce with their ancient freedom; it was obliged to turn it almost wholly to the side of Hamburgh, and the cities in the German ocean: from which change, some people took occasion to change it, some to that of the *Hamburgh Company*, though the ancient title of *Merchant-adventurers* is still retained in all their writings.

This *company* was greatly reduced, when its trade was laid open by William III.

COMPANY of *Merchants of the Staple* was incorporated by Edward III. Their factory was at Middleburgh, in Zealand; but the staple being removed in 1388 to Calais, it was from thence, viz. in 1390, removed from thence to England.

COMPANY, *Russia*. This was first projected towards the end of the reign of king Edward VI. entered into the first and formed about the 4th and 5th of Philip and Mary; but had not its perfection, till its charter was confirmed by act of parliament, under queen Elizabeth, in 1566. It had its rise from certain adventurers, who were sent to discover, if on the discovery of new countries, and to find out a north east passage to China: these, sailing into the White Sea, and making up to the port of Archangel, were exceedingly well received by the Muscovites and, at their return, obtained letters patent to secure to themselves the commerce of Russia, for which they had formed an association.

The charter was promised them by Edward VI. but he dying, was first dispatched by queen Mary, in 1555. By this charter, the association was declared a body politic, under the name of *the Company of Merchant-adventurers of England, for the discovery of lands, territories, islands, &c. unknown, or unfrequented*. The privileges were, to have a governor, four consuls, and twenty-four assistants, for their commerce; for their policy, to make laws, inflict penalties, send out ships to make discoveries, take possession of them in the king's name, set up the banner royal of England, plant them; and lastly, the exclusive privilege of trading to Archangel, and other parts of Muscovy, not yet frequented by the English.

This charter, not being sufficiently guarded, was confirmed by parliament in the eighth year of queen Elizabeth; wherein it was enacted, that in regard the former name was too long, they should now be called *Company of English Merchants for discovering new Trades*; under which name, they should be capable of acquiring and holding all kinds of lands, manors, rents, &c. not exceeding a hundred marks *per ann.* and not held of her majesty; that no part of the continent, island, harbour, &c. not known or frequented before the first voyage or the merchants of their *company*, situate to the north, or north-west, or north-east of London; nor any part of the continent, islands, &c. under the obedience of the emperor of Russia, or in the countries of Armenia, Media, Hyrcania, Persia, or the Caspian Sea, should be visited by any subjects of England, to exercise any commerce, without the consent of the said *company*, on pain of confiscation. The said *company* shall use no ships in her new commerce, but those of the nation; nor transport any cloths, serges, or other woollen stuffs, till they have been dyed and pressed. That in case the *company* discontinue of itself to unload commodities in the road of the abbey of S. Nicolas, in Russia, or some other port, on the north coasts of Russia, for the space of three years, the other subjects of England shall be allowed to traffick to Narva, while the said *company* discontinued its commerce into Russia, only using English vessels.

This *company* subsisted with reputation almost a whole century, till the time of the civil wars. It is said, the year then reigning, hearing of the murder of king Charles I. ordered all the English in his states to be expelled; which the Dutch taking the advantage of, settled in their room. After the Restoration, the remains of the *company* re-established part of their commerce at Archangel, but never with the same success as before; the Russians being now well accustomed to the Dutch merchants and merchandize.

This *company* subsists still, nearly on the foot of that of Hamburgh, and the northern and Turky *companies*; i. e. each member thereof traffacks for himself, and on his own foundations: only paying an acknowlegement of 12 or 13l. sterling, besides some other dues imposed, from time to time, for the occasions of the *company*, and the commerce in general. It is under the direction of a governor, four consuls, and assistants.

COMPANY, *North Sea*, or as some, more agreeably to its charter, call it *Eastland Company*, is established on similar ground with that of Hamburgh; from whence it appears to have been dismembered.

Its charter is dated in the year 1579. By the first article the *company* is erected into a body politic, under the title of *the Company of Merchants of the East*; to consist of Englishmen, all real merchants, who have exercised the

business

business thereof, and trafficked through the Sound, before the year 1568, into Norway, Sweden, Poland, Livonia, Prussia, Pomerania, &c. as also Revel, Coningsberg, Dantzick, Copenhagen, &c. excepting Narva, Muscovy, and its dependencies. Most of the following articles grant them the usual prerogatives of such *companies*; as a seal, governor, courts, laws, &c.

The privileges peculiar to this *company* are, that none shall be admitted a member, who is already a member of any other *company*, nor any retail-dealer at all. That no merchant qualified, be admitted without paying six pounds, thirteen shillings and six pence. That a member of another *company*, desiring to renounce the privileges thereof, and to be received into that of the East, shall be admitted *gratis*; provided he procures the same favour for a merchant of the East, willing to fill his place. That the merchant-adventurers who never dealt in the East, nor the places expected in the charter, may be received as members of the *company* on paying forty marks (that, notwithstanding this union of the *Adventurers of England* with the *Company of the East*, each shall retain its rights and privileges. That they shall export no cloths but what are dyed and prefled, except a hundred pieces *per annum*, which are allowed them *gratis*.

This charter was confirmed by Charles II. in 1609, with this addition; that no perfon, of what quality foever, living in London, fhould be admitted a member, unless he were free of the city.

This *company* was complained of as a monopoly, and firft entrufted by legal authority in 1673; and fince the declaration of rights in 1689, exifts only in name; but ftill continues to elect annual officers, who are a governor, a deputy, and twenty-four aſſiſtants.

COMPANY, *Turky*, or *Levant* COMPANY. This *company* is eſtabliſhed on ſimilar ground with that of the *Hamburgh Company*, i. e. there is no common fund, wherein the adventurers depoſit their ſtock to make one ſingle commerce; but the commerce thither is free, each member trafficking for himſelf; but obſerving the rules and orders of the *company*; and all contributing occaſionally, towards the common expences.

This flouriſhing body had its riſe under queen Elizabeth, in 1581. James I. confirmed its charter in 1605, adding new privileges. During the civil wars, there happened ſome innovations in the government of the *company*; many perſons having been admitted members, not qualified by the charters of queen Elizabeth and king James, or that did not conform to the regulations preſcribed. Charles II. upon his reſtoration, endeavoured to ſet it upon its ancient baſis; to which end, he gave them a charter, containing not only a confirmation of their old one, but alſo ſeveral new articles of reformation.

By this the *company* is erected into a body politic, capable of making laws, &c. under the title of the *Company of Merchants of England trading to the Seas of the Levant*. The number of members is not limited, but is ordinarily about three hundred. The principal qualification required is, that the candidate be a freeman of London, and a wholeſale merchant, either by ſervitude, or by ſerving an apprenticeſhip of ſeven years. Thoſe under twenty-five years of age to pay 25*l.* ſterling at their admiſſion; thoſe above, twice as much. This fine was reduced by act of parliament, in 1753, to 20*l.* and the privilege of admiſſion extended to every Britiſh ſubject. Each makes oath, at his entrance, not to ſend any merchandizes to the Levant, but on his own account; and not to conſign them to any but the *company*'s agents or factors. This reſtriction is likewiſe enlarged by the above mentioned ſtatute.

The *company* has a court, or board, at London, which is compoſed of a governor, deputy-governor, and fifteen directors, or aſſiſtants; who are all actually to live in London, or the ſuburbs. They have alſo a deputy-governor in every city, and port, where there are any members of the *company*. The aſſembly at London ſends out the veſſels, regulates the tariff for the price at which the European merchandizes ſent to the Levant are to be ſold; and for the quality of thoſe returned. It raiſes taxes on merchandizes, to defray impoſitions, and the common expences of the *company*; preſents the ambaſſador which the king is to keep at the Porte, elects two conſuls for Smyrna and Conſtantinople, &c.

One of the beſt regulations of the *company* is, not to leave the conſuls, or even ambaſſador, to fix the impoſition on veſſels for defraying the common expences (a thing fatal to the *companies* of moſt other nations); but to allow a penſion to the ambaſſador, and conſuls, and even to the chief officers; as ſecretary, chaplain, interpreters, and janizaries: that there may not be any pretence for their raiſing any ſums at all on the merchants, or merchandize.

In extraordinary caſes, the conſuls, and even the ambaſſador, have recourſe to two deputies of the *company*, reſiding in the Levant: or, if the affair be very important, they aſſemble the whole body. Here are regulated the preſents to be given, the voyages to be made, and every thing to be deliberated; and on the reſolutions here taken, the deputies appoint the perſons to furniſh the moneys, &c. required.

It is true, the ambaſſador and conſul may act alone on theſe occaſions; but the penſion being allowed them on condition of declining them, they chooſe rather to act.

The ordinary commerce of this *company* employs from twenty to twenty-five veſſels, carrying from twenty-five to thirty pieces of cannon.

The merchandizes exported thither are, cloths of all kinds and colours, pewter, lead, pepper, cochineal, and a great deal of ſilver, which they take up at Cadiz: the returns are in raw ſilk, galls, cottons, wools, cottons, Morocco leather, aſhes for making glaſs and ſoap, and ſeveral gums, and medicinal drugs.

The commerce of this *company* to Smyrna, Conſtantinople, and Scanderoon, is not eſteemed much leſs conſiderable than that of the Eaſt-India *company*; but is, doubtleſs, more advantageous to England; becauſe it takes off much more of the Engliſh manufactures than the other, which is chiefly carried on in money.

The places reſerved for the commerce of this *company* are, all the ſtates of Venice, in the gulf of Venice; the ſtate of Raguſa; all the ſtates of the grand ſeignior, and the ports of the Levant and Mediterranean; excepting Carthagena, Alicant, Barcelona, Valencia, Marſeilles, Toulon, Genoa, Leghorn, Civita Vecchia, Palermo, Meſſina, Malta, Majorca, Minorca, and Corſica; and other places on the coaſts of France, Spain, and Italy.

COMPANY, *South-Sea*. Many take this *company*, eſtabliſhed by ſtat. 9 Anne, 1711, to have been originally intended rather as a political contrivance for raiſing a fund of money, to ſerve in the preſſing occaſions of the ſtate, than as a real eſtabliſhment for the ſake of commerce. For the nation being exhauſted of money by the long wars with France, it is no wonder the phantom of a new *company* ſhould be raiſed, to bring in the ſubſcriptions of the monied men; as the only expedient to be ſupplied with money, without diſſatisfying the people, already worn out with ſubſidies, &c.

The total capital of this *company* was at firſt 9,177,967*l.* 14*s.* 4*d.* but in 1715 it was enlarged to ten millions, at an intereſt of 6 *per cent.* reduced in 1727 to 5 *per cent.* The capital was increaſed again in 1719 to 11,746,814*l.* 9*s.* 10*d.* And if the plan of 1720 had perfectly ſucceeded, the amount of the capital would have been 33,411,399*l.* 6*s.* 3*d.* See FUND.

Be this as it will, it is certain, the miniſtry never thought ſeriouſly, during the whole courſe of the war, about making any ſettlement on the coaſts of South America; which was the thing wherewith the people were firſt flattered: beſides, that the fund having been apparently perverted to defray the expences of the war, its value was ſo lowered, that it muſt, in all probability, have ſunk outright, but for the unexpected help it met with in 1713.

By the treaty of Utrecht, the buſineſs of the *French Aſſiento company*, which was to furniſh the Spaniſh Weſt-Indies with negroes, was reſigned to the Engliſh, in favour of the *South-Sea Company*; which, by this means, relieved itſelf from its languiſhing ſituation, and became in a condition to vie with the moſt flouriſhing companies of commerce in England. See ASSIENTO.

The *South-Sea company*, who, without changing their name, took on them the Aſſiento, or farm of negroes, preſerved the ſame eſtabliſhment, until the peace of Aix-la-Chapelle, in 1748; and their veſſels diſembarked their negroes, which they had purchaſed through all the coaſts of Africa within their grant, at Buenos Ayres.

The *company*, it is certain, ſet out with good ſucceſs; and there was room to hope ſtill better; ſince, beſides that the value of their ſtock, the firſt five years, roſe rather, in proportion, than that of any other *company*; his majeſty, after purchaſing 30,000 ſhares therein, was pleaſed to condeſcend to be their governor, or firſt director. This *company* is under the management of a ſub-governor, deputy-governor, and twenty-one directors, choſen every three years; for which a qualification of 2000*l.* ſtock is ſufficient, and for an elector 500*l.* For what remains of the hiſtory of this *company*, with that fatal train of romantic *projects* it drew after it, ſee BUBBLE.

COMPANY, *Greenland*. See GREENLAND.

COMPANIES, *Weſt-India*, or thoſe of the Engliſh colonies in North America, are of a form eaſily ſeen from thoſe above mentioned; and too numerous to be here deſcribed.

Their names are, the *Virginia Company*, *New-England*, *New*

New York, Pensylvania, New Scotland, Massachusets, Connecticut, Bermudas, Tobago, and Carolina Companies. To these may be added the *Hudson's Bay Company*, incorporated by charter in 1670. This *company*, by a joint stock, carries on a considerable trade to the factories established in Hudson's Bay and Straits, whither the natives repair with their fine beaver, furs, &c. It is under the direction of a governor, deputy-governor, and seven assistants.

COMPANY, *Scotch Darien.* This was established with good prospect at Edinburgh, in 1695, for the commerce of South America. In 1698, they sent an armament and a colony, which they endeavoured to establish in the isthmus of Darien, which parts North and South America; but the English ministry not thinking proper to avow and support the first successes of the *company*, which had alarmed Spain, ever jealous of this part of her territories, the Scotch colony was dispersed by the Spaniards in 1699, and thus vanished the best project that ever was formed, for disputing with that nation the possession of those countries, from which she pretends to exclude all other nations.

COMPANY, *Dutch East-India*, had its rise in the midst of the struggle which that people had for their liberty: for the Spaniards having forbid all commerce with them, and shut up all their ports; necessity inspired some Zealanders to seek a new north-east passage to China.

This enterprize proving unsuccessful to three several armaments in 1594, 1595, and 1596, a second *company* was formed, under the name of the *Company of remote Parts*; which, in 1595, took the ordinary route of the Portuguese to the Indies, and returned, in two years and a half's time, with little gain, but good hopes.

This *company*, and a new one just established at Amsterdam, being united, equipped other fleets; and these occasioned other *companies* at Amsterdam, Rotterdam, in Zealand, &c. Insomuch that the states soon began to apprehend they might be prejudicial to each other. Under this concern, they called all the directors of the several *companies* together, who all consented to an union, the treaty whereof was confirmed by the states in 1602, a very remarkable epocha, as being that of the most solid and celebrated establishment of commerce that ever was in the world.

Its first capital was six millions six hundred thousand guilders. It had sixty directors, divided into several chambers; twenty in that of Amsterdam, twelve in that of Zealand, fourteen in that of Delft and Rotterdam, and a like number in those at Hoorn and Enchuysen. As each grant expires, the *company* is obliged to procure a new one, which it has already done four times since the first; viz. one in 1623, for twenty-one years, like the first; another for twenty-one years, commencing in 1643; and a third in 1665, for forty years; a fourth in advance, commencing in 1698, to end in 1740. Each grant costs the *company* a considerable sum: that of 1647, cost 1,600,000 guilders, and the two following ones more: that of 1698, was confirmed by a placard of the states-general, granting them an exclusive privilege, which was prolonged in 1761 for thirty years more.

Their factories, residencies, &c. in the East-Indies, are very numerous; reaching from the Persian gulf to the coast of China: the principal is that of Batavia, the centre of their commerce: here resides their general, with the state and splendor of a sovereign prince; making war and peace with the eastern kings and emperors at pleasure.

The other more considerable factories are, Taiouan on the coast of China, Nangasac in Japan, Malacca, Surat, Amboyna, Banda, Siam, Moluccos, &c. several on the coast of Coromandel, and at Ispahan, Cape of Good Hope, &c. In all, they number forty factories, and twenty-five fortresses. They have the whole trade of the spices in their own hands.

COMPANY, *Dutch West-India*, established in 1621, with an exclusive privilege to trade twenty-four years along the coasts of Africa, between the tropic of Cancer, and the Cape of Good Hope; and in America, from the south point of Newfoundland, through the straits of Magellan, that of Le Maire, or others, to the straits of Anian, both in the North and South sea.

The directors are divided into five chambers (as in the East-India *company*), out of which nineteen are chosen for the general direction of affairs. In 1647, the *company* renewed its grant for twenty-five years; but it was scarce able to hold out the term, on account of its great losses and expences in taking the bay of Todos los Santos, Pernambuc, and the greatest part of Brasil from the Portuguese. The weakness of this *company*, which had several times in vain attempted to be joined to that of the East-Indies, occasioned its dissolution at the expiration of its grant.

In 1674, a new *company*, composed of the ancient proprietors and their creditors, was settled in the same rights and establishment with the former; and still subsists, though considerably decayed. Their first capital was about six millions of florins. Its principal establishments are, one at Cape Verd, another on the Gold Coast of Africa, at Tobago, Curaffao, &c. in America.

COMPANY, *Dutch North*, has no exclusive privilege; the advantage of its patent being of another kind, and very inconsiderable.

There are also, in Holland, *companies* for the Baltic sea, the fishery of Nova Zembla, Davis's Straits, and Greenland: yet none of their fisheries are interdicted to private traders; all the difference between these and the *companies* consisting in this, that the former may not go ashore to cut their fish in pieces, and melt their lard; but must bring their luggage to Holland.

COMPANY, *Dutch Levant.* In strictness, there is no Levant *company* in Holland: but the commerce of the private traders is so considerable, that the state has taken the regulation thereof on itself.

To this end, they have established a chamber of direction at Amsterdam, composed of six deputies, and a register; who, under the burgomasters, take care of every thing relating to the commerce of the Mediterranean; especially that of Smyrna and Constantinople.

This *company* names the consuls, appoints the number and strength of convoys, terminates differences among the traders, and has also a right, on occasion, to add new regulations to the old ones; though those be of no force, till confirmed by the states-general.

COMPANY, *French East-India*, was established in 1664, with an exclusive privilege, to trade for fifty years in all the seas of the East-Indies and South-sea; no adventurer to be admitted without a thousand livres in stock; and foreigners, who have twenty thousand livres in stock, to be reputed regnicoles.

The patent grants them the island of Madagascar; and the king to be at one fifth of the expence of the three first armaments, without interest; the principal to be refunded in ten years; or, if the *company* find it loses on the whole, the loss to fall on the king's side.

The capital fund of the *company*, which was mostly furnished by the king, was seven or eight millions of livres, but was to have been fifteen millions.

In effect, though no means were wanting to support the *company*, yet it still drooped, and still struggled; till, having subsisted ten years without any change in its form, and being no longer able to discharge its engagements, there were new regulations concerted, but to little purpose. At length, things not being disposed for a new East-India *company*, nor much good to be expected from the old one, in 1708, the ministry allowed the directors to treat with the rich traders of St. Malo, and so resign to them their privilege, under certain conditions. In the hands of these last, the *company* began to flourish.

Its chief factory is at Pondicherry, on the coast of Coromandel: this is the residence of the director-general; the other factories are inconsiderable. The merchandizes which the *company* brings into France are, silks, cottons, spices, coffee, rice, salt-petre; several kinds of gums and drugs, wood, wax, printed callicoes, muslins, &c.

COMPANY, *French West-India*, was established in 1664. Their charter gave them the property and seigniory of Canada, Acadia, the Antilles islands, isle of Cayenne, and the Terra Firma of America, from the river of the Amazons to that of Oroonoko; with an exclusive privilege for the commerce of those places, as also of Senegal, and the coasts of Guinea, for forty years, only paying half the duties.

The stock of the *company* was so considerable, that, in less than six months, forty-five vessels were equipped; wherewith they took possession of all the places in their grant, and settled a commerce: yet this only subsisted nine years. In 1674, the grant was revoked, and the countries above reunited to the king's dominions, as before; the king reimbursing the actions of the adventurers. This revocation was owing partly to the poverty of the *company*, occasioned by its losses in the wars with England, which had necessitated it to borrow above a million; and even to alienate its exclusive privilege for the coasts of Guinea: but also to its having in good measure answered its end; which was to recover the commerce of the West-Indies from the Dutch, who had torn it from them: for the French merchants, being now accustomed to traffic to the Antilles, by permission of the *company*, were so attached to it, that it was not doubted they would support the commerce after the dissolution of the *company*.

COMPANY, *French Mississippi*, was first established in 1684, in favour of the chevalier De la Salle; who having projected it in 1669, and being appointed governor of the fort of Frontignac, at the mouth of that river, travelled

over the country in the year 1683, and returned to France to solicit the eſtabliſhment. This obtained, he ſet ſail for his new colony, with four veſſels loaded with inhabitants, &c. but entering the gulf of Mexico, he did not, it ſeems, know the river that had coſt him ſo much fatigue; but ſettled on another river, unknown; where his colony periſhed by degrees; ſo that, in 1685, there were not a hundred perſons remaining. Making ſeveral expeditions to find the Miſſiſippi, he was killed in one of them by a party who mutinied againſt him; whereupon the colony was diſperſed and loſt. M. Hiberville afterwards ſucceeded better: he found the Miſſiſippi, built a fort, and ſettled a French colony there; but he being poiſoned, it is ſaid, by the intrigues of the Spaniards, who feared ſuch a neighbour, in 1712, M. Crozat had the whole property of trading to the French territories, called Louiſiana, granted him for fifteen years.

COMPANY *of the Weſt*. In 1717, the ſieur Crozat ſurrendered his grant; and in the ſame year a new *company*, was erected, under the title of *Company of the Weſt*; to which beſides every thing granted to the former *company*, was added the commerce of beaver, enjoyed by the Canada *company* from the year 1706, but expiring in 1717. In this eſtabliſhment, an equal view was had to the finances, and the commerce of the nation; and, accordingly, part of the conditions of its eſtabliſhment regarded the ſettling a colony, a trade, &c. the other the vending part of the bills, called *bills of ſtate*, which could no longer ſubſiſt on their preſent footing. The former are no more than are uſual in ſuch eſtabliſhments: for the latter, the actions are fixed at five hundred livres; each payable in bills of ſtate; the actions to be eſteemed as merchandize, and in that quality to be bought, ſold, and trafficked. The bills of ſtate, which make the fund of the actions, to be converted into yearly revenue. To put the finiſhing hand to the *company*, in 1719, its fund was fixed at an hundred millions of livres; which being filled, the caſh was ſhut up.

COMPANY, *Indian*. The junction of the former *company* with that of Canada, was immediately followed by its union with that of Senegal; both in the year 1718, by an arret of council, which at the ſame time granted the new *company* the commerce of beavers, and made it miſtreſs of the negro, or Guinea trade, to the French colonies in America.

Nothing was now wanting to its perfection, but an union with the Eaſt India *company*, and with thoſe of China and St. Domingo, which was effected; with the two firſt in 1719, and with the third in 1720. This union of the Eaſt-India and China *company* with the *company* of the Weſt, occaſioned an alteration of the name; and it was henceforth called the *India company*.

The reaſons of the union were the inability of the two former to carry on their commerce, the immenſe debts they had contracted in the Indies, eſpecially the *Eaſt Company*; complaints whereof had been ſent to court by the Indians, which diſcredited the *company* ſo that they durſt not appear any longer at Surat: laſtly, the little care they took to diſcharge their engagements; and their having transferred their privilege to the private traders of St. Malo, in conſideration of a tenth in the profits of the returns of their ſhips.

The ancient actions of the *company* of the Weſt, which were not at par when this engraſſment was projected, before it was completed, were riſen to 300 *per cent.* which unexpected ſucceſs gave occaſion to conclude the new actions of the united *companies* would not bear leſs credit. The concourſe of ſubſcribers was ſo great, that in a month's time there were above fifty millions ſubſcribed for: the firſt twenty-five million actions which were granted to the India *company*, beyond the hundred millions of ſtock allowed the *company* of the Weſt, being filled as ſoon as the books were open; to ſatisfy the earneſtneſs of the ſubſcribers, the ſtock was increaſed by ſeveral arrets to three hundred millions. Credit ſtill increaſing, the new actions roſe to 1200 *per cent.* and thoſe of the ancient *company* of the Weſt to 1900 *per cent.* an exorbitant price, to which no other *company* ever roſe. Its condition was now ſo flouriſhing, that in 1719 it offered the king to take a leaſe of all his farms for nine years, at the rate of three millions five hundred thouſand livres *per ann.* more than had been given before; and alſo to lend his majeſty twelve hundred millions of livres to pay the debts of the ſtate. Theſe offers were accepted; and the king, in conſideration hereof, granted them all the privileges of the ſeveral grants of the *companies* united to that *company*, to the year 1770, on condition, however, of diſcharging all the debts of the old Eaſt-India *company*, without any deduction at all. The loan of twelve hundred millions not being ſufficient for the occaſions of the ſtate, was augmented, three months afterwards, with three hundred millions more; which, with the former loan, and another of one hundred millions before, made ſixteen hundred millions; for which the king was to pay intereſt at the rate of three *per cent.*

The duke of Orleans, in February 1720, did the *company* the honour to preſide in their aſſembly, where he made ſeveral propoſals to them on the part of the king: the principal of theſe was, that they ſhould take on them the charge and adminiſtration of the royal bank. This was accepted of: and Mr. Law, comptroller-general of the finances, was named by the king *Inſpector-General of the India Company and Bank united*.

This union, which, it was propoſed, ſhould have been a mutual help to both thoſe famous eſtabliſhments, proved the firſt point from whence the fall of both commenced: from this time, both the banksbills and the actions of the *company* began to fall: in effect, the firſt periſhed abſolutely, and the other had been drawn along with it, but for the prudent precautions taken for its ſupport.

The firſt precaution was the revoking the office of inſpector-general, and the obliging Mr. Law to quit the kingdom: the ancient directors were diſcarded, and new ones ſubſtituted; and, to ſhut the bottom of the *company's* affairs, it was ordered, they ſhould give an account of what they had received, and diſburſed, both on the account of the *company*, and of the bank, which they had had the management of near a year. Another precaution to come at the ſtate of the *company*, was by endeavouring to diſtinguiſh the lawful actionaries from the Miſſiſippi extortioners; whoſe immenſe riches, as well as their criminal addreſs in realizing their actions, either into ſpecie or merchandize, were become ſo fatal to the ſtate; in order, if poſſible, to ſecure the honeſt adventurers in their ſtock. To this end, an inquiſition was made into their books, &c. by perſons appointed by the king; and the new directors, or, as they were called, *regiſſeurs*, began ſeriouſly to look about for their commerce abroad. The French have had ſeveral other *companies*, ſome whereof have fallen of themſelves, the reſt upon the expiration of their grants, as the

Baſtion COMPANY *of France*, which was, at firſt, only a ſimple aſſociation of two merchants of Marſeilles in the fifteenth century, for fiſhing of coral in the gulf of Stora-Courcoury on the coaſt of Barbary, on the frontiers of Algiers and Tunis. Having obtained leave of the ſultan Solyman II. to make an eſtabliſhment, and having likewiſe treated with the Moreſh princes of the country; in 1561 they built a little fort, called the *Baſtion of France*, whence the *company* took its name.

The firſt undertakers not being ſucceſsful, a new grant was obtained of Mahomet III. in 1604, to new undertakers: in 1628, it began to flouriſh, and the colony conſiſted of eight hundred people: but the death of their governor in 1633, gave them a blow they never recovered.

Several of the *companies* have ſince endeavoured to ſet the fiſhing of coral on its ancient footing, but hitherto in vain.

COMPANY, *Guinea*, was eſtabliſhed in 1685. Its grant expired in 1705; but it continued its trade of negroes, by the king's permiſſion, under the name of Aſſiento *company*, to the year 1713; when, by the treaty of Utrecht, that trade was ſurrendered to the Engliſh South-ſea *company*; which ſee.

COMPANY, *Aſſiento*. See *Guinea* COMPANY, and ASSIENTO.

COMPANY, *Cape Verd*, the ſame with that of Senegal, under another name: it was eſtabliſhed in 1664, before the *company* of the Weſt; but the coaſts of Africa being included in the grant of this laſt, we hear no more of the Cape Verd *company* till the year 1675, when it roſe afreſh under the title of *Company of Senegal*. It was further confirmed in 1681; but, being unable to pay its debts, was diſſolved in 1696.

COMPANY, *French South-Sea*, is the ſame with the Aſſiento *company*. See ASSIENTO.

COMPANY, *Canada*, eſtabliſhed in 1628, for the commerce of caſtor-ſkins, &c. Its grant expiring in 1717, it was united to the *company* of the Weſt: which ſee.

COMPANY, *Acadie*, eſtabliſhed in 1683. Its grant expiring in 1703, and the war, &c. preventing a new one, the colony was neglected; and was taken by the Engliſh in 1710, and confirmed to them by the treaty of Utrecht.

COMPANY, *French Levant*, eſtabliſhed in 1670; but its privilege revoked in 1684.

COMPANY, *French North*, eſtabliſhed in 1669, and expiring with its grant in 1690.

COMPANY, *St. Domingo*, eſtabliſhed in 1698, for fifty years, carried on with honour to the year 1720, and then united to the India *company*.

COMPANY, *Daniſh North*, was eſtabliſhed at Copenhagen in 1647. Its eſtabliſhments are very conſiderable in Norway; beſides which, it ſends veſſels to Waranger, whence

they convey their merchandizes by land into the Danish Lapland; and, by sledges drawn by rein-deer, into the Muscovite Lapland. It also sends others for Barandal and Siberia; where its agent takes them up, and conveys them, in like manner, on sledges, to Pangorod, the capital of this part of the Muscovite empire.

The commodities it sends thither are rix-dollars, tobacco, and linens; it returns nothing but furs and skins.

COMPANY, *Danish-Island*, established in the same year with the North *Company*: its chief factory is at Kirkebar, a large town in that island.

COMPANY, *Danish East India*, established about the year 1617; their chief factory is at Tranquebar, whither they send two or three vessels every year.

COMPANY, *Levant, of the Genoese*, established in 1664, and confirmed by the Porte; notwithstanding the opposition of the French.

Its chief commerce was to be in pieces of five sols, which the Genoese had before furnished the Turks withal, though in the French name, and under their banner: they were now to do it under their own banner; and accordingly, while the humour of these pieces lasted, as they served not only for money, but were likewise used by the Greek and Turkish women of the islands, as ornaments in their head-dress, at the bottom of their vests or petticoats, which were covered with them, the *company* succeeded well enough: but that money being afterwards decried in 1670, the *company* has languished ever since; and can now scarce support a miserable commerce.

For a more particular account of the rise and progress of most of the above mentioned *companies*, see Anderson's Hist. of Commerce.

COMPANY, in *Sea Language*, denotes the whole crew of a ship, including her officers.

COMPANY *of Ships*, is used for a fleet of merchant-vessels, who make a kind of charter party among themselves; whereby, under several clauses and conditions tending to their common safety, they engage not to quit one another, but to defend each other reciprocally, during their voyage.

These associates, in the Mediterranean, are called *consorts*. The chief conditions of the charter-party are, that such and such shall be owned admiral, vice-admiral, and rear-admiral; and those that bear no guns, shall pay so much *per cent.* of their cargo, for the expences of the admiral; that such and such signals shall be observed; that if they be attacked, the damages shall be reimbursed by the *company* in general, &c.

COMPANY, *Rule of*, or *Fellowship*, in *Arithmetic*, is a rule whereby we discover, or ascertain, the share of the profits, or losses, belonging to the several partners, or associates, in any enterprize, in proportion to the stock each contributed thereto, and the time that stock was in bank. See FELLOWSHIP.

COMPANY, in *War*, denotes a little body of infantry, commanded by a captain.

The French use the word indifferently for the horse, or foot; but the English appropriate the term troop to a *company* of horse. See TROOP.

Companies of foot of the British establishment commonly used to consist of one captain, one lieutenant, one ensign, three serjeants, three corporals, two drums, and forty-nine private centinels; in all sixty. But, of late years, *companies* have been increased, by the addition of twenty centinels, to eighty men. Ten, and sometimes twelve *companies*, make a regiment.

A *company* in the guards is eighty private men. See REGIMENT and GUARDS.

In the French guards the *company* is a hundred and twenty; in the Swiss guards two hundred.

Companies not embodied into regiments are called *independent companies*. The French also have their *free companies*, who never enter the body of any regiment; and *companies of ordonnance*, who in like manner never enter the body of a regiment, but consist of the gendarmes and light horse. They were instituted by Charles VII. who chose out fifteen captains, under each of whom were to be a hundred lances, or men at arms, each man at arms to receive pay for six persons, himself among the number; the rest to be three archers on horseback, a cutler, and a servant.

COMPANY, *artillery*. See ARTILLERY.

COMPARATES, COMPARATA, in *Logic*, the terms or subjects of a COMPARISON; or the two things compared to each other.

COMPARATIONE—*Punctum ex* COMPARATIONE. See PUNCTUM.

COMPARATIONIS *Homogeneum*. See HOMOGENEUM.

COMPARATIVE *Anatomy*. See ANATOMY.

COMPARATIVE *Degree*, in *Grammar*, is an inflexion between positive and superlative degrees; whose effect *is*, to set a thing above or beneath the level of another.

The Latins expressed their *comparative degree* by a particular termination of their adjectives, and particles; wherein they are followed by the English, though by few others of the modern languages.

The French form most of their *comparatives*, by adding the particles *plus*, *moins*, and *aussi*; the Italians, by *piu*, *meno*, &c. as the thing is to be raised, lowered, or equalled to another.

COMPARISON, the relation of two persons or things, considered as opposed, or set against each other, in order to find wherein they agree or differ; or wherein one has the advantage of the other.

COMPARISON *of Ideas*, an act of the mind, whereby it *compares* its IDEAS one with another, in respect of extent, degree, time, place, or any other circumstances.

This operation of the mind is the ground of RELATIONS.

Brutes seem not to have this faculty in any great degree: they have, probably, several ideas distinct enough; but cannot compare them farther than as to some sensible circumstances annexed to the objects themselves: the power of *comparing* general ideas, which we observe in men, they have not, as we may probably conjecture.

COMPARISON, in *Rhetoric*, is a FIGURE, or rather PLACE, in speech, whereby two things are considered with regard to some third, which is common to them both.

Thus, Cicer. Topic. *Catoni licuit sequi bellum civile, igitur & Ciceroni licebit. It was allowed Cato to engage in the civil wars, therefore it may be allowed Cicero:* where, to engage in the civil wars, is common to both.

There are three kinds of *comparison*; the first *a majori*, i. e. from the major to the minor, as that of Cicero against Anthony, *Quid fecerit domi suæ, cum alienæ tam sit insolens? Or* that of Terence, *Quem ferat, si parentem non ferat suum?* From the same place, Ovid endeavours to appease Cæsar.

Cur ego posse negem timeri Cæsaris iram,
Cum videam natos hostibus esse Deos?

The second, *à minori*, i. e. from the minor to the major: thus Cicero, *Majores nostri sæpe mercatoribus, ac navicularis injuriosus tractatis, bella gesserunt; vos tot civium Romanorum millibus una nuntia atque uno tempore necatis, quo tandem animo esse debetis?*

The third *à pari*; as when we contend, that what obtains in one thing, ought to obtain in another of the same kind: *It was a law, that he who killed his father should be sewed up in a sack, and thrown into a river; therefore he who killed his mother deserves the same punishment.*

Capto tuam, pudet heu, sed capto, Maxime, cænam:
Tu capis alterius; jam sumus ergo pares.
Mane salutatum venio, tu diceris ipse,
Ante salutatum; jam sumus ergo pares, &c
Mart. lib. ii.

COMPARTIMENT, or COMPARTMENT, a design composed of several different figures, disposed with symmetry; to adorn a parterre, a ceiling, pannel of joinery, or the like.

COMPARTMENTS, in *Gardening*, are beds, plats, borders, and walks, laid out according to the form of the ground, and depend more on a good fancy, than on any set of rules, for their construction. They are also sometimes merely diversities or knots of flower-gardens or parterres, of which there is an infinite variety, according to the fancy of the designer. Plain *compartments* are pieces of ground divided into equal squares and flower-beds, marked out by lines, and made of regularly equal length and breadth. Some allow to these squares borders of two feet broad, if the plot of ground be small, and, if larger of three feet, and edge the borders with box, or with upright hardy thyme: the alleys up between are to be laid with sand or gravel, and kept clean weeded.

A COMPARTMENT *of tiles*, is an arrangement of white and red tiles varnished, for the decoration of the covering of a roof.

The term of *compartiment* is also used in painting. The Turkish and Moorish paintings are only *compartiments*: the fine bindings of books are in *compartiments*, &c.

COMPARTIMENT, *alley of*. See ALLEY.

COMPARTIMENT, in *Heraldry*. See QUARTERING.

COMPARTITION, in *Architecture*, the useful and graceful distribution of the whole ground plot of an edifice, into rooms of office, and of reception, or entertainment. *Compartition* makes one of the great divisions of the art of BUILDING.

COMPASS. The mariners, or nautical *compass*, is an instrument used by pilots, to direct the course of their ships.

It consists of a box which includes a magnetical needle, that always turns to the north; allowing for a little declination, which is various in various places, and even, at various times, in the same place. See VARIATION.

In the middle of the box is fixed a perpendicular pivot, which bears a card, or pasteboard, on whose upper surface are described several concentric circles; the outmost of which is divided into 360 degrees; the other into 32 points, answering to the 32 winds; each point being 11° 15′: the four principal, viz. N. S. E. and W. are called cardinal points, and the names of the others are compounded of these.

In the centre of this card is fitted a brass cone, or cap, a little concave, which plays at liberty on the pivot; and along, in the thickness of the card, is fitted the needle, which is covered over with a glass, that its motions may be observed: the whole is inclosed in another box, where it is sustained by brass hoops, to keep the needle horizontal. See DIP. See it represented, *Tab. Navigation, fig.* 1.

The needle is made of a thin plate of steel, in form of a lozenge: the middle being cut out, so as to leave nothing but the extremities and an axis in the middle, to which the cap is fitted. See NEEDLE.

The *compass* has been sometimes observed to be disturbed by the electricity of its glass cover, and this from so slight an application of the finger as was barely necessary to wipe off a little dust. The same glass, rubbed a little more with the finger, a bit of muslin, or of paper, would attract either end of the needle, so as to hold it to the glass for several minutes; far out of the due direction, according to that part of the glass which was most excited. And when the needle, after adhering to the glass, has dropt loose, and made vibrations, those would not be bisected, as usual, by that point where the needle should rest, but either be made all on one side, or be very unequally divided, by means of some remains of electrical virtue in that part of the glass which had attracted the needle, until at length, after fifteen minutes or more, all the electricity being discharged, the magnetical power took place. Phil. Trans. N° 480. p. 243.

The remedy for this inconvenience, is to moisten the surface of the glass; a wet finger will do it immediately and effectually. Phil. Trans. N° 480. p. 244.

There is reason to believe, that glass does at times become in some degree attractive, without any friction at all, and may possibly be excited by great concussions in the air; such as thunder, or the discharge of great ordnance, and so may disturb the *compass*.

The effect of ELECTRICITY and LIGHTNING in giving polarity to *magnetic* NEEDLES, and likewise in reversing them, has been long since, and frequently observed by Dr. Franklin, S. Beccaria, and others. See AURORA BOREALIS, MAGNETS, &c.

The mariner's *compass*, with a chart, is much less dangerously moved than the common *compass* with a bare needle. And the deeper or farther distant the needle hangs below the glass, the less disturbance it is likely to receive.

The minute, irregular, reciprocating variations, which have been observed in the directions of dipping and horizontal needles, and mentioned in the Philosophical Transactions, may probably have been caused by the glasses which covered the instruments made use of. Phil. Trans. N° 425. N° 480. p. 245.

The invention of the *compass* is usually ascribed to Flavio de Melfi, or Flavio Gioia, a Neapolitan, about the year 1302; and hence it is, that the territory of Principato, which makes a part of the kingdom of Naples, where he was born, bears a *compass* for its arms.

Others say, that Marcus Paulus, a Venetian, making a journey to China, brought back the invention with him in 1260. What confirms this conjecture is, that at first they used the *compass* in the same manner as the Chinese still do; i. e. they let it float on a little piece of cork instead of suspending it on a pivot. It is added, that their emperor Chiuingus, a celebrated astrologer, had a knowlege of it 1120 years before Christ. The Chinese only divide their *compass* into twenty-four points.

Fauchet relates some verses of Guyot de Provence, who lived in France about the year 1200, which seem to make mention of the *compass* under the name of *marinette*, or *mariner's stone*; which shews it to have been used in France near a hundred years before either the Melphite or Venetian. The French even lay claim to the invention, from the fleur de lys, wherewith all nations still distinguish the north point of the card.

With as much reason Dr. Wallis ascribes it to the English, from its name *compass*, whereby most nations call it; and which he observes is used in many parts of England to signify a circle.

Though the mariner's *compass* has been long in use, the best construction of it was attended with many inconveniences, till the late improvement which it has received from the invention and experiments of Dr. Gowin Knight, and the farther emendation of Mr. Sneaton.

This chiefly consists in the shape and temper of the NEEDLE; in the discovery of proper means for restoring the loss of magnetism in a voyage, and of contrivances to hinder the card from being greatly affected by the various motions of the ship. However, these contrivances have been found too delicate to encounter the shocks of a tempestuous sea. See *Tab. Navigation, fig.* 2.

AB represents the outer wooden box; C and D are two milled nuts, by means of which the axis of the inner box GH, and ring EF, by which it is supported, are lifted from their edges on which they move, in order to increase the friction, and prevent the too great vibrations occasioned by the motion of the ship in a high sea. I is one of the axes of the inner box, by which it is suspended on the ring EF; KL is the magnet, or needle, of a regular parallelepiped shape, and M a small beam of ivory, best seen in *fig.* 3. that confines the cap to its place. The cap is ivory, so turned, as to be capable of receiving a small bit of agate, which is ground concave, and polished on that side, where it forms the apex of the hollow cone in the cap: the under part of it is represented by C, *fig.* 4. The card, *fig.* 3. is a single varnished paper, reaching as far as the outer circle of figures, which is made of thin brass, with its edge turned down at right angles, as in A and B, *fig.* 4. to the plane of the card, to make it more stiff. F and G are two brass screws that fix the brass edge, &c. to the needle. This brass ring is designed to support the card, and to throw the weight of it as near the circumference as possible, for preventing the effect of the friction at the centre; and is divided into degrees and half-degrees: which divisions are determined by means of a cat-gut line O, *fig.* 2. stretched perpendicularly about the inside of the box, and as near the brass edge as possible. The brass ring, by being placed below the card, and the needle above it, seems to bring the centre of gravity low enough to admit of the cap being put under the needle, so that a hole in the needle is unnecessary; and the needle, being above the card, is more easily touched with a pair of bars. Underneath the card are two small weights, D and E, *fig.* 4. which represents the back side of the card, sliding on two wires, placed at right angles to each other, which by being moved nearer to, or farther from the centre, counterbalance the dipping of the card in different latitudes, and serve to restore the equilibrium of it, when by any other means it happens to be got too much out of level. The pedestal, that supports the card, is represented in *fig.* 5. It contains a sewing needle fixed in two small grooves to receive it, by means of the collet C; and at D the stem of the pedestal is fixed into an octagon, that it may be the more easily unscrewed. P Q R S, *fig.* 2. represents an index, which may be occasionally added at the top of the inner box, and will serve for all altitudes of the object. It consists of a bar, equal in length to the diameter of the inner box, and at each end is furnished with a perpendicular style, having a slit parallel to its sides. One slit, to which the eye is applied, is narrow, and the other is wider, with a small cat-gut stretched up the middle of it, and continued horizontally from the top of one style to that of the other; and there is also a line drawn along the upper surface of the bar. This line, the narrow slit, the horizontal cat-gut, and the perpendicular one, are in the same plane, perpendicular to the horizon, when the inner box is at rest, and hangs freely. The index does not move round, but is always placed on so as to answer the same side of the box. When the index is not wanted for use, it may be taken off, and placed in two pieces, T and V, properly notched to receive it. W represents the handle of the box. The instrument thus constructed serves the purposes of an azimuth and amplitude *compass*. If the sun's azimuth is desired, turn the wooden box, till the shadow of the horizontal thread, or that of the perpendicular thread in one style, or the light through the slit in the other, falls upon the line on the index bar, or vibrates to an equal distance on each side of it; then observe the degree for the azimuth, marked on the brass edge by the cat-gut line, reckoned on the outward circle of figures: and the situation of the index bar, with regard to the card and needle, will shew on what quarter of the *compass* the object is placed. If the rays of the sun are strong enough to cast a shadow, place the eye behind the narrow slit in one of the styles, and turn the box till some part of the horizontal or perpendicular thread appears either to intersect the centre of the sun or to vibrate to an equal distance on each side of it, and let the degree cut by the nonius be observed. If the sun's amplitude were to be observed, the general process is the same; excepting that the degrees are to be numbered on the inner circle of figures on the card, which are the complements of the outer, to 90. Phil. Trans. vol. xlvi. art. 18 and 19. p. 505—517.

Knight's

Knight's *compaſſes* are now generally uſed in the royal navy; and it may be reaſonably expected that they ſhould be provided for merchant ſhips as well as others.

*The uſe of the ſea-*COMPASS *is obvious.* For, the courſe a ſhip is to ſail in, being known by the chart; and the *compaſs* ſo placed, as that the two parallel ſides of the ſquare box be diſpoſed according to the length of the ſhip, i. e. parallel to a line drawn from the head to the ſtern; the rudder is to be directed accordingly; v. gr. if the courſe be found on the chart between the ſouth-weſt and ſouth-ſouth-weſt, i. e. ſouth-weſt ¼ to the ſouth; turn the ſtern ſo as that a line from the ſouth-weſt, ¼ ſouth, exactly anſwer the mark on the middle of the ſide of the box. This is all that is requiſite.

The azimuth COMPASS differs from the common ſea *compaſs* in this; that there is faſtened, on the round box wherein the card is, a broad circle AB (*Tab. Navigation, fig.* 6.) one half whereof is divided into 90 degrees, and thoſe ſubdivided diagonally into minutes: *b c* is an index moveable on *b*, having a ſight, *d a*, erected thereon, and moving on a hinge. From the upper part of the ſight, to the middle of the index, is faſtened a fine hypotheneſal lineſtring *a e*, to give a ſhadow on the line in the middle of the index. The circle AB is croſſed at right angles with two threads, from the extremities whereof are drawn four lines on the inſide of the round box: there are alſo four lines drawn at right angles to each other on the card. The round box fitted with its card, graduated circle, and index, is hung in the braſs hoops BB, and theſe hoops faſtened to the ſquare box CC.

Captain Middleton mentions an *azimuth compaſs* of his own contrivance, by which the variation may be determined with greater eaſe and exactneſs than by any others in uſe before the year 1738. He has given no particular deſcription of it, but only ſhews the manner of uſing it. It carries a teleſcope with a vertical hair in it, and may be conveniently uſed for taking the ſun's altitude by reflection. Phil. Tranſ. abr. vol. viii. p. 374.

The uſe of the azimuth COMPASS is for finding the ſun's magnetical azimuth, or amplitude, and thence the variation of the *compaſs*. If the obſervation be for an amplitude at ſun-riſing, or for an azimuth before noon, apply the centre of the index *b c* to the weſt point of the card, within the box; ſo that the four lines of the edge of the card, and thoſe on the inſide of the box, may meet. If the obſervation be for the ſun's amplitude ſetting, or an azimuth in the afternoon, turn the centre of the index right againſt the eaſt point of the card, and make the lines within the box concur with thoſe on the card; the inſtrument thus fitted for obſervation, turn the index *b c* towards the ſun, till the ſhadow of the thread *a e* fall directly on the ſlit of the ſight, and on the line that is along the middle of the index: then will the inner edge of the index cut the degree and minute of the ſun's magnetical azimuth from the north or ſouth. But note, that if, when the *compaſs* is thus placed, the azimuth is leſs than 45° from the ſouth, and the index *b c* turned towards the ſun, it will paſs off the diviſions of the limb: the inſtrument, therefore, in this caſe, muſt be turned juſt a quarter of the *compaſs*, i. e. the centre of the index muſt be placed on the north or ſouth point of the card, according as the ſun is from you; and then the edge will cut the degree of the magnetic azimuth, or the ſun's azimuth from the north, as before. See AMPLITUDE, and the article COMPASS, above.

The ſun's magnetical amplitude thus found, the variation of the needle is thus determined.

Being out at ſea the fifteenth of May, 1717, in 45° north latitude, the tables give me the ſun's latitude 19° north, and his eaſt amplitude 27° 25′ north: by the *azimuth compaſs*, I find the ſun's magnetical amplitude at his riſing and ſetting: and find he riſes, 9 gr. between the 62d and 63d degree, reckoning from the north towards the eaſt point of the *compaſs*, i. e. between the 27th and 28th degree, reckoning from the eaſt.

The magnetical amplitude, therefore, being here equal to the true one, the needle has no variation; but if the ſun at his riſing ſhould have appeared between the 52d and 53d degree from the north towards the eaſt; his magnetical amplitude would then have been between 37 and 38 degrees, i. e. about 10 degrees greater than the true amplitude: therefore, the needle would vary about 10 degrees north-eaſterly.

If the magnetical eaſt amplitude found by the inſtrument ſhould be leſs than the true amplitude, their difference would ſhew the variation of the needle eaſterly.

If the true eaſt amplitude be ſouthward, as alſo the magnetical amplitude, and this laſt be the greater; the variation of the needle will be north-weſt; and *vice verſa*. What has been ſaid of north-eaſt amplitudes, holds alſo of ſouth-weſt amplitudes. And that of ſouth-eaſt amplitudes, holds of north-weſt amplitudes.

Laſtly, if amplitudes be found of different denominations, v. gr. if the true amplitude be ſix degrees north, and the magnetical amplitude five degrees ſouth; the variation, which in this caſe is north-weſt, will be equal to the ſum of the magnetical and true amplitudes: underſtand the ſame for weſt amplitudes.

The variation may likewiſe be found from the azimuth; but in that caſe, the ſun's declination, latitude of the place, and his altitude, muſt be given, that his true azimuth may be found.

This inſtrument is alſo uſeful in ſettling the ſhip's wake, in order to find the LEE-*way*; and alſo to find the bearings of head-lands, and other objects.

COMPASS is alſo an inſtrument of conſiderable uſe in SURVEYING, DIALLING, &c.

Its ſtructure, in the main, is the ſame with that of the *mariner's compaſs*: conſiſting like that, of a box and needle: the principal difference conſiſts in this, that inſtead of the needle's being fitted into the card, and playing with it on a pivot, it here plays alone; the card being drawn on the bottom of the box, and a circle divided in 360 degrees on the limb. See *Tab. Surveying, fig.* 3. This inſtrument is of obvious uſe to travellers, to direct them in their road: and to miners, to ſhew them what way to dig, with other conſiderable uſes.

1. *To take the declination of a wall by the* COMPASS. Apply that ſide of the *compaſs* whereon the north is marked along the ſide of the wall; the number of degrees over which the north end of the needle fixes, will be the declination of the wall, and on that ſide: v. gr. if the north point of the needle tends towards the north, that wall may be ſhone on by the ſun at noon; if it fix over fifty degrees, counting from the north towards the eaſt, the declination is ſo many degrees from north towards eaſt.

But ſince the needle itſelf declines from the north towards the weſt, with us, 13°; it muſt be noted, that to retrieve the irregularity, 13° are always to be added to the degrees ſhewn by the needle, when the declination of the wall is towards the eaſt; on the contrary, when the declination is towards the weſt, the declination of the needle is to be ſubtracted.

2. *To take an angle with the* COMPASS. Suppoſe the angle required be D A E (*Tab. Surveying, fig.* 4.) apply that ſide of the *compaſs* whereon the north is marked to one of the lines, AD; when the needle reſts, obſerve the degrees at which its north point ſtands, which ſuppoſe 80: ſo many degrees does the line decline from the meridian. In the ſame manner take the declination of the line AE, which ſuppoſe 215°; ſubtract 80° from 215, the remainder is 135: which ſubtracted from 180, there will remain 45°; the quantity of the angle required.

But if the difference between the declination of the two lines exceed 180°; in that caſe, 180° muſt be ſubtracted from that difference; the remainder then is the angle required.

For the method of laying this down on paper, ſee PLOTTING.

Note, in meaſuring angles by the *compaſs*, there needs not any regard be had to the variation; that being ſuppoſed the ſame in all the lines of the angles.

3. *To take a plot of a field by the* COMPASS. Suppoſe the field A, B, C, D, E, (*Tab.* II. *Surveying, fig.* 19.) for the greater accuracy let there be two ſights fitted to the meridian line of the *compaſs*: place it horizontal, and through the ſights look along the ſide AB, or a parallel line to it, applying the eye to the ſight at the ſouth point of the *compaſs*. Draw a rough ſketch of the field by the eye, and on the correſponding line enter down the degree to which the needle points, which ſuppoſe 90; meaſure the length of the ſide, and enter that too, which ſuppoſe 10 chains.

In this manner proceed with all the reſt of the ſides and angles of the field; the ſides, which ſuppoſe 70, 65, 70, 50, 94 fathom; and the angles, which ſuppoſe 30, 100, 130, 240, 300 degrees. To protract the field, ſet down the ſeveral angles obſerved, one after another, and ſubtract the leſſer from the next greater: thus you will have the quantity of the ſeveral angles, and the length of the lines that include them. For the reſt, ſee PLOTTING, and PROTRACTING.

Note, all the angles of the figure taken together, muſt make twice as many right angles, abating two, if no miſtake have been committed.

COMPASS *of proportion*. See SECTOR and PROPORTION.

COMPASS *dials* are ſmall dials, fitted in boxes, for the pocket, to ſhew the hour of the day by direction of the needle; which indicates how to place them right by turning the dial about, till the cock or ſtyle ſtand directly over the needle, and point to the northward: but theſe can never be very *exact*, becauſe of the variation of the needle itſelf. See DIAL.

COMPASS *ſaw*. See SAW.

COMPASSES, or *pair of* COMPASSES, a mathematical inſtrument uſed for the deſcribing of circles, meaſuring lines, &c. The common *compaſſes* conſiſt of two branches

or legs, of iron, brass, or other metal, pointed at bottom; and joined by a rivet, whereon they move, as on a centre. These are reckoned the best, part of whose joint is steel, and where the pin on which the point turns is a steel screw. The points should also be made of hardened and polished steel. In some the points are fixed; in others they may be taken off, and a drawing-pen, pencil, or cutting wheel, substituted in their room.

The invention of *compasses* is ascribed to Talus, nephew of Dædalus by his sister, whom the poets fay Dædalus killed out of envy. We have *compasses* now of various kinds and contrivances, accommodated to the various uses they are intended for: as,

COMPASSES *of three legs*. Their structure is like that of the common *compasses*, letting aside the excess of a leg, which has a motion every way: their use is to take three points at once, and so to form triangles: to lay down three positions of a map to be copied at once, &c.

COMPASSES, *Beam*, consist of a long branch, or beam, carrying two brass cursors; the one fixed at one end, the other sliding along the beam, with a screw to fasten it, on occasion. To the cursors may be screwed points of any kind; whether steel, for pencils, or the like. It is used to draw large circles, to take great extents, &c.

Bow-COMPASSES, or BOWS, are a small sort of *compasses*, that shut up in a hoop, which serves for a handle. Their use is to describe arcs, or circumferences of circles of very small radius.

COMPASSES, *Caliber*. See CALIBER.

COMPASSES, *Glass-makers*, are very substantial, serving to cut pasteboard, brass, &c. jointed like the common *compasses* with a quadrant, or bow, as the *spring compasses*, only its use different: as serving here to keep the instrument firm at any opening.

COMPASSES, *cylindrical and spherical*, used in taking the diameter, thickness, or caliber of round, or cylindric bodies; such as cannons, pipes, &c. They consist of four branches joined in a centre; two of them circular, and two flat, a little bent at the ends.

To use them, one of the flat points is put within the cannon, the other without: the two opposite points shew the thickness. See CALIBER *Compasses*.

There are also *sphero-cal compasses*, differing in nothing from the common ones, but that their legs are arched; serving to take the diameters of round bodies, &c.

COMPASSES, *Elliptic*. Their use is to draw ellipses, or ovals of any kind: they consist of a beam AB (*Tab. Geometry, fig.* 2.) about a foot long, bearing three cursors; to one of which may be screwed points of any kind: to the bottom of the other two are rivetted two sliding dovetails, adjusted in grooves made in the cross branches of the beam. The dove-tails having a motion every way, by turning about the long branch, go backwards and forwards along the cross: so that when the beam has gone half-way about, one of these will have moved the whole length of one of the branches; and when the beam has got quite round, the same dove-tail has got back the whole length of the branch. Understand the same of the other dove-tail.

Note, the distance between the two sliding dove-tails is the distance between the two foci of the ellipsis; so that by changing that distance, the ellipsis will be rounder or slenderer. Under the ends of the branches of the cross are placed four steel points to keep it fast.

The use of this *compass* is easy; by turning round the long branch, the ink, pencil, or other point, will draw the ellipsis required. Its figure shews both its use and construction.

COMPASSES, *German*, whose legs are a little bent outwards towards the top; so that, when shut, only the points meet.

COMPASSES, *Hair*, so contrived within side, as to take an extent to a hair's breadth.

COMPASSES, *Lapidary's*, a piece of wood in form of the shaft of a plane, cleft a-top, as far as half its length; wherewith they measure the angles, &c. of the precious stones, as they cut them. In the cleft is a little brass rule, fastened there, at one end, by a pin; but so that it may be moved in a manner of the bevel; with this kind of square they take the angles of the stones, laying them on the shaft as they cut them.

COMPASSES, *Proportional*, are those whose joint lies between the points terminating each leg: they are either *simple* or *compound*. In the former first the centre is fixed, so that one pair of these serves only for one proportion. *Compound proportional compasses* consist of two branches (*Tab. Geometry, fig.* 3.) each pointed at either end with steel: the length of the branches is cut through, for a cursor to slide up and down; in the middle of which cursor is a screw, serving to join the branches, and to fix them at any point required.

On the one leg are divisions, serving to divide lines into any number of equal parts, for reducing of *figures*, &c. On the other are numbers, for inscribing any regular polygon in a circle proposed.

The use of the first is easy: Suppose, v. gr. a right line required to be divided into three equal parts; push the cursor till the screw be just on the figure 33 where fixing it, take the length of the given line between the longest parts of the legs: the distance between the two shortest will be one third of the given line. In the same manner may the line be divided into any other number of parts.

For the use of the line of polygons: Suppose, v. gr. a pentagon required to be inscribed in a circle; push the cursor till the middle of the screw be against 5, the number of sides in a pentagon; between the shortest parts of the legs take the semidiameter of the circle: the legs thus opened, the distance between the points of the longest parts will be the side of the pentagon to be inscribed in the circle. And thus for a figure of any other number of sides.

Proportional COMPASSES *with the scales lines*. The structure of these also like that of the common *proportional compasses*, only a little nicer, that it needs no particular description. See *Tab. Geometry, fig.* 4.

The lines on the first face are the line of lines, marked *lines*: it is divided into 100 equal parts, every tenth numbered; and the line of chords, which goes to 60°, is marked *chords*.

On the other face are a line of fines to 90°, and a line of tangents to 45°. On the other side are the tangents from 45° 20′ to 71° 34′; on the other, secants from 0° to 70° 30′.

For the use of these compasses: 1. To divide a line into any number of equal parts, less than 100: divide 100 by the number of parts required: flip the cursor till the line on the sliding dove-tail be against the quotient on the line of lines: then, the whole line being taken between the points of the *compasses* most remote from the centre; the aperture of the other will shew the division required. 2. A right line given, supposed to be divided into 100 parts, to take any number of those parts: flip the line on the sliding dove-tail to the number of parts required; the whole line being taken between the points farthest from the centre, the aperture of the other two will include the number of divisions required. 3. The radius being given to find the chord of any arch under 60°: flip the line on the sliding dove-tail to the degrees required on the line of chords: the radius being taken between the points farthest from the center of the cursor; the aperture of the other line will be the chord required, provided the number of degrees be greater than 29: if it be less, the aperture taken from the radius will leave the chord required. 4. If the chord of an arch under 60° be given and the radius required; flip the line on the dove-tail to the degrees given on the line of chords: the given chord being taken between the two points next the cursor, the aperture of the other will be the radius required. 5. The radius being given, to find the fine of any number of degrees. Slip the line on the dove-tail to the degree on the line of lines whose fine is required: the radius taken between the points furthest from the cursor, the aperture of the other will give the fine of the angle required. But if the fine fought be less than 30°, the difference of the apertures of the opposite points will be the fine required. 6. The radius being given, to find the tangent of any number of degrees under 71: if the tangent required be under 26° 30′, then flip the line on the dove-tail to the degree proposed on the tangent line; the radius taken between the points farthest from the cursor, the aperture of the others will be the tangent of the degrees required: if the tangent required be above 29° 30′, but under 45°; the line on the cursor must be flipped to the degrees given on the tangent line: then the radius being taken between the points farthest from the cursor; the aperture of the others will be the tangent. If the tangent required be greater than 45°, but less than 56° 30′, flip the notch on the tangent side of the turned cheek to the degree 0 in the tangent line on the side of the *compass*; the radius taken between the points farthest from the cursor; the difference between the aperture of the other, and these, added together, will be the tangent required. Thus, for the tangents of other degrees under 71.—After the like manner may the secant of any number of degrees under 71 be found.

Mr. Heath, a mathematical instrument-maker in London, constructed a pair of *proportional compasses*, in 1740, with a curious and useful contrivance for preventing the shorter legs from changing their position, when these *compasses* were used. It consisted of a small beam soldered to a screw, and running parallel to the leg of the *compasses*, nearly of the length of the groove; in this

beam a slit was made, which admitted of a sliding-nut, the other end of which fell into a hole in the bottom of the screw, belonging to the great nut of the *compasses*. The screw-pin of the beam passed through an adjustor by means of which the mark on the slider might be brought exactly to any division. But the *proportional compasses* have been much out of use since the invention of the SECTOR.

COMPASSES, *Spring*, or *Dividers*, are made of hardened steel, the head arched: which, by its spring, opens the *compasses*; the opening being directed by a circular screw, fastened to one leg, and let through the other, worked with a nut.

COMPASSES, *Triangular*. See COMPASSES *of three legs*, and TRIANGULAR.

COMPASSES, *Trifectine*, the invention of M. Tarragon, for the trifection of angles, geometrically.

The instrument consists of two central rules, and an arch of a circle of 120 degrees, immoveable, with its radius; the radius is fastened with one of the central rules, like the two legs of a sector, that the central rule may be carried through all the points of the circumference of the arch. The radius and rule must be as thin as possible, and the rule fastened to the radius hammered cold, to acquire an elasticity: the breadth of the other central rule must be triple the breadth of the radius. In this rule there is a groove, with a dove-tail, to be fattened on it, for its motion: in the centre of each rule must likewise be a hole. See the Journ. des Sçavans, Sept. 1688.

COMPASSES, *Turn-up*, a late contrivance to save the trouble of changing the points: the body is like the common *compasses*; towards the bottom of the legs, without-side, are added two other points, beside the usual ones; the one carrying a drawing pen-point, the other a port-crayon, both adjusted so as to turn round, and so be in the way of use, or out of it, as occasion requires.

The points of small *compasses* are tempered by a lamp and blow-pipe, heating them red-hot; when cold, they are hard: the larger are tempered by a charcoal-fire and a blow-pipe, heating them to a cherry-colour, then plunging them in water.

See M. Bion's Construction and Uses of Mathematical Instruments, by Stone; and Robertson's Treatise on the same subject.

COMPASSING, in *Naval Architecture*, a term used to denote such pieces of timber as are incurvated into the figure of an arch.

COMPASSING *the king's death*, in *Law*. See TREASON.

COMPASSION, COMMISERATION, in *Ethics*, a mixed passion, compounded of love and sorrow, and excited by the sight or recital of distress. Hobbes makes this a merely selfish passion, and defines it, as being fear for ourselves; Hutcheson resolves it into INSTINCT: but Dr. Butler much more properly considers *compassion* as an original, distinct, particular affection in human nature. Hobbes of Human Nature, cap. ix. sect. 10. Hutcheson's Enquiry into Moral Good and Evil. Butler's Sermons, Serm. v. and vi.

COMPATIBLE, something that may suit, or consist with another. See INCOMPATIBLE.

COMPENDIUM, an abstract, EPITOME, or reduction of a large matter into a little compass.

COMPENSATION, an action whereby any thing is admitted as an equivalent to another.

COMPENSATION, in the *Civil Law*, is a kind of right, whereby a debtor pursued by his creditor, for the payment of a debt, demands that the debt may be *compensated* with what is owing him by the creditor.—*Compensation* is equivalent to payment, and answers to that which is called SET-*off*, in common law.

COMPERTORIUM, in the *Civil Law*, denotes a judicial inquest made by delegates, or commissioners to find out, and relate the truth of a cause.

COMPETENCE, or COMPETENCY, in *Law*, the authority, or right, of a judge, for taking cognizance of any matter. See JURISDICTION.

COMPETENT *witnesses*. See WITNESS.

COMPETENTES, in *Church History*, an appellation given to the *catechumens*, when, being sufficiently instructed in the Christian religion, they required BAPTISM.

COMPITA, in *Zoology*, a name by which some have called the *cimex major*, or BIJABELLE, the great Venetian *cimex*.

COMPITALIA, or COMPITALITIA, feasts held among the ancients in honour of the *lares*.

The word comes from *compitum*, a *cross-way*; because the feast was held in the meeting of several roads.

The *compitalia* are more ancient than the building of Rome. Dionysius Halicarnassæus, and Pliny, indeed say, that they were instituted by Servius Tullius: but this only signifies, that they were then introduced into Rome.

Notwithstanding what Dion relates, that the *compitalia* were celebrated a little after the Saturnalia, and that the Roman calendar fixes them on the twelfth of January, it appears that they had not fixed any day, at least, not in the time of Varro, as is observed by Columbon.

The feast being thus moveable, the day whereon it was to be observed, was proclaimed every year. It was ordinarily held on the fourth of the nones of February, i. e. on the second of that month. Macrobius observes, that they were held not only in honour of the *lares*, but also of *mania*, *modasti*. The priests who officiated at them were slaves and infants; and the sacrifice was a few. They were re-established, after a long neglect, by Tarquin the Proud, on occasion of an answer of the oracle, *That they should sacrifice heads for heads*, i. e. that for the health and prosperity of each family, children were to be sacrificed: but Brutus, after expelling the kings, in lieu of those barbarous victims, substituted the heads of garlick and poppy; thus satisfying the oracle, which had enjoined *capitia, heads*, at an easier rate.

During the celebration of this feast, each family placed at the door of their house, the statue of the goddess *Mania*: they also hung up at their doors figures of wool, representing men and women; accompanying them with supplications that the *Lares* and *Mania* would be contented with those figures, and spare the people of the house.

As for slaves, in lieu of the figures of men, they offered balls or fleeces of wool. Servius Tullus ordered, that the slaves who assisted at the *compitalia*, should be free during the whole time of the feast. Augustus ordered the statues of the *Lares*, placed in the cross-ways, to be adorned with flowers twice a year.

COMPLAINANT, in *Law*, a PLAINTIFF, or one who prefers a *complaint* against another, to be relieved by justice or equity.

COMPLEMENT, *Arithmetical*. See ARITHMETICAL.

COMPLEMENT, in *Astronomy*, is used for the distance of a star from the zenith; or the arch comprehended between the place of the star above the horizon, and the zenith.

COMPLEMENT *of the course*, in *Navigation*, is the number of points the course wants of 90 degrees, or eight points; viz. of a quarter of the compass.

COMPLEMENT *of the curtin*, in *Fortification*, that part of the anterior side of the CURTIN, which makes the DEMI-GORGE.

COMPLEMENT *of the line of defence*, is the remainder of the line of DEFENCE, after you have taken away the ANGLE of the flank.

COMPLEMENT, in *Geometry*, is what remains of a quadrant of a circle, or of ninety degrees, after any certain arch has been retrenched from it.

Thus, if an arch or angle be 30 degrees, we say its *complement* is 60 degrees, since 60+30=90.

The arch and its *complement* are relatives; and are only used with regard to each other.

The sine of the *complement* of an arch is called the *co-sine*; of a tangent, the *co-tangent*, &c.

We sometimes also say the *complement of an angle*; meaning so much as it wants of a right angle, or of 90 degrees.

COMPLEMENTS *of a parallelogram*, are the two lesser parallelograms, made by drawing two right lines parallel to each side of a parallelogram, through a given point in the diagonal.

Such are the parallelograms C and M (*Tab. Geometry, fig.* 1.)—It is demonstrated, that in every parallelogram, the *complements* C and M are equal: for Z+C+o =R+M+x; as making up on each side the great triangles, made equal by the diagonal; of which, Z=R, and o=x (because the diagonal makes them so); wherefore the the remaining PARALLELOGRAM C=M.

COMPLEMENT *of life*, in the *Doctrine of Life Annuities*, is the number of years which a given life wants of 86. Thus 56 is the *complement* of 30, 30 of 50, &c. Mr. De Moivre supposes an equal decrement of life through all its stages till the age of 86, which he considered as the utmost probable extent of life. Thus, if there be 56 persons alive at 30 years of age, it is supposed that one will die every year, till, in 56 years, they will be all dead. The same will happen to 46 at 40, in 40 years, and thus for all ages. This hypothesis is far conformable to Dr. Halley's table, formed from his observations at Breslaw, that the value of lives deduced either from the hypothesis, or the table need not be distinguished; and it very much eases the labour of calculating them. De Moivre's Treatise on Annuities, annexed to his Doctrine of Chances, p. 265. Price's Observations on Reversionary Payments p. 2. See LIFE-*Annuities*.

COMPLEMENT *of an interval*, in *Music*, is the quantity which it wants of an OCTAVE. See INTERVAL.

COMPLEX, a term ordinarily used as synonymous with *compound*; though, strictly speaking, there is some difference between them.

Complex is properly applied where a thing contains divers others; or consists of divers parts, not really distinct

from one another; but only imaginarily, or in our conception.

In Logic, *Complex* is opposed to simple, and *compound* to single.

COMPLEX *object*. See OBJECT.

COMPLEX *opposition*. See OPPOSITION.

COMPLEX *term*, or *idea*, is a TERM or IDEA compounded of several simple or incomplex ones.

Thus, in the proposition, *A just God cannot leave crimes unpunished*; the subject of this proposition, viz. *a just God*, is a *complex term*, or stands for a *complex idea*, composed of two simple, or *incomplex* ones, viz. *God* and *Just*. Mr. Locke observes, that though the mind be perfectly passive in the formation of simple ideas; yet it exerts several actions of its own about them, when once formed: and that by this means it is, that they become the materials and foundation out of which all our knowledge is framed.

These acts are chiefly three, viz. 1. The combining of several simple ideas into one compound one: and thus it is that all *complex* ideas are made.

2. The bringing two ideas, whether simple or *complex*, together; setting them by each other, and so viewing them, without uniting them into one; by which it gets its idea of RELATION.

3. The separating several ideas from all other ideas that accompany them in their real existence: and thus all its general ideas are formed.

As simple ideas are observed to exist in several combinations united together; so the mind may consider them as united, not only as they are really united in external objects, but as itself has joined them: ideas thus made up of several simple ones put together, we call *complex*; as man, beauty, army, gratitude, &c.

Complex ideas, however compounded and decompounded, though their number be infinite, and their variety endless, may be all reduced under these three heads, viz. *modes*, *substances*, and *relations*; which see under their proper heads. MODE, SUBSTANCE, and RELATION.

Complex ideas are often considered as simple and distinct beings, though made up of several simple ideas; as body, spirit, &c.

COMPLEX *proposition*, in *Logic*, is that in which the subject, or predicate, or both, are made up of *complex* terms: and if the term added to the subject be essential or necessary to it, then it is called *explicative*; otherwise it is *determinative*, the adjoined term limiting the subject to a particular part of its extension. Some logical writers ascribe the *complexion* of a proposition, in some cases, to the copula, as in modal propositions; but this rather pertains to the predicate. See *Compound* and *Modal* PROPOSITION.

COMPLEX *syllogism*, is that, in which the middle term is not connected with the whole subject, or the whole predicate in two distinct propositions, but is intermingled and compared with them by parts: e. g. The sun is a senseless being, the Persians worshipped the sun, therefore the Persians worshipped a senseless being.

COMPLEXI *pars*, in *Anatomy*, a name given by Riolanus, and others, to a muscle called by Albinus *biventer cervicis*, and by some the *complexus*.

COMPLEXIO, COMPLEXION, in *Metaphysics*, the union, or coalition of several things different from each other; either really, or only in our conception. See COMPLEX.

COMPLEXIO, in *Logic*, is sometimes applied to the second operation of the mind, viz. the judgment; considered as it affirms or denies any thing; such affirmation, &c. necessarily importing a combination of several things.

Complexio is sometimes also used by logicians in the sense of dilemma.

COMPLEXIO, in *Rhetoric*, &c. is a figure including a repetition, and a connexion at the same time; the sentence both beginning, and ending, with the same word.

Thus Tully: *Quis hæc tulit? Rullus. Quis monstrorum partem populo fore gis provavit? Rullus. Quis comitiis præsidet? Rullus.*

COMPLEXION, in *Physics*, is used for the temperature, habitude, or natural disposition of the body.

Some philosophers distinguish four general and principal *complexions* in man, viz. the *sanguine complexion*, which according to them, answers to the air; having the qualities thereof, as being hot, and moist. It takes its name from *sanguis*; because the blood is there supposed to be predominant.

The *phlegmatic complexion* takes its name from the pituita, or phlegm, in which it abounds; and corresponds to water; being cold and moist.

The *bilious*, or *choleric complexion*, takes its name from the bile, or choler: it is supposed of the nature of fire, hot and dry.

Lastly, the *melancholic complexion* partakes of the nature of earth, being cold and dry. But this sort of reasoning is now not much regarded.

COMPLEXUS, or *Par* COMPLEXUM, in *Anatomy*, is a pair of muscles, arising with six thin small tendons from the transverse processes of the vertebræ of the neck and thorax, growing fleshy in its ascent; again becoming tendinous about the middle; and again fleshy, where it is inserted laterally into the posterior part of the upper transverse line of the *os occipitis*, and the hind part of the *processus mastoides*. See *Tab. Anat. Myol.* fig. 7. n. 5.

The former is called *complexus major*, and the latter *complexus minor*, or *mastoideus lateralis*. Winslow.

This last is often mistaken for a portion of the *longissimus dorsi*. Some anatomists have reckoned four of these muscles instead of two.

When they act together, they pull the head directly backwards: but either of them acting alone, it draws it obliquely back.

COMPLICATION *of diseases*, a mixture, or combination of several diseases; especially where they have any affinity to one another; as the dropsy, asthma, and jaundice, happening together.

What much perplexes the physicians is, when with a fever there is a *complication* of some other disorder.

COMPLINE, in *Ecclesiastical Antiquity*, denotes that evensong, which completed the whole service of the day in religious houses, and began at nine of the clock at night.

COMPLUTENSIAN *Bible*. See *Greek* BIBLES.

COMPONE, or COMPONED, or *Cobony*, in *Heraldry*.—A bordure *compony*, is that formed or composed of a row of angular parts, or checquers of two colours. See *Tab. Heraldry*, *fig.* 19.

COMPONED, or COMPOSED, is also used in general for a bordure, a pale, or a fesh, composed of two different colours, or metals, disposed alternately, separated and divided by fillets, excepting at the corners; where the junctures are made in form of a goat's foot.

COMPOS *Mentis*. See NON-COMPOS.

COMPOSED *Bastion*. See BASTION.

COMPOSITE *Numbers*, those that can be measured by some number, besides itself, above unity; as 12, by 2, 3, 4, and 6.

Compositi numbers between themselves, are the same with COMMENSURABLE *numbers*.

COMPOSITE *Order*, in *Architecture*, the last of the five orders of columns; so called, because its capital is *composed* out of those of the other orders. See *Tab. Architecture*, *fig.* 28.

It borrows a quarter-round from the Tuscan and Doric; a double row of leaves from the Corinthian; and volutes from the Ionic: its cornice has fingle modillions, or dentils.

The *composite* is also called the Roman and the Italic order, as having been invented by the Romans; conformably to the rest, which are denominated from the people among whom they had their rise.

Most authors rank this after the Corinthian; either as being the richest, or as the last that was invented: Scamozzi alone places it between the IONIC and CORINTHIAN; out of a view to its delicacy and richness, which he esteems inferior to that of the Corinthian; and therefore makes no scruple to use it under the Corinthian; wherein he is followed by M. le Clerc.

The proportions of this order are not fixed by Vitruvius; he only marks its general character, by observing that its CAPITAL is composed of several parts taken from the Doric, Ionic, and Corinthian: he does not seem to regard it as a particular order; nor does he vary it at all from the Corinthian, except in its capital. In effect, it was Serlio who first added the *composite* order to the four of Vitruvius, forming it from the remains of the temple of Bacchus, the arches of Titus, Septimius, and the goldsmiths: till then, this order was esteemed a species of the Corinthian, only differing in its capital.

The order being thus left undetermined by the ancients, the moderns have a kind of right to differ about its proportions, &c. Accordingly Scamozzi, and after him M. le Clerc, makes its column nineteen modules and a half, which is less by half a module than that of the Corinthian: as, in effect, the order is less delicate than the Corinthian. Vignola makes it twenty; which is the same with that of his Corinthian: but Serlio, who first formed it into an order, by giving it a proper ENTABLATURE and BASE, and after him M. Perrault, raise it still higher than the Corinthian.

This last does not think different ornaments and characters sufficient to constitute a different order, unless it have a different height too: agreeably, therefore, to his rule of augmenting the heights of the several columns by a series of two modules in each; he makes the *composite* twenty modules, and the Corinthian eighteen; which, it seems, is a medium between the arches of Titus and the temple of Bacchus.

For the parts of the order, see COLUMN, FRIEZE, PEDESTAL, &c.

M. Per.

M. Perrault, in his Vitruvius, diſtinguiſhes between *compoſite* and *compoſed* order. The latter, he ſays, denotes any compoſition whoſe parts and ornaments are extraordinary, and unuſual; but have, withal, ſomewhat of beauty; both on account of their novelty, and in reſpect of the matter, or genius of the architect: ſo that a *compoſed* order is an arbitrary, humorous compoſition, whether regular or irregular.

The ſame author adds, that the Corinthian order is the firſt *compoſite* order, as being compoſed of the Dorie and Ioſic; which is the obſervation of Vitruvius himſelf, lib. iv. cap. 1.

COMPOSITE *ſtalk*. See STALK.

COMPOSITIO *menſurarum*, the title of an ancient ordinance for meaſures, not printed; it is mentioned in the ſtatute of 23 Hen. VIII. cap. 4.

COMPOSITION, in a general ſenſe, is the uniting or joining of ſeveral diſtinct things, ſo as to form one whole, called a *compound*.

The ſchoolmen diſtinguiſh two kinds of *compoſition*; the one *entitative*, which is between things of the ſame nature, e. gr. two or more drops of water: the other *eſſential*, when things of different kinds are joined, and thus conſtitute new things, or eſſences, different from any of the parts: and thus, ſay they, from the matter and the form of wood, ariſes wood; whoſe eſſence is very different from either of thoſe ingredients taken ſeparately.

COMPOSITION *of bodies*, in *Chemiſtry*. See COMBINATION and AFFINITY.

COMPOSITION, in *Commerce*, a contract between an inſolvent debtor and his creditors; whereby the latter agree to accept of a part of the debt, in compenſation for the whole, and give a general acquittance accordingly.

COMPOSITION, in *Grammar*, denotes the joining of two words together; or prefixing a particle to another word, to augment, diminiſh, or change its ſignification. See WORD, &c.

COMPOSITION *of ideas*, is an operation of the mind, whereby it combines ſeveral of its SIMPLE ideas into COMPLEX ones.

Under the ſame operation may likewiſe be reckoned that of enlarging; whereby we put ſeveral ideas together of the ſame kind, as ſeveral units to make a dozen.

In this, as in others, brutes come far ſhort of men; for though they take in and retain ſeveral combinations of ſimple ideas; as poſſibly, a dog does the ſhape, ſmell, and voice of his maſter; yet theſe are rather ſo many diſtinct marks whereby he knows him, than one complex idea, made out of thoſe ſimple ones.

COMPOSITION, in *Law*. See MODUS.

Compoſitions were anciently allowed for crimes and offences, even for murder. By this expedient it was propoſed to reſtrain the violence of private revenge. The cuſtom may be traced back to the ancient Germans, and prevailed in other uncivilized nations. Tavernier relates, that in Perſia a murderer is ſtill delivered to the relations of the perſon whom he has ſlain, who put him to death with their own hands; and if they refuſe a ſum of money as a compenſation, the ſovereign cannot pardon the murderer. Robertſon's Hiſt. vol. i. chap. v. p. 363.

COMPOSITION, in *Logic*, is a method of reaſoning, wherein we proceed from ſome general ſelf-evident truth, to other particular and ſingular ones.

The method of *compoſition*, called alſo *ſyntheſis*, is juſt the reverſe of that of *reſolution*, or *analyſis*.

Reſolution is the method whereby we ordinarily ſearch after truth; *compoſition*, that whereby a truth found, is diſcovered and demonſtrated to others: reſolution is the method of inveſtigation; *compoſition*, of demonſtration.

The method of *compoſition* is that uſed by Euclid, and other geometricians; reſolution, that uſed by algebraiſts and philoſophers. The two methods differ juſt as the methods of ſearching a genealogy; which are either by deſcending from the anceſtors to the poſterity, or by aſcending from the poſterity to their anceſtors: each have this in common, that their progreſſion is from a thing known, to another unknown.

The method of *compoſition* is beſt obſerved by the mathematicians; the rules hereof are, 1. To offer nothing but what is couched in clear expreſs terms; and to that end to begin with definition. 2. To build only on evident and clear principles; to that end, to proceed from axioms or maxims. 3. To prove demonſtratively all the concluſions that are drawn hence; and to this purpoſe, to make uſe of no arguments or proofs, but definitions already laid down, axioms already granted, and propoſitions already proved; which ſerve as principles to thoſe that follow.

COMPOSITION, in *Muſic*, is the art of diſpoſing muſical ſounds into airs, ſongs, &c. either into one, or more parts; to be ſung with the voice, or played on inſtruments.

Zarlini defines *compoſition* to be the art of joining and combining CONCORDS together, which are the matter of muſic: but this definition is too ſcanty; becauſe DISCORDS are always uſed with concords in the *compoſition* of parts.

Under *compoſition* are comprehended the rules, 1. of *melody*, or the art of making a ſingle part; i. e. of contriving and diſpoſing the ſimple ſounds, ſo as that their ſucceſſion and progreſs may be agreeable. 2. Of *harmony* or the art of diſpoſing and concerting ſeveral ſingle parts ſo together, that they make one agreeable whole.

It may be here obſerved, that melody being chiefly the buſineſs of the imagination, the rules of *compoſition* ſerve only to preſcribe certain limits to it; beyond which, the imagination, in ſearching out the variety and beauty of airs, ought not to go: but harmony being the work of judgement, its rules are more certain, extenſive, and more difficult in practice.

In the variety and elegance of the melody, the invention labours a great deal more than the judgement; ſo that method has but little place: but in harmony it is otherwiſe; the invention, here, has nothing to do; and the *compoſition* is conducted from a nice obſervation of the rules of harmony, without any aſſiſtance from the imagination at all.

COMPOSITION *of motion*, is an aſſemblage of ſeveral directions of motion, reſulting from powers acting in different, though not oppoſite lines.

If a point move or flow according to one and the ſame direction; whether that motion be equable or not, yet it will ſtill keep the ſame right line; the celerity alone being changed, i. e. increaſed, or diminiſhed, according to the forces with which it is impelled. If the directions be oppoſite, as one, e. gr. directly downward, the other upward, &c. yet ſtill the line of motion will be the ſame.

But if the compounding motions be not according to the ſame line of direction, the compound motion will not be according to the line of direction of any of them, but in a different one from them all; and this either ſtraight or crooked, according as the direction or celerities ſhall require.

If two compounding motions be each of them equable, the line of the compound motion will ſtill be a ſtraight line; and this, though the motions be neither at right angles one to another, nor equally ſwift, nor (each to itſelf) equable; provided that they be but finite; that is, both accelerated and retarded alike.

Thus, if the point *a* (*Tab. Mechanics, fig. 4.*) be impelled equally with two forces; viz. upwards, towards *b*, and forwards, towards *d*; it is plain, that when it is gone forwards as far as *a c*, it muſt of neceſſity be gone upwards as far as *e c*; ſo that were the motions both equable, it would always go on in the diagonal *a e*.

Nay, ſuppoſe the motions unequal as to celerity, ſo, v. gr. as that the body move twice as faſt upwards as forwards, &c. yet it ſtill muſt go on in the diagonal *a e*; becauſe the triangles *a e i*, *a c i*, &c. and *a c d* will ſtill be ſimilar, being as the motions are; and it will have deſcribed the diagonal in the ſame time which it would have required to deſcribe either of the ſides ſingly.

But, if the motions be diſſimilar, then the *compound* motion muſt be a curve.

And, if a body, as *b* (*fig. 5.*) be impelled or drawn by three different forces, in the three different directions *b a*, *b c*, and *b d*, ſo that it yields to none of them, but continues in *æquilibrio*; then will thoſe three powers or forces be to one another, as three right lines drawn parallel to thoſe lines, expreſſing the three different directions, and terminated by their mutual concourſes.

Let *b e* repreſent the force by which the body *b* is impelled from *b* to *a*; then will the ſame right line *b e* repreſent alſo the contrary equal force, by which *e* is impelled from *e* to *a*; but by what hath been ſaid before, the force *b e* is reſolvable into the two forces acting according to the two directions *b d* and *b c*, to which the other impelling from *b* to *e*, is as *b c* to *b d*, and *b c* or *d e*, reſpectively.

So likewiſe two forces, acting without the directions *b d*, *b a*, and being equipollent to the force acting without the direction *b e*, from *b* to *e*; will be to the force acting according to the direction *b c*, from *b* to *c*, as *b d*, *b c*, to *b c* and therefore, the forces acting in the directions *b d*, *b c*, and equipollent to the force acting in the direction *b e*, are to the force acting in the direction *b c*, as *b d*, *b c*, or *d e*, to *b c*: that is, if a body be urged by three different equipollent powers in the directions *b a*, *b d*, and *b c*; theſe three forces ſhall be to one another as *b e*, *b d*, and *d e*, reſpectively.

This theorem, with its corollaries, Dr. Keill obſerves, is the foundation of all the new mechanics of M. Varignon: by help hereof, may the force of the muſcles be computed, and moſt of the mechanic theorems in Borelli,

relli, De Motu Animalium, be immediately deduced. See MOTION.

COMPOSITION *of numbers and quantities*. See COMBINATION.

COMPOSITION, in *Oratory*, the order and coherence of the parts of a discourse.

As a part of general ELOCUTION, it regards the turn and harmony of the periods: and therefore to *composition* belong both the artful joining of the words, whereof the style is formed, and whereby it is rendered soft and smooth, gentle and flowing, full and sonorous; or the contrary: and the order, which requires things first in nature and dignity, to be put before those of inferior consideration.

Composition consists of four parts: which rhetoricians call PERIOD, ORDER, JUNCTURE, and NUMBER. Ward's Oratory, vol. i. p. 340.

COMPOSITION, in *Painting*, includes the invention as well as disposition of the figures, the choice of attitudes, &c. *Composition*, therefore, consists of two parts; one of which finds out, by means of history, proper subjects for a picture, and the other disposes them to advantage.

COMPOSITION, in *Pharmacy*, the art, or act, of mixing divers ingredients together in a medicine; to that they may aid each other's virtues, supply each other's defects, or correct any ill qualities thereof.

COMPOSITION, in *Printing*, ordinarily called *compositing*, is the arranging of several types or letters in the composing-stick, into order to form a line; and of several lines ranged in order in the galley, to make a page; and of several of those to make a form.

The *composing-stick* is made of iron generally, sometimes of brass, or wood; of greater or less length or depth, according to the page to be composed, or the compositor's fancy: it has two sliding pieces, to be fastened by means of a nut and screw, which are slipped forwards or backwards, at the pleasure of the compositor, and according to the space which the lines, notes, &c. are to take up. See *Tab. Agriculture, fig.* 5.

The *composing-stick* animarly contains seven or eight lines of a middle-sized letter; these, when set, are taken out, by help of a thin slip of brass, termed a rule, and dispatched in the galley; and others composed, till a page be formed. The page being composed, is tied up, and set aside; and the rest of the pages of the sheet prepared in the same manner: when done, they are carried to the imposing or correcting-stone; there ranged in order, and disposed in a chase, or iron-frame, fitted with wooden furniture; then, the quoins being struck in, it is carried to the press to be printed.

COMPOSITION *of proportion*. If there be two ratios, wherein the antecedent of the first is to its consequent, as the antecedent of the other is to its consequent: then, by *composition* of proportion; as the sum of the antecedent and consequent of the first ratio, is to the antecedent, or the consequent, of the first; so is the sum of the antecedent and consequent of the second ratio, to the antecedent, or the consequent of the second.

E. gr. If A : B :: C : D: then by *compositon*, A + B : A or B :: C + D : C or D.

COMPOSITION *of ratios*, in *Arithmetic* and *Algebra*, is performed by multiplying the quantities or exponents of two or more ratios together: the produce is then said to be compounded of the ratios whose components were multiplied. Thus if the quantities or exponents of the ratios *a* to *b*, *c* to *d*, *e* to *f*, be multiplied, we shall have $\frac{a}{b} \times \frac{c}{d} \times \frac{e}{f} = \frac{ace}{bdf}$. And the ratio *a c e* to *b d f*, is then said to be compounded of the several ratios *a* to *b*, *c* to *d*, *e* to *f*, &c. Thus also the ratio of 10 to 12, is compounded of the ratio 2 to 3, and of 3 to 4; for $\frac{2}{3} \times \frac{3}{4} = \frac{6}{12} = \frac{10}{12}$.

This operation is by some called *addition* of ratios.

COMPOSSIBLES, *compossibilia*, in *Logic*, such things as are COMPATIBLE, or capable of subsisting together.

COMPOST, in *Agriculture* and *Gardening*, a compound, or mixture of earths, dungs, &c. applied by way of MANURING, for the meliorating and improving of soils, and assisting the natural earth in the work of vegetation.

The gardeners have magazines, or layfalls of *composts*, adapted to the different sorts of soil. Light loose land requires a compost of a heavy nature; such as the scourings of ditches, ponds, &c. mixed with earth, dung, &c. A heavy, clayey, or cloddy land, requires a *compost* of a more sprightly and active kind, to insinuate into the heavy lumpy clods, as dungs, soils, ashes, and natural nitre.

Mr. Bradley prescribes several different sorts of *composts*, to forward the growth of trees; viz. a quantity of fine loam, broken and mixed with sharp sand, and ashes of burnt furzes, weeds, &c. or fine soil with sand and burnt grass-turf, and rotten-wood: or fine soil with sand and rape-seed, after the oil is pressed out, with burnt turf; or fine soil with sand and malt-grains; or cheese-dung, with wood-ashes and loam, or mother earth.

The same author recommends a mixture or preparation of soils answering to loam, or mother-earth, as greatly preferable for planting or sowing forest-trees in, to any of those richer *composts* which, though they hasten the growth of the tree, will not make the timber near so firm and durable.

COMPOUND, the result or effect of a composition of different things; or that which arises from them.

Strictly speaking, every new *composition* does not produce a new *compound*; but only that from which a new essence arises. Thus, when one drop of water is added to another, there does not arise a new physical *compound*; the essence being the same now, as before the union.

COMPOUND differs from COMPLEX, and stands opposed to SIMPLE.

We say, the ingredients of a *compound*; apothecaries are great dealers in *compounds*.

COMPOUND *Flower*. See FLOWER.

COMPOUND *Force, Formi, Fossil, Fruition, Fracture, Gland, Harmony*. See the substantives.

COMPOUND *interest*, called also *interest upon interest*, is that which is reckoned not only upon the principal, but upon the INTEREST itself forborn; which hereby becomes a sort of secondary principal.

COMPOUND *Machine, Masonry*. See the substantives.

COMPOUND *motion*, that motion which is effected by several conspiring powers.

Powers are said to conspire, if the direction of the one be not directly opposite to that of the other; as when the radius of a circle is conceived to revolve about a centre; and at the same time a point to move straight along it. All curvilinear motion is *compound*.

It is a popular theorem, in *Mechanics*, that in an uniform *compound* motion, the velocity produced by the conspiring powers, is to that of either of the powers separately, as the diagonal of a parallelogram, according to the direction of whose sides they act separately, to either of the sides.

COMPOUND *numbers*. See COMPOSITE.

COMPOUND *pendulum*, in *Mechanics*, that which consists of several weights constantly keeping the same distance, both from each other, and from the centre about which they oscillate. See PENDULUM.

COMPOUND *proposition*. See PROPOSITION.

COMPOUND *quantities*, in *Algebra*, are such as are connected together by the signs + and −: thus, $a + b - c$, and $b a - b$, are *compound* quantities.

COMPOUND *ratio* is that which the product of the antecedents of two or more ratios has to the product of their consequents.

Thus 6 to 72 is a ratio *compounded* of 2 to 6, and 3 to 12. See PROPORTION, and COMPOSITION *of ratios*.

COMPOUND *Sounds, Sucds, Taste, Ulcer, Words*. See the substantives.

COMPOUNDED *idea*, in *Logic*, unites several ideas of a different kind, which are usually considered as distinct single beings, whether those united ideas be SIMPLE or COMPLEX. See COLLECTIVE *idea*.

COMPOUNDING *felony*, in *Law*. See TIPPET-BOTE.

COMPREHENSION, in *English Church-History*, denotes a scheme proposed by sir Orlando Bridgman in 1667-8, for relaxing the terms of conformity in behalf of protestant dissenters, and admitting them into the communion of the church. A bill for this purpose was drawn up by lord chief baron Hale, but disallowed. The attempt was renewed by Tillotson and Stillingfleet in 1674, and the terms were settled to the satisfaction of the non-conformists, but the bishops refused their assent. This scheme was likewise revived again immediately after the Revolution; the king and queen expressed their desire of an union; however the design failed after two attempts; and the act of TOLERATION was obtained. Birch's Life of Tillotson, p. 47, 167, &c.

COMPREHENSION, in *Metaphysics*, is that act of the mind, whereby it apprehends, or knows, any object presented to it, on all the sides, whereon it is capable of being apprehended, or known.

To *comprehend* a thing, is defined by the schoolmen, *rem aliquam totam & totaliter cognoscere*. See APPREHENSION.

COMPREHENSION, in *Rhetoric*, a trope, or figure, whereby the name of a whole is put for a part; or that of a part for a whole; or a definite number of any thing for an indefinite.

COMPRESS, in *Surgery*, a bolster of linen cloth, folded in several doubles, and laid under the bandage, to prevent a wound from bleeding or swelling; or to retain the medicines applied thereto.

The word comes from, *comprimere, to press hard*.

Scultetus, in his Arsenal of Chirurgery, observes that the

ancients composed their *compresses* of carded flax, or of feathers, sewed between two linens; and called them pillows, or plumages, *pulvini*, or *pulvilli*, &c.

It is frequently the custom among surgeons, after the plaster and other dressings are applied, to cover all with a *compress*, which is made of the softest old linen, four, six, or eight times doubled. These are of service, not only by preserving the parts from the injuries of the external air, but also for securing and fixing the plasters, and other dressings.

Compresses are also frequently applied where no plaster is made use of; sometimes dry, sometimes wetted with certain liquors, which are supposed to be strengthening, emollient, resolving, lenient, cooling, &c. They are frequently dipped in the decoctions of certain herbs, into wine, spirit of wine, vinegar, or oxycrate, and sometimes into lime-water, and are administered either cold or hot, as the nature of the case requires.

Compresses are of various forms, suited to different occasions.

Compresses of all kinds are intended for these purposes: 1. To preserve and cherish the natural heat of the body. 2. To secure the dressings that are laid under them. 3. To convey liquid remedies to parts wounded, or otherwise disordered, and to prolong the use of them. 4. To fill up any cavities or depressions of the parts, that the dressings (especially in fractures), may be applied with greater security: and lastly, to prevent bandages from bringing on a troublesome itching, or other pain or uneasiness on the skin. Heister.

COMPRESSION, the act of pressing, or squeezing something, so as to set its parts nearer to each other, and make it possess less space.

Compression properly differs from *condensation*, in that the latter is performed by the action of cold, the former by some external violence: or, more strictly speaking, *compression* is the action of any force on a body, without regarding its effect; whereas *condensation* denotes the state of a body that is actually reduced into a less bulk.

Pumps, which the ancients imagined to act by suction, do, in reality, act by *compression*; the *embolus*, or sucker, in going and returning in the narrow pipe, *compresses* the air inclosed, so as to enable it by the force of its elasticity to raise the valve, and make its escape: upon which, the balance being destroyed, the pressure of the atmosphere on the stagnant surface, drives up the water in the pipe thus evacuated of its air. See PUMP.

Water was thought incapable of *compression*, and it was believed till lately, that after the air had been purged out of it, no art or violence is able to bring its parts closer, or to make it take up less compass. In an experiment made by the Academy del Cimento, water, when violently squeezed, made its way through the infinitely fine pores of a ball of gold, rather than undergo any *compression*.

The ingenious Mr. Canton, F. R. S. attentively considering this experiment, found that it was not sufficiently accurate to justify the conclusion, which had been universally drawn from it; since the Florentine philosophers had no method of determining that the alteration of figure in their globe of gold, occasioned such a diminution of its internal space, as was exactly equal to the quantity of water forced into its pores. In order to bring this matter to a more accurate and decisive trial, he procured a small glass tube of about two feet in length, with a ball at one end of an inch and a quarter in diameter. Having filled the ball and part of the tube with mercury, and brought it exactly to the heat of 50° by Fahrenheit's thermometer, he marked the place where the mercury stood in the tube, which was about six inches and a half above the ball; and then raised the mercury by heat to the top of the tube, and sealed the tube hermetically; and when the mercury was brought to the same degree of heat as before, it stood in the tube $\frac{3}{10}$ of an inch higher than the mark. The same experiment was repeated with water exhausted of air, instead of mercury, and the water stood in the tube $\frac{7}{10}$ of an inch above the mark. Since the weight of the atmosphere on the outside of the ball, without any counterbalance from within, will compress the ball, and equally raise both the mercury and water, it appears that the water expands $\frac{4}{10}$ of an inch more than the mercury, by removing the weight of the atmosphere. Having thus determined that water is really *compressible*, he proceeded to estimate the degree of *compression* corresponding to any given weight. For this purpose he prepared another ball, with a tube joined to it; and finding that the mercury in $\frac{1}{100}$ of an inch of the tube was the hundred-thousandth part of that contained in the ball, he divided the tube accordingly. He then filled the ball and part of the tube with water exhausted of air; and leaving the tube open, placed this apparatus under the receiver of an air-pump, and observed the degree of expansion of the water answering to any degree of rarefaction of the air: and again by putting it into the glass receiver of a condensing engine, he noted the degree of *compression* of the water corresponding to any degree of condensation of the air. He thus found, by repeated trials, that in a temperature of 50°, and when the mercury has been at its mean height in the barometer, the water expands one part in 21740, and is as much *compressed* by the weight of an additional atmosphere, or the *compression* of water by twice the weight of the atmosphere, is one part in 10850 of its whole bulk. Should it be objected, that the *compressibility* of the water was owing to any air which it might be supposed to contain, he answers, that more air would make it more *compressible*; he therefore let into the ball a bubble of air, and found that the water was not more *compressed* by the same weight than before.

In some farther experiments of the same kind, Mr. Canton found that water is more *compressible* in winter than in summer; and he observed the contrary in spirit of wine, and oil of olives.

The following table was formed, when the barometer was at twenty-nine inches and a half, and the thermometer at fifty degrees.

	Millionth parts.	Spec. grav.
Compressibility of spirit of wine	66	866
Oil of olives	48	918
Rain-water	40	1000
Sea-water	40	1028
Mercury	3	13505

He infers that these fluids are not only *compressible*, but elastic; and that the *compressions* of them, by the same weight, are not in the inverse ratio of their densities, or specific gravities, as might be supposed. Phil. Trans. vol. lii. 1762, art. 103. and vol. liv. 1764. art. 47.

The *compression* of the air, by its own weight, is surprisingly great; but the air may be still farther *compressed* by art. See *Elasticity of* AIR.

This immense *compression* and dilatation, Sir Isaac Newton observes, cannot be accounted for in any other way, but by a repelling force, wherewith the particles of air are endued; by virtue whereof, when at liberty, they mutually fly each other.

This repelling power, he adds, is stronger and more sensible in air, than in other bodies; because air is generated out of very fixed bodies, but not without great difficulty, and the help of fermentation: now those particles always recede from each other with the greatest violence, and are *compressed* with the greatest difficulty, which, when contiguous, cohere the more strongly. See AIR, ATTRACTION, COHESION, DILATATION, and REPULSION.

COMPRESSOR *naris*, in *Anatomy*, a name given by Albinus, and some others, to one of the muscles of the face, called by Winslow the *transversalis nasi*, and *inferior nasi*, and by Cowper, the ELEVATOR *alæ nasi*.

COMPRISE *mont*. See NIENT.

COMPROMISE, a treaty, or contract, whereby two contending parties establish one or more arbitrators, to judge of and terminate their differences in an amicable way.

The regular way of appointing a *compromise* is by a writing, expressing the names of the arbitrators, the power of choosing an umpire, or super-arbitrator, in case of need, a time limited for the arbitrage, and a penalty on the party who does not abide by the decision.

By the civil law, a slave cannot make a *compromise* without the leave of his master, nor can a pupil without the authority of his guardian, or a wife without that of her husband. So a slave, a deaf or dumb man, a minor, and the person who is a party in the cause, are incapable of being chosen arbitrators in a *compromise*.

The occasions on which a *compromise* is not allowed of, are restitutions, marriage-causes, criminal affairs, questions of state; and, generally, any thing wherein the public interest is more concerned than that of private persons.

In our law, a *compromise* is not of so much extent. West defines it the faculty, or power of pronouncing sentence between persons at controversy, given to arbitrators by the parties mutual private consent, without public authority.

COMPROMISE is also used in beneficiary matters; where it signifies an act, whereby those who have the right of election, transfer it to one or more persons, to elect a person capable of the office or dignity.

We have seen members of parliament elected by *compromise*; when the electors, not being able to agree among themselves, give the power of electing, at least of nominating, to two persons; obliging them by oath, or otherwise, to choose such as they think the most capable, and best disposed.

COMPTING, or COUNTING-HOUSE, an office in the king's houshold, under the direction of the lord-steward; so called, because the accompts for all expences of the king's houshold

houſhold are here taken daily by the lord ſteward, comptroller, cofferer, maſter of the houſhold, the clerks of the green-cloth, and the clerks comptrollers. They alſo there make proviſion for the houſhold, and make payments, and orders, for the good government thereof.

In the *compting-houſe* is the board of GREEN-CLOTH.

COMPTROL, or CONTROLE, in, properly, a double REGISTER, kept of acts, iſſues, &c. of the officers or commiſſioners in the revenue, army, &c. in order to perceive the true ſtate thereof, and to certify the truth, and the due keeping of the acts ſubject to that enregiſtrement.

COMPTROLLER, an officer eſtabliſhed to *compterol*, or over-ſee public accounts, and to certify, on occaſion, whether things have been *compterolled*, and examined, or not. Thus, we have a *compteroller of the king's houſhold*, or of the accounts of the board of green-cloth; *compteroller-general* of the cuſtoms; *compteroller* of the navy; *comptroller* of the mint; *compteroller* of the exciſe; *compteroller* of the accounts of the army; of the CHAMBER, &c.

COMPTROLLER *of the wardrobe*, is an officer whoſe duty it is to inſpect the muſters of the artillery, to make the payliſt, and take the accounts and remains of ſtores. He is accountable to the office of ordnance.

COMPTROLLER *of the hanaper*, is an officer in chancery, attending the lord chancellor daily in term and ſeal time. This officer is to take all things ſealed from the clerk of the hanaper, included in bags of leather, and to note the juſt number and effect thereof; to enter them in a book, with all the duties belonging to the king and other officers for the ſame, and ſo charge the clerk of the HANAPER with them.

COMPTROLLERS *of the pells*, are officers of the EXCHEQUER, whereof there are two, *viz.* two chamberlains clerks, who keep a *compterol* of the pell of receipts and going-out: originally they took notes of other officers accompts, in order to diſcover if they did amiſs.

COMPTROLLER *of the pipe*, an officer of the EXCHEQUER, who writes or ſummons twice a-year, to levy the farms and debts of the PIPE.

He was anciently called *duplex ingroſſator*.

COMPULSOR, an officer under the Roman emperors, diſpatched from court into the provinces, to compel the payment of taxes, &c. not paid within the time preſcribed.

The word is formed of the verb *compellere, to oblige, conſtrain*.

Theſe were charged with ſo many exactions, under colour of their office, that Honorius caſhiered them by a law in 412.

The laws of the Viſigoths mention military *compulſors*; which were officers among the Goths, whoſe buſineſs was to oblige the tardy ſoldiers to go into the fight, or to run to an aſſault, &c.

Caſſian mentions a kind of monaſtic *compulſors*, whoſe buſineſs was to declare the hours of canonical office, and to take care the monks went to church at thoſe hours.

COMPUNCTION, in *Theology*, an inward grief in the mind for having offended God.

The word comes from *compungere*, of *pungere, to prick*.

The Romaniſts own their confeſſion inſignificant, unleſs attended with *compunction*, or pricking of heart. See CONFESSION.

Among ſpiritualiſts, *compunction* bears a more extenſive ſignification; and implies not only a grief for having offended God, but alſo a pious ſenſation of grief, ſorrow, and diſpleaſure, on other motives. Thus, the miſeries of life, the danger of being loſt in the world, the blindneſs of the wicked, &c. are ſo pious people motives of *compunction*.

COMPURGATOR, in *Law*, one that by oath juſtifies, or clears another's innocence. They were introduced in the juriſprudence of the middle ages, and their number varied according to the importance of the ſubject in diſpute, or the nature of the crime with which a perſon was charged. See OATH, and WAGER *of Law*.

COMPUTATION, the manner of accounting and eſtimating time, weights, meaſures, and money.

The word is ſometimes alſo uſed among mathematicians in the like ſenſe as CALCULATION.

COMPUTATION *of a planet's motion*. See PLANET.

COMPUTATION is particularly uſed in law in reſpect of the true account, or conſtruction of time, ſo underſtood as that neither party do wrong to the other, nor the determination of time be left at large, or be taken otherwiſe than according to the judgment and intention of law.

Indentures of demiſe be ingroſſed, bearing date May 27, 1709, to have and to hold the lands in S. for three years from henceforth; and the indentures be delivered the 4th of June following: in this caſe, *from henceforth* ſhall be computed from the day of the delivery, and not from the date. And if the indentures be delivered at four of the clock in the afternoon, the ſaid 4th of June, the leaſe ſhall end the third day of June, in the third year: the law, in ſuch *computation*, rejecting all fractions or diviſions of the day, on account of that uncertainty which is the mother of contention. In writings, ordered by the ſtat. 27 Hen. VIII. to be inrolled within ſix months; if ſuch writings have date, the ſix months ſhall be accounted from the date, and not from the delivery: if they want date, it ſhall be accounted from the delivery. Coke, lib. 5.

If a deed be ſhewn to a court at Weſtminſter, it ſhall remain in court (by judgment of law) all the term in which it is ſhewn: for all the term is but as one day in law. Coke, ibid. If a church be void, and the patron does not preſent within ſix months, the biſhop of the dioceſe may collate his chaplain; but theſe ſix months ſhall be computed according to twenty-eight days in the month; and not according to the calendar.

COMPUTO, a writ thus called from its effect, which is to compel a bailiff, chamberlain, or receiver, to yield his accompts. See ACCOUNT.

The ſame lies for executors of executors; and againſt the guardian in ſocage, for waſte made in the minority of the heir.

COMPUTO *vicecomitis habenda reſpectu*. See RESPECTU.

COMUS, in *Mythology*, the god of jollity or feſtivity.

There is great reaſon to believe he is the Chimera of the Moabites; Beel-Phegor, Baal Peor, Priapus, and Bacchus. He is repreſented under the appearance of a young man, with an inflamed red countenance, his head inclined, and crowned with flowers; his air drowſy; leaning on a humiſman's ſpear in his left hand, and his right an inverted torch in his right. His ſtatue was placed at the chamber doors of new married perſons; his pedeſtal crowned with flowers.

CONARION, or CONOIDES, a name for the *pineal gland*; a ſmall gland, about the bigneſs of a pea, placed in the upper part of that hole in the third ventricle of the brain called the *anus*; and tied by ſome fibres to the nates.

It is compoſed of the ſame ſubſtance as the reſt of the brain; and has this peculiar to it, that it is ſingle; whereas all the other parts are double. Hence, des Cartes takes occaſion to ſuppoſe it the immediate place, or ſeat of the ſoul.

CONATUS, *endeavour*, a term frequently uſed by philoſophical and mathematical writers; nearly equivalent to *niſus*.

Conatus ſeems to be the ſame, with reſpect to motion, that a point is with reſpect to a line; or leaſt, the two have this in common, that as the point is inceptive of the line or the term from which it commences; ſo is the beginning of all motion called the *conatus*. Add, that as in mathematical demonſtrations, the extenſion of the point is conceived as if it were nothing at all; ſo, in the *conatus* of motion, there is no regard to the time wherein, or the length which it advances. See *Laws of* NATURE.

Hence, ſome define *conatus* to be a quantity of motion not capable of being expreſſed by any time or length. Accordingly, all motion tends preciſely the ſame way, wherein the moveable is acted on, or determined by the moving power. See MOTION.

CONCAMERATED, among *Builders*, an appellation given to ſuch roofs as are arched in the vaults.

CONCAMERATIO was an arched room in our ancient churches, between the eaſt end of the church, and the high altar; ſo formed, that in proceſſions they might ſurround it.

CONCATENATION, in *Philoſophy*, a connexion of things, in manner of a *chain*.

The *concatenation* of ſecond cauſes is an effect of PROVIDENCE. See CAUSE.

CONCAVE is applied to the inner ſurface of a hollow body; particularly if it be circular.

CONCAVE is particularly underſtood of mirrors or lenſes: *concave lenſes* are either *convexo* on both ſides, called *concavo-convex*; or *concave* on one ſide and plane on the other, called *plano-concave*; or *concave* on one ſide, and convex on the other, called *concavo-convex*, or *meniſcus-concave*, as the one or the other ſurface is a portion of a leſs ſphere.

The property of all *concave* lenſes is, that the rays of light, in paſſing through them, are deflected or made to recede from one another; as in convex lenſes they are inflected towards each other; and that the more, as the concavity and convexity pertain to leſs circles.

Hence, parallel rays, as thoſe of the ſun, by paſſing through a *concave* lens, become diverging; diverging rays are made to diverge the more, and converging rays are either made to converge leſs, or become parallel, or go out diverging.

Hence, objects viewed through *concave* lenses appear diminished; and the more so, as they are portions of less spheres; and this in oblique, as well as in direct rays.

Concave mirrors have the contrary effect to lenses: they reflect the rays which fall on them, so as to make them approach more to, or recede from, each other than before, according to the situation of the object; and that the more as the concavity is greater, or the spheres whereof they are segments, less. *See* MIRROR.

Hence, *concave* mirrors magnify objects presented to them; and that in a greater proportion, as they are portions of greater spheres.

Hence also, *concave* mirrors have the effect of burning objects, when placed in their focus. See BURNING-GLASS.

CONCAVITY, An arch of a curve has its *concavity* turned one way, when the right lines that join any two of its points are all on the same side of the arch.

Archimedes, intending to include such lines as have rectilinear parts, in his definition, says, a line has its *concavity* turned one way, when the right lines that join any two of its points are either all upon one side of it, or while some fall upon the line itself, none fall upon the opposite side. Archim. de Solent. and Cyl. Def. 2. Mac Laurin's Fluxions, art. 180.

When two lines, having their *concavities* turned the same way, have the same terms, and the one includes the other, or has its *concavity* towards it, the perimeter of that which includes is greater than the perimeter of that which is included. Archim. lib. 2. 2.

CONCEALERS, in *Law*, such as find out concealed lands, i. e. lands kept privily from the king, by common persons, having nothing to show for their title, or claim therein.

They are thus called *per excellentiam*, *as one is a stander, &c.* Lord Coke calls them *fur dubius homines generis*. See MISPRISION.

CONCENTRATED *potting*, in *Chemistry*. See CAMENTATION.

CONCENTRATION, in general, denotes the retiring, or withdrawing of a thing inwards, towards the centre, or middle.

External cold is said to *concentrate* the heat within bodies: after meals, the natural warmth retires, and as it were *concentrates*, to promote the digestion.

CONCENTRATION is also used by Dr. Grew for the highest degree of mixture, viz. that wherein two or more atoms of particles touch, by a reception, and intrusion of the one with the other. See MIXTION.

This he takes to be the case of all fixed bodies without taste or smell; their constitution being so firm, that all the particles be detached from each other by some extraordinary means, they cannot affect those senses.

CONCENTRATION, in *Chemistry*, consists in approximating the proper and integrant parts of a body, by taking away some substance interposed between those parts, and which is extraneous and superabundant to the body to be *concentrated*. Thus, a solution of any saline substance in water may be concentrated by expelling part of the water of the solution.

But custom has applied the word *concentration* to the DEPHLEGMATION of acids, and particularly of vitriolic acid, by DISTILLATION, and of vinegar by CONGELATION.

CONCENTRATION, or *rectification*, of vitriolic acid by *distillation*, is performed, in order to purify it from the water, by which it is weakened, or from the inflammable matter, which renders it black and sulphureous. When the quantity of water with which it is diluted is very considerable, a great part of it may be discharged in deep or glass bottles, without distillation. The water will exhale, and the acid be to a great degree *concentrated*. But as the quantity of remaining water is diminished, it adheres to much the more strongly to the acid, and the heat must be increased to such a degree as would raise the acid with the water, and dissipate it in open vessels. Add besides, the acid, when it is become very strong, attracts the moisture of air, and combines with it; thus imbibing as much water from the air as it loses by evaporation. The *concentration*, therefore, must be completed by distillation. For this purpose, a retort of good glass, capable of resisting acids, must be half filled with the acid, and set on a sand-bath, entirely covered with sand. When a receiver has been adapted to it, heat must be applied and very gradually augmented, till drops are distilled. The heat must be increased in proportion to the degree of *concentration*, but not so as to make the acid boil, which might be attended with pernicious consequences. The duration of this process depends on the quality and strength of the acid. The vitriolic acid formerly kept by druggists required, that one half of it should be distilled, in order to make the remaining part twice as heavy as water. At present, it is much stronger and cheaper. That which is usually manufactured for sale is more or less combined with inflammable matter, which may be disengaged from it by a distillation similar to that above described. When the phlogisticated vitriolic acid acquires a strong heat, and becomes considerably *concentrated*, it acts upon the inflammable matter, dissipating or burning it: in consequence of which the liquor becomes perfectly white and transparent, which is a sign that the operation is finished. The retort must be left in the sand-bath till it is cold, and then the acid is to be poured into a clean, dry, crystal-glass bottle, closed by a glass stopper, and covered with leather. The phlogisticated, or sulphurous liquor, which passed over into the receiver, is called *spirit of* VITRIOL. See ACID *vitriolic*, and VITRIOL.

CONCENTRATION *of vinegar by congelation*. This method was first employed by Stahl. M. Geoffroy has since made many experiments on the subject, an account of which is given in the Memoirs of the Academy of Paris for 1730. Acids resist congelation much more than water; but if vinegar be exposed to a cold marked by 8 or 10 below 0 in Reaumur's THERMOMETER, a considerable quantity of ice will be formed. This ice consists entirely of pure water, and the remaining unfrozen liquor is a much stronger vinegar. If this vinegar be again exposed to a stronger degree of cold, a kind of watery ice, containing a quantity of unfrozen acid, will be produced, and the remaining acid will thereby acquire a considerable degree of additional strength, which may be again increased by repeating the congelation with greater cold. Wines may be well concentrated in the same way; and they thus acquire a thick consistence, and are preferred from history in the vicissitudes of climates and seasons. Cold may be likewise successfully employed for northern countries to *concentrate* sea-water, and to approximate the particles of salt, by separating the ice, which is little else than pure water, as soon as it is formed. The mineral acids might probably be *concentrated* by congelation, though in a very low degree. Other methods, besides that above described, have been used for *concentrating* vinegar; such as simple distillation; and the combination of this acid with fixed alkalies and metals, and afterwards distilling the salts resulting from such combinations, whence a very strong kind of vinegar is obtained, called *radical vinegar*. See Macquer's *Dict. Chem.* art. CONCENTRATION. See VINEGAR.

CONCENTRATION, in *Distillery*. Dr. Shaw, in his Essay on the Distillery, is for introducing a method of concentrating the fermentable parts of vegetables, from which their spirits are to be drawn by distillation; which, if it can be brought to be practised in the large way, will prove of very great use to the British distillery, as it will greatly shorten the distiller's business, which at present, including the brewing, fermenting, &c. is much too long. He proposes only to evaporate carefully the wort, or other tinctures or decoctions of vegetables made for the distilling of their spirits, to the consistence of treacle: in this form they might be sold to the distiller, who might keep them by him as long as he pleased, and occasionally use them, by the easy method of reducing them into wort, by mixing warm water with them.

CONCENTRATION, in *Medicine*, when by an addition of earth, dry and absorbent substances, the acid of any liquor is attracted and imbibed, whilst the aqueous parts are left, and the acid as it were conveyed into another body, this is called *concentration*. The use of this species of *concentration* is obvious, in cases where acidities are to be subdued or corrected: hence absorbents are called *concentrating* medicines. To the belongs that species of *concentration*, in which by an acid any body is corroded, and remains combined with it. Thus vinegar first combined with, and then distilled from, verdegrise, is much stronger than it was before, and for that reason is called *concentrated*. There is another species of *concentration*, which is, when alkaline salts are saturated with acid spirits, which are to remained in them, that both in conjunction constitute neither an acid nor an alkaline, but a neutral salt. The use of this species of *concentration* is obvious, that, is to procure neutral salts. Lastly, *concentration*, in an extensive sense, denotes an union or combination of a spirit, a salt, or a sulphur with any body: thus, in sublimate mercury, which is formed of quicksilver, and the acid of the sea-salt united together, the spirit of salt is said to be *concentrated*.

CONCENTRIC, in *Geometry* and *Astronomy*, something that has the same common centre with another.

The word is principally used in speaking of round bodies and figures, viz. circular, elliptical ones, &c. but may be likewise used for polygons, drawn parallel to each other, upon the same centre.

Concentric stands opposite to ECCENTRIC.

Nonius's method of graduating inſtruments conſiſts in deſcribing with the ſame quadrant 45 *concentric arches*, dividing the outermoſt into 90 equal parts, the next into 89, &c.

CONCEPTACULUM, among *Botaniſts*, a kind of PERICARPIUM, compoſed of ſoft and leſs rigid valves, and containing one cavity.

CONCEPTION, in *Grammar*. See SYLLEPSIS.

CONCEPTION, in *Logic*, the ſimple apprehenſion, or perception, which we have of any thing, without proceeding to affirm, or deny any thing about it.

Some writers diſtinguiſh between *conception* and perception; making the latter to denote the conſciouſneſs of an object when preſent, or to include the reality of its object; whereas *conception* expreſſes the forming an idea of an object whether preſent or abſent, or without any conviction of its reality. See Lord Kaime's El. Criticiſm, vol. ii. p. 508.

The ſchoolmen uſually make two kinds of *conception*; the one *formal*, the other *objective*.

The *firſt* is defined to be the immediate and actual repreſentation of any thing propoſed to the mind: on which footing, it ſhould be the ſame thing to the underſtanding, that a word or voice is to the ear; whence ſome alſo call it *verbum mentis*.

The *ſecond* is the thing itſelf repreſented by a formal *conception*. But others explode the notion of an *objective conception*, as being in reality, no *conception* at all; excepting where the mind contemplates its own acts, &c.

Formal or proper conceptions, are ſubdivided into *univocal*, where ſeveral things are diſtinctly reprefented as under ſome common ratio, or in the ſame degree of perfection; *analogous*, where ſeveral things are repreſented as under ſome proportional likeneſs; and *equivocal*, where they are repreſented immediately as ſuch, without regard to any common ratio or likeneſs.

CONCEPTION, in *Medicine*, denotes the firſt formation of the embryo, or foetus, in the womb.

Conception is no other than ſuch a concourſe and commixture of the proliſic ſeed of the male with that of the female, in the cavity of the uterus, as immediately produces an EMBRYO.

The ſymptoms of *conception*, or PREGNANCY are, when in a few days after the conjugal act, a ſmall pain is perceived about the navel, and is attended with ſome gentle commotions in the bottom of the abdomen; and within one, two, three, or even four months, the menſes ceaſe to flow, or prove in leſs quantity than uſual. Upon the firſt failure of this kind, the woman begins to count the ſeries of her weeks, without taking any notice of the time before elapſed; after this, or between the ſecond or third months, but generally about the third, the motions of the embryo become perceivable to the mother; who hereupon becomes troubled with a naufea, vomiting, loathing, longing, &c. About this time the breaſts begin to ſwell, grow hard and painful, and contain a little milk: the nipples alſo become larger, firmer, and darker coloured, a livid circle appearing round them: the eyes ſeem ſunk and hollow. During the two firſt months of pregnancy, the woman grows thinner, and flenderer; the abdomen being alſo depreſſed; though it afterwards diſtends, and grows gradually larger.

The manner wherein *conception* is effected is thus laid down by the modern writers: in the ſuperficies of the ovaries of women, there are found little pelluciid ſpherules, conſiſting of two concentric membranes, filled with a lymphatic humour, and connected to the ſurface of the ovaria, underneath the tegument, by a thick calix, contiguous to the extremities of the minute ramifications of the Fallopian tubes.

Theſe ſpherules, by the uſe of venery, grow, ſwell, raiſe, and dilate the membrane of the ovary into the form of papillæ; till, the head propending from the ſtalk, it is at length ſeparated from it; leaving behind it a hollow cicatrix, in the broken membrane of the ovary; which, however, ſoon grows up again.

Now, in theſe ſpherules, while ſtill adhering to the ovary, foetuſes have been frequently found: whence it appears, that theſe are a kind of ova, or eggs, deriving their ſtructure from the veſſels of the ovary, and their liquor from the humours prepared therein.

Hence alſo it appears, that the Fallopian tubes being ſwelled, and ſtiffened by the act of venery, with their muſcular fimbriæ, like fingers, may embrace the ovaries, compreſs them, and by that compreſſion expand their own mouths: and thus the eggs, now mature, and detatched as before, may be forced into their cavities; and thence conveyed into the cavity of the uterus; where they may either be cheriſhed and retained, as when they meet with the male ſeed; or, if they want that, again expelled. Hence the phenomena of falſe *conceptions*, abortions, foetuſes found in the cavity of the abdomen, the Fallopian tubes, &c. For, in coition, the male ſeed, abounding with living animalcules, agitated with a great force, a brisk heat, and, probably, with a great quantity of animal ſpirits, is violently impelled through the mouth of the uterus, which on this occaſion is opener, and through the valves of the neck of the uterus, which on this occaſion are laxer than ordinary, into the uterus itſelf; which now, in like manner, becomes more active, turgid, hot, inflamed, and moiſtened with the flux of its lymph and ſpirits, by means of the titillation excited in the nervous papillæ by the attrition againſt the rugæ of the vagina.

The ſemen thus diſpoſed in the uterus, is retained, heated, and agitated, by the convulſive conſtriction of the uterus itſelf; till meeting with the ova, the fineſt and moſt animated part enters through the dilated pores of the membranula of the ovum, now become glandulous, is there retained, nouriſhed, dilated, grows to its umbilicus, or navel; ſtrikes the other leſs lively animalcules; and thus is *conception* effected.

Hence it appears, that *conception* may happen in any part where the ſemen meets with an ovum: thus, whether it be carried through the Fallopian tube to the ovary, and there caſt upon the ovum; or whether it meet with it in ſome recels of the tube itſelf; or, laſtly, whether it join it in the cavity of the uterus, it may ſtill have the ſame effect, as it appears from obſervation actually to have.

But it is probable, that *conception* is then moſt perfect, when the two, viz. the ſemen and ovum, are carried at the ſame time into the uterus, and there mixed, &c.

Other anatomiſts chooſe to ſuppoſe the male ſeed taken up, before it arrives in the uterus, by the veins which open into the vagina, &c. and thus mixed with the blood; by which, in the courſe of circulation, it is carried, duly prepared, into the ovary, to impregnate the eggs. See GENERATION.

It has been advanced by ſeveral writers, that women may poſſibly *conceive* in their ſleep, and be with child, without any knowledge of the occaſion of it.

As ridiculous and abſurd as this doctrine may appear to the generality of the world, no leſs an author than Genſili has thought it worthy a particular diſſertation. Act. Erud. ann. 1715. p. 122. See PREGNANCY.

CONCEPTION, *immaculate*, of the Holy Virgin, is a feaſt eſtabliſhed in honour of the Holy Virgin; particularly with regard to her having been conceived and born *immaculate*; i. e. without original ſin; held in the Romiſh church on the 8th of December.

Allatius, in his Prolegomena on Damaſcenus, endeavours to prove this feaſt to have been celebrated by ſeveral churches in the Eaſt, as early as the eighth century. It was firſt eſtabliſhed in France about the year 1140; but it had been obſerved in England, in conſequence of the zeal of archbiſhop Anſelm, before this period.

The *immaculate conception* is the great ſubject of controverſy between the Scotiſts and Thomiſts; the former maintaining, and the latter impugning it.

The Dominicans eſpouſed the party of St. Thomas, and held out a long time in defence of the Virgin's being conceived in original ſin; they were condemned by pope Clement VII. in 1308, at the proſecution of the univerſity of Paris, and were obliged to retract. The council of Trent, ſeſſ. v. in the decree of *original ſin*, declares it not to be the intention of the council to include the Virgin *under* it; her *conception* it calls *immaculate*; and appoints the conſtitutions of Sixtus IV. to be obſerved with regard to it.

This controverſy between the Dominicans and Franciſcans was revived in the ſeventeenth century; and a feſtival was appointed by Clement XI. in 1708, to be celebrated throughout the Romiſh church: however, the Dominicans perſiſt in denying the obligation of this law, and in maintaining their ancient doctrine.

In the three Spaniſh military orders of St. James of the Sword, Calatrava, and Alcantara, the knights take a vow, at their admiſſion, to defend the *immaculate conception*. This reſolution was firſt taken in 1652.

Peter d'Alva and Aſtorga have publiſhed forty-eight huge volumes in folio, on the myſteries of the *conception*.

CONCEPTION, *religious of the order of*. See THEATINES.

CONCERT, or CONCERTO, a number, or company of muſicians, playing, or ſinging the ſame ſong, or piece of muſic, together.

The deſignation of a full *concert* for violins is two principal, and two ſecond violins, a tenor violin, and a violoncello, with thorough baſs for the harpſichord.

The word *concert* may be applied where the muſic is only melody, i. e. where the performers are all either in uniſon, or only at the interval of an octave; but it is more properly, as well as more uſually, underſtood of harmony, or where the muſic conſiſts of divers parts, a baſs, tenor, &c.

CONCERTANTE, in *Italian Muſic*, is uſed for the reciting parts of a piece of muſic, to diſtinguiſh them from thoſe which ſing only in the grand chorus. Greſſinieau makes *concertante* ſignify thoſe parts that ſing or play throughout the whole piece. Broſſ. Dict. Mus. in voc. Muſ. Dict. p. 35.

CONCERTATO, in *Italian Muſic*, is uſed for a piece compoſed in ſuch a manner, as that all the parts may have their recitals, be it for two, three, four, or more voices, or inſtruments: thus they ſay *muſica concertata, ſalmi concertati*, a 2, a 3, a 4, &c. Broſſ. Dict. Muſ. in voc.

CONCERTO *grojſo*, in *Italian Muſic*, is uſed to denote the grand chorus of a concert, or thoſe places where all the ſeveral parts perform or play together. Broſſ. Dict. Muſ. in voc.

CONCESSI, a term much uſed in conveyances, &c. Its effect is to create a COVENANT, as *dedi* does a warranty.

CONCESSION, in *Rhetoric*, a figure whereby ſomething is granted, or allowed to the adverſary, either to prevent being detained by unneceſſary incidents, or to make ſome advantage of. *I will not contend with you the reality of the contract; what I plead for, is relief againſt the injuſtice of it. True, ſhe is ſalſe; but ought ſhe not to ſhew her acknowledgments to heaven for the favour, by making a virtuous uſe of her beauty?*

CONCESSIT, *fur*, in *Law*, a ſpecies of FINE.

CONCHA, in *Natural Hiſtory*, a genus of bivalve ſhells, the animal inhabiting which is called *tubus*. This is a very comprehenſive genus, comprizing the OYSTER, CHAMA, MUSCLE, HEART-*ſhell*, PECTEN, SOLEN, &c.

CONCHA, in *Anatomy*, a name given the ſecond, or inward cavity of the auricle, or external EAR; reaching to the entrance of the auditory duct.

The word has its origin from a ſemblance this cavity bears to a *ſea-ſhell*, called in Latin *concha*.

Some alſo give the ſame name to the firſt cavity of the inward ear, which others call the *drum*; and others to the veſtibulum of the labyrinth, which is the ſecond cavity of the internal ear.

CONCHA, Χογχη, in *Antiquity*, a liquid meaſure among the Athenians, which contained two *myſtra*, or half an ounce. As much oil as it was capable of holding, weighed five drams one ſcruple, and twenty grains, according to Gor. Deſin. Pitiſc. Lex. and Eiſenchom. Others think that the *concha* contained three ſpoonfuls, ninety-ſix of which filled a pint veſſel *(ſextarius)*; a *ſextarius* was therefore equivalent to thirty-*two conchæ*, and ſix *ſextarii* made one *congius*, a meaſure equivalent to our three quarts, according to Salmaſ. Exerc. Plinian. and Bodæus, in Theophraſt. According to Fernelius, the *concha* was equivalent to two *myſtra*, or five ſpoonfuls: which, according to Jacobus Sylvius, are equivalent to ſix drams. According to Galen, in his work De Ponderibus & Menſuris, cap. xi. the *concha magna* contained the ſame quantity with the *acetabulum*, which in liquid meaſure was an ounce and a half, and in weight fifteen drams. The *concha minor* was in liquid meaſure half an ounce, and in weight five drams.

CONCHA *anomifera*, in the hiſtory of ſhell-fiſh. See ANATIFERA *concha*.

CONCHA *anomiæ*, in *Natural Hiſtory*, the name of a foſſile ſhell-fiſh, found in great abundance, and in a great variety of ſpecies; but not known in any of them living, on the ſhores or in the ſeas of our own or other countries. In Gloucerſhire, and ſome other of our counties, theſe are found in common with pebbles on the ploughed lands in other places. They are a ſort of bivalve ſhell, the valve of which are of unequal extent, both of them convex, and the head or beak of the longer valve crooked, and falling over the head of the other. See *Tab.* III. *of Foſſil Claſs* 9.

The great general diſtinction of this numerous claſs of bodies, is into thoſe which are of a ſmooth ſurface, and thoſe which are of a ſtriated or rough one.

Others alſo of the ſame claſs, or of one very nearly allied to it, are found in many of our inland counties, ſome very long from the cardo, or hinge, to the margin; and others very ſhort, and very long the contrary way. They are found indifferently in all ſorts of ſtrata, in earth, in ſtones in ſand, and among gravel.

CONCHA *ſtriſicata*, in *Natural Hiſtory*, a name given by ſome authors to the genus of ſhells, called by others the MUREX.

CONCHA *glabra*, in *Natural Hiſtory*, the name of a large genus of ſhells, called by authors the BOLIDUM, and in French the *tonne*.

CONCHÆ *latiſſimi muſculus*, a name given by Riolanus, and others, to one of the muſcles of the EAR, called by Cowper *internus auris*, and by Albinus, very properly, the *tenſor tympani*.

CONCHÆ *margaritiferæ*, a name ſometimes uſed for thoſe *mytæ* which produce pearls. See MUSCLE.

CONCHÆ *narium inferiores* in *Anatomy*, or inferior ſhells of the noſtrils, are two in number, ſituated in thoſe *foſſæ* under the openings of the maxillary ſinus, and immediately above the lower orifices of the lachrymal ducts. They cover theſe orifices much in the ſame manner as the ſuperior *conchæ* of the ethmoidal bone cover the maxillary openings. They are connected with the *oſſa maxillaria*, *palati*, and *unguis*, and ſometimes with the *os ethmoides*. They compleat the bony ſtructure of the noſe, augment its ſurface, and render it proportionable to the extent of the organ of ſmell, and of the pituitary membrane. Wiuſlow.

CONCHA *ſuperius ou cultus auris*, a name given by Santorini to a muſcle of the EAR, called by Albinus, and the French writers, *auris ſua anterior*.

CONCHA *ſpeculorum*, the *ſpectre-ſhell*, a name given by authors to a ſpecies of voluta from ſome odd figures deſcribed on its ſurface, repreſenting rough draughts of terrible phantoms. It is an elegant ſhell, of a middle ſize, and is of a white ground, and the figures are reddiſh; theſe form three large and broad bands, ſurrounding the ſhell at top and bottom, and in the middle; and between theſe there are ſeveral ſeries of ſmall ſpots. It is a ſcarce ſhell, and uſually ſells at a large price.

CONCHA *Veneris*, in *Natural Hiſtory*, the name by which ſeveral ſpecies of CHAMA are called. The ſhell is univalve, wreathed, and has a ſmall longhudinal and denticulated chink, or aperture, in it. It is alſo called *concha porcellana*, from its aperture in ſome meaſure reſembling the mouth of a hog; and *concha Erythræa*, from its being found in the Red Sea, called *Erythræum*. It is alſo called *concha Cytherioca*, from Venus, who received the epithet *Cytherea*, from Cythera, a Grecian iſland. That this fiſh was uſed by the ancients as an aliment, we read in Seneca, Ep 95. Mundius aſſerts that they prove a ſtimulus to venery, and provoke urine. Bondeletius informs us, that theſe ſhells are an ingredient in the *pilulæ de libello*, for removing ſtones, and curing ulcers in the uterus. But inſtead of the *concha veneria*, the apothecaries generally uſe cockles. Excellent dentifrices are prepared from this ſhell, which is alſo uſed for curing ulcers in the canthus of the eye, and the *fiſtula lachrymalis*. It is remarkably dying, without exciting any heat.

The powder of theſe ſhells muſt be owned to poſſeſs an abſorbent drying quality; but that on account of their beauty, or any other circumſtances, their powder is preferable to that of other ſhells, is by no means probable.

CONCHITES *marmor*, a name given by the ancients to a ſpecies of marble dug near Megara, and remarkable for containing a great number of ſea-ſhells, and other marine bodies immerſed in it.

CONCHOID, or CONCHOIDES, in *Geometry*, a curve line which always approaches nearer a ſtraight line to which it is inclined, but never meets it.

It is deſcribed thus: draw a right line BD *(Tab. Analyſis, fig.* 1.) and another AC, perpendicular to it in E; draw any number of right lines, as CM, CM, cutting BD in Q; make QM=QN=AE=EP; the curve wherein the points M, M are found, is the *conchoid*, or *conchoid prima*; ſo called by its inventor Nicomedes. The other, wherein the points N, N are found, is the *conchoid ſecunda*; the right line BD the *rule*, the point C the *pole*. The inventor alſo contrived an inſtrument, whereby the firſt *conchoid* may be deſcribed mechanically; thus, in the rule AD *(Tab. Analyſis, fig.* 2.) is a channel or groove cut, to that a ſmooth nail, firmly fixed in the moveable rule CB, in the point F, may ſlide freely within it; into the rule EG is fixed another nail in K, for the moveable rule CB, to ſlide upon.

If then the rule BC be ſo moved, as that the nail F paſſes along the canal AD; the ſtyle, or point in C, will deſcribe the firſt *conchoid*.

Now let AP=*x* (*fig.* 1.); AE=*a*; PE=MR=*a*−*x*; wherefore, as *x* increaſes, *a*−*x*, or MR will decreaſe; and therefore the curve continually approaches nearer to the rule BD.

In the ſame manner it appears, that the right line NO muſt continually decreaſe; and therefore that the ſecond *conchoid*, alſo, muſt continually approach nearer the rule. But inaſmuch as between each *ſecond* and the right line BD, there will be the right line QM or QN, equal to AE; neither of the *conchoids* can concur with the right line BD: conſequently, BD is an aſymptote of each *conchoid*. See ASYMPTOTE.

There will be other kinds of *conchoids* produced, if CE: CQ :: QM^*a*: AE^*b*: indefinitely, if CE^*a*: CQ^*a* :: QM^*b*: AE^*b*: wherefore, if CE=*b*. EA=*a*, CQ=*x*, QM=*y*: then *a*^*b*=*x*^*y*; and for infinite *conchoids*, *a*^*m*. *b*^*n*=*x*^*n*. *y*^*n*.

CONCHYLIA. See SHELL-*fish*.

CONCIATOR, in the *Glass Art*, is for the crystal glass what the founder is at the green glass-houses. He is the person that weighs and proportions the salt to ashes and sand, and works them with a strong fire, till they run into lumps, and become white; and if the metal be too hard, and consequently brittle, he adds salts or ashes; and if too soft, sand; till making them to a due temper, which is only known by the working.

CONCILIO—*Querela eorum coram* & CONCILIO. See QUERELA.

CONCINNOUS *intervals*, in *Music*. See INTERVALS.

CONCLAMATIO, in *Antiquity*, a shout raised by those present at burning the dead, before they set fire to the funeral pile. See SHOUT. The word was also applied to the signal given to the Roman soldiers to decamp, whence the expression *conclamare vasa*; and *conclamari arma*, was a signal for battle. It was likewise used for a practice of calling to a person deceased three times by his name, and when no reply was returned, they thus expressed his decease, *conclamatum est*. Whence the same term was afterwards applied to the cessation of the Roman empire.

CONCLAVE, an assembly or meeting of all the cardinals that are at Rome, shut up for the ELECTION of a POPE.

The *conclave* had its rise in the year 1270, and on this occasion: Clement IV. being dead at Viterbo, in 1268, the cardinals were two years without being able to agree on the election of a successor: in effect, things were carried to such pass, that they were upon the point of breaking up, without coming to any conclusion at all.

The inhabitants of Viterbo, then, being apprized of their design, by the advice of St. Bonaventure, then at Viterbo, shut the gates of their city, and locked up the cardinals in the pontifical palace, adjoining to the cathedral, till they were brought to a better understanding.

Hence arose the custom which has since prevailed, of shutting up the cardinals in a single palace, till they have elected the pope.

Such was the origin of the *conclave*, as related by Onuph. Panvinius, Ciseonius, and Paperbroche.

CONCLAVE is also used for the place wherein the election of the pope is performed; which is, now, at St. Peter's in the Vatican; though Gregory X. and Clement V. appointed it should always be held in the place where the last pope should die.

While the affair is in hand, if it be in winter, the walls and windows are all mured up, excepting only a single pane, to give a little light: in summer the windows are not closed; but the great door of the hall is secured with four locks, and four bolts: an aperture being, however, left, through which to supply the imprisoned prelates with victuals.

In the hall, which is very ample, there are cells or stalls erected for as many cardinals as are to be present at the election; the cells being only separated by deal boards.

The cells are marked with letters of the alphabet, and are distributed to the cardinals by lot: each cardinal puts his arms on the cell that falls to his share.

After the assembly has continued three days, they are only allowed one dish for a meal; and after fifteen days more, only bread and water: though this rule is not very strictly regarded.

Each cardinal is allowed two *conclavists*, or servants to attend him, and to be shut up with him.

The election is begun ten days after the pope's decease, and decided by a majority of two parts in three of the cardinals present.

These regulations were principally established by Gregory X. in 1274, and Clement VI. in 1351.

Matthew Paris says, the word *conclave* anciently signified the pope's wardrobe.

It is a popular proverb in Italy, *chi entra papa, esce cardinale*: he who enters pope, comes out cardinal; q. d. he who according to common report will be elected pope, ordinarily is not.

CONCLUSION, in *Law*, is where a man by his own act upon record hath charged himself with a duty or other thing, or concluded any matter whereby he shall be *concluded*: as if a sheriff returns that he hath taken the body upon a *capias*, and hath not the body in court, at the day of the return of the writ; by the return, the sheriff is concluded from plea of escape, &c. Termes de Ley, 153. &c. In another sense, the word *conclusion* signifies the end of any plea, replication, &c. and a plea to the writ, is to *conclude* to the writ; a plea in bar, to *conclude* to the action, &c. *Conclusion* of plea in bar shall be, *et hoc paratus est verificare*:—of other pleas, *et de hoc ponit se super patriam*. Kitch. 219, 220.

CONCLUSION, in *Logic*, the last part of an argument; or the consequence drawn from something either assumed or proved before.

The *conclusion* of an argument contains two parts: the *consequent*, which is the matter of it; and the *consequence*, which is its form, and which, of a simple absolute proposition, renders the *consequent* relative to the premises whence it is drawn.

The question, and *conclusion*, by the schoolmen, are the same ideas, considered in different views, or relations: in the question they are considered as doubtful; in the *conclusion* as void of doubt.

CONCLUSION, in *Oratory*, consists of two parts; the RECAPITULATION, or ENUMERATION, and the PASSIONS.

CONCLUSIVE *Conjunctions*. See CONJUNCTION.

CONCOCTION, in *Medicine*, the change which the food undergoes in the stomach, &c. to become chyle.

This change consists in destroying the texture and cohesion of the parts of the food; preparing part of it for some particular service of the animal frame; and the rest to be carried off as excrements, by proper conductories.

The ancients gave the term COCTION, or *concoction*, to what we now ordinarily call *digestion*; from a notion of the food's being, as it were, boiled in the stomach, and its nutritious juice expressed by the heat of the adjacent parts.

They assigned two *concoctions*, viz. one in the stomach, and a second in the small intestines, &c. which latter they attributed to the admixture of the bile and pancreatic juice.

The *concoction* of the aliments in the stomach, is their DIGESTION, or reduction to a sort of emulsion or chyle. By the *concoction* of the humours, the writers of institutes mean, the reduction of the chyle to blood, which is called the *second concoction*; and also the separation of any fluid from the blood, by means of glands destined for this use, which is called the *third concoction*.

It is commonly said that the faults arising from any defect in the first *concoction*, are not amended in the second, nor those from the second by the third; that is when the aliment is not sufficiently comminuted in the organs of digestion, the particles of the chyle are not small enough to circulate regularly through the minute vessels of the lungs, and be converted into good blood; it not being possible for the organs of sanguification to dissolve farther the particles they receive from the stomach. Hence these particles being too large to circulate through the capillary arteries, obstructions and all their consequences proceed. And the third *concoction*, that is in the glands, is not better adapted to the farther dissolution of these particles, than the second. James's Medical Dict. art. Coction.

The several *concoctions* in the body, with regard to the propagation of the species, and the preservation of the individual, have been since reduced to five: those are CHYLOSIS for chyle, CHYMOSIS for chyme, HÆMATOSIS for blood, PNEUMATOSIS for spirits, and SPERMATOSIS for seed.

CONCOMITANT, in *Theology*, something that accompanies, or goes along with, another.

Concomitant grace is that which God affords us during the course of our actions to enable us to perform them; and as the Roman schoolmen say, to render them meritorious.

CONCOMITANT *Necessity*. See NECESSITY.

CONCORD, *Form of*, in *Ecclesiastical History*, a standard-book, among the Lutherans, composed at Torgow, in 1576, and thence called the book of Torgow, and reviewed at Berg, by six Lutheran doctors of Germany, the principle of whom was James Andreæ. This book contains, in two parts, a system of doctrine, the subscription of which was a condition of communion, and a formal and very severe condemnation of all who differed from the compilers of it, particularly with respect to the majesty and omnipresence of Christ's body, and the real manducation of his flesh and blood in the eucharist. It was first imposed on the Saxons by Augustus, and occasioned great opposition and disturbance, both among the Lutherans and reformed. The dispute about it was revived in Switzerland in 1718, when the magistrates of Bern published an order for adopting it as the rule of faith; the consequence of which was a contest, that reduced its credit and authority. Mosheim's Eccl. Hist. by Dr. Maclaine, vol. iv. p. 53, &c. and vol. v. p. 98.

CONCORD, in *Grammar*, that part of syntax, or construction, whereby the words of a sentence agree among themselves, i. e. whereby nouns are put in the same case, number, gender, &c. and verbs in the same number and person, with nouns and pronouns.

The rules of *concord* are generally the same in all languages, as being of the nature of what is in use almost every where, for the better distinguishing of discourse.

Thus, the distinction of the two numbers singular and plural,

plural, obliges us to make the adjective agree with the substantive in number; that is, to put the one either in this or that number, according as the other is: for the substantive being the thing confusedly, though directly, marked by the adjective; if the substantive word mark several, there are several subjects of the form marked by the adjective, and by consequence this should be in the plural; as *homines docti*, &c.

Again, the distinction of masculine, and feminine, renders it necessary to put the substantive and adjective in the same degree.

And verbs should have *concord* or agreement with nouns and pronouns in number and person.

If any thing occur apparently contrary to those rules, it is by a figure; i. e. something is implied, or the ideas are considered more than the words themselves.

CONCORD, in *Law*, is the agreement between two parties who intend the levying a fine of lands to one another, how and in what manner it shall pass.

CONCORD is also an agreement made upon any trespass committed (between two, or more); and is divided into *concord executory*, and *concord executed*.

Plowden observes, that the first binds not, being imperfect; but the latter is perfect, and binds the party.

Others are of opinion, that *concords* executory are perfect, and bind no less than those executed.

CONCORD, in *Music*, denotes the relation of two sounds which are always agreeable to the ear, whether applied in succession or consonance.

If two single sounds be in such a relation, or have such a difference of tone, as that, being sounded together, they make a mixture, or compound sound, which affects the ear with pleasure, that relation is called *concord*: and whatever two sounds make an agreeable compound in consonance, those same will always be pleasing, in succession, or will follow each other agreeably.

The reverse of CONCORD, is what we call a DISCORD; which is a denomination of all the relations or differences of tone that have a displeasing effect.

Concord and harmony are, in effect, the same thing; though custom has applied them differently. An *concord* expresses the agreeable effect of two sounds in consonance: so harmony expresses the same sort of agreement in a great number of sounds in consonance: add, that harmony always implies consonance; but *concord* is sometimes applied to succession: though never but when the terms will make an agreeable consonance: whence it is that Dr. Holder, and some other writers, use the word *consonance* for what we call *concord*.

Unisonance, then, being the relation of equality between the tones of two sounds, all the unisons are *concords*, and in the first degree: but an interval being a difference of tone, or a relation of inequality between two sounds, becomes a *concord* or discord, according to the circumstances of that particular relation. Indeed, some restrain *concord* to intervals, and make a difference of tone essential thereto; but that is precarious: and Mr. Malcolm thinks, that as the word implies *agreement*, it is applicable to unison in the first degree.

It is not easy to assign the reason or foundation of *concordance*: the differences of tone, we have elsewhere observed, take their rise from the different proportions of the vibrations of the sonorous body, i. e. of the velocity of those vibrations in their recourses; the more frequent those recourses are, the more acute will be the tone, and *vice versa*.

But the essential difference between *concord* and discord lies deeper: there does not appear any natural aptitude in the two sounds of a *concord*, to determine it to give us a pleasing sensation, more than in the two sounds of a discord: these different effects are merely arbitrary, and must be resolved into the divine pleasure.

We know by experience what proportions and relations of tone afford pleasure, and what do not; and we know also how to express the difference of tone by the proportion of numbers; we know what it is pleases us, though we do not know why: we know, v. gr. that the ratio of 1:2 constitutes *concord*, and 6:7 discord; but on what original grounds agreeable or disagreeable ideas are connected with those relations, and the proper influence of the one on the other, is above our reach.

By experience we know, that the following ratios of the lengths of chords are all *concord*; viz. 2:1, 3:2, 4:3, 5:4, 6:5, 5:3, 8:5; that is, take any chord for a fundamental, which shall be represented by the number 1, and the following divisions thereof will be all *concord* with the whole; viz.

1. 2. 3. 4. 5. 6. 8.

So that the distinguishing character between *concords* and discords must be looked for in these numbers, expressing the intervals of sound; not abstractedly, and in themselves, but as expressing the number of vibrations. Now, unisons are in the first degree of *concord*, or they have the most perfect likeness or agreement in tone; and therefore have something in them accessory to that agreement which is found, less or more, in every *concord*: but it is not true, that the nearer two sounds come to an equality of tone, the more agreement they have; therefore, it is not in the equality or inequality of the numbers that this agreement lies.

Farther, if we consider the number of vibrations made in any given time by two chords of equal time; on the principle laid down, they are equal: and therefore the vibrations of the two chords coincide, or commence together as frequently as possible, i. e. they coincide at every vibration: in the frequency of which coincidence, or united measure of the motions of the two chords, and of the undulations of the air occasioned thereby, it is, that the difference of *concord* and discord must be sought. Now, the nearer the vibrations of two strings approach to a coincidence as frequent as possible, the nearer they should approach that condition, and consequently the agreement, or unisons; which is confirmed by experience.

For if we take the natural series 1, 2, 3, 4, 5, 6, and compare each number to the next, as expressing the number of vibrations in the same time of two chords, whose lengths are reciprocally as those numbers; the rule will be found exact, for 1:2 is best, then 2:3; after 6 the consonance is unsufferable; the coincidences being too rare: though there are other ratios that are agreeable, besides those found in that continued order, viz. 3:5, and 5:8, which, with the preceding five, are all the *concording* intervals within, or less than an octave, or 1:2, that is, whose acutest term is greater than half the fundamental.

On this principle, 3:5 will be preferable to 4:5; because those being equal in the number of vibrations of the acuter term, there is an advantage on the side of the fundamental in the ratio 3:5, where the coincidence is made at every third vibration of the fundamental, and every fifth of the acute term: to also the ratio 5:8 is less perfect than 5:6; because, though the vibrations of each fundamental that go to one coincidence are equal, yet in the ratio 5:6, the coincidence is at every fifth of the acute term, and only at every eighth in the other case.

Thus, we have a rule for judging of the preference of *concords*, from the coincidence of their vibrations; agreeably to which rule, they are disposed into the order of the following table; to which the names of the *concords* in practice, the ratio of their vibrations, the lengths of the chords, and the number of coincidences in the same, are expressed.

	Ratios, or vibrations.			Coincid.
		Grave Term.	Acute Term	
Unison	—	1	1	
Octave, 8ve	—	2	1	60
Fifth, 5th	—	3	2	30
Fourth, 4th	—	4	3	20
Sixth, gr.	—	5	3	20
Third, gr.	—	5	4	15
Third, leſſer	—	6	5	12
Sixth, leſſer	—	8	5	12
		Grave Lengths.	Acute Lengths.	

Though this order be settled by reason, yet it is confirmed by the ear. On this foundation, *concords* must still be the more perfect, as they have the greatest number of coincidences, with regard to the number of vibrations in both the chords; and where the coincidences are equal, the preference will fall on that interval, whose acutest term has fewest vibrations to each coincidence: which rule, however, is in some cases contrary to experience; and yet it is the only rule hitherto discovered.

F. Mersenne, indeed, after Kircher, gives us another standard for settling the comparative perfection of intervals with regard to the agreement of their extremes in tone: and it is this.

The perception of *concordance*, say they, is nothing but the comparing two or more different motions which in the same time affect the auditory nerve: now we cannot make a certain judgment of any consonance, till the air be as oft struck in the same time by two chords, as there are units in each member expressing the ratio of that *concord*; v. gr. we cannot perceive a fifth, till two vibrations of the one chord, and three of the other, are accomplished together; which chords are in length as 3 to 2: the rule then is, that those *concords* are the most simple and agreeable, which are generated in the least

time; and those on the contrary, the most compound and harsh, which are generated in the longest time.

For instance, let 1, 2, 3, be the length of 3 chords, 1 : 2 is an octave; 2 : 3 a fifth; and 1 : 3 an octave and fifth compounded, or a twelfth. The vibrations of chords being reciprocally as their lengths, the chord 2 will necessarily vibrate once, while the chord 1 vibrates twice, and then exists an octave; but the twelfth does not yet exist, because the chord 3 has not vibrated once, nor the chord 1 thrice, which is necessary to form a twelfth.

Again, for generating a fifth, the chord 2 muſt vibrate thrice, and the chord 3 twice; in which time, the chord 1 will have vibrated 6 times; and thus the octave will be thrice produced, while the twelfth is only produced twice; the chord 2 uniting its vibrations ſooner with the chord 1, than with the chord 3; and they being ſooner conſonant than the chord 1 or 2 with that 3. Whence, that author obſerves, many of the myſteries of harmony, relating to the performance of harmonious intervals, and their ſucceſſion, are eaſily deduced.

But this rule, upon examining it by other inſtances, Mr Malcolm has ſhewn defective, as it does not anſwer in all poſitions of the intervals with reſpect to each other; but a certain order, wherein they are to be taken, being required: and there being no rule, with reſpect to the order, that will make this ſtandard anſwer to experience in every caſe: ſo that at laſt we are left to determine the degrees of *concord* by experience and the ear.

Not but that the degrees of *concord* depend much on the more or leſs frequent uniting the vibrations, and the ear's being more or leſs uniformly moved, as above; for that this mixture or union in motion is the true principle, or, at leaſt, the chief ingredient in *concord*, is very evident: but beſide there ſeems to be ſomething farther in the proportion of the two motions, neceſſary to be known, in order to fix a catholic rule for determining all the degrees of *concord*, agreeable to ſenſe and experience.

The reſult of the whole doctrine is ſummed up in this definition.—*Concord* is the reſult of a frequent union, or coincidence of the vibrations of two ſonorous bodies, and, by conſequence, of the undulating motions of the air, which, being cauſed by theſe vibrations, are like and proportionable to them; which coincidence, the more frequent it is, with regard to the number of vibrations of both bodies, performed in the ſame time, *ceteris paribus*, the more perfect is that *concord*: till the rarity of the coincidence, in reſpect of one or both the motions, produces diſcord. *See ſome of the remarkable phenomena of ſounds accounted for from this theory, under the word* UNISON; ſee alſo INTERVAL, &c.

Mr. Carre, in the Memoirs of the Royal Academy of Sciences, lays down a new general propoſition, to determine the proportion which cylinders are to have, in order to form the *concords* or conſonances of muſic. And it is this—that the ſolid cylinders, whoſe ſounds yield thoſe *concords*, are in a triplicate and inverſe ratio of that of the numbers which expreſs the ſame *concords*.

Suppoſe, e. gr. two cylinders, the diameters of whoſe baſes and lengths are as 3 to 2; it is evident their ſolidities will be in the ratio of 27 to 8, which is the triplicate ratio of 3 to 2: we ſay then, that the ſounds of thoſe two cylinders will produce a fifth, which is expreſſed by thoſe numbers; and that the biggeſt and longeſt will yield the grave ſound, and the ſmalleſt the acute one.—And the like of others.

Concords are divided into *ſimple*, or original, and *compound*.

A *ſimple*, or *original concord*, is that whoſe extremes are at a diſtance leſs than the ſum of any two other *concords*.

On the contrary, a *compound concord* is equal to two or more *concords*.

Other muſical writers ſtate the diviſion thus: an octave 1 : 2, and all the inferior *concords* above expreſſed, are all ſimple and original *concords*: and all greater than an octave, are called *compound concords*; as being compoſed of, and equal to the ſum of one or more octaves, and ſome ſingle *concord* leſs than an octave; and are uſually, in practice, denominated from that ſimple *concord*.

As to the compoſition and relations of the original concords, by applying to them the rules of the addition and ſubtraction of intervals, they will be divided into *ſimple* and *compound*, according to the firſt and more general notion; as in the following table.

Simple *Concords*.	Compound *Concords*.	
5 : 6 a 3d leſſ 1ta	3d. and 2d.	8ve. com-
4 : 5 a 3d gr.	8th 1. 3 4th.	poſed of
3 : 4 a 4th.	5th g. 4th.	5th.

8th 4th or	
6th 3d.	
or 3d. g.	
3d. 1. 4th	

The octave is not only the firſt *concord* in point of perfection, the agreement of whoſe extremes is greateſt, and the neareſt to uniſon; inſomuch that, when ſounded together, it is impoſſible to perceive two different ſounds; but it is alſo the greateſt interval of the ſeven original *concords*; and, as ſuch, it contains all the leſſer, which derive their ſweetneſs from it, as they ariſe more or leſs directly out of it; and which decreaſe gradually, from the octave to the leſſer ſixth, which has but a ſmall degree of *concord*.

What is very remarkable, is the manner wherein theſe leſſer *concords* are found in the octave, which ſhews their mutual dependencies.

For, by taking both an harmonical and arithmetical mean between the extremes of the octave, and then both an harmonical and arithmetical mean betwixt each extreme, and the moſt diſtant of the two means laſt found; viz. betwixt the leſſer extreme and the firſt arithmetical mean, and betwixt the greater extreme and the firſt harmonical mean; we have all the leſſer *concords*.

Thus, betwixt 360 and 180, the extremes of octave, we take an arithmetical mean, it is 270; and an harmonical mean is 240: then, betwixt 360 the greateſt extreme, and 240 the harmonical mean, take an arithmetical mean, it is 300; and an harmonical mean is 288. Again, betwixt 180 the leſſer extreme of the octave, and 270 the firſt arithmetical mean, it is 225, and an harmonical one 216.

Thus we have a ſeries of all the *concords*, both aſcending towards acuteneſs from a common fundamental 360; and deſcending towards gravity from a common acute term 180: which ſeries has this property, that taking the two extremes, and any other two at equal diſtances, the four will be in geometrical proportion.

The octave, by immediate diviſion, reſolves itſelf into a fourth and fifth; the fifth, again, by immediate diviſion, produces the two thirds; the two thirds are therefore found by diviſion; though not by immediate diviſion; and the ſame is true of the two ſixths. Thus do all the original *concords* ariſe out of the diviſion of the octave; the fifths and fourths immediately and directly, the thirds and ſixths mediately.

From the perfection of the octave ariſes this remarkable property, that it may be doubled, tripled, &c. and yet ſtill will preſerve a *concord*, i. e. the ſum of two or more octaves are *concords*; though the more compound will be gradually leſs agreeable: but it is not ſo with any other *concord* leſs than octave; the doubles, &c. whereof are all diſcords.

Again, whatever ſound is *concord* to one extreme of the octave, is concord to the other alſo; and if we add any other ſimple *concord* to an octave, it agrees to both its extremes; to the neareſt extreme it is a ſimple *concord*, and to the fartheſt a compound one.

Another thing obſervable in this ſyſtem of *concord*, is, that the greateſt number of vibrations of the fundamental cannot exceed five; or that there is no *concord* where the fundamental makes more than five vibrations, to one coincidence with the acute term. It may be added, that this progreſs of the *concords* may be carried on to greater degrees of compoſition, *even in infinitum*; but ſtill the more compound, the leſs agreeable.

So a ſingle octave is better than a double one, and that than a triple one; and ſo of fifths, and other *concords*. Three or four octaves is the greateſt length we go in ordinary practice; the old ſcales went but to two; no voice or inſtrument will well go above four. See THIRD, FOURTH, and FIFTH.

CONCORDANCE, a dictionary or index to the Bible, wherein all the leading words, uſed in the courſe of the inſpired writings, are ranged alphabetically; and the various places where they occur referred to; to aſſiſt in finding out paſſages, and comparing the ſeveral ſignifications of the ſame word.

Cardinal Hugo de St. Charo is ſaid to have employed five hundred monks at the ſame time in compiling a Latin *concordance*: ballides which, we have ſeveral other *concordances* in the ſame language; one, in particular, called the *concordance* of England, compiled by J. Darlington, of the order of Predicants; another more accurate one, by the Jeſuit de Zamora.

R. Mordecai Nathan has furniſhed us with a Hebrew *concordance*, firſt printed at Venice in 1523, containing all the Hebrew roots branched into their various ſignifications, and under each ſignification all the places in ſcripture wherein it occurs: but the beſt and moſt uſeful Hebrew *concordance* is that of Buxtorf, printed at Baſil in 1632.

Dr. Taylor, publiſhed in 1754, a Hebrew *concordance* in two volumes folio, adapted to the Engliſh Bible, and diſpoſed after the manner of Buxtorf. See the preface of this work.

The Greek *concordances* are only for the New Teſtament: indeed we have one of Cone. Kircher's on the Old; but this is rather a concordantial dictionary than a *concord-*

ances; containing all the Hebrew words in an alphabetical order; and underneath, all the interpretations or senses the LXX. give them; and in each interpretation, all the places where they occur in that version.

In 1718, Trommius published his Greek *concordance* for the Septuagint at Amsterdam in two volumes folio; and Schmidius improving on a similar work of H. Stephen, has given an excellent Greek *concordance* for the New Testament, of which is that of Leipsic, an. 1717.

Calasius, an Italian Cordelier, has given us *concordances* of the Hebrew, Latin, and Greek, in two columns: the first, which is Hebrew, is that of R. Mordecai Nathan, word for word; and according to the order of the books and chapters: in the other column is a Latin interpretation of each passage of Scripture quoted by R. Mordecai; this interpretation is Calasius's own: but in the margin he adds that of the LXX. and the Vulgate, when different from his. The work is in four volumes folio, printed at Rome in 1621.

We have several very copious *concordances* in English; as Neumann's &c. but the last and best esteemed, is that in 4to. by Alex. Cruden.

CONCORDANT *Verses*, such as have several words in common; but which, by the addition of other words, convey an opposite, at least a different meaning. Such are those,

Ex { *Canis* / *Lupus* } *in fero* { *mentur* / *nutritur* } *& omnia* { *fervet.* / *vastat.*

CONCORDAT, in the *Canon Law*, denotes a covenant, or agreement concerning some beneficiary matter, as a resignation, permutation, promotion, or the like.

The council of Trent. *Sess.* vi. *de reform.* cap. 4. speaking of *concordats* made without the authority and approbation of the pope, calls them *concordias quæ tantum suos obtinent auctores, non successores.* And the congregation of cardinals, who have explained this decree, declares also that a *concordat* cannot be valid so as to bind successors, unless confirmed by the pope.

CONCORDAT is also used, absolutely, among the French, for an agreement concluded at Bologna, in 1516, between pope Leo X. and Francis I. of France, for regulating the manner of nominating to benefices.

The *concordat* serves in lieu of the PRAGMATIC *sanction*, which has been abrogated; or, rather, it is the pragmatic sanction softened and reformed.

The *concordat* between the pope and the republic of Venice resembles the former.

There is also a German *concordat*, made between the emperor Frederic III. and the princes of Germany, in 1448, relating to beneficiary matters, confirmed by pope Nicholas V.

CONCOU, in *Botany*, a name given by the people of Guinea to an herb which is in great esteem with them for killing that troublesome sort of worm called the Guinea worm, which breeds in their flesh. They bruise the leaves, and, mixing them with oil, apply them in form of a cataplasm. The leaves of this shrub somewhat resemble those of the cagrow, but they are thicker and stiffer, and are not so full of veins. They are broadest within one third of the base, and from thence they go tapering to each end. They are placed on long footstalks of a fine green throughout. Phil. Trans. No 232.

CONCOURSE, or CONCURRENCE, the reciprocal action of divers persons, or things, co-operating toward the same effect, or end.

The schoolmen distinguish two kinds of *concurrence*; viz. *mediate*, which consists in giving a power or faculty to act; and *immediate*, which is a contemporary influence of one cause along with another, to produce an effect.—Thus the grandfather *concurs mediately* to the production of a grandson, as he originally gives the power of generating to the father; but the father *concurs immediately* with the mother to the production of the same child. With respect to the agency of *God*, some divines maintain both these kinds of concurrence; others deny the latter. See CAUSE.

CONCOURSE, *Point of*. See FOCUS.

CONCRETE, in the *School Philosophy*, an assemblage, or COMPOUND.

CONCRETE, *Physical*, or a CONCRETE *body*, may denote any mixed body, or body composed of different principles; and consequently, all sensible bodies whatever, as all bodies arise from a coalition of divers elements, or at least of divers principles, matter, and form.

But, in strictness, *concrete* is only used for those compounds wherein the ingredients still retain their distinct natures, not are wholly converted into a new common nature.

Authors distinguish *natural concretes*, and *artificial* ones: antimony is a *natural concrete*, and soap a factitious *concrete*.

CONCRETE *Juices*. See JUICES.

CONCRETE, *Logical*, or a CONCRETE *word*, called also *paronymum*, is that which has a compound signification, as denoting both the subject, and some quality or accident of the subject, which gives it its denomination.

Such, e. gr. are *man*, *learned*, *white*; for *man* signifies as much as *having human nature*; *learned*, as much as *having learning*, &c. Hence the word *concrete* is chiefly used to express the union of qualities or quantities with the bodies or subjects, without any separation, even in idea.

The opposite term whereby things are separated in thought, is *abstract*.

Concrete properly signifies a subject accompanied with its form or quality; as *pious*, *bard*, *white*: *abstract*, on the contrary, expresses the form and quality without the subject, as *piety*, *hardness*, *whiteness*.

CONCRETE *Numbers* are those which are applied to express or denote any particular subject: as two men, three pounds, two thirds of a shilling, &c.

Whereas, if nothing be connected with a number, it is taken abstractedly or universally: thus, three signifies only an aggregate of three units; let those units be men, pounds, or what you please.

CONCRETION, the act whereby soft bodies are rendered hard; or, an insensible motion of the particles of a fluid or soft body, whereby they come to a consistence.

The word is used indifferently for *induration*, *condensation*, *congelation*, and *coagulation*.

CONCRETION is also used for a coalition of several little particles into a sensible mass, called a CONCRETE; by virtue of which union, the body acquires this or that figure, and these or those properties.

CONCUBINAGE sometimes expresses a criminal, or prohibited commerce between the two sexes; in which sense it comprehends *adultery*, *incest*, and *simple fornication*.

In its more restrained sense, *concubinage* is used for a man's and a woman's cohabiting together in the way of MARRIAGE; without having passed the ceremony thereof.

Concubinage was anciently tolerated: the Roman law calls it an allowed custom, *licito consuetudo*. When this expression occurs in the constitutions of the Christian emperors, it signifies what we now call a *marriage in conscience*.

The *concubinage* tolerated among the Romans in the time of the Republic, and of the heathen emperors, was that between persons not capable of contracting marriage together: nor did they even refuse to let inheritances descend to children which sprung from such a tolerated cohabitance.

Concubinage between such persons they looked on as a kind of marriage; and even allowed it several privileges: but then this *concubinage* was confined to a single person, and was of perpetual obligation, as much as marriage itself.

Hottoman observes, that the Roman laws had allowed of *concubinage* long before Julius Cæsar made that law whereby every one was allowed to marry as many wives as he pleased. The emperor Valentinian, Socrates tells us, allowed every man two.

CONCUBINAGE is also used for a marriage performed with less solemnity than the formal marriage; or a marriage with a woman of inferior condition, and to whom the husband does not convey his rank, or quality.

Cujas observes, that the ancient laws allowed a man to espouse, under the title of *concubine*, certain persons, such as were esteemed unequal to him, on account of the want of some qualities requisite to sustain the full honour of marriage. He adds, that though *concubinage* was beneath marriage, both as to dignity, and civil effects; yet was *concubine* a reputable title, very different from that of *mistress* among us.

The commerce was esteemed so lawful, that the *concubine* might be accused of adultery in the same manner as a wife.

This kind of *concubinage* is still in use in some countries, particularly in Germany, under the title of a *half-marriage*, *morganatic marriage*, or *marriage with the left-hand*; alluding to the manner of its being contracted, viz. by the man's giving the woman his left hand instead of the right.

This is a real MARRIAGE, though without solemnity; the parties are both bound for ever; though the woman be thus excluded from the common rights of a wife, for want of quality or fortune.

The children of *concubines* were not reputed either legitimate or bastards, but natural children, and were capable only of donations.

They were deemed to retain the low rank of the mother; and were on this ground unqualified for inheriting the effects of the father.

CONCUBINAGE, in a *Legal sense*, is used as an exception against her that sueth for dower, alledging thereby, that she was not a wife lawfully married to the party, in whose

whose lands she seeks to be endowed, but his *concubine*.

CONCUBINE, a woman whom a person takes to cohabit with him, in the manner, and under the character, of a wife, without being authorised thereto by a legal marriage.

CONCUBINE is also used for a real, legitimate, and only wife, distinguished by no other circumstances but a disparity of birth or condition between her and the husband. Du-Cange observes, that one may gather from several passages in the epistles of the popes, that they anciently allowed of such *concubines*. The seventeenth canon of the first council of Toledo declares, that he, who with a faithful wife keeps a *concubine*, is excommunicated; but that if the *concubine* served him as a wife, so that he had only one woman, under the title of *concubine*, he should not be rejected from communion: which shews that there were legitimate wives under the title of *concubines*.

In effect, the Roman laws did not allow a man to espouse whom he pleased; there was required a kind of parity, or proportion, between the conditions of the contracting parties; but a woman of inferior condition, who could not be espoused as a wife, might be kept as a *concubine*; and the laws allowed of it, provided the man had no other wife.

It is certain the patriarchs had a great number of wives, and that these did not all hold the same rank; some being subaltern to the principal wife; which were what we call *concubines*, or half-wives. The Romans prohibited a plurality of *concubines*, and only had regard to the children issuing from a single *concubine*, because the might become a legitimate wife. Solomon had 700 wives, and 300 *concubines*: the emperor of China has sometimes two or three thousand *concubines* in his palace. Q. Curtius observes, that Darius was followed in his army by 305 *concubines*, all in the equipage of queens.

CONCUPISCENCE, among divines, an irregular desire, appetite, or lust after carnal things, inherent in human nature.

The dominion or prevalence of *concupiscence*, according to F. Malebranche, is what we call *original sin*.

The origin of *concupiscence* he ascribes to those impressions made on the brain of our first parents at their fall; which are still transmitted and continued on those of their children: for as animals produce their like, and with like traces in the brain (whence the same sympathies and antipathies in the same kind); and whence the same conduct on the same occasions); so our first parents, after their fall, received such deep traces in the brain, by the impression of sensible objects, that they might well be supposed to communicate them to their children.

The schoolmen use the term *concupiscible appetite* for the desire we have of enjoying any good; in opposition to *irascible appetite*, whereby we eschew what is evil.

CONCURRENCE. See CONCOURSE.

CONCURRING, or CONGRUENT *Figures*, in *Geometry*, such as, being laid upon one another, do exactly correspond to, and cover one another, and consequently must be equal among themselves. Thus, triangles having two sides and the contained angle equal each to each, appear to be equal to one another in all respects. See CONGRUITY.

CONCUSSION *crimen repetundarum*, in *Jurisprudence*, is the abuse of power by some person entrusted with a public commission or employment; by extorting money from those under his power or command. This crime is taken notice of in the heads of the Digest, or Code—*ad legem Juliam repetundarum*; and it is to be observed, that he who gave a bribe contrary to the oath he had taken, might be prosecuted as well as the receiver: and that the judge who was corrupted was deemed guilty of *concussion*, as much as he who purchased property which was in a course of litigation. The magistrates were even forbidden to acquire any thing by way of purchase, donation, or otherwise, in the provinces wherein they resided, under pain of being guilty of *concussion*.

The crime of *concussion* was not ranked in the number of public offences, except when committed by a magistrate: when committed by a person of inferior station, it was only a private crime; but it is not the quality of the person which renders the crime public or private, but the nature of the crime itself.

CONDALUS, in *Antiquity*, a kind of ring usually worn by slaves.

COND, Cos, or CONN, in *Sea Language*, signifies to guide or conduct a ship in her right course.

He that *conds* her, stands aloft with a compass before him, and gives the word of direction to the man at the helm how he is to steer. See STEERING.

If the ship go before the wind, or, as they call it, bewixt the sheets, the word is either *starboard*, or *port the helm*; according as the *conder* would have the helm put to the right or left side of the ship, upon which the ship always goes the contrary way.

If he says, *helm a mid-ship*, he would have the ship to go right before the wind, or directly between her two sheets.

If the ship fail by a wind, or on a quarter wind, the word is, *aloof, keep your luff, fall no luff, veer no more, keep her to, touch the wind, bring a cove of the lee-tack*; all which expressions are of the same import, and imply that the steersman should keep the ship near the wind.

On the contrary, if he would have her fall more large, or more before the wind, the word is, *ease the helm, no more, bear up*.

If he cries *steady*, it means, keep her from going in and out, or making yaws (as they call it), howbeever the sails, whether large, or before a wind: and when he would have her go just as she does, he cries, *keep her thus, thus*, &c.

CONDEMNATION, the act of passing, or pronouncing SENTENCE, or giving judgment against a man; whereby he is subjected to some penalty or PUNISHMENT; either in respect of fortune, reputation, or life.

CONDEMNATION *to the galleys*. See GALLEYS.

CONDEMNATION *of prizes* taken from the enemy. See PRIZE.

CONDENSATION, the act whereby a body is rendered more dense, compact, and heavy.

Condensation consists in bringing the parts closer to each other, and increasing their contact: in opposition to *rarefaction*; which renders the body lighter and looser, by setting the parts farther asunder, and diminishing their contact, and of consequence their cohesion.

Wolfius, and some of the more accurate writers, restrain the use of the word *condensation*, to the action of cold: what is done by external *applications*, they call *compression*.

Air easily *condenses*, either by cold, or by art: water congeals, but never has been supposed to *condense*, i. e. to be brought into a less space; because it has even penetrated the most solid body, even gold, rather than lose of its bulk. See COMPRESSION, AIR, SPRING, and CONDENSER.

It was found, in the observatory at France, during the great cold of the year 1670, that the hardest bodies, even metals, glass, and marble itself, were sensibly *condensed* by the cold, and became much harder, and more brittle, than before; till their former state was retrieved by the ensuing thaw.

Water alone seems to expand by cold; inasmuch as when congealed, the ice takes up more space than the water did before. But this must be rather owing to the intromission of some foreign matter, as the nitrous particles of the ambient air, than to any proper rarefaction of the water by the cold.

The Cartesians, indeed, taking it for granted that there is no vacuum, deny that there can be any such thing as proper *condensation*, or RAREFACTION. According to them, when a body takes up more space than it did before, its parts are distended by the destruction of a subtile matter through its pores: and when its bulk, again, is reduced into less space, this is owing to the extrusion or egress of that matter through the same pores; by virtue whereof, the parts of the body, though not the parts of matter, come nearer each other.

For as extension and matter, according to them, are the same thing; a body can never take up more or less place, any otherwise than by the accession or diminution of matter: and thus they conclude there is no VACUUM.

Now, that, in the rarefactions of grofs bodies, their parts are distended by the accession of air, is frequently manifest: but this does not follow from the plenitude of the world, but from the fluid and elastic nature of air; or from its gravity and pressure. That there is such a thing as *condensation*, without the loss of any matter, is evident from Galileo's experiment: a cock, being with a female screw fitted to a hollow brass ball, or cylinder, to as that a syringe, by means of a male screw, may be applied to it; by working the syringe, the air will be forced into the ball, and turning the cock, it will be retained; insomuch that, upon examining the vessel by the balance, its weight will be found increased. If the cock be returned, the air will burst out with violence, and the ball will sink to its former weight.

From the experiment it follows, 1°. That air may be crouded into a less volume and bulk than it ordinarily takes up, and is therefore compressible.—*For the quantity of its* COMPRESSION, see AIR.

2°. That from the recovery of its weight, just so much air is expelled as was injected; and that, therefore, compressed air returns to its primitive expansion, if the compressing force be removed; and it has therefore an elastic force.

3°. That it is a certain sign of compression, if, upon opening

opening the orifice of a veſſel, any portion of air be obſerved to fly out.

4°. That ſince the weight of the veſſel is increaſed by injecting air; the aerial maſs muſt have a nitus downwards, in lines perpendicular to the horizon; and is therefore heavy, and preſſes ſubject bodies in lines perpendicular to the horizon, according to the conditions of gravity.

Condenſed air has effects juſt oppoſite to thoſe of rarefied air; birds, &c. appear briſker and more lively therein than in the common air, &c.

CONDENSER, a pneumatic engine, made of glaſs, in a cylindric or globular figure, or conſiſting of two very ſtrong braſs cups, whoſe brims, covered with wet leather, are preſſed together, and kept down by an iron croſs-bar with pillars and ſcrews, by which, with an *injecting* SYRINGE, an unuſual quantity of AIR may be crouded into a given ſpace. The orifice of the *condenſer* is fitted with a female ſcrew to receive the male ſcrew at the end of the ſyringe: it is alſo furniſhed with a GAGE. See *Tab.* II. *Pneumatics, fig.* 23, 24.

They can by this throw in 2, 3, 4, 5, or 10 atmoſpheres into the *condenſer*, i. e. twice, thrice, four, &c. times as much air as there would be in the ſame compaſs without the engine. See CONDENSATION.

CONDENSING *of wines*. See WINES.

CONDERS, in the *Cuſtoms*. See BALERS.

CONDIGNITY, *merit of*. See MERIT.

CONDITION, in the *Civil Law*, an article of a treaty, or contract; or a clauſe, charge, or obligation, ſtipulated in a contract, or added in a donation, legacy, teſtament, &c.

The donee does not loſe his donative, if it be charged with any diſhoneſt or impoſſible *conditions*. Lawyers diſtinguiſh three kinds of *conditions*, under which a legacy or donation may be made: theſe are the *caſual*, which depends merely on chance; the *poteſtative*, which is abſolutely in our power; and the *mixed condition*, which is both caſual and poteſtative together.

CONDITION, in *Common Law*, is a manner, quality, or reſtriction, annexed to an act; qualifying or ſuſpending the ſame; and making it precarious and uncertain, whether or no it ſhall take effect.

In a leaſe there may be two ſorts of *conditions*; *condition collateral*, and *condition annexed to the rent*.

CONDITION, *collateral*, is that annexed to a collateral or foreign act; as *e. gr.* that the leſſee ſhall not go to Paris. *Condition* is alſo divided into *condition in deed*, and *condition implied*.

CONDITION *in deed, or expreſſed*, is annexed by expreſs words to the feoffment, leaſe, or grant, either in writing, or without. As, if I infeoff a man in lands, reſerving a rent to be paid at ſuch a feaſt; *upon condition*, if the feoffee fail of payment, it ſhall be lawful for me to reenter.

CONDITION *implied*, called alſo *condition in law*, is when a man grants to another the office of a ſteward, bailiff, keeper of a park, &c. for life: though there be no *condition* expreſſed in the grant, yet the law makes one covenly; which is, that if the grantee do not juſtly execute all things belonging to the office, it ſhall be lawful for the grantor to diſcharge him.

CONDITION *precedent*, is when a leaſe or eſtate is granted to a perſon for life, upon *condition* of the payment of a certain ſum by the leſſee to the leſſor at a certain day, which he ſhall have a fee ſimple: in this caſe the *condition* precedes the eſtate in fee, and on performance gains the fee-ſimple.

CONDITION *ſubſequent*, is when a man grants to another his manor in fee, upon *condition* that the grantee ſhall pay to him a certain ſum on ſuch a day, or that his eſtate ſhall ceaſe: ſo that here the *condition* follows the eſtate, and the performance preſerves it.

CONDITION *without which, ſine qua non*, uſed in *Philoſophy*, in ſpeaking of ſome accident or circumſtance, which is not eſſential to the thing, but is yet neceſſary to its production. Thus, *light* is a *condition without which* a man cannot ſee objects, though he have good eyes; and thus fire, though conſidered in itſelf, may burn without wood; yet is its preſence a *condition without which* the wood cannot be burnt.

CONDITIONAL, ſomething not abſolute, but ſubject to limitation. See CONDITION.

Conditional legacies are not due till the conditions are accompliſhed.

The Arminian divines maintain, that all the decrees of God, relating to the ſalvation and damnation of man, are *truly conditional*; and the Calviniſts, that they are all abſolute. See ARMINIAN, &c.

CONDITIONAL *conjunctions*, in *Grammar*, are thoſe which ſerve to make propoſitions conditional. As, *if, unleſs, provided that, in caſe of*, &c.

CONDITIONAL *propoſitions*, in *Logic*, are ſuch as conſiſt of two parts, connected together by a *conditional* particle. Of theſe, the firſt, wherein the condition lies, is called the *antecedent*, and the other the *conſequent*.

Thus, If the ſoul be ſpiritual, it is immortal: is a *conditional propoſition*, wherein, *if the ſoul*, &c. is the antecedent, and *it is immortal* the conſequent.

The truth of theſe propoſitions depends on the truth of the connexion of them, and they may be properly denied or contradicted when the argation affects their conjunctive particles.

CONDITIONAL *ſyllogiſm*, is that whoſe major or minor, or both, are *conditional* propoſitions: *e. gr.* If there be a God, the world is governed by Providence; but there is a God, therefore the world is governed by Providence.

CONDITIONAL, *ſtate, and reſignation*. See the ſubſtantives.

CONDITIONALS, *ſcience of*, i. e. of *conditional truths*, imports that knowledge which God has of things, conſidered, not according to their eſſence, their nature or their real exiſtence; but under a certain ſuppoſition, which imports a condition never to be accompliſhed.

Some of the ſchoolmen deny, that God has the knowledge of *conditionals*: the Thomiſts maintain, that God's knowledge of *conditionals* depends on a predeterminating decree; others deny it.

F. Daniel obſerves, that the truths which compoſe the knowledge of *conditionals*, being very different from thoſe which compoſe the knowledge of intuition, and that of underſtanding; a third claſs muſt be added, and the knowledge of God be divided into *intuitive, intellective*, and *conditional*. See KNOWLEDGE.

CONDORE, in *Ornithology*, the name of the largeſt of all birds in South America; and perhaps, by the deſcription of it, in the world. It is frequently met with on the Andes. It is of the carnivorous kind, and ſo very ſtrong, fierce, and voracious, that it often ſeizes lambs from the flock; and Don Ulloa informs us, that he actually ſaw one of them riſing with a lamb in its talons. The Indians have various ways of catching them: beſides traps and ſnares laid for them near any carrion, they kill a cow or other animal, and moiſten its fleſh with the juice of ſome ſtrong intoxicating herbs, and then bury the body till it putrefies. In this ſtate they take it up, and lay it on the ground; and when the *condores* come near to devour it, they are intoxicated and rendered motionleſs, when the Indians fall upon and kill them.

CONDORMIENTES, religious ſectaries, whereof there have been two kinds. The firſt aroſe in Germany, in the thirteenth century; their leader was a native of Toledo. They held their meetings near Cologne; where they are ſaid to have worſhipped an image of *Lucifer*, and to have received anſwers and oracles from him: the legend adds, that an eccleſiaſtic having brought the euchariſt to it, the idol broke into a thouſand pieces; which put an end to the worſhip. They had their name from their *lying all together*, men and women, young and old.

The other ſpecies of *Condormientes* were a branch of Anabaptiſts in the ſixteenth century; ſo called, becauſe they lay, ſeveral of both ſexes, in the ſame chamber; on pretence of evangelical charity.

CONDUCT, *ſafe*. See SAFE-*conduct*.

CONDUCTOR, the name of a ſurgeon's inſtrument, uſed when a ſinus is laid open, and being put up into the bladder, ſerves to guide or conduct the knife, in the operation of cutting for the ſtone. See LITHOTOMY.

CONDUCTOR, in *Surgery*, likewiſe denotes an inſtrument, not long ſince contrived by Mr. Wathen, for ſecuring a fractured limb in the conveyance of the patient from the place where the accident occurred, to the place where the cure is to be completed. It conſiſts of two tin CANULÆ, with grooves and ſliders: theſe *canulæ* with their ſliders incloſed are, like SPLINTS of the ſame length, to be placed one on each ſide of the fractured leg, and ſecured on the knee and ancle joints by a tin band, which is jointed and cuſhioned. The ſlide may be drawn out at pleaſure, and the degree of extenſion thus procured is continued by a key-check, which faſtens on the teeth of the ſlider. The *conductor* may be ſhortened by preſſing the key, and letting the ſlider return into the *canula*.

CONDUCTORS, in *Electricity*, a term firſt introduced into this ſcience by Dr. Deſaguliers, and uſed to denote thoſe ſubſtances which are capable of receiving and tranſmitting the electric virtue, in oppoſition to ELECTRICS, in which the ſame virtue may be excited and accumulated. The former are alſo called *non-electrics*, and the latter *non-conductors*. All bodies are ranked under one or other of theſe two claſſes: though none of them are *perfect electrics*, or *perfect conductors*, ſo as wholly to retain, or freely and without reſiſtance to tranſmit the electric fluid.

fluid. Electricians, in the infancy of this science, apprehended, that some substances contained the electric matter, and that others were wholly destitute of it; and they were hence led to call the former *electrics per se*, and the latter *non-electrics*: but subsequent experiments proved, that the electric fluid was really drawn from those bodies, which at first were thought to have none in them; and that it was diffused through *all the matter* of the terraqueous globe: and, therefore, the terms *conductor* and *non-conductor* were adopted, as less exceptionable, and more agreeable to phenomena. Metals and semi-metals, ores, and all fluids (excepting air and oils), together with the substances containing them, the effluvia of flaming bodies, ice, unless froze very hard, and snow, most saline and stony substances, charcoals, of which the best are those that have been exposed to the greatest heat, smoke, and the vapour of hot water, belong to the class of *conductors*. We may observe here, that the electric fluid passes through the substance, and not merely over the surfaces of metallic *conductors*: because if a wire of any kind of metal be covered with some electric substance, as resin, sealing wax, &c. and a jar be discharged through it, the charge will be conducted as well with as without the electric coating.

It has likewise been alledged, that electricity will pervade a vacuum, and will be transmitted through it almost as freely as through the substance of the best *conductor*: but Mr. Walsh found, that the electric spark or shock would no more pass through a perfect vacuum, made by the assistance of M. De Luc, than through a stick of solid glass. In other instances, when the vacuum hath been made with all possible care, the experiment has not succeeded. We may also observe, that many of the forementioned substances are capable of being electrified, and that their *conducting* power may be destroyed and recovered by different processes: e. g. green wood is a *conductor*; but baked, it becomes a *non-conductor*: its *conducting* power is restored by charring it; and again destroyed by reducing it to ashes. And again, many electric substances, as glass, resin, air, &c. become *conductors*, by being made very hot; air heated by glass mill be excepted. The difference between these two kinds of substances, in consequence of which some retain, and others convey the electric matter, has been among the *desiderata* in this science. Dr. Franklin, in a letter dated 1751, observes, that the perfect *conductors* of electric matter, are only metals and water; and that other bodies *conduct* only as they contain a mixture of these; without more or less of which they will not *conduct* at all. But this ingenious philosopher found reason afterwards to retract this opinion; since several substances have been discovered to act as good *conductors*, as particularly, hot air and charcoal, which contain no water or metal, at least in such a quantity as to induce a change in their nature; and S. Beccaria has proved, that water itself is an imperfect *conductor*.

Dr. Priestley has lately advanced another hypothesis, no less probable than ingenious. He considers the characteristic distinction between *conducting* and *non-conducting* substances to consist in this, that the former contain PHLOGISTON intimately united with some base; and that the latter, if they contain it all (glass being supposed to contain none), retain it more loosely. He was led to this discovery by his experiments on the *conducting* power of CHARCOAL, which he found exactly to agree with metals in this particular, that while they have the phlogiston, they *conduct*, and, when deprived of it, they will not *conduct*. Dr. Priestley was afterwards confirmed in his hypothesis, upon observing the affinity between phlogiston and water, which gave him occasion to conclude, that water, in its natural state, contains some portion of phlogiston; in proof of which conclusion he has since found, that long agitation in the purest water injures air, in that a candle will not burn in it, which is precisely the effect of all phlogistic processes. Is not (says S. Beccaria) the inflammability of resins, sulphurs, and other oiled substances, the cause why such bodies are disposed to be electrified by *deficiency*, since in consequence of such inflammability they receive, when rubbed, a greater degree of heat? And may not the great quantity of phlogiston with which metallic substances abound, as well as the great ease with which common fire moves within them, be the reason why metallic substances quickly contract by friction a considerable degree of heat, and are thus disposed to give (or part with) their electric fire in the highest degree? We may observe, that when metallic bodies are melted by lightning, the bodies contiguous to them are very liable to be burnt by the phlogiston which is then set free from them. We may add to the above conjectures, that glass, when unpolished, also contracts heat more easily on account of the separation between the parts which compose its surface, and of their smallness; in the same manner as inflammable bodies are the more easily kindled, as their surface has a greater ratio to their mass. Mr. Henly, in a very long course of experiments, observed, that those bodies that were most replete with phlogiston, became the most easily, and the most powerfully electrified *negatively* by friction: he also observes that a thick scum from the surface of some linseed oil, perfectly dried, became a very strong negative electric. See on this subject Priestley's History of Electricity, vol. i. Observations on Air, vol. i. p. 283, &c. vol. ii. p. 354. Cavallo's Complete Treat. of Elect. chap. ii. Franklin's Letters, &c. p. 69, &c. 2d. ed. 1769. Henly's Exp. and Obs. in Elect. Phil. Trans. vol. lxvii. part i. p. 122, &c.

CONDUCTOR, *prime*, in *Electricity*, is an insulated *conductor* so connected with the ELECTRICAL *machine*, as to receive the electricity immediately from the excited electric. The first metallic *conductors*, that were applied to this purpose, were those of Mr. Grey in 1734: he suspended several pieces of metal on silken lines, and charged them with electricity. Mr. Du Fay fastened to the end of an iron bar, which he used as his *prime conductor*, a bundle of linen threads, to which he applied the excited tube; but these were afterwards changed for small wires suspended from the common gun-barrel, or other metalline rod. In the present advanced state of the science, this part of the electrical apparatus has been considerably improved. The *prime conductor* is made of hollow brass, and generally of a cylindric form (see *Tab. Electricity, fig.* 4.); and care should be taken that it is perfectly smooth and round, without points and sharp edges; if holes are made in it for the purposes of different experiments, the same caution should be observed. The ends of the *conductor* are spherical; and it is necessary, that the part most remote from the electric should be made much larger and rounder than the rest, in order to resist the effort of the electric matter to escape, which is always the greatest at the greatest distance from the electric: and the other end should be furnished with several pointed wires or needles, either suspended from, or fixed to an open metallic ring, and pointing to the globe, or cylinder, in order to collect the fire. The *prime conductor*, instead of hanging on silken strings, which are liable to continual motion, should be supported by pillars of solid glass covered with sealing-wax or good varnish. The electricians should be provided with several metallic *conductors* of different sizes, which may be used as occasion requires. *Prime conductors* of a larger size are usually made of paste-board, covered with tin-foil or gilt paper; and these are useful for throwing off a longer and denser spark than those of a smaller size: they should terminate in a smaller knob or obtuse edge, at which the sparks should be solicited. Mr. Nairne prepared a *conductor* six feet in length, and twelve inches in diameter, from which he drew electrical sparks at the distance of sixteen, seventeen, or eighteen inches. But there is a *maximum*, which the size of the *prime conductor* should not exceed; for it may be so large, that the dissipation of the electricity from its surface may be greater than that which the electric is capable of supplying.

Dr. Priestley recommends a *prime conductor* of polished copper, in the form of a pear (see *fig.* 6. *b*), supported by a pillar and a firm basis of baked wood: this receives its fire by a long arched wire of tost brass (*c*), which may be easily bent, and rolled and lowered to the globe: it is terminated by an open ring (*m*), in which are hung some sharp-pointed wires. In the body of this *conductor* are holes for the insertion of metalline rods. This, he says, collects the fire perfectly well, and retains it equally every where. Phil. Trans. vol. lxxii. part i. art. 7. Hist. Elect. vol. ii. § 2.

Mr. Henly has contrived a new kind of *prime conductor*, which, from its use, is denominated the *luminous conductor*, (see *fig.* 8.) It consists of a glass tube, EB, eighteen inches long, and about two inches in diameter. The tube is furnished at both ends with brass caps and ferules about two inches long, as F D and E B, cemented and made air-tight, and terminated by brass balls D and B. In one of these caps, as F, a small hole is drilled, which is covered by a strong valve, and which serves for exhausting the tube of its air; and the ball D is made to screw on the cap F. Within the tube at each end there is a knobbed wire, projecting to the distance of two inches and a half from the brass caps, and terminating as represented at H and I. To the ball D is annexed a fine-pointed wire for receiving and collecting the electricity, and at the other end H there is a wire with a knob or ball for discharging it. The *conductor*, thus prepared, is supported on pillars of sealing-wax, or glass. Besides the common purposes of a *prime conductor* to an electrical machine, this apparatus serves to exhibit and ascertain the direction of the electric matter in its passage through it: for, when the point C is brought

near the excited globe or cylinder of a machine, it will appear illuminated with a ſtar, and a weak light will occupy the inner part of the tube; a lucid pencil will iſſue from the ball H, and the oppoſite ball I will be illuminated with a ſtar. But if the point C be connected with the inſulated rubber of a machine, the appearances will be reverſed; the ſtar will appear at H, and the pencil at I; for in the former caſe H diſcharged, and in this caſe it receives the electric fire, as in *fig.* 9. If the knob of an uncharged bottle be nearly in contact with the braſs ball B, or a chain be ſuſpended from it to the table, and the experiment be repeated as above deſcribed, the ball I, when C is preſented to the excited glaſs, will be enveloped with a denſe white atmoſphere of electricity; and when C is preſented to the inſulated rubber, the atmoſphere will appear upon the ball H; and the ſame will happen on the application, firſt, of a bottle poſitively charged, and then of a bottle negatively charged, as in *fig.* 10 and 11. From an experiment ſimilar to this, S. Beccaria inferred, that electricity conſiſts of one uniform homogeneous fluid, and not of two, viz. the vitreous and reſinous, as ſome have ſuppoſed: for, if this were the caſe, both balls ſhould have been encompaſſed with their proper atmoſpheres at the ſame time. If inſtead of balls, the wires in the tube terminate in points, the appearance will be the ſame. Phil. Tranſ. vol. lxiv. part ii. p. 403.

CONDUCTORS, *pointed metallic*, were propoſed by Dr. Franklin for preſerving buildings, &c. ſoon after the identity of electricity and lightning was aſcertained; and they exhibit a very important and uſeful application of modern diſcoveries in this ſcience. This ingenious philoſopher, having found that pointed bodies are better fitted for receiving and throwing off the electric fire than thoſe that were terminated by blunt ends or flat ſurfaces, and that metals were the readieſt and beſt *conductors*, ſoon diſcovered that lightning and electricity reſembled one another in this and other diſtinguiſhing properties: he accordingly recommended a pointed metalline rod to be raiſed ſome feet above the higheſt part of a building, and to be continued down into the ground or the neareſt water. The lightning, ſhould it ever come within a certain diſtance of this rod or wire, would be attracted by it, and paſs through it preferably to any other part of the building, and be conveyed into the earth or water, and there diſſipated, without doing any damage to the building. Many facts have occurred to evince the utility of this ſimple and ſeemingly trifling apparatus. However, ſome electricians, of whom Mr. Wilſon is the principal, have objected to the pointed termination of this *conductor*; preferring rather a blunt end: becauſe, they ſay, a point invites the electricity from the clouds, and ſtrucks it at a greater diſtance than a blunt *conductor*. Phil. Tranſ. vol. liv. p. 234. vol. lxiii. part ii. p. 47.

This ſubject has been very accurately examined and diſcuſſed; and pointed *conductors* are almoſt univerſally, and for the moſt ſufficient reaſons, recommended as the moſt eligible and proper. A ſharp pointed *conductor*, as it attracts the electric fire at a greater diſtance than the other, draws it off by degrees; and by conveying it away gently and in a continued ſtream, prevents a ſtroke; whereas a *conductor* with a blunt termination receives the whole diſcharge of a cloud at once, and is much more likely to be exploded, whenever a cloud comes within the ſtriking diſtance. To which we may add, that buildings guarded by either natural or artificial *conductors* terminating in a point, have ſeldom or ever been ſtruck by lightning; but others, having flat or blunt terminations, have been often ſtruck and damaged by it. For a farther account of the nature and efficacy of points in electricity, ſee POINTS.

The beſt *conductor for this purpoſe* is a rod of iron, or rather of copper, as being a better *conductor* of electricity, and not ſo liable to ruſt, about three quarters of an inch thick, which is either to be faſtened to the walls of a building by wrought cramps, or ſupported by wooden poſts at the diſtance of one or two feet from the wall; the upper end of it ſhould terminate in a pyramidal form with a ſharp point and edges; and if it is made of iron, be gilt or painted near the top; and be elevated above the higheſt part of the building, e. g. the ſtack of chimnies to which it may be faſtened, a ſmall five or ſix feet. The lower end ſhould be driven five or ſix feet into the ground, and directed away from the foundations of the building, or continued till it communicates with the neareſt water. If this part be made of lead, it will be more ſecure from decay. When the *conductor* is formed of different pieces of metal, care ſhould be taken that they are well joined: and Mr. Henly adviſes, that a communication be made from the *conductor* by plates of lead, eight or ten inches broad, with the lead on the ridges and gutters, and with the pipes that carry down the rain water, which ſhould be continued to the bottom of the building, and made to communicate either with moiſt earth or water, or with the main pipe which ſerves the houſe with water. Phil. Tranſ. vol. lxiv. part ii. p. 403. If the building be large, two, three, or more *conductors* ſhould be applied to different parts of it, in proportion to its extent.

Chains have been uſed for the preſervation of ſhips; but as the electric matter does not paſs readily through the links of it, copper wires, a little thicker than a gooſe quill, have been preferred, and are now generally uſed. They ſhould reach two or three feet above the higheſt maſt, and be continued down in any convenient direction, ſo as always to touch the ſea-water. Theſe were firſt recommended to lord Anſon by Dr. Watſon in 1762. Phil. Tranſ. vol. lii. part i. p. 633. See Franklin's Letters, &c. ed. 1769. p. 65, 124, 479, &c. and Cavallo's Elect. chap. ix.

The *conductor* or machine for drawing electricity from the clouds is thus conſtructed: A pole, *a*, of a manageable length is erected on the top of a building (the higher the better), having on the upper end a ſolid piece of glaſs or baked wood, a foot long, (ſee *fig.* 12.): This is covered with a tin or copper veſſel, *b*, in the ſhape of a funnel, in order to prevent its being wetted. Above this there riſes a long ſlender rod, *c*, terminating in a pointed wire, having a ſmall wire twiſted round it, to conduct the electricity the better to the funnel. From the funnel a wire, as *d*, deſcends along the building, and is conveyed through the window into the room, where the experiments are made. This wire is connected with an inſulated *conductor*, which will be electrified whenever there is a conſiderable quantity of electricity in the air; and notice will be given, when it is properly charged, either by Mr. Canton's balls (ſee ELECTROMETER), or by a ſet of BELLS, deſcribed under that article. For the ſafety of theſe experiments, the electrified wire ſhould be brought within a few inches of a *conducting* rod which ſerves to guard the houſe, that the redundant electricity may paſs off in that way, without ſtriking any perſon who may happen to ſtand near it.

Experiments on the electricity of the atmoſphere may be made with greater exactneſs, by raiſing a kite, by means of a ſtring in which a ſmall wire is twiſted. The beſt ſtring for this purpoſe may be formed by twiſting a copper thread, ſuch as is uſed for trimmings, &c. or, if expence be diſregarded, a ſilver or gold thread, with two very ſmall threads of twine. Mr. Nairne uſes a ſtring ſoaked in a ſtrong ſolution of ſalt, which becomes a good *conductor*, by imbibing the moiſture of the air. The extremity of this line muſt be ſilk, and the wire muſt terminate in a metallic *conductor* of any convenient form. But the following apparatus will ſerve for ſilk greater ſecurity in a thunder-ſtorm. Let the ſtring of the kite (*Vab. Electricity, fig.* 13.) be wound upon a reel, *b*, and paſs through a ſlit in a flat board, faſtened at the top of it, by which more or leſs of the ſtring may be let out at pleaſure. Let the reel be fixed to the top of ſuch a funnel, *c*, as was above deſcribed; and from the funnel let a metallic rod, *d*, with a large knob be projected, to ſerve for a *conductor*. The funnel and reel muſt be ſupported by a ſtaff, *e*, the upper end of which, at leaſt, ſhould be well baked: and the lower end may be made ſharp to thruſt into the ground, when the kite is well raiſed. The ſafety of this apparatus depends upon the chain, *f*, faſtened to the ſtaff, by a hook a little below the funnel, and dragging on the ground: for the redundant lightning will ſtrike from the funnel to the chain, and thus be conducted as far as any one chuſes, without touching the perſon who holds the ſtaff. Sparks may be taken from the *conductor* belonging to this apparatus with all ſafety, by means of a ſmall rod of baked wood, *a*, furniſhed with a ſmall funnel, *b*, and a braſs rod, *c*, and a chain connected with it; for the lightning, which ſtrikes the rod, will paſs by the funnel and chain, without touching the perſon who holds the rod. Hiſt. of Elect. vol. ii. p. 103, &c. 8vo. ed. 1775.

CONDUCTORS, in the *Military Art*, are aſſiſtants given to the commiſſary of the ſtores, to receive or deliver out ſtores to the army; to attend at the magazines by turns, when in garriſon; and to look after the ammunition-waggons in the field. They bring their account every night to the commiſſary, and are immediately under his command.

CONDUCTOS *ad proficiſcendum*. See CAPIAS.

CONDUIT, a canal, or PIPE, for the conveyance of water, or other fluid matter.

In the earth are ſeveral ſubterraneous *conduits*, through which the waters paſs that form ſome SPRINGS; and through which alſo paſs the vapours, which form METALS and MINERALS.

Artificial conduits for water are made of lead, ſtone, caſt iron, potters earth, &c. See PLUMBERY.

In the province of New Mexico, there is said to be a subterraneous *conduit*, in form of a grotto, extending six hundred miles in length. See DUCT, TUBE, &c.

CONDYLOMA, in *Anatomy*. See CONDYLUS.

CONDYLOMA, in *Medicine*, is a soft, painless tumor, of the endematous kind, arising on the internal coat of the anus, and the muscles of that part, or in the neck of the matrix.

The word comes from κονδυλος; because the *condylomas* has usually *rugæ*, or wrinkles, like the joints of the body.

The *condyloma*, by long continuance, grows fleshy, and, shooting out as from a stalk, takes the denomination FICUS.

Condylomata are frequently the effect of venereal ailments, and, if neglected, sometimes prove cancerous: their cure depends on mercurial unctions, and proper escharotics to consume them; though extirpation either by ligature or incision, if the nature of the part will admit, is the most expeditious. A salivation is often necessary, in order to facilitate and complete the cure.

CONDYLUS, κονδυλος, a name which *Anatomists* give to a little round eminence, or protuberance at the extremity of a bone. *See Tab. Anatomy (Osteol.) fig. 2. lit. n.*

Such is that of the lower jaw, received within the cavity of the *os petrosum*.

When this eminence is large, it is called the head of the bone.

CONE, in *Geometry*, a solid body, having a circle for its basis, and terminated at the top in a point, or vertex. *See Tab. Conics, fig. 5.*

The *cone* is generated by the motion of a right line, KM, round an immoveable point K, called its *vertex*, along the circumference of a plane, called its *base*, MN: or it may be conceived as generated by the revolution of the triangle KLM, about the right line KL, which is called the axis of the *cone*, and KM its *latus*, or *side*. If the axis be perpendicular to the base, it is said to be a *right cone*: and if inclined, or oblique, a *scalenous cone*. *Scalenous cones* are again divided into *obtuse-angled*, and *acute-angled*.

Euclid defines a *cone* a solid figure, whose base is a circle, as CD (*fig. 3.*) and is produced by the entire revolution of the plane of a right-angled triangle CAB, about the perpendicular leg AB.

If this leg, or axis, be greater than CB, half the base; the solid produced is an *acute-angled cone*; if less, it is an *obtuse-angled cone*; and, if equal, a *right-angled cone*.

But Euclid's definition only extends to a *right cone*: that is, to a *cone* whose axis is at right angles to the base; and not to oblique ones, whose axis is not at right angles to the base.

For a more general and comprehensive description of a *cone*, which may take in both right and oblique ones, suppose an immoveable point A (*fig. 4.*) without the plane of the circle BDEC; and suppose a right line AE, drawn through that point, and produced infinitely both ways, to be moved quite about the circumference of the circle; the two superficies that will arise from this motion are each called *conic superficies*; but, taken conjunctly, they are called *superficies vertically opposite*, or only *opposite superficies*. The immoveable point A, common to both the superficies, is called the *vertex*; the circle BDEC, the *base*; the right line AC, drawn through the vertex A and C, the *centre of the base*; and if infinitely produced, the *axis*; and the solid comprehended under the conical superficies and the base is a *cone*.

Properties of the CONE.—1. *The area or surface of every right cone, exclusive of its base, is equal to a triangle whose base is the periphery, and its height the side of the* cone.

Or, the curve superficies of a right *cone* is, to the area of its circular base, as AC (*fig. 3.*) the length of the hypothenuse of the right-angled triangle describing it, is to CB, the base of the same triangle: that is, as the slant height of the *cone*, to the semidiameter of the base.

Hence, the surface of a right *cone* is equal to a sector of a circle described on the side of the *cone*, as a radius, whose arch is equal to the periphery of the *cone*; and has therefore the same proportion to its periphery, which the diameter of the base has to twice the side of the *cone*. *Hence we have a method of describing a tent or cage that shall just cover a* cone.—Thus, with the diameter of the base AB (*Tab. Conics, fig. 6.*) describe a circle, and produce the diameter to C, till AC be equal to the side of the *cone*. To 2 AC and AB, determined in numbers, and 360°, find a fourth proportional; and with the radius CA, on the centre C, describe an arch DE equal to the number of degrees found: the sector CDE with the circle AB will be a tent for the *right cone*.

If, then, the side of a truncated *cone* be set off from A to F, and an arch GH be described with the radius CF; by finding a fourth proportional to 360°, to the number of degrees of the arch GH, and to FC; and thence determining the diameter of the circle IF, we shall have a net or cover of the truncated *cone*.

For CDBAE is a net for the entire *cone*; CGFIH for the *cone* cut off; therefore, DBEHIG for the truncated *cone*.

2. *Cones and pyramids, having the same bases and altitudes, are equal to each other.*

Now, it is shewn, that every triangular prism may be divided into three equal pyramids; and therefore, that a triangular pyramid is one third of a prism, standing on the same base, and having the same altitude.

Hence, since every multangular body may be resolved into triangular ones, and every pyramid is a third part of a prism having the same base and altitude; since a *cone* may be esteemed an infinite-angular pyramid, and a cylinder an infinite-angular prism; a cone is a third part of a cylinder, which has the same base and altitude.

Hence we have a method of measuring the surface and solidity of a cone.—Thus, *for the solidity*: find the solidity of a prism, or cylinder, having the same base with the *cone*, or pyramid. Which found, divide by 3; the quotient will be the solidity of a *cone*, or a pyramid. Thus, v. gr. if the solidity of a cylinder be 603592960, the solidity of the *cone* will be found 201864320.

For the surface; that of a right *cone* is had by multiplying the semi-periphery of the base into the side, and adding the product to the base.

Suppose, e. gr. the diameter of the *cone* NM (*fig. 2.*) 56, the periphery will be 175.92768, and the base 2463.0144. Suppose the altitude or axis KL, 246; since $LM = \frac{1}{2}NM = 28$, and $KM^2 = KL^2 + LM^2 = 60516 + 784 = 61300$, $KM = 247.5$ &c. Consequently the superficies of the *cone*, exclusive of the base is, 21771.2884; and the whole together 24234.3624.

The *solidity* of an oblique *cone* is obtained in the same manner with that of the right *cone*: but it is much more difficult to find its surface, since it cannot be reduced to the measure of a sector of a circle, because all the lines drawn from the vertex to the base are not equal. See a Memoir on this subject, by M. Euler, in the Nouv. Mem. de Petersburgh, tom. 1. Dr. Barrow has demonstrated, in his Lectiones Geometricæ, that the solidity of a *cone* with an elliptic base, forming part of a right *cone*, is equal to the product of its surface by a third of one of the perpendiculars drawn from the point in which the axis of the right *cone* intersects the ellipse; and that it is also equal to one third of the height of the *cone* multiplied by the elliptic base: and therefore that the perpendicular is to the height of the *cone*, as the elliptic base to the surface.

As to the measure of the surface, and solidity, of a truncated cone, ABCD (*fig. 7.*). Its altitude CH, and the diameters of its bases AB and CD, being given, find their circumferences: to the square of the altitude CH, add the square of the semi-difference of the radii AH, and from the aggregate extract the square root, which will give the side AC: the semi-sum of the peripheries, multiplied by that side, gives the superficies of the *truncated cone*.

To find the solidity: as the difference of the semidiameters AH is to the altitude of the truncated *cone* CH, so is the greater semidiameter AF to the altitude of the entire *cone* FE. This being found, subtract the altitude of the truncated *cone* GY, which will leave that of the *cone* taken off, EG.

Find the solidity of the *cone* CED and AEB, subtract the other from this; the remainder will be the solidity of the truncated *cone* ACDB.

For the sections of the CONE, see CONIC *Section*.—*For the ratio of* CONES *and Cylinders*, see CYLINDER.—*For the centres of gravity and of oscillation of a* CONE, see CENTER.

CONES *of the higher kinds*, are those whose bases are circles of the higher kinds; and are generated by supposing a right line fixed in a point, on high, though conceived capable of being extended more or less, on occasion; and moved or carried round a circle.

CONE *of rays*, in *Optics*, includes all the several RAYS which fall from any point of a radiant, on the surface of a glass.

CONE, *double or spindle*, in *Mechanics*, is a solid formed of two equal cones joined at their bases. If this be laid on the lower part of two rulers making an angle with one another, and elevated above the horizontal plane, it will move towards the raised ends, and seem to ascend, though it really descends. Let ABD (*Tab. Mechanics, fig. 31.*) be the common base of the two *cones*, its centre C will be the centre of gravity of the whole solid; therefore if DF represents one of the rulers elevated to an angle FDG, whose line FG is less than the semidiameter of the *cone* CD, it is plain that the centre of gravity C at the position of the *cone* in D, is more distant from the centre of the earth, to which all heavy bodies tend, than

in

in its position between the legs of the ruler at F; and therefore it will descend, as on an inclined plane C F E, from C to F, where it will stop, being supported on the raised ends of the rulers.

CONE, in *assaying*. See MELTING-*cone*.

CONE, in *Botany*, a hard dry seed-vessel of a conical figure, consisting of several woody parts; and is, for the most part, scaly, adhering closely together, and separating when ripe.

CONE-*shell*, in *Natural History*, the name given by many to a species of TUBULUS *marinus*, not known to us in its recent state, but frequently found fossile in the Swedish stones used in pavements.

CONE *and key*. Bracton, lib. ii. cap. 37. num. 3. says, *Femina in tali statu (i. e. 14 et. 15 annorum) potest dispensare domui suæ, et habere* cone *et key*.

The words come from the Saxon *cuna*, i. e. *calculus*, and *key*, *clavis*; so that a woman was then held to be of competent years when she was able to keep the accounts and keys of the house: and Glan. lib. viii. cap. 9. has somewhat to the same purpose.

CONEPATL, in *Zoology*, the name of an American animal, very much like the raccoon in shape, but variegated with two long streaks of white, one on each side of the ridge of the back, which run even into the tail. It is a tame and harmless animal, but of a stinking smell; and when purfued, or provoked, will discharge its excrements at the perfon who offends it, to fix or eight feet diftance; thefe have a very bad fmell, and fpoil people's cloaths, by leaving indelible yellow fpots on them. Ray. See XOLOITZCUINTLI.

CONESSI, or CONESSI, in the *Materia Medica*, a bark brought from the Eaft Indies. It is frequent in Ceylon, and Malabar, where the natives give it in diarrhœas, flemeries, and dyfenteries. We ufe it in powder for the fame purpofes, the dofe being from half a dram to a dram. It is proper to give a dofe of ipecacuanha before taking it.

This tree grows alfo on the Coromandel coaft, in the Eaft Indies, and is not unlike the *cedaroides* of the *hortus Malabaricus*. The bark fhould be freth powdered, and the electary prepared with fyrup of oranges every day or every other day. Med. Eff. vol. iii. art. 4.

CONFARREATION, a ceremony among the ancient Romans, ufed in the marriage of perfons whofe children were deftined for the honour of prieftbood.

Confarreatio was the moft facred of the three modes of contracting marriage among that people; and conftituted, according to Servius, in this, that the *pontifex maximus* and *flamen dialis* joined and contracted the man and woman, by making them eat of the fame cake of falted bread: whence the term, *far* fignifying *meal* or *flour*.

Ulpian fays, it conftited in the offering up of fome pure wheaten bread; rehearfing, withal, a certain formula, in prefence of ten witneffes. Dionyfius Halicarnaffeus adds, that the husband and wife did eat of the fame wheaten bread, and threw fome on the victims.

CONFECTION, in *Pharmacy*, a kind of compound remedy, of the conftitence of a foft electary.

There are feveral electaries, which bear the name of *confections*; fome of which, in the medical language, are *corroborative*, and others *purgative*.

Of the number of the corroborative *confections* are thofe of *alkermes*, of *hyacinth*, and the *anacardine*: a purgative one is the *confection Hamech*. The *confection of alkermes* has its name from the principal ingredient therein; which is the *kermes*, or *alkermes*, or fcarlet-grain. The other ingredients are, pearls, muik, cinnamon, ambergris, leaf-gold, juice of pippins, and rofe water. It is ranked among the beft *cardiacs*, and is frequently ufed for the palpitation of the heart, or fyncope; and fometimes in the fmall-pox and meafles.

The *confection of hyacinth* has nearly the fame virtues with that of *alkermes*; but, befides, it is frequently ufed as an aftringent. It conftits of near triple the number of drugs; whereof the precious ftone, called the *hyacinth*, is efteemed the principal; the chief of the reft are, red coral, bole armeniac, terra figillata, myrrh, the fantals, burnt hartfhorn, camphor, fapphire, emerald, topaz, and moft of the ingredients of the *confection* of alkermes. The *anacardine confection*, now difufed in England, is compofed chiefly of ANACARDIUMS; whence the name. The other drugs are, long pepper, black pepper, moft kinds of myrobalans, caftoreum, &c. It is ufed to purge the blood, and is proper in cold diteafes.

The *confection Hamech* takes its name from that of its inventor, an Arabian phyfician. Its ingredients are, polypody, myrobalans, agaric, fenna, tamarinds, red rofes, manna, colocynth, &c. It is applied as a drattic for the purging of the groffer humours and viscidities: it is alfo of fome reputation in vertigoes and cancers.

CONFECTIO *cardiaca*, a name given in the late London difpenfatory to the fo much efteemed medicine, commonly known by the name of the *confectio Rabeirhara*. The compofition is alfo altered as well as the name, and is ordered now to be made in the following manner: take freth tops of rofemary, and juniper berries, of each a pound; the leffer cardamom feeds, freed from their hufks, zedoary, and faffron, of each half a pound. Draw a tincture from thefe, with a gallon and a half of proof fpirit; reduce this tincture, when ftrained, to the weight of about two pounds and a half, by a gentle evaporation; then finifh the electary by adding the following fpecies finely powdered: viz. of compound powder of crabs claws, fixteen ounces; cinnamon and nutmeg, of each two ounces; cloves, an ounce; double refined fugar, two pounds. Pemberton's London Difpenfatory, p. 338.

CONFECTIO *Damocratis*. See MITHRIDATE.

CONFECTIO *Franciforii*. See DIACORDIUM.

CONFECTIO *Japonica*, is prepared of Japan earth, three ounces; tormentil root, nutmeg, and olibanum, of each two ounces: opium, diffolved in Lifbon wine, a dram and a half, fimple fyrup and conferve of rofes, of each fourteen ounces. An electary of thefe ingredients fupplies the place of *diafcordium*; and the dofe is from a fcruple to a dram.

CONFECTIO *Paulina*, a name given in the late London Difpenfatory to the compofition which ufed to be called *confectio archigenis*. It is now ordered to be made in the following manner: take coftus or zedoary, cinnamon, long pepper, black pepper, ftrained ftorax, galbanum, opium, and ruffin caftor, of each two ounces; of fimple fyrup, boiled to the conftitence of honey, an equal weight to thrice the fpecies. Pemberton's London Pharm. p. 339.

CONFECTOR, among the *Ancient Romans*, a fort of GLADIATOR, hired to fight in the amphitheatre againft beafts; thence alfo denominated *beftiarii*.

The *confectores* were thus called *à conficiendis beftiis*, from their difpatching and killing beafts.

The Greeks called them ΚΑΘΕΚΤΟΙ, q. *ἀ. daring, refs, defperate*; whence the Latins borrowed the appellations PARABOLANI, and *parabolarii*. The Chriftians were fometimes condemned to this fort of combat.

CONFECTS, or CONFITS, a denomination given to fruits, flowers, herbs, roots, and juices, when boiled and prepared with fugar, or honey, to difpofe them to keep, or render them more agreeable to the tafte.

The ancients only *confited* with honey; at prefent, fugar is more frequently ufed. *Confects half-fugared*, are thofe only covered with a little fugar, to leave more of the natural taite of the fruit.

Confects are reduced to eight kinds; viz. *liquid confects, marmalades, jellies, pafles, dry confects, conferves, candies*, and *dragees*, or *fugar-plums*.

Liquid confects are thofe whofe fruits, either whole, in pieces, in feeds, or in ciufters, are *confited* in a fluid tranfparent fyrup, which takes its colour from that of the fruits boiled in it. There is a good deal of art in preparing thefe well; if they be too little fugared they turn; and if too much, they candy. The moft efteemed of the liquid *confects* are plums, efpecially thofe called mirabiles, barberries, quinces, apricots, cherries, orange flowers, little green cureos from Madeira, green cafia from the Levant, myrobalans, ginger, cloves, &c.

Marmalades are a kind of paftes almoft liquid, made of the pulp of fruits, or flowers, that have fome conftitence; fuch as apricots, apples, pears, plums, quinces, oranges, and ginger. Marmalade of ginger is brought from the Indies by way of Holland: it is efteemed good to revive the natural heat in old men. See MARMALADE.

Jellies are juices of feveral fruits, wherein fugar has been diffolved, and the whole, by boiling, reduced into a pretty thick conftitence; fo as, upon cooling, to refemble a kind of thin tranfparent glue, or ifinglafs. *Jellies* are made of various kinds of fruits, efpecially gooiberries, currants, apples, and quinces: there are other jellies made of flefh, fifh, hartfhorn, &c. but they are not to be kept, being very fubject to corrupt.

Paftes are a kind of marmalades, thickened to that degree by a proper boiling, as to affume any form, when put into little moulds, and dried in the oven. The moft in ufe are thofe of gooiberries, quinces, apples, apricots, and orange flowers: thofe of piftachios are much efteemed; thofe of ginger are brought from the Indies.

Dry confects are thofe whofe fruits after having been boiled in the fyrup, are taken out again, drained, and put to dry in an oven. Thefe are made of fo many kind of fruits, that it would be hard to explain them all: the moft conliderable are citron, and orange-peel, plums, pears, cherries, apricots, &c.

Conferves are a kind of dry *confects*, made of fugar, and paftes of flowers or fruits, &c. The moft ufual among thefe are thofe of rofes, mallows, rofemary, of hops,

of

of orange flowers, violets, jessamin, pistachoes, citrons, and sloes.

Note. The apothecaries, under the title of *confection*, comprehend all kinds of *confetti*, both dry and liquid; whether of flowers, fruits, seeds, roots, barks, or leaves, prepared with sugar or honey, to preserve, &c.

Comfits are ordinarily entire fruits, candied over with sugar, after having been boiled in the syrup; which renders them like little rocks, crystallized, of various figures and colours, according to the fruits enclosed within them. The best candies are brought from Italy. See CANDY.

Sugar-plums are a kind of little dry *confits*, made of small fruits, or seeds, little pieces of bark, or odoriferous and aromatic roots, &c. incrustated and covered over with a very hard sugar, ordinarily very white. Of these there are various kinds, distinguished by various names: some made of barberries, others of berberries, melon-seeds, pistachoes, filberds, almonds, cinnamon, orange-peel, coriander, aniseed, caraways, &c.

CONFEDERACY, an alliance or league between divers princes and states.

CONFEDERACY, in *Law*, is when two or more persons combine to do any damage to another, or to commit any unlawful act.

Confederacy is punishable, though nothing be put in execution: but there it must have these four incidents: 1. That it be declared by some matter of prosecution: as by making of bonds or promises to one another: 2. That it be malicious: as for wilful revenge: 3. That it be false, i. e. against the innocent: and, lastly, That it be out of court, voluntarily.

CONFERTA *folia*, among *Botanists*. See LEAF.

CONFERVA, in *Botany*. See HAIR-*weed*, and *Tab.* XIII. *Botany*, N° 2.

We find many of our pools and rivers in the summer months thick covered with the green *conferva*: they are also frequently driven by the winds against the shores of our rivers, and cover the whole surface with a green mantle. This, with us, has never been found to be of any ill consequence to animals; but there is a peculiar species of it in some parts of the world, that is undistinguishable from ours in appearance, but is poisonous. Phil. Trans. N° 17. See some curious experiments by Dr. Priestley on a species of *conferva* or water-mols of a peculiar kind; the manner of its production and its effect, by the concurring action of light upon it, in dephlogisticating or depurating the air to which it has access, and thereby increasing the quantity of it, in Observ. on Air, &c. vol. iv. p. 335, &c. vol. v. sect. 2, 3, 4, 5.

CONFESS *and avoid*, in *Law*, a species of REPLICATION, in which the plaintiff introduces some new matter or distinction, consistent with his former declaration: as in an action of trespass upon land of which the plaintiff is seised; if the defendant shews a title to the land by descent, the plaintiff may either deny the fact or *confess and avoid* it, by replying that such descent happened, but that the defendant hath since demised the lands to the plaintiff for the term of life. Blackst. Com. vol. iii. p. 310.

CONFESSION, *confessio*, in *Rhetoric*, the same with what is otherwise called PARHOMOLOGY.

CONFESSION, in a *Civil Sense*, a declaration or acknowledgment of some truth, though it be against the interest of the party who makes it; whether it be in a court of justice, or out of it. It is a maxim, that in civil matters the *confession* is never to be divided, but always taken entire; and that a criminal is never condemned on his simple *confession*, without other collateral proofs; nor is a voluntary extra-judicial *confession* admitted as any proof. A person is not admitted to accuse himself, according to that rule in law, *non auditur perire volens*.

CONFESSION *of action*, in *Law*, is a species of PLEA to the ACTION, in which the merits of the complaint are answered, by confessing either wholly, or, which is most common, in part.

CONFESSION *of indictment*, is a prisoner's acknowledgment of the offence, when he is brought to the bar to be arraigned: upon a simple and plain confession, which the court is backward in receiving and recording, nothing remains but to award judgment. This *confession* is made before the judge; in consequence of which, the prisoner submits to the legal penalty annexed to his crime; or the prisoner by *confession* becomes an APPROVER, or accuser of others.

CONFESSION, in *Theology*, denotes the verbal acknowledgment which a penitent makes of his sins to God: in a more partial and restricted sense, it is a declaration of a person's sins, made to a priest, in order to obtain absolution for the same. The Romish church makes *confession* a part of the sacrament of penance.

Confession was anciently public and general, in the face of the church; though the Romanists have since altered it, and made it private and auricular.

Confessions are to be buried in eternal silence, under pain of the greatest punishment to the priest who reveals them. Bellarmin, Valentia, and some other Romish controversial writers, endeavour to trace up AURICULAR *confession* to the earliest ages; and thus contend for a point given up by the rest. M. Fleury owns, that the first instance of auricular *confession* he can meet with, is that of St. Eloi, who being grown old, made a *confession* to a priest of all his sins from his youth upwards. See POPERY. The Indians, according to Lafeviter, have a kind of *confession*; and the same may be said of the Jews: these last have formulas for those who are not capable of making a detail of all their sins; the ordinary form is in alphabetical order; each letter containing a capital sin. This they usually recite on Mondays and Thursdays, and on fast-days, and on other occasions; some every night and morning. When any of them find themselves near death, they send for ten persons, more or less, one of them a rabbin, and in their presence recite the *confession*. See Leo de Modena.

CONFESSION *of faith*, denotes a list, or enumeration and declaration of the several ARTICLES of belief, in a church. The *Augustan confession* is that of the Lutherans: it was presented to Charles V. in 1530.

In the council of Rimini, the catholic bishops found fault with places in a *confession of faith*, and observed that the church never used to vary them.

CONFESSIONAL, or CONFESSIONARY, in *Church History*, a place in churches, usually under the main altar, wherein were deposited the bodies of deceased saints, martyrs, and confessors.

CONFESSIONAL is also used in the Romish church for a little box, or desk in the church, where the confessor takes the confessions of the penitent.

CONFESSO, *Pro*. See PRO-CONFESSO.

CONFESSOR, a Christian who has made a solemn, and resolute profession of the faith, and has endured torments for its defence. A mere saint is called a *confessor*, to distinguish him from the roll of dignified saints, such as *apostles*, *martyrs*, &c.

In ecclesiastical history, we frequently find the word *confessors* used for martyrs: in after times, it was confined to those, who after having been tormented by the tyrants, were permitted to live and die in peace. And at last it was also used for those, who, after having lived a good life, died under an opinion of sanctity. According to St. Cyprian, he who presented himself in torture, or even to martyrdom, without being called to it, was not called a *confessor*, but a *professor*: and if any out of a want of courage abandoned his country, and became a voluntary exile for the sake of the faith, he was called *exorcist*.

CONFESSOR is also a priest, in the Romish church, who has a power to hear sinners in the sacrament of penance, and to give them absolution.

The church calls him in Latin *confessarius*, to distinguish him from *confessor*, which is a name consecrated to saints. The *confessors* of the kings of France, from the time of Henry IV. have been constantly Jesuits: before him the Dominicans and Cordeliers shared the office between them. The *confessors* of the house of Austria have also, ordinarily, been Dominicans and Cordeliers: but the latter emperors have all taken Jesuits.

CONFESSOR *to his Majesty*. See CLERK *of the closet*.

CONFIGURATION, the exterior surface that bounds bodies, and gives them their particular figure.

That which makes the specific difference between bodies, is the different *configuration*, and the different situation of their parts. A short, or long sight, depends on the different *configuration* of the crystalline.

CONFIGURATION *of the planets*, in *Astrology*, is a certain distance or situation of the planets in the zodiac, whereby they are supposed to aid, or oppose each other. See ASPECT.

CONFIGURATIONS *of salts*, a term used by some to express the combinations of the particles of the salts of plants, and other substances, into certain figures, on evaporating the water in which they have been dissolved, so fruitfully as not to admit of their shooting into their own regular crystals.

CONFIRMATION, the act of ratifying or rendering a title, claim, pretension, report, or the like, more sure and indisputable.

CONFIRMATION, in *Law*, denotes the conveyance of an estate, or right in *esse* from one man to another, whereby a voidable estate is made sure and unavoidable, or a particular estate is increased, or possession made perfect: and it is particularly used for the strengthening or bolstering an estate of one already in possession of it by a voidable title.

Thus, if a bishop grant his chancellorship by patent, for term of the patentee's life; this is no void grant: yet it is voidable by the bishop's death, except it be strengthened also by the dean and chapter's *confirmation*.

CONFIRMATION, in *Rhetoric*, is the third part of an oration, wherein the orator undertakes to prove, by laws, reasons, authorities, and other arguments, the truth of the propositions advanced in his narration. Cicero, De Invent. lib. i. cap. 24.

Confirmation is either *direct* or *indirect*: the first confirms what the orator has to urge for strengthening his own cause: the second, properly called CONFUTATION, refels the opposite arguing of the adversaries. The two parts together are sometimes placed under the head or title of CONFUTATION.

The *confirmation* is, as it were, the life and soul of the oration: in this the main force of the argumentation lies. Whence Ariſtotle, properly enough, calls it *nervi, fides*.

CONFIRMATION, in *Theology*, the ceremony of laying on hands, for the conveyance of the Holy Ghoſt.

Among the ancients it was conferred immediately after baptiſm; and was eſteemed, in ſome meaſure, to be a part thereof: whence the fathers call it the *accompliſhment* of baptiſm. The ground of the practice was an opinion of the imperfection of baptiſm, which in their apprehenſion only prepared perſons for the reception of the graces of the Holy Spirit, which were actually conferred in *confirmation*. Tertull. de Bap. p. 599, &c. and Lord King's Hiſt. of the Prim. Church, chap. v. p. 80, &c.

Among the Greeks, and throughout the Eaſt, it ſtill accompanies baptiſm; but the Romaniſts make it a diſtinct independent ſacrament.

It appears that *confirmation* has all along been ordinarily conferred by the biſhop: St. Cyprian, and moſt of the fathers, ſpeak of it in ſuch terms as to imply it to have been confined to the biſhop alone; and Fleury and moſt of the moderns, from them, lay it down as a diſtinguiſhing character between the offices of a prieſt or deacon, and that of a biſhop, that the former might baptize, but the latter alone might anoint and *confirm*; by virtue of their ſucceſſion to the apoſtles, to whom it originally belonged. But from ſome paſſages in St. Gregory, &c. others gather, that the prieſts, on occaſion, had likewiſe the power of *confirming*.

It has been alledged, that, as *confirmation* always ſucceeded baptiſm, and made a neceſſary part of it, and ſeveral of the primitive Chriſtians eſteemed both neceſſary to ſalvation, it muſt have been performed by preſbyters as well as by biſhops; becauſe the biſhop of a church might be abſent for a very conſiderable time, as was the caſe with Cyprian, or the ſee might be vacant; and as preſbyters baptized, it is reaſonable to conclude that they alſo *confirmed*. Lord King has ſhewn that *confirmation* and abſolution were the ſame thing: and that preſbyters, ſometimes with the biſhop, and ſometimes without the biſhop, did abſolve by impoſition of hands: and he has cited ſeveral ancient authorities in order to prove, that *confirmation* was frequently repeated with reſpect to the ſame perſon. Hiſt. Prim. Church, p. 91, &c.

It is certain, among the Greeks, the prieſt who baptizes, alſo *confirms*: which practice, Lucas Holſtenius ſhews, is of ſo old a ſtanding among them, that it is now generally looked on as belonging properly, and of right, to the prieſt; though ſome will have it to have been borrowed by them from the biſhops. Hence, ſome of the Latin divines acknowledge, that though the biſhop be the ordinary miniſter of *confirmation*, yet, that the prieſt, in his abſence, may alſo confer it, in quality of miniſter extraordinary.

The council of Rouen, held in 1072, decrees, that *confirmation* muſt be conferred faſting, both on the ſide of the giver, and that of the receiver.

It has been urged, however, that this ceremony, with reſpect to the real importance and utility of it, was peculiar to the days of the apoſtles: though it is retained among Proteſtants, it is doubted whether it be a neceſſary inſtrument of grace. The order of *confirmation* in the church of England, does not determine the preciſe age of the perſon to be *confirmed*.

CONFISCATE, in *Law*, is applied to goods forfeited to the exchequer or public treaſury.

The word is derived from *fiſcus, a hamper, pannier, or baſket*, wherein the emperor's money uſed to be kept.

The title to goods which are not claimed by any other, is given by law to the king. If a man, indicted for ſtealing the goods of another, in which caſe they become, in effect, the proper goods of him indicted, be aſked about them in court, and diſclaim them: he thereby loſes the goods, though he be afterwards acquitted of the theft, and the king ſhall have them as *confiſcate*: but otherwiſe, had he not diſclaimed them.

CONFISCATION, a legal adjudication of goods or effects to the fiſc, or treaſury.

Thus, the bodies and effects of criminals, traitors, &c. and merchandizes that are contraband, prohibited, or brought aboard or aſhore without paying the duties, when ſeized, are *confiſcated*.

It is an axiom in law, that he who *confiſcates* the body, *confiſcates* alſo the effects, to the profit of the king, or the lord of the fee; i. e. he who is condemned to loſe his life, muſt alſo loſe his goods; yet the widows of criminals do not loſe their dowers, nor their ſhare in the goods of the community, by the forfeiture of their huſbands.

CONFLAGRATION, a general burning of a city, or other conſiderable place. In which ſenſe, Nero is ſaid to have procured the Chriſtians to be accuſed of the *conflagration* of Rome, which was done by his own order.

But the word is more ordinarily reſtrained to that grand period, or cataſtrophe, of our world, wherein the face of nature is expected to be changed by a deluge of fire, as it was anciently by that of water. The ancient Pythagoreans, Platoniſts, Epicureans, and Stoics, appear to have had a notion of the *conflagration*; though whence they ſhould derive it, unleſs from the ſacred books, is difficult to conceive; except, perhaps, from the Phœnicians, who themſelves had it from the Jews.

Seneca ſays expreſly, *Tempus advenerit quo ſidera ſideribus incurrent, & omni flagrante materia una ignis, quicquid nunc ex depoſito lucet, ardebit.* This general diſſolution the Stoics call *ἐκπύρωσιν, ecpyroſis*. Mention of the *conflagration* is alſo ſeveral times made in the books of the Sibyls, Sophocles, Hyſtaſpes, Ovid, Lucan, &c.

Dr. Burnet, after F. Tachard, and others, relates, that the Siameſe believe, that the earth will at laſt be parched up with heat; the mountains melted down; and the earth's whole ſurface reduced to a level, and then conſumed with fire. And the Brahmins of Siam do not only hold, that the world ſhall be deſtroyed by fire; but, alſo, that a new earth ſhall be made out of the cinders of the old. Various are the ſentiments of authors on the ſubject of the *conflagration*; the cauſe whence it is to ariſe, and the effects it is to produce. Divines ordinarily account for it metaphyſically; and will have it take its riſe from a miracle, as a fire from heaven. Philoſophers contend for its being produced from natural cauſes; and will have it effected according to the laws of mechanics; ſome think an irruption of a central fire ſufficient for the purpoſe; and add, that this may be occaſioned ſeveral ways; viz. either by having its intention increaſed; which, again, may be effected either by being driven into leſs ſpace by the encroachments of the ſuperficial cold, or by an increaſe of the inflammability of the fuel thereto it is fed: or by having the reſiſtance of impriſoning earth weakened; which may happen either from the diminution of its matter, by the conſumption of its central parts; or by weakening the cohęſion of the conſtituent parts of the maſs, by the exceſs or the defect of moiſture.

Others look for the cauſe of the *conflagration* in the atmoſphere; and ſuppoſe that ſome of the meteors there engendered in unuſual quantities, and exploded with unuſual vehemence, from the concurrency of various circumſtances, may be made to effect it, without ſeeking any farther.

The aſtrologers account for it from a conjunction of all the planets in the ſign Cancer; as the deluge, ſay they, was occaſioned by their conjunction in Capricorn.

Laſtly; others have recourſe to a ſtill more effectual and flaming machine; and conclude the world is to undergo its *conflagration* from the near approach of a COMET, in its return from the ſun. Thoſe wandering bodies do indeed ſeem to menace us a little; being able, both by their tranſverſe motion acroſs the earth's way, by the hugeneſs of their ſize, and the intenſe fire wherewith they glow in their recefs from the periheſion, to produce the moſt ſignal changes and revolutions in the ſyſtem of things.

Mr. Whiſton has ſhewn, that they are extremely well fitted to produce the phenomena of the deluge; and has gone a good way towards proving, that the comet of 1680, was the very body to which that event was owing; as being then in its approach toward the ſun, and its atmoſphere crouded with the watery vapours it had gathered in thoſe inconceivably cold regions, into which it had fled off in its aphelion.

This ſame comet, Sir Iſaac Newton has calculated, when in its periheſion, December the 8th, was heated, by the vicinity of the ſun, to a degree two thouſand times more hot than red-hot iron: he ſhews, likewiſe, that it would ſcarce be cool again in fifty thouſand years.

This ſame comet, Dr. Halley obſerved November the 11th, was not above a ſemidiameter of the earth from the earth's way: ſo that had the earth, at that time, been in that part of its orbit, ſomething very extraordinary might have been apprehended; but whether in the way of fire, or water, may, perhaps to ſome, leave room to doubt. But it is ſcarcely conceivable, that the comet ſhould bring any vehement degree of heat, out of thoſe regions it comes from, whatever heat it might carry thither.

CONFLUENCE,

CONFLUENCE, Conflux, the place where two RIVERS join, and mix their waters.

CONFLUENT, in *Medicine*, an epithet given to that species of *small-pox* wherein the puſtules run into one another.

CONFORMATION, the particular texture and conſiſtence of the parts of any body, and their diſpoſition to make a whole.

We ſay, light of different colours is reflected from bodies according to their different *conformation*; in oppoſition to the Carteſians, who pretend, that reflected light becomes of different colours, according to the different *conformation* of the bodies that reflect it. The *conformation* of the members of an embryo is not perfect enough to allow of diſſection.

Conformation, in *Medicine*, is uſed to expreſs that make and conſtruction of the human body, which is peculiar to every individual.

Hence, a *male conformatio* ſignifies ſome fault in the firſt rudiments; whereby a perſon comes into the world crooked, or with ſome of the *viſcera*, or cavities, unduly framed, or proportioned. Many are ſubject to incurable aſthmas, from a too ſmall capacity of the *thorax*, and the like original vicious *conformations*.

CONFORMITY, in the *Schools*, is the CONGRUENCY, or relation of agreement between one thing and another; as between the meaſure, and the thing meaſured; the object, and the underſtanding; the thing, and the conception; the thing, and the diviſion thereof, &c.

CONFRERES, from *con*, and *frere*, *brother*; denote brethren in a religious houſe, or the fellows of one and the ſame ſociety. 32 Hen. VIII. c. 24.

CONFRONTATION, the act of bringing two perſons, in preſence of each other, to diſcover the truth of ſome fact, which they relate differently.

The word is chiefly uſed in criminal matters; where the witneſſes are *confronted* with the accuſed; the accuſed with one another, or the witneſſes with one another.

CONFUSED *notion*. See NOTION.

Confused *viſion*. See VISION.

CONFUSION, in a general *ſenſe*, is oppoſed to ORDER; in a perturbation whereof, *confuſion* conſiſts: e. gr. when things prior in nature do not precede; or poſterior do not follow, &c.

In a logical ſenſe, *confuſion* is oppoſed to *diſtinctneſs*, or *perſpicuity*; and may happen, either in words, as when miſconſtrued or miſapplied; or in ideas, as when the idea of any thing preſents ſomething along with it, which does not properly belong to that thing.

In a phyſical ſenſe, *confuſion* is a ſort of UNION, or MIXTURE by mere contiguity. Such is that between fluids of contrary natures; as oil and vinegar, &c.

Confusion, *property by*, in *Law*, denotes the intermixture of the goods of two perſons in ſuch a manner, that their reſpective portions cannot be aſcertained. If this be by conſent, they have a common intereſt in proportion to their ſhares; but the law allows no remedy to the perſon who mixes his property with that of another, without his knowledge and approbation. Blackſtone's Comm. vol. ii. p. 405.

Confusion *of tongues*, in the *Hiſtory of the World*, is a memorable event, which happened in the 100 hundred and firſt year, according to the Hebrew chronology, and the four hundred and firſt year by the Samaritan, after the flood, at the overthrow of Babel; and which was providentially brought about, in order to facilitate the diſperſion of mankind, and the population of the earth. Until this period there had been one common language, which formed a bond of union, that prevented the ſeparation of mankind into diſtinct nations; and ſome have ſuppoſed, that the tower of Babel was erected as a kind of fortreſs, by which the people intended to defend themſelves againſt that ſeparation, which Noah had projected. Uſher ad A. M. 1757.
